Zinc screens, six feet wide, with round holes are used. The elevator is placed in the middle of the back of the cleaner between the sills, instead of on the side. At the bottom of the elevator is a hopper with a slide gate into the elevator, which regulates the amount of feed to the sieves; so that when a dump of clear wheat goes through the separator it cannot overload the sieves, and run good wheat over with the tailings; the hopper holds it till it is gradually worked off. The elevator discharges upon a distributing board which distributes the grain evenly over the sieves, whether feeding fast or slow without any adjusting; thence upon and through a coarse sieve, where it encounters a strong blast of wind; thence upon a slide which discharges it at the upper end of the series of zinc screens, and passing over these screens to the front, is discharged into the sacks. The discharge is high enough so that the grain spout used on the separator can be used on the cleaner.

All the sieves, screens, and cleaning apparatus are in one shoe, supported by two springs on each side, driven by a cam movement of one-quarter of an inch, with a speed of 600 revolutions per minute.

The cleaning is complete, rapid and saving, scarcely a kernel of wheat finding its way anywhere except into the sack where it belongs. The best principles of "mill cleaning" have been applied to this cleaner in a light and compact form. The grain is conveyed from the separator to the hopper, with an auger driven by a simple device. Unlike other cleaners, it does not have to be built according to the side of the separator the parties intend to use it, (and after which they cannot be used on any other side), but it can be used on either side of the separator, whenever desired. In cleaning up the sheets about the sack-tender, they can be emptied into the hopper instead of taking them to the derrick.

Steps have been taken to secure a patent on this device. Any further information can be had by addressing the inventor, G. W. T. Carter, at Byron, Contra Costa Co., or M. C. Hawley & Co., S. F. The cleaners are being built at Jackson & Truman's shops, in this city, where they can be examined by all interested.

MINERAL ZONES.—Experts, when called upon to "swear" upon a mining suit, are prone to dilate at great length upon "mineral zones," particularly if they are hired to establish the existence of such a thing by the plaintiffs—the defendants seldom having to do with anything larger than a lode or vein. The following definition recently given a man of Tombstone by one of the most celebrated of Pacific coast experts, will enlighten the public on what constitutes, in law, a mineral zone. He says: "Well, now, I'll tell you what a mineral zone is: A man goes into a district and makes a discovery and locates a claim. He then makes another location upon the east and another on the west. He sinks a shaft in the center two or three hundred feet deep and then drifts west two hundred feet and cuts a vein; that's ledge number one; he then runs along another one or two hundred feet and cuts another vein. That's ledge number two. He goes ahead again, and cuts another vein, and that's ledge number three. He does the same thing on the east, and finds nothing but veins or ledges. Now, suppose this man had only made the one location, and John Roe had come along and located on the east side of him, and Richard Roe on the west, and he had gone on and sunk and drifted and cut these same veins or ledges in John's and Richard,s ground, that would constitute a mineral zone." The history of mining is full of such instances, and expert witnesses were invented to establish such facts.—*Tombstone Epitaph.*

Permanence of the Tombstone Fissures.

"Will the mines go down?" has been, says the *Epitaph*, the question of paramount interest since the discovery of Tombstone, and still remains so, notwithstanding the fact that the 600-foot level has been opened out in the Grand Central and shows a strong and well-defined ledge, with every indication of permanence and continuity down to unfathomable depths. If the origin of the Contention fissus, upon which the Grand Central is located, is of igneous origin, as asserted by Prof. Blake in his paper on the "Geology of Tombstone," read before the American Institute of Mining Engineers, then there can be no question of the lode going down, and that, too, with a probable increase in size and strength. Thus far the developments in the Grand Central substantiate this view of the case, the ledge so far developed on the 600-foot level being stronger than at points nearer the surface.

The question of the continuation of the ledge downwards being settled in the affirmative, the next question is as to its probable ore-bearing qualities. For a solution of this last and equally vital point, we are compelled to draw our conclusions from analogy Looking over the broad field of mining, the world over, we find that where true fissures have been subject to extensive operations, the ore has been found to make with the ledge, in variable quantities it is true, to the utmost depth attained upon them. Another fact to be taken into account is the manner of occurrence of ore laterally within these fissures. It is a well-known fact that the paying bodies are found in chimneys or chutes of ore of variable lengths, often separated by long intervals of barren ground. Thus, too, in depth these ore bodies are found to have a limit succeeded by barren vein matter. Take the Comstock as an illustration. The surface bonanzas commenced on the north with the Ophir, thence going south came the Gould & Curry, Chollar and Gold Hill mines. The deep bonanzas were California, Consolidated Virginia, Savage, Hale & Norcross and Belcher, being sandwiched in between the lesser surface deposits. That a similar condition of occurrence of the bonanzas in the Contention fissure will be found, we have every reason to believe, and that the utmost limit of production will be reached before a depth of 1,500 to 2,000 feet is attained is hardly probable. What may be found below those points nothing but persistent work will tell.

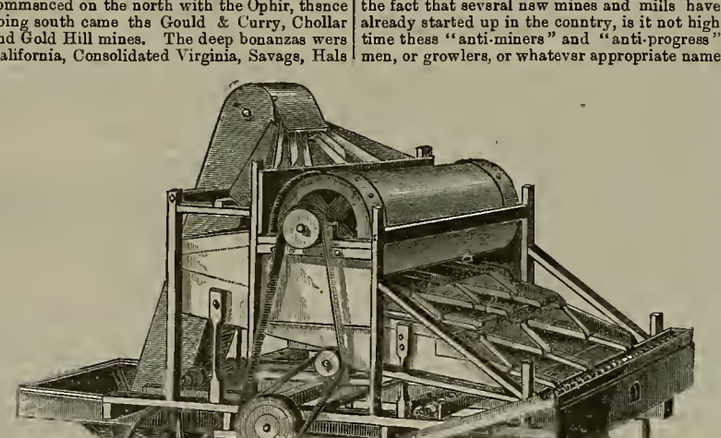
The water problem in the new Grand Central shaft remains unsolved, notwithstanding two weeks have passed since the first strike was made. On Thursday last a drill-hole in the bottom of the shaft brought forth a strong stream that indicated a near approach to the fountain head. The hole was immediately plugged up and the work of timbering the shaft resumed, in order that when the shots were fired, if a strong flow should result, no damage by caving in of the shaly sides of the shaft would ensue. The timbering was finished last evening and the plug withdrawn, when it was found that the flow of water had considerably abated. Another deep hole had been put down in hard rock without any flow of water whatever; therefore, it was the opinion of the foreman that the hole of Thursday had merely tapped a vein of no great extent. Preparations have been made for handling the water until the flow shall equal several thousand gallons in the 24 hours, after which a pump will have to be put in. The drifts north and south along the ledge on the 600 level are in about 110 ft each, and the ledge is steadily improving. Heretofore the ore has been bunchy in the mass of vein matter, whereas now it is becoming more uniform and of a much better grade. A most remarkable feature is the disappearance of silver and the large yield of gold in the ore, the assays for several days showing hardly a trace of the former metal, and giving a range between $86.25 and $115.75 per ton gold. A bonanza of this kind of ore will make the Grand Central more famous than it has been with its argentiferous record of the past.

GENERAL HURLBUT, U. S. Minister to Peru, died suddenly at Lima on March 28.

Oregon Quartz Mines.

The *Bedrock Democrat*, of Baker City, Oregon, says: "We are highly pleased to see that many of our placer mine enthusiasts are turning attention to prospecting for quartz and developing the ledges already discovered. They are beginning to fall in line with the little army of progressive spirits who have been laboring unceasingly to bring our mineral resources to the notice of capitalists. In nearly every instance, the class of whom we speak are old-timers, men accustomed to rich placer and seam diggings (yet, to the credit of many of our early miners, we are proud to find them among the most enterprising and successful of our progressive miners), but it is a well-known fact that nearly all of the quartz discoveries made within the past few years were by men who came to this country since the palmy days of placer and seam mining. Many of the good old pioneers were aware of the existence of gold-bearing ledges, which prospected only a few small colors—probably $12 or $15 rock—which they little thought would, in the near future, prove a better property than their ounce diggings. Men accustomed to making money easy and spending it freely, are usually not the men to see a fortune in quartz which prospects as low as $5 or $8 per ton, and even stay with the lode and develop it into a good property. To-day there are golden opportunities in undeveloped quartz mines all through this section.

A few years hence many will regret they did not prospect more carefully and extensively their claims. Of course we know that it is not all gold that glitters, and that every ledge which shows a prospect will not prove a paying property; but we do claim that a little more energy on the part of claim holders will surely add several more good mines to this district. Then in the face of this reasonable view, and the fact that several new mines and mills have already started up in the country, is it not high time these "anti-miners" and "anti-progress" men, or growlers, or whatever appropriate name you may call them, were seeing the folly of their course, and taking an active part in the encouragement of bringing to light the millions of hidden treasure which no sane person can reasonably doubt lies within a practical working depth within the limits of our district. Shall we not increase our energies and explore our mines to a reasonable depth rather than linger along for years, and finally leave the work and its fruits to the experienced quartz miners of other go-ahead camps, who are already looking this way. We do not wish to portray this subject in a false light, nor as an enthusiast. We are simply trying to show up our mining advantages as they are, and giving a few words of encouragement to our miners, as well as chiding those who appear to have a mania in crying down our quartz-mining industry. Time is certainly demonstrating that these anti-miners don't know it all.



CARTERS' NEW WHEAT CLEANER.

MACHINERY for the Yaqui Milling & Mining Co., of Sonora, arrived at the depot yesterday, and is now being transferred to teams waiting to convey it to its destination. The 25-horse power movable engine is mounted on wheels, by which it not only becomes more easy of shipment, but much time is also saved when putting it in place for work. A 10-stamp mill is sufficient for the present wants of the company, but it will be further enlarged as necessity may require.—*Arizona Citizen.*

THE Stanislaus *Wheat Grower* says: The Mount Diablo coal vein continues east, in all probability, into the Sierra Nevada. The vein dips at an angle of 15°, until it passes under the San Joaquin river, when it rises to the surface at about the same angle. Some prospecting in the foothills northest of Knight's Ferry would probably result in the discovery of a ledge.

IT IS stated that a 20-stamp mill will be erected on the Magna Charta, Montana, the coming season. This would give the Alice company 100 stamps. There is no doubt about the capacity of the mines to keep them in continuous operation.

Questions for Mining Engineers.

Blasting and Hoisting Coal.

A few weeks ago, Mr. C. M. Percy, well known from his connection with the Wigan Mining and Mechanical School, retired from the services of the Wigan Coal and Iron Co., on which occasion an exceedingly large audience assembled in the lecture-room for the purpose of witnessing the interesting ceremony of a presentation to that gentleman. A number of speeches were made, which are reported in the *Colliery Guardian*. Among them was one by Mr. Eckersley, ex-High Sheriff of Lancashire, in the course of which he made some suggestive remarks which we present in an abbreviated form:

Scientific improvements were being daily developed, and it was necessary for anyone adopting the engineering profession to keep pace with those advances. He ventured to submit there were two great questions demanding their attention. The first was, how were the fiery seams of coal to be worked without the great loss of life which at present prevailed? The second—and he thought the practical attention of mining engineers and colliery managers should be directed to it—was as to how sciences could be applied with the view of reducing the cost of raising the coal to the surface, reducing it to such a price as would give the proprietors a reasonable return for their invested capital, and the workmen an ample and a fair remuneration.

These were grave questions, requiring the consideration of men of science and of those upon whom devolved the management of the mines. He confessed that he was one of those who believed that if the use of explosive substances was entirely prohibited in working the coal seams of the district, a great saving of human life would be effected and coal would be raised with a greatly diminished percentage of slack or small coal. Gunpowder was very violent in its action, and ought to be dispensed with in coal-mining. He hoped that shortly some more improved method of winning the coal would be introduced, and that the working man would be able to earn his daily bread without having to resort to the use of gunpowder. What was the object of using this dangerous element? He understood it was that the coal might be more easily loosened and rendered convenient for removal. That seemed a very simple matter, but when they had this explosive substance to contend with—a substance that had to be used in every place where man had to be employed on the following day—he could compare it to nothing else but a series of small guns let off one after the other like soldiers firing a *feu de joie*. It was true that the effect produced, placed the material in a favorable position for removal on the following day, but in his opinion this was secured at a great expense. In the first place it gave the gas pent up in the coal seam an opportunity for escaping, which might otherwise remain there if left undisturbed by the combustion. In the next place, it gave a violent shock to the roof; in fact, every time a shot was fired it produced a similar effect to that of an earthquake. Were blasting with gunpowder in mines discontinued he was convinced they would hear a great deal less of falls of roof; and if they took even a lower view of the question he would say that blasting was an expensive process. He estimated that the depreciation consequent upon the use of gunpowder was not less than from 16 to 20 per cent. of the whole of the coal raised. There could be no doubt that blasting shattered the coal to such an extent that 33 per cent. of it fell into slack or small coal, and that, he calculated, made a depreciation of from 16 to 20 per cent., as he had already stated. The question was one worthy of the serious attention of mining engineers and mining students, and he hoped it would receive that attention which it deserved.

WATER LEVEL IN TOMBSTONE.—The Tombstone *Epitaph* says the permanent water region in the Grand Central mine has been found, and at 18 ft. below where first struck the flow became so strong that work had to be suspended last Wednesday, and now it has raised up to the point where the first seepage was discovered, making 18 ft. in the shaft. No further sinking can be done until a pump is put in to handle the constantly increasing flow as they go down. It is to be hoped that Mr. Gage will decide to follow up the important work that he has thus far so successfully carried out in the systematic development and working of this great property. Should he decide upon pumping machinery when he returns from a visit East, it will take at least 90 days to get it in working order; therefore, under the most favorable circumstances, at least four months must elapse before any sinking can be done. There is a very great interest felt in this matter by every miner in the district, for the reason that so much depends upon results below water level. One thing has already been settled in the Grand Central mine, and that is, the ledge is quite as strong on the 600 level as at any point above, and quits as well defined.

VERY heavy snows have fallen during the past winter in Idaho and northern Utah, and it is feared that on the approach of warm weather the Utah & Northern railroad will have much trouble with floods.

The Engineer.

The Brooklyn Bridge.—Mr. W. A. Roebling, Chief Engineer of the Brooklyn bridge, states in a recent report, in giving a detailed account of what has been done to strengthen the superstructure, that the aggregate strength of the wire composing each of the four cables has been estimated to be 12,300 tons (of 2,000 pounds) and the elastic limit, two-thirds of that amount—namely, 8,200 tons. From all the tests made, the average strength of all the wires was not placed too high. The method of splicing the wires was such that the full strength of the wire was maintained at all points. The superstructure consists essentially of the floor system and stiffening trusses. One of the most serious difficulties to be contended with in this structure is the maintenance of the balance of spans arising from the exceptional length of the land spans. Mr. Roebling gives the total weight of the bridge, including the transitory load, as 17,780 tons, from anchorage to anchorage—3,460 feet. Mr. Roebling adds: "It being the wish of the Board, as shown by the resolution annexed to the report of the committee, of which Mr. Kinsella was chairman, on the 6th of May, 1878, that the bridge should be adequate to the passage of the Pullman car, it became incumbent upon me to provide the necessary truss power with which to transfer the concentrated loads and to check the increased deformation of the cables resulting therefrom." He explains in great detail what he has accomplished, and finishes the report with the words: "The cables are strong enough to pull up the two anchorages."

The Tunnel from Sicily to Italy.—The length of the submarine tunnel between Italy and Sicily will be about 43,296 ft. The minimum depth of the sea above the line of the tunnel is 360 ft., and the thickness of rock between the roof of the tunnel and the bottom of the sea is 114 ft. The direction of the tunnel from St. Agata to Punta del Pizzo is almost due northwest to southeast, the two inclines leading to the tunnel running parallel with the above for some distance and then descending to the lowest level by spiral tunnels. The length of each of these inclines is 14,640 ft., and the degree of inclination will be about 35 per 1,000, this having been found by experience to be perfectly practical. According to the opinion of all geologists, the bottom of the Straits of Messina consists of crystalline rock (granite gneiss and mica schiste). Neither in Calabria nor in Sicily can the upper strata that cover this crystalline rock be so thick as to reach the level of the bottom of the descending inclines. Geological and hydraulic considerations agree in the conclusion that the submarine isthmus between Punta del Pizzo and St. Agata cannot consist of material that is compact or easily corroded.

The Bay of Biscay Canal.—The project of uniting the Bay of Biscay with the Mediterranean is beginning to be seriously talked of. The length of the canal will be 270 miles, and the estimated cost $248,000,000. The projectors assume that the canal, when constructed, will take almost the entire trade from the Atlantic to the Mediterranean, leaving the famed fortress of Gibralter to watch over waters undisturbed by ships of traffic. The canal would undoubtedly reduce the importance which Gibraltar now holds as the key to the Mediterranean, but there seems some doubt if it can be made profitable as a business venture. There would be very little saving of time by the new route, after allowing for the slowness of canal travel, compared with that on the open sea. But, in the event of war, the French might find it convenient to run ships into the Mediterranean, without passing under the guns of Gibraltar.

Washington Monument.—The engineer in charge of the construction of Washington monument, in Washington, reports that the addition to the hight of the structure since the work was renewed, Aug. 7, 1880, is 100 ft. The monument is now 250 ft. high above the base. Seventy-four ft. were added last year. The balance of appropriation available December 1st was enough to carry the obelisk to the hight of 286 ft.

Oldest Timber in the World.—The ancient temples of Egypt are believed to contain the oldest timber in the world, in the shape of dowel pins, which are incorporated with stone work known to be not less than 4,000 years old. These dowel pins, according to the appearance they present, are thought to have been made from the tamarisk or shittim wood—in ancient times a sacred tree in Egypt.

Cologne to be Made a Seaport.—It has been proposed in Germany to dredge the Rhine, so that Cologne may become a seaport. The proposition has been received with much favor and with some apprehension on the part of Hollanders and Netherlanders, through fear of serious injury to the ports of Antwerp and Rotterdam.

The Austrian government now works 200 miles of railroad which it owns, and 1,194 miles belonging to companies, while 407½ miles that it owns are worked under contract by corporations.

Useful Information.

Removing Paint.

A preparation, of which potash and soda are the principal components, has just been introduced into England, and is said to be a perfect paint remover. Some experiments made with the preparation upon various specimens of wood and metal, all old samples, well painted with several coats of good oil colors, were very successful. The compound, which is of a cream-like consistency, and quite white, is spread over the painted surface, and after being left on a few minutes is wiped off. Its action upon the body of the paint is thorough and complete, a saponification is set up which continues, the soda is liberated, and this process goes on, the alkali being liberated as it is wanted, till the whole of the paint is removed. Painted surfaces in about a quarter of an hour show every trace of paint cleanly removed, and the wood exposed as if it had been planed.

The action of this preparation seems to be two-fold. There is, first, the destructive action of the applied alkali, always caustic, and, next, a continued sponge-like action going on: in other words, a constant and perfect causticity is maintained. The result of the preparation on metal is equally convincing. A gas meter, if exposed to the compound about 20 minutes, has the japan removed and the bright metal exposed. Other forms of the preparation are of a weaker character, and nearer soap in their composition. They are intended to remove dirt, and their action is just the reverse of the compound already described. The preparations are liquid and are soluble in water, and their cleansing power upon cloth of an unmistakable dirty and greasy character is said to be almost magical. These solutions are adapted for delicate carvings and fabrics of all kinds and their use by restorers, decorators and others will be highly esteemed. The modification of the solution for cleaning cloth is well adapted for restoring the linings of railway carriages and stuff seats of all descriptions. No scraping or erasing is necessary, and there is nothing injurious, it is said, in the preparations which can attack or injure metals or cloths. They all produce a minimum action on brushes, which is a consideration, and, what is very important, the color is not taken out by the use of the solutions. The price is less than that of other preparations. The "paint remover" can be easily applied by being spread over the painted surface to be removed. It is sold in five-pound tins at about 60 cents.

An Elastic Lacquer.—A patent has been taken out in Germany for a new description of elastic and flexible lacquer, which will not peel off, and which is suitable for the coating of carriage cloths, plans, and other articles to be folded up, as well as for wood and iron work, walls, etc., but which may also be employed as an insulating layer for damp rooms as a means against dry rot, and in rendering stuffs water-proof. To produce the lacquer, 50 kilogrammes of linseed oil varnish are heated up to a boiling point. In another vessel about 15 kilogrammes of lime are slaked in 20 kilogrammes of water. As soon as the lime boils, about 50 kilogrammes of hot melted caoutchouc are added to the lime water, and the whole is then stirred until it has become thoroughly mixed. The composition is poured into the boiling varnish, the whole being stirred all the time. Further stirring takes place until a homogeneous mass is formed, which is afterward strained or filtered, and left to cool. After cooling, the lacquer has a pap-like consistency. To apply the lacquer it is diluted with the desired quantity of varnish, and put on with a brush, either in a warm or cold state; but it is said to be better to apply it warm, as then no varnish is required for diluting it. In rendering linen water-proof the lacquer may be put on by means of a brush or roller. After treatment, the linen or other stuffs, paper, etc., are hung up to dry. Stuffs are perfectly dry and ready for use in two days. The product is stated to be lustrous, elastic, not sticky, and perfectly water-proof.

New Hair Dye.—A one per cent. solution of nitrate of silver gives to human hair a dull reddish brown, which is particularly unnatural and disagreeable in a strong light; but this defect, which is visible in all cases in which nitrate of silver has been used, may be obviated by the addition of a certain amount of copper salt to the argentic solution. Nitrate of silver, 30 grams; sulphate of copper, 2.5 grams. Dissolve the two salts in 250 cubic centimeters of water, and add sufficient ammonia to dissolve the precipitate formed, and make it up to one liter. An instantaneous dye may be made by steeping the hair in a solution of pyrogallic acid in acetic acid, and then in the argenti-cupric solution dissolved above. The hair should be allowed to dry partially after the application of the pyrogallic solution. By varying the proportion of the pyrogallic acid from 1 gram to 50 grams per liter, any tint may be obtained from light brown to black.—*Moniteur Scientifique.*

Formula for Soap to Wash with Sea Water, After the Process of Rome and Mollard.—For one boiling of 116 gallons, take: Lye at 13°, 66 gallons; oil of copiah, 22 gallons; palm oil, 22 gallons, oil earth, nut, or olive oil, 2½ gallons; silicate of soda, 3½ gallons; total, 116 gallons, nearly.

India-Rubber Varnish.—Dr. Elder gives the following recipe for making India-rubber varnish: Inclose 30 grams of finely-cut caoutchouc in a capacious linen bag, and suspend this within a flask containing a liter of benzine, by means of a thread held fast by the stopper, so that the bag remains near the surface of the liquid. In the course of six or eight days, the soluble portion of the caoutchouc—about 40 to 60 —will pass into the benzine, while the contents of the bag will expend enormously. The clear solution, which is quite viscous, and contains 1.2 to 1.5 of caoutchouc, is then carefully separated. The swelled contents of the bag retain one-fourth to one-third of the benzine used, and may be utilized for the preparation of an inferior kind of varnish. A solution of India-rubber in benzine, kept in half-full bottles, is decomposed on exposure to light, which may be seen by the change in the solution from a viscous to a thin fluid condition. Even in the dark this change goes on, but it takes about three times as long.

Transparent Leather.—Messrs. L. Starck & Co., of Mentz, Germany, have patented a new process for manufacturing transparent leather. Common skins are deprived of the hair, cleaned and spread on frames, and are rubbed with a mixture containing 100 parts glycerin 26° B., 0.2 parts sallicylic acid, 0.2 parts picric acid, and 2½ parts boric acid. Before the skins are perfectly dry they are brought into a room from which sunlight is excluded, where they are impregnated with a diluted solution of bichromate of potash, and then dried. The skins are then covered with a diluted solution of shellac in alcohol of high degree. The transparent leather is said to be well-adapted for manufacturing such objects as must possess great strength with small dimensions, as thread for sewing leather, small belts for tools, looms, sewing-machines, etc. The coefficient of strength of this transparent leather is said to be three times greater than that of other leather. Its price is higher for the same weight, but lower for the same dimensions.

True Musk, which is used so largely as a perfume, is taken from certain glands in the musk deer; but its high price has caused Mr. Fairthorne, an American pharmacist, to substitute the similar secretion of the musk-rat. For a long time the Russians have used these skins to scent and preserve their garments; but no attempt has hitherto been made, we believe, to extract the perfume in a serviceable form. Mr. Fairthorne takes ten or twelve musk-rat skins, and cuts them into small slips. These are allowed to macerate for a week or two in a pint of alcohol, with the addition of two drachms of soaked lime. On filtering the liquid, a very fragrant tincture, having a musky smell, three times stronger than the ordinary extract of musk, is obtained. Mr. Fairthorne employs it instead of the real tincture of musk for the manufacture of eau de Cologne.

Good Health.

A Singular Disease in Russian Chrome Works.—The manager of the single establishment in Russia for the manufacture of chrome, reports a curious disease among his men. He says: "The workmen suffer from the action upon the nose of the dust of bichromate of potash, and the disease manifests itself thus: A little hole is formed on the partition of the nose (dividing the two nostrils), and increases gradually until the partition entirely disappears, with the exception of the lower part of it, so that to a superficial observer there is nothing the matter with the nose, except perhaps a little outward depression. It must be remarked that as soon as the partition is gone the process seems to stop there, and neither the lungs, air-tubes, nor throat are in the least affected. Its influence is very different with different individuals. Some workmen, after having been employed for 10 years at the works, remain unaffected, while with others the hole in the nose begins to be formed after one month's work. A general inspection of all the men at the works not long ago, proved that more than 50 of them had diseased noses. When the disease sets in first, the man feels tickling in the nose; a week or so after, it bleeds, and in a few days more there is no uncomfortable feeling of any sort, and thus the hole is formed almost without any pain." There are, it is said, six works of the kind in the world—three in Glasgow, Scotland, one in Russia, one in Austria, and one in this country. It would be interesting to know whether the same trouble has ever been noticed outside of Russia.

A Remedy for Toothache.—Dr. F. P. Atkinson describes, in the *Practitioner*, an English medical work, a novel form of treatment for toothache, to which he was led by Dr. Murrell's results with nitro-glycerine in angina pectoris. Being afflicted with severe toothache, and proceeding on the similarity in effect following the employment of nitro-glycerine and nitrate of amyl, he applied to the aching tooth cotton wool, saturated with Richardson's compound anæsthetic ether, which contains the nitrate. Instant relief ensued, which was maintained for four hours by a pledget of wool previously soaked in laudanum. Dr. Atkinson adds that a 1% solution nitro-glycerine has the same effect in stopping pains as nitrate of amyl; and thus a means of relieving a most distressing complaint is opened up.

Beans as Food.—The nutritive value of beans is very great—greater than almost any other article of food in common use. Considering their richness, they are probably the cheapest food we have, but somewhat difficult of digestion, probably owing to the fact that we rarely cook them enough and masticate inefficiently. In preparing beans for the table, they should first be well soaked in cold water and then thrown into boiling water and cooked until of a medium consistency, between a fluid and a solid, neither too thick nor too thin. They require some acid on them when eaten, and a sufficient amount of salt to render them palatable. They may be eaten with potatoes or other vegetables which contain more starch and less albumen, rather than with too much bread or meat. In Germany there is a process patented by which beans and all leguminous seeds are reduced to a very fine flour, and rendered capable of being used as food by the most delicate persons. We have samples of this flour, which equals in fineness the best wheat flour, and it is used extensively for making soups for invalids. These soups are worth a hundred times as much as beef tea. There is a fortune awaiting any one who will prepare a flour from beans as perfect as this flour from Germany. Bean soup, rightly made, is exceedingly delicious and wholesome, and ought to be used more extensively than it is.—*Sanitarian.*

Moral Effect of Tea, Coffee, etc.—Dr. Beck, of Leipsic, a famous German physician, writes as follows on the moral effect of different articles of food and drink: "The nervousness and peevishness of our times are chiefly attributable to tea and coffee; the digestive organs of confirmed coffee drinkers are in a state of chronic derangement, which reacts on the brain, producing fretful and crying moods. Fine ladies addicted to strong coffee have a characteristic temper, which I might describe as a mania for acting the persecuted saint. The snappish, petulant humor of the Chinese can certainly be ascribed to their immoderate fondness for tea. Beer is brutalizing, wine impassions, whisky infuriates, but eventually unmans. The alcoholic drinks, combined with a flesh and fat diet, totally subjugate the moral man, unless their influence be counteracted by violent exercise; but with sedentary habits they produce those unhappy flesh sponges, which may be studied in metropolitan bachelor balls, but better yet in wealthy convents. The soul that may still linger in a fat Austrian abbot is functional to his body only as salt is to pork—in preventing imminent putrefaction."—*Herald of Health.*

Had His Hearing Restored.—A rather singular occurrence recently happened near the Western and Atlantic crossing on Alabama street, says the Chattanooga (Tenn.) *Times.* Mr. F. Matthews, track master of the Alabama and Great Southern road, has been totally deaf in his left ear for a number of years, caused by cutting railroad iron in a repair shop, and has consulted a number of prominent physicians and auriculists without deriving any benefit from them. A switch engine was standing near, as Mr. Matthews was crossing the track, and, starting up at that moment, the wheels suddenly slipped on the rails, while a heavy jar ensued, followed by a sharp rush of escaping steam. As soon as the noise had in a measure subsided, Mr. Matthews remarked to a friend standing near that his ear had cracked, and began to pull out fragments of some substance which seemed as hard as rock. Upon further investigation he found that his hearing had been entirely restored, and that what experienced men had failed to do had been accomplished by one of the most natural and ordinary occurrences of every day life.

Worn out Before Their Time.—There is perhaps no country in the world where there are so many people who are worn out before their time as in California. The most direct cause of this is the inclination of the people here to overwork themselves. Our climate is so bracing, and generally so favorable to physical exercise that we are apt to work ourselves down before we become aware of it. Then, again, this overwork at first produces excessive appetite, which is too commonly accompanied by over-feeding with flesh, strong drink, and beer, the idea being that this high feeding enables a person to do more work than a more natural diet. In the long run, however, it is not so profitable as moderation, for it too often breaks down the constitution in the prime of life, and leaves a long cup of misery to be quaffed at our leisure.

Remedy for Poison Oak.—Dr. S. A. Brown who is stationed at Mare Island, in this State, announces he has discovered a certain remedy for poisoning from sumac, ivy, etc. It is bromine dissolved in olive oil, cosmoline or glycerine. He used 20 drops of bromine to one ounce of oil, rubbing it on the affected part 3 or 4 times a day, and washing it off occasionally with castile soap.

Keep the Children Warm.—Half the illness and fretfulness of little children might be prevented by keeping them warm enough. They are often so unequally dressed—some parts covered to excess, and others, more vital still, left almost unclothed, that they are in constant discomfort. They cannot tell the difficulty, and thoughtless mothers dismiss the whole subject with the general complaint of crossness.

Passing Events.

The warm weather for the past week or so has stimulated prospectors in many parts of the country; and where prospecting has not already begun, the men are only waiting for the first opportunity to start in. Probably the sections of this coast which will attract most attention are portions of Montana and Idaho. The region around Butte, Montana, is now receiving a large, new population, and will be pretty well prospected. The Wood River country will, before long, swarm with prospectors, and there is little doubt that very many new mines will be found. Other men, again, prefer the southern country and will try their fortunes in New Mexico and Arizona, or even in Mexico. There are many thousand more men who will interest themselves in mining this year than ever before.

No decision has yet been declared in the debris suit, and little is said on the subject, but a final solution of the difficulty is none the less anxiously looked for.

The discovery of iron ore at Sheep Ranch, Calaveras county, elsewhere noted, is an event of more than passing interest. Iron, copper and lead ores are now in demand and prospectors no longer neglect searching for them.

Production of the Precious Metals.—No. 4.

[An abstract of the Census Monograph on the Bullion output of the country.]

Nevada.

The production of this State shows a considerable decline, as compared with that of the preceding six years. This is not due to any general falling off in the prosperity of the mining industry of the State, but to the decrease in the yield of the leading source, the Comstock lode. From 1871 to 1879, Nevada had outranked all the other states and territories in its output of the precious metals; but in the present census year it has fallen to the third place, having been passed by both Colorado and California. With the yield of the outside districts maintained at the existing rate of production, an important discovery of ore in the Comstock would perhaps raise Nevada again to the first rank. And even without any striking new developments, there is still a reserve of low-grade ore and tailings remaining unworked, sufficient to give a large and steady product for many years to come.

In 1876 the yield of the Comstock, according to Mr. Del Mar's careful analysis, was: Gold, $18,002,906; silver, $20,570,078; total, $38,522,984.

During the census year the product of the whole Comstock district, including the Virginia, Gold Hill, and Devil's Gate sub-districts, the outlying veins, such as the Occidental, etc., and the yield of tailings worked at various points throughout the entire tract known as the Washoe country, was: gold, $3,109,156; silver, $3,813,174; total $6,922,330. Showing, a decline of $31,650,654, or 82.06 per cent., since 1876.

The bullion product of Nevada represents an average of $44.16 gold, $112.29 silver, and $156.45 gold and silver for each square mile of its area. In this respect Nevada is surpassed by Colorado, the figures for which are $25.98 gold, $159.22 silver, and $185.20 total. But with reference to its population, Nevada, even with the reduced output, remains the richest of the mining States and Territories, as its annual product, if distributed equally per capita, would give $78.51 gold, $199.63 silver, and $278.14 total to every man, woman and child within its borders. Notwithstanding the large proportion of adult males, it will be seen that this would be a fair income for the actual working population. The Nevada mines, however, are largely owned outside the State, and although they have not, taken as a whole, been profitable during the year, the local disbursements in wages, etc., continue steadily, so that the inhabitants have a direct interest in the prosecution of work, independently of the question of ownership.

Placer Mines.—The placer yield of Nevada is insignificant. No important gravel deposits having suitable water supply are known to exist. The ground worked is in most cases merely the wash from the croppings of quartz veins. Operations are conducted on a small scale at Tuscarora, Tule canyon, points in the neighborhood of the Comstock, and in a few other isolated spots. The aggregate yield for the year is estimated roundly at $50,000.

UTAH.

The bullion product of Utah is remarkably steady, varying latterly but little from year to year. This Territory presents facilities for arriving at true valuation of the product which are wanting in many other mining localities. The mines are more concentrated, the yield coming from a comparatively few but rich claims, and the bulk of the ore is treated by a few large smelting works and mills, where accurate accounts are kept. It is, therefore, easier to collect full statistics of the product than in places where the bullion is derived from a vast number of sources, each one of which furnishes only a small quota, as is the case where placer mining forms an important factor. The census figures for Utah are also the more reliable from the fullness and clearness with which the schedules were prepared by the special expert for the Territory.

The tabulation of the product is based on returns from 535 deep mines, one placer mine, 18 amalgamating mills, 34 smelting works, and 10 miscellaneous metallurgical establishments, consisting of sampling, concentration, and leaching works. Many of these sources were, however, unproductive during the census year.

The following table shows the amount of ore raised in the several counties. The silver-lead ores sold to the smelters are in many cases transported for reduction out of the district in which they were raised; and as their identity is lost in the mixture of ores from all portions of the Territory, and even from other States and Territories, it is impossible to segregate the bullion yield by districts.

UTAH—Cash Receipts from Ore Sold.

Scattered	.....	180.00	180.00	.....	100
Total	75,101	57,581.78	142,682.73	53	47

The most noticeable feature shown in the foregoing table is the large proportion of milling ore which Utah furnishes, compared with her base ores, although a Territory generally supposed to be dependent upon her smelting works. It should be noted, also, that of the ore smelted there was a considerable amount which might have been treated by amalgamation, but which, because of the absence of proper milling facilities or because of unusual richness, it was advisable to sell to the smelters. But, while the percentage by weight of ore milled was 53%, as against 47% for ores smelted, the same proportion does not hold with regard to value, the percentage of bullion extracted being only 51.08% for the product of amalgamating mills, as against 48.92% for that from smelting works—a nearly even ratio.

This difference is accounted for by the fact that, as a rule, the ores smelted, on account of the greater expense usually involved, are richer than the ores which will bear the milling expense; and also because of the higher proportion of the assay contents of the ore extracted by the smelting process, as compared with the milling results. The following analysis of the total bullion product of the Territory shows the relative amounts coming from each source:

UTAH—Analysis of Product.

Classification of source.	Gold.	Silver.	Total.
Amalgamating mills, from ore raised during census year	$175,024	$2,247,009	$2,422,033

RECENTLY, in order to test the capacity of the new circular saw at Port Blakely, a log 24 ft. long, and 7 ft. in diameter, containing over 6,000 ft. of lumber, was hauled into the mill, and soon ripped into inch boards. This, we believe, is the largest log in diameter ever sawed on Puget sound.—*Walla Walla Daily Union.*

IT is probable that a Signal Service station will be established at Cape Mendocino.

Italian Rocks and Contained Minerals.

Descriptive memoir of a collection of 200 specimens of Italian rocks and contained minerals, classified in stratigrapbical order, from tbe most ancient up to tbe more recent ones. Tbis series, made on tbe spot expressly for tbe State Mining Bnrean of California, by desire of the State Mineralogist, Mr. Henry G. Hanks, indicates with tbe utmost prscision, the topographical origin, and is divided in sucb a manner as to enable tbs student to refer to tbe antbor's works for more ample information on the snbjeot, viz.:

I Tesori Sotterranei dell'Italia, 3 vole., in 8 vo., ill., Tnrin, 1873-81.

Le Acque Minerali dell'Italia, 2 vols., in 8 vo., ill., with analyses, Tnrin, 1868-76.

The Mineral Resources of Central Italy, in Englisb, 1868, 1 vol., ill., containing descriptions of the mines and marbles (now becoming rare).

I Combustibili Minirali dell'Italia, Turin, 1879, 1 vol.

Dell 'Oro in Nativia (a full monograpb on gold), 1 vol., ill., Turin, 1881.

Tbe labels indicate: 1st. The orograpbical division. 2d. The bydrographical basins. 3d. The description nf eacb snmple, and the use to which they are pnt in the arts and manufactnres. 4tb. The uame of the townsbip from whicb the specimen was procnred. 5th. The mine of Ollomont. Ollomont (Tnrin). Val Pelline, Pennine Alps.

3792. Cbalcopyrites, from tbe copper lode in the cblorite schists. Ollomont copper mine. Ollomont (Turin). Val Pelline, Pennine Alps.

3793. Quartz, of somewbat greasy luster, accompanied by cbalcopyrites and pyrites from the copper lode. Ollomont mine. Ollomont (Turin). Val Pelline, Pennine Alps.

3794. Dark, dull-green cblorite scbist. Bobbio Pellice (Turin). Val Pellico, Cottian Alps.

3795. Pale, grayish-green cblorite schist, of somewhat silky luster. Val Tournanche, brancb of Val d'Aosta, Pennine Alps.

3796. Quartzose talo schist, consisting of pale-green talo and opaque wbite quartz. Donves (Turin). Val Pelline, Pennine Alps.

3797. Bluisb-gray calc schist. Pre Saint Didier (Turin). Val d'Aosta, Pennine Alps.

3798. Lead-gray foliated calc scbist. Gignod (Turin). Vallone del Gran Sen Bernardo, Pennine Alps.

3799. Chalcopyrites, witb gangue of milk-white qnartz, in cblorite scbists. Ollomont copper mine. Ollomont (Turin). Val Pelline, Pennine Alps.

3800. Pre-palœczoic group—Huronian system. Green serpentine schist, showing very distinctly tbe original stratification of tbe rock. Locana (Turin). Valle dell'Orco, Graien Alps. Used locally for rocfing instead of slnte or tiles.

3801. Grayisb-green and blackisb-green serpentine scbist, with perfect indication of original stratification. Bobbio Pellice (Turin). Val Pellice, Cottian Alps.

3802. Pale, bluisb-green compact serpentine schist. Bobbio Pellice (Turin). Val Pellice, Cottian Alps.

3803. Very dark bluisb-green serpentine, of nearly compact structnre. Bobbio Pellice (Turin). Val Pellice, Cottian Alps.

3804. Brownisb-green serpentine, containing the merest trace of bronzite. From the Monte Mussini, in tbe immediate vicinity to veins of magnesite and giobertite. Caselette (Turin). Val di Susa, Cottian Alps.

3805. Concretionary white giobertite (carbonate of magnesia); forms veins in the midst of serpentine, which is generally mncb decomposed in its proximity, and accompanied hy veins of eupbotide. Caselettc (Turin). Val di Susa, Cottian Alps. Used for chemical works and for making artificial mineral waters.

3806. Resinite, accompaying giobertite, and with it forming reticulated veins in serpentine. Caselette (Turin). Val di Susa, Collian Alps.

3807. Yellowish-brown decomposing serpentine, the rock in immediate contact with tbe reticulated veins of giobertite and resinite. Derived from tbe hard form of serpentine (No. 3804 above) and traversed by veins of euphotide. Caselette (Turin). Val di Suee, Cottian Alps.

3808. Snow-white sepiolite, or Meerschaum; accompaniee giohertite. Caselette (Turin). Val di Susa, Cottian Alps.

3809. Brownisb-white resinite, showing contact witb yellowish-brown decomposing serpentine. Caselette (Turin). Val di Susa, Cottian Alps.

3810. Compact porcelain-wbite, semi-opal, accompanying resinite. From the Mussine, Caselette (Turin). Val di Suse, Cottian Alps.

3811. Resinite of geletinous appearanoe, sbowing the passage into opaque-white, semi-opal at eitber side of tbe concretion. Caselette (Turin). Val di Susa, Cottien Alps.

3812. Opaque, grayish-white, semi-opal accompanying the reticnlated veins of giobertite and resinite. From the Mussine. Caselette (Turin). Val di Susa, Cottian Alps.

(TO BE CONTINUED.)

Gravel Channels.

The Blind Miner's Theory.

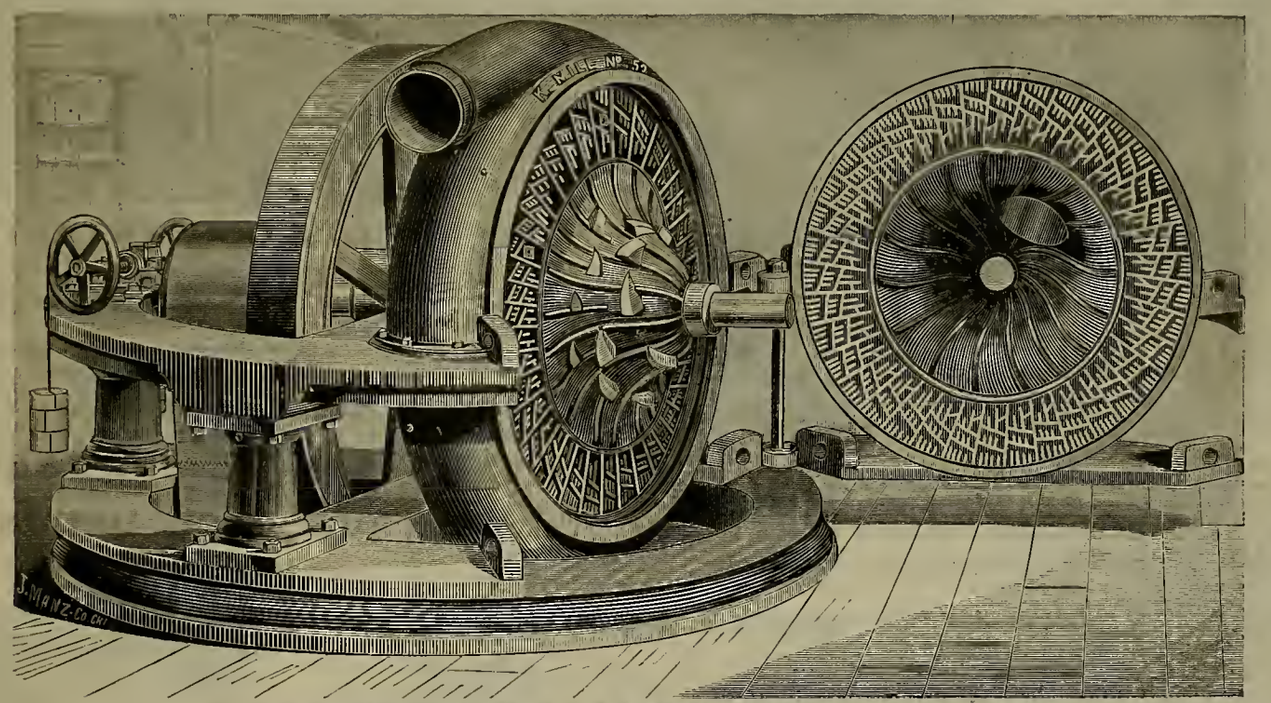
EDITORS PRESS:—I have always looked upon the editor of the Nevada *Transcript* as a friend, and do not believe now tbat be would willfully pnblish a lie to injure me, mnch less to injure tbe cause of our prosperity; bnt let all nnderstand tbat I am able to speak for myself, and defend anytbing I olaim to understand against any man, and I defy any man in tbis State to prove against me that tbere ever was any *lead* that wonld pay in a gravel obannel that oarried volume of water enough to handle its gravel. I don't consider 54 years an extremely old man. My motber was 30 years older tban tbat when she died, and my father lived more tban bis allotted days. Now, yon see tbere bave been elements at work to make it a hard road for me to travel, and means resorted to tbat an bonorable man wonld not only call mean, bnt disbonest. I bave been robbed of every dollar of my money throngh intri and rascality, and tbe parties would like to justify tbemselves by villifying me, and tbere seems to be a feeling in the public mind that all discoveries tbat would benefit mankind, that cannot be patented of rigbt, are pnblic property, and ought to be demanded without the least guarantee of reward to tbe discoverer, no matter how mncb hard work and stndy it every offer that a man could make to get help, and they say that tbey bave spent over $50,000 in tbat time in this bill by guess, and tbey bave only snceeded in convincing themselves that I was right in tbe first place, that tbere was no cbannel in tbe middle of the bill.

Now, tbere are nine deposits in tbe Alta channel yet undistnrbed in tbis hill, neither more nor less, and I could bave taken $5,000 in tbe start and opened every one of tbem, without a doller of assessments, and prodnce over $2,000,000 wortb of mines; snd I can take $1,000 now and prove a discovery that wonld bring greater prosperity to California tban ever tbe miners saw witbout it. This is entirely a drift mining advantage, hut even bydranlic mines wonld be immensely benefited by tbe knowledge, and as soon as I can possibly do jnstice to myself and family, I will teacb tbe public more about gravel mining than tbey ever dreamed of knowing, and set pbysical geology on a new basis, sn they can rapidly clear up tbe gross blunders tbey are now making. How much tbis discovery will benefit mankind outside of mining, is beyond the ken of man, but remember, it is not an easy problem to master wbat has puzzled the world so long, and it will take time and study to nnderstand it, and the best of philosophers to practice it. Now, I tbink you sbonld pnblisb this as my defense.

H. CLENDENEN.

Randolph Flat, April 10, 1882.

AT tbe Tombstone mine tbey are pushing



VIEW SHOWING GRINDING FACES OF NORTHWESTERN FERTILIZING COMPANY'S ORE MILL.

name of tbe province (between parentbeses). 6tb. Tbe geological age, according to the new nomenclatnre, decided npon by the Geological Congress at Bologna, in 1881.

Alpine Region.

3784. Primary crystalline rocks.—Gray granite, poor in mnscovite, from tbe Monte Bianco, the bigbest monntain in Enrope (4,810 meters), Conrmayenr (Tnrin). Val. d'Aosta, Pennine Alps.

3785. Greenish-gray granite, containing vitreous and opaqne-white quartz a large amount of greenish-gray felspar, and minute scales of mnscovite; from the Monte Bianco, Conrmayeur (Turin). Val d'Aosta, Pennine Alps.

3786. White and black granite; from Mont' Orfano, Mergozzo (Novara), Val. d'Ossola, Lepontine Alps. Tbis beautiful granite contains small scales of bleckish muscovite, speringly distribnted in tbe midst of white felspar, scarcely to be dietingnisbed at a sbort distance from the quartz associated witb it. It is much used for paving cities (Milan, etc.); also as an ornamental building stone, and is much esteemed on account of its durability.

3787. Pink granite, containing pink felspar of large crystalline structnre, white quartz and small crystels of blackisb-brown muscovite. Gignesa (Novara). Lago Maggiore, Lepontine Alps. Thie is a splendid ornamental building stone, mnob prized, tbongb little employed, being too expensive for general use.

3788. Fine-grained, black and gray granite, wbich passes into eyenite by containing hornblende. From near tbe lodes of magnetic iron, Traversella iron mines. Traverselle (Turin), Val Chiusella, Graian Alps.

3789. Pre-palœzoic, metamorpbic sedimentary rooke in general. Dark, dull-green chlorite schist. Etronbles (Turin). Vallone del Gran, San Bernardo, Pennine Alps.

3790. Dark, grayish-green cblorite scbist, enclosing the lode of copper pyrites and pyrites. Copper mine of Ollomont. Ollomont (Turin). Val Pelline, Pennine Alps.

3791. Finely crystalline pyrites, forming veins without definite walls, togetber witb copper pyrites, in the midst of cblorite schist. Copper bas cost bim. I bave never run 5,000 ft. of tnnnel in my claim, nor bave I worked without a prospect tbat I wonld sbow any miner (if he were a miner), the prospect was good. I have tbree deposits on my claim ("positives"), and I base tbeir value upon tbe estimated value upon the two next deposits above them that have been taken out; that would be abont $20,000,000, if I wonld add tbe lies, and a little over $200,000 each if they were sifted out. I am right on tbe Alta lead, between two deposits, and bave got as high as 16 cents to the pan, and that is a rich lead. It is abont 30 ft. wide, but too thin to drift ont.

I bad in tbe beginning about 500 ft. to run either way to reach a deposit. I was in tbe channel 700 ft. from the month of an old tunnel without a dollar, and subject to the whime of my partners. I have rnn about 2,400 ft. of tnnnel and the smallest cayote-holes, and I am now abont 450 ft. from wbere I started. Before I could reach one deposit, I was forced by my partners to go after the other, against my solemn protest; and wben I reached its locality, we were 18 ft. too higb. I have not been able to work more than half tbe time, I bave owned the claim, and I have done all this work nnder circnmstances tbat would bave disbeartened a mule. I have run twice to tbe surface for air 650 ft., and bnndreds of ft. on acconnt of bad surveying. I have never had $50 at a time to belp myself in the mine since I commenced. My partners have worked on peoples sympathy for me to borrow money for themselves, on the pretense of helping me in my mine, and at tbe same time were not ebowing one dollar in twenty. Nearly all of tbe work has been done hy myself, a boy, and a Chinaman; and there bas not been 500 ft. rnn that will not benefit the mine; and no man could go straigbter to the deposit than I have been going.

I live 3 miles from Grass Valley and I walked tbere 28 times, to get $200 eubscribed in $20 shares in my mine, and no assessments to belp me. Then I walked tbere over 20 times to collect it, and I bave not got it all yet; and I was most rascally need in my tunnel, in working it out. Now I have done everytbing and made tbe incline air shaft at tbe Combination mine down into tbe ore regions as rapidly as possible, and it is looking splendid. This ore body bas been an exceedingly large and interesting one. Tbe dimensions thus far explored are 530 ft. long, by 140 ft. wide. This includes tbat portion belonging to the Vizine company. The Tombstone company has extracted from its ground up to date, 11,000 tons, and the Vizina about 6,000, making an aggregate of 17,000. The gross value of tbis bonanza bas not been less than $1,250,000. This puts the yield per ton below what is well known much of it returned. Tbe ontlook for a continuation of tbis body in the Tombstone company's gronnd is still good for thousands of tons.

A NEW MINERS' UNION.—The miners in Aurora have organized themselves into a union and elected tbe following officers: H. V. Poor, President; D. Perrier, Vice President; J. L. Scott, Recording Secretary; Chas. F. Quimby, Financial Secretary; Roland H. Cutts, Treasnrer; Eugene Godat, Conductor; J. F. Gillis, Warden. The object is to keep wages at $4 per day for underground miners.

THE Utab Commiseion provided for in the Anti-Polygamy bill will be appointed by the President some time in April. The Commission will eet out eoon after its organization in Wasbington. It is now estimated thet six monthe will be required for the Commission to perform its work and perfect the machinery for the government of the Territory.

THE Contention mine, at Tombstone, wbich yielded over $170,000 last month, had a yield per ton, estimating 2½ tons crushed per day per stamp, wbich will not be far out of tbe way, is $82.84, being ahout the fignres for the first year's work.

IF the statements of tbose who ought to know are correct, the appropriations which are to he reported in the River and Herber bill will be the most extraordinary ever made. Tbey will reacb $15,000,000.

CHICAGO **FRASER & CHALMERS,** ILLINOIS,

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Bruntou's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

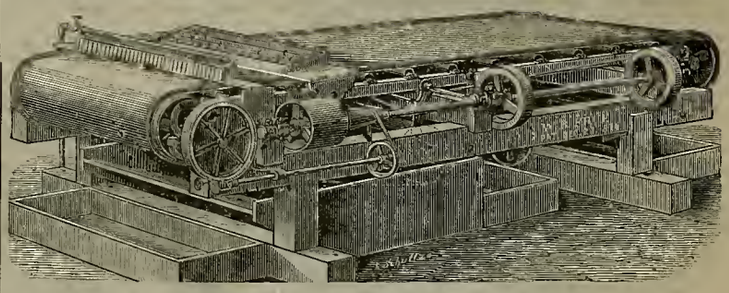
$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

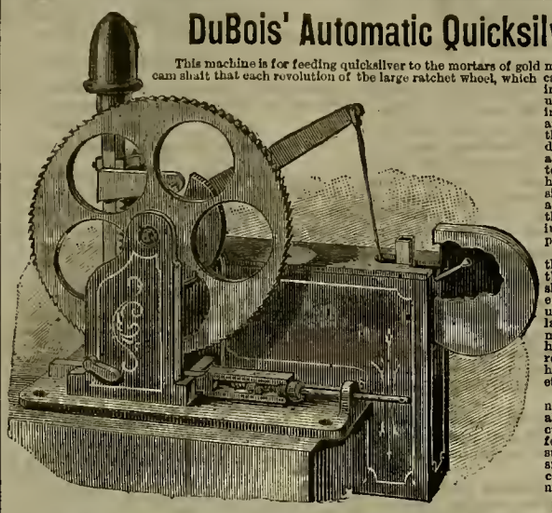
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similar to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

255,900—CUSHION PROTECTOR FOR BOTTLES—James M. Thorpe, San Jose, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

CUSHION PROTECTOR FOR BOTTLES.—James M. Thorpe, San Jose. No. 255,900. Dated April 4, 1882. This bottle protector belongs to that class wherein the bottle or vessel is surrounded by a rubber band or cord resting in a groove. Heretofore in this class of protectors, bottles have been made with the groove for containing the rubber cushion in the same relative position. By this construction, when the bottles are packed, the packing rings of contiguous bottles abut against each other, and the two bottles would be separated by the projecting portions of two packing rings, thus occupying much more space than is necessary. The object of this invention of Mr. Thorpe's is to overcome this objection, and it consists in a bottle provided with a series of grooves or bolding devices near its upper end, and a series of the same near its lower end, in combination with adjustable elastic packing rings, whereby the inventor is enabled to readily place the packing rings on contiguous bottles at varying elevations, so that they will not abut against each other.

TUYERE.—J. E. Day, assignor of half to J. C. Aitken, San Francisco. Dated April 4, 1882. No. 255,842. This new tuyere is for forges. It consists in the construction and arrangement of the air-pipe, in connection with a peculiar, removable protecting casting, fitting upon said pipe and receiving the fire upon itself, said casting being provided with a removable grate immediately over the ventilating hole in the pipe below. The main object of this invention may be explained by noticing the present construction of forges with the tuyeres generally in use. Any pipe which can be made to conduct air to the fire may be regarded as a tuyere; and in many cases the only tuyere used is a piece of pipe with a few holes cut in its top, directly under where the fire is built. The objection to this is that, the fire being built upon the pipe, it not only soon clogs up, but will burn out in a short while and become useless. The object of this invention of Mr. Day is to provide an inexpensive tuyere made of a piece of pipe, in which the ventilation will be good, and which will be protected from burning out.

HAY STACKING APPARATUS.—Gamos Richardson, San Jose, Santa Clara county. No. 255,887. Dated April 4, 1882. This invention relates to an improved apparatus for stacking hay in the field, and it consists of a framework which is set up on one edge, so as to stand upright, and it is provided with suitable grips or braces to hold it up, and also with pulleys, over which two or more ropes lead, to attach to the nettings on which the hay is placed, passing thence to guide pulleys, and to the horses or power by which they are operated. In combination with the frames, nettings and ropes, the inventor employs ways or guides, over which the nettings, with their load, may be elevated to the top of the stack without rolling devices or any other means for preventing contact, and without a direct lift.

BUCKLE.—Alexander Cadwell, Petalnma. No. 255,838, Dated April 4, 1882. This invention relates to a new and useful buckle, of the kind having tongues, and commonly known as "tongue buckles," and it consists in curving inwardly the point of the tongue, and providing a hole or socket in the end of the buckle frame into which the inturned or curved head of the tongue is adapted to fit, after passing through the hole in the strap. The object of this construction is to afford greater security in buckling. The tongue, being thus held in the hole of the buckle, will prevent the strap from slipping off of it.

VINEYARD PLOW. — A. C. Taylor, S. F. No. 255,898. Dated April 4, 1882. The improvement which this patent covers is specially applicable to what are known as "vineyard plows." The improvement consists in the construction of a plow having the lower portion of the share and mold board made stationary, while the upper portion is hinged in front, so that it may swing outward, and stand in the same curve with the front of the mold board, or it may swing back beneath the beam and not turn a furrow, but will allow the earth, which has been lifted by the plow, to fall back into the furrow again. The beam swings upon a vertical pivot, so as to throw the plow to or from the land in the ordinary manner.

CHECK FOR HORSES.—Martin M. Nathanson, S. F. No. 255,882. Dated April 4, 1882. This check for horses consists of a peculiar strap adapted to fit over the nostrils of a horse, with means of tightening the same when desired. It further consists of a lever and cord, or strap attached to said nose strap, by means of which the nose strap may be tightened from a vehicle to which the horse is harnessed. A brake attachment to the vehicle, working in connection with this check, has been devised.

News in Brief.

THERE is a severe famine in Zululand. Crops have failed because of the drouth.

THE Rev. Charles Wadsworth, who died in Philadelphia April 1st, was well known in this city as former pastor of Calvary Presbyterian Church.

THE Union Pacific Railroad Company's financial balance sheet for the past year shows an excess of receipts over expenditures of $13,111,153.

GUITEAU has sold to a circus manager the suit of clothes he wore when he shot President Garfield, and a sculptor is making a bust of the assassin.

IT is understood that the Secretary of War recommends four or five months' guard-house confinement for Sergeant Mason, with the forfeiture of pay, and dishonorable discharge.

OUR importations of iron and steel, cutlery, machinery, firearms, tools, saws, hardware and other manufactures of these materials amounted last year to $46,668,171, against $63,963,252 for the previous year.

THE American Board of Foreign Missions at Bonter, has been advised by cable from Constantinople that in a region of Turkey, three times as large as Massachusetts, the people are starving by reason of the ravages of locusts. An urgent appeal for succor is made.

JUMBO, the big elephant from London, has been safely landed at New York. As soon as he touched American soil he was treated to a quart of whisky, which he swallowed with a satisfaction becoming any tosper. Jumbo conducted himself most appropriately upon the voyage.

ACCORDING to the New York *Sun*, there is a perceptible slackening in the demand for railroad materials. The steel-rail mills have plenty of orders, and the locomotive works have not yet begun discharging men; but locomotives which a year ago were worth $15,000 are now to be had for $12,000.

A LARGE force of workmen are engaged at Indio, a station on the desert, about half way between Los Angeles and Yuma, putting up an eating house, a hunk house for employes, and a roundhouse with six locomotive stalls. Indio is to be made the end of a freight division, and will no doubt prove a great relief to railroad men.

STAHLSCHMIDT and Ward report that the British steamship *Euphrates*, 1,716 tons, the British ship *Escombia*, 1,957 tons, the ship *Blue Jacket*, and the ship *W. J. Roteh* sailed about ten days ago from Hongkong. The steamship has between 2,000 and 2,500 Chinese, and the ships about 1,000 more. The steamship is due this month. The Chinese are intended for railway work, and other shiploads will follow.

J. A. Richardson, agent of the California Fish Commissioners, arrived in Truckee Saturday morning with 12,000 young trout for distribution in Prosser creek, two miles from that place. Six thousand were Eastern trout, 3,000 McCloud and 1,000 land-locked salmon. These fish are about one month old, and when placed in the creek were in a fine condition. Richardson has also sent 6,000 Eastern front and land-locked salmon to Nevada City, for distribution there.

IT is said that Charles Crocker is contemplating the erection of a magnificent art edifice on his property on the north side of Post street, between Kearny and Dupont. The building is to be five stories in hight, the two upper stories to be rented to artists, and the ground floor to be used as stores, while the remainder of the building will be made the home of the Art Association, Society of Decorative Art, and other art societies.

THE Eastern Railway Company of France has just made a new essay in the application of electricity. A train equipped with the most recent and improved electrical apparatus proceeded from Paris to Gretz. The carriages were connected by electric communications, the brakes acted by electricity, and all the compartments of the thirteen carriages composing the train were lighted by electric lamps. The results of the experiments were completely satisfactory.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Rooms and Board in Oakland.

Rooms (with or without board) can be had in Oakland on reasonable terms, with a family of English people, location, a pleasant one within 3 blocks of Postoffice. Good references furnished and required. Call or address No. 1274 Franklin St., Oakland, or enquire at the office of this paper.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

Pleasure in Recommending, Etc.

OAKDALE, Stanislaus Co., Cal., March 6, 1882.

Messrs. Dewey & Co.—DEAR SIRS:—I hereby acknowledge receipt of patent with copies, for which please accept my sincere thanks. I shall take pleasure in recommending your agency when I have an opportunity.

Yours Truly, J. M. NELSON.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. McGREW—Santa Clara county.
M. P OWEN—Santa Cruz county.
B. W. CROWELL, San Benito and Monterey counties.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARMD C. HOAG—California.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first-class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Amusements.

AIR COMPRESSORS
FOR SALE.—3 12x15 in double cylinder, second-hand BURLEIGH AIR COMPRESSORS, newly refitted with improved valves and adapted to run by belt together or separately—all as good as new. Can be bought to advantage.
LOCKE BROS, Salem, Mass.

Dewey & Co.'s Patent Agency and Newspaper Offices.
Dewey & Co.'s Patent Agency and the business offices of the Mining and Scientific Press, Pacific Rural Press, Pacific States Watchman and the Fraternal Record are now favorably situated at No. 252 Market Street. Elevator entrance, *No. 12 Front St., S. F.*

Mining and Other Companies.
Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Bullion Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Storey county, Nevada.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of March, 1882, an assessment (No. 23) of Thirty (30c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 3, Safe Deposit Building, 328 Montgomery street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the second (2d) day of May, 1882, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the twenty-fourth (24th) day of May, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
J. M. BRAZELL, Secretary.
Office—Room 3, Safe Deposit Building, No. 328 Montgomery street, San Francisco, Cal.

QUICKSILVER.

NEW ALMADEN QUICKSILVER, A BRAND, DIRECT

From the works, for sale in any quantity, by

J. B. RANDOL,

No. 320 Sansome Street, San Francisco

GEORGE WILSON,

MINING ENGINEER and METALLURGIST,

Parral, State of Chihuahua, Mexico,

VIA EL PASO, TEXAS,

Mines examined, reported on and superintended in any part of Mexico. Will buy or rent good mining property. FOR SALE.—Several groups of good mines in State of Durango. 1,450,000 acres ranches.

Terms Moderate.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformily and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. ☞Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT. No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONG R THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., ENGLISH & WRIGHT, Agents

No 327 Pine St., San Francisco.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

The CONSUMER'S COMPANY sell the best Powder at the lowest rates.

Office—218 California St., San Francieco.

Carson and Colorado Railroad.

(NARROW-GAUGE.)

The Company announcee the completion of its line March 1, 1882, to CANDELARIA, Columbus Mining District, Esmeralda Co., Nev., 158 miles from Mound House (Junction with Virginia and Truckee Railroad).

STAGE CONNECTIONS,

At Hawthorne with U. S. Stage Company's daily coaches for Aurora (26 m.); Bodie (37 m.); Lundy and Bridgeport.

At Luning (125 miles from Mound House) with Gilmer, Salisbury & Co.'s tri-weekly stages (leaving Tuesday, Thursday and Saturday mornings) for Grantsville, Belmont and Tybo.

At Belleville (150 miles from Mound House) with Belleville and Independence Stage Co.'s stages for Benton (40 m.), Bishop Creek, Big Pine and Inaependence.

At Candelaria, with U. S. Stage Co.'s stages for Columbus (8 m.), Silver Peak, Montezuma, Alida Valley, Gold Mountain, etc.

THROUGH TICKETS

To the above points for sale at San Francisco, Sacramento Reno, Carson and Virginia R. R. Ticket offices

This is the direct and natural route for Passengers and Freight, to points in Southern Nevada, Mono and Inyo counties, California. The line, laid with steel rails and red wood ties and equipped with new and first-class rolling stock, is penetrating new and most promising Mining Districts which are now attracting deserved attention throughout the country.

For information or through freight rates apply to

H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agent, Carson, Nev.

W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

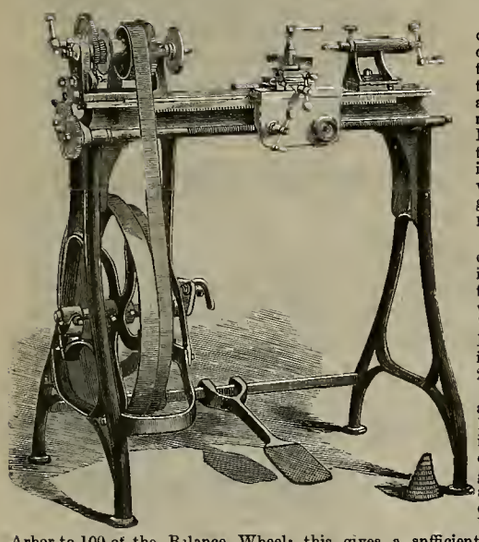
WOOD WORKING MACHINERY, MANUFACTURED BY THE H. B. SMITH MACHINE COMPANY,

And HAZARD STEEL Ropes and Cables.

SCREW CUTTING LATHE.



This cut represents a new screw cutting Foot Lathe which was put on the market about two years ago to meet the demand for a first-class tool at a low price, which will do a great variety of work, both in metal and wood, and is the best Lathe made, considering its capacity and price. The cut gives a good idea of its appearance, and below we give dimensions of parts and general description.

Description of Lathe, 4 ft. Bed.

The Lathe occupies a floor space of 28 by 48 inches, the centers being 44 inches high from the floor; the bed is 48 inches long, 6½ inches wide, 5½ inches deep, with double Vs. for Carriage and Tail Stock. It swings 10 inches over bed and 6 inches over carriage, and will turn 26 inches long.

The Head Stock is back geared, and the Cone has three speeds for 1¾ inch belt, the smallest being 3 inches diameter, the larger 6 inches diameter; this, with the back gears gives six different speeds, the fastest giving about 1,000 revolutions of the Arbor to 100 of the Balance Wheel; and the slowest, 75 of the Arbor to 100 of the Balance Wheel; this gives a sufficient range for all kinds of work.

The Arbor in Head Stock has a ⅝ inch hole through it, which is very convenient for turning the ends of long rods, making small screws, studs, &c. The Centres are ½ inch diameter. There is an attachment in Head Stock for reversing the motion of Carriage.

The carriage has a rack and pinion for moving it by hand, and a split nut moved by a cam on the face of Carriage to throw it in gear with screw; the reversing motion is in Head Stock.

The Tool Post has a slot for tools ⅝x1¼ inchss; the tool is adjusted by a wedge made on the arc of a circle and fitted to a convex washer. The leading screw runs the whole length of Lathe, and has 10 threads to the inch. A set of gears go with the lathe which will cut all common threads and a great variety of othsr sizss by compounding them; there is a screw stop on the Carriage for screw cutting, &c.

The Tail Stock can be set over for turning tapers, &c. The spindle of Tail Stock is 1 1-16 inches diameter, and has a motion of 3 inches. The center is fitted to a taper hole, which is the method adopted by all the best makers, and is the same size as the one in Head Stock, so that chucks and other tools fitted to one can be used in the other.

The Foot Motion, we consider the best made, the crank is adjustable and the shaft has swivel bearings; the balance wheel is 22 inches diameter and has 3 speeds to match Cone on Head Stock.

Send for Circular on Lathes.

Dunham, Carrigan & Co.,

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, APRIL 22, 1882.

VOLUME XLIV Number 16

California and Mexican Mines.

If a correct list was made of the gold quartz mines in Calaveras, Amador, Tuolumne and other mining counties that are now idle, or not being worked, our mining community would be greatly astonished at their number. It is not, however, from the want of merit in the mines, as any one of those who have now been engaged in quartz mining in this State for the past 30 years will tell you; and as to the working of low-grade ore, we surely can do as well as they are doing in Australia, where $5 rock is made to pay handsomely; and we really believe, though we do not like to think so, that if the same mines were situated in Mexico, that a large proportion of them would very soon be purchased, or arrangements made for working them. Particularly if the same mode of testing was used here as applied there, the results no doubt would be equally good. We have always done all in our power to assist and further legitimate mining everywhere, but particularly in California, and we flatter ourselves we have accomplished a great deal. One of our oldest subscribers, who has been extensively engaged in mining here for the past 29 years, remarked to us the other day, that we had done more to advance legitimate mining than any other paper published in this State.

We have nothing to say against the investment in Mexican mines; on the contrary; but we should very much like to see some of the money spent in our own mines, and in the employment of our own miners, instead of Mexican's, who, like the Chinese, neither regard us or our institutions with favor.

In the *Mining Magazine*, New York, 1861, is an article on the "Historical and General Notes upon the Silver Mines of Mexico," wherein it says: "In 1827, such was the rage for Mexican mines in England that they were bought before being examined by the company's agents in Mexico; that £3 000 000 sterling was invested in the mines; that the practical experience of the native miners was underrated, their machinery condemned without any previous inquiry as to its powers, or the different degrees of perfection which it had attained in different districts. Gradual improvement was pronounced too sluggish a process, and Cornwall was drained of half its population in order to substitute an entirely new method for that which had been endeared to the Mexicans by the experience of three centuries. The total failure of this attempt was the natural consequence, and many of the boasted improvements introduced from Cornwall had not been productive of any solid advantage, while many were complete failures."

The average Mexican miner has acquired a practical knowledge, so that he can distinguish the different kinds of silver and copper ores, and also to know their value; whereas it will take our Californian a long time to gain the same information. With regard to gold, their rude tests with a wooden vessel, or *batea*, which few of our miners can use, is, to say the least of it, a very safe one. The horn-spoon, from all the information we can obtain, is mostly used for testing the different stages in the amalgamation process of silver.

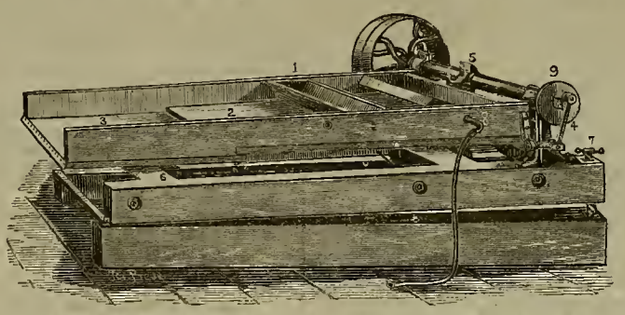
There are a number of mines in California that have not been worked for the past eight or ten years, the owners vainly trying to place them at very high figures on the Eastern market, relying on the report of some expert to effect that purpose. The best report, after all, is a working test, say of 20 or 30 tons, taken from different points where the vein is well developed, and such test to be made under the guidance and direction of a competent practical miner.

THE unjust law requiring foreign mining companies doing business in Massachusetts to pay a tax of one-tenth of one per cent. upon their capitalization has been repealed by the Legislature. Under the new law recently passed and approved by the Governor, the tax is reduced to one-fortieth of one per cent., no company to be liable for over $300 per annum.

An Improved Tuyere.

We made, the other day, a brief note concerning a recently patented tuyere invented by Jeremiah Day. As it is something of considerable interest, we now give an engraving showing the device and describe it more fully. The object of this invention is to provide an inexpensive tuyere, made of a piece of pipe, in which the ventilation will be good, and which will be prevented from burning out.

The engraving shows the tuyere with the removable protecting casting and the grate. The pipe is preferably a common gas-pipe, led upon the forge from a common bellows or blower, in the usual way. The end is made air-tight by a screw cap, adapted to be removed to clean the pipe.



PATTEN'S ROCKING AND PERCUSSION CONCENTRATOR.

In the pipe upon its upper side is made an aperture over which the casting fits. This casting is made just large enough to fit snugly over the pipe, and is made with a convex top, and is therefore thicker at the middle than at the ends. It is provided with a central aperture or grate-opening, which, when the casting is fitted in the pipe, is directly over the opening in said pipe.

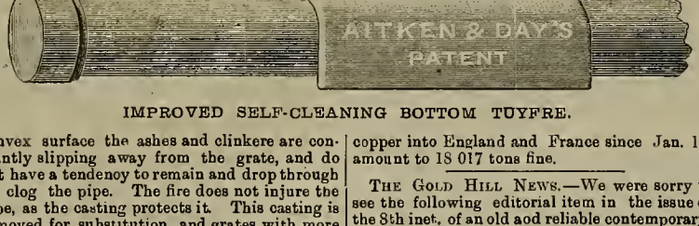
The grate (shown in the small cuts) is adapted to fit closely in the grate-opening, and has any suitable number of bars. The fire is built upon the grate and casting, and on account of the convex surface the ashes and clinkers are constantly slipping away from the grate, and do not have a tendency to remain and drop through to clog the pipe. The fire does not injure the pipe, as the casting protects it. This casting is removed for substitution, and grates with more or less opening to give more or less draft, according to nature of work.

A point of advantage is also in extending the air-pipe beyond the fire and closing its end. The air, when forced into the pipe, reaches its whole extent and keeps that portion of the pipe beyond the fire cool. It acts as an air-chamber to increase the draft through the opening and keeps up a circulation, thus preventing the pipe from becoming as hot as it would were the end to remain in the fire and the air escape therefrom. It also allows greater space for the small coals which drop through the grate to congregate before being blown out; and, lastly, it allows the cleaning to be done easily, for by removing the cap the pipe may be blown out and thoroughly cleaned.

This tuyere is easily connected by merely putting it over the nozzle of the bellows or blast-pipe. It is ready for use. There is no water, no slide, no bolts, no crank and no rod. It will never burn out or choke up, and is the only tuyere suitable for general blacksmithing for bellows or blowers. The castings will be sold alone by the patentees, Aitken & Day, 44 and 46 Main street, in this city, and the user can procure his own pipe. A beauty of this tuyere is that it will keep the fire from spreading all over the forge. The castings for the smallest size only cost $1, and those for No. 4—the largest size—cost $3.50. The whole thing, of the largest size, costs but $6.

If running with a blower, and the engine should break down, it is not necessary to disconnect, but the nozzle of a bellows or portable blower may be put in the end where the cap is, and work can go on. This cannot be done with other tuyeres. The patent right for this device is for sale.

COPPER.—A reduction of quotations for English manufactured copper of £2 per ton was announced by the Associated Smelters on March 31, but on the 7th a sudden advance to £64 10s for spot and £65 6s for three months' parcels took place. On the 10th, there was a slight reaction, and then the market went up and down till the 27th, when it declined a little. Quotations in Liverpool on the 1st, and according to James Lewis & Co.'s circular, were as follows: Chile bars, good ordinary brands, spot, £64 5s and £65 5s with three months prompt; ore, 13s 3d; and regulus, 13s 6d per unit. Chile exports to March 24th are 12,220 tons fine. The total visible supply of copper is now 51,843 tons fine against 54,190 tons on March 1st. Imports of copper into England and France since Jan. 1st amount to 18 017 tons fine.



IMPROVED SELF-CLEANING BOTTOM TUYERE.

THE GOLD HILL NEWS.—We were sorry to see the following editorial item in the issue of the 8th inst. of an old and reliable contemporary, the Gold Hill *News*.—"Owing to the great depression in business interests of this town, the stagnation of mining industries in this district, and unfavorable prospects for the near future, the News Publishing Company has decided to suspend further publication of the Gold Hill *Daily News*, until July next."

SIX MILLION pounds of plumbago are annually imported into the United States, and it is estimated that the home production in New York, Pennsylvania, Canada, and elsewhere equals this amount. This valuable material is used principally in the manufacture of lead-pencils, stove polish and crucibles. Its market price varies, according to quality, from $25 to $75 per ton.

THERE is a general strike among almost all classes of laborers at Toronto, Canada. Probably not less than 2,000 workmen are engaged in it. The strike is driving business to Western towns.

The Patten Concentrator.

We illustrate on this page C. W. Patten's concentrator—a new device in this line. By referring to the cut, the figures indicate the parts as follows:

1. Hopper for receipt of pulp; 2. Pan or separating portion of table; 3. Tailings discharge. (The opposite end is concentration or sulphuret discharge.); 4. Crank flange and rocking connection; 5. Cam to produce lateral motion and percussion; 6. Bottom frame; 7. Screws to regulate inclination of table; 8. Distributing or wash water pipe; 9. Standard and driving shaft.

This machine may be described as combining the rocking and percussion motion, which allows it to be set up with the pulp or gangue discharge end highest, which is the reverse to other concentrators; and by this means it is less liable to carry off the mineral with the gangue. By the peculiar construction of the concentrating table, and the combination of the principles and motions of the rocker, pan and percussion table, it is claimed that this concentrator will work more tailings closer and cleaner than any heretofore in use, and, by amalgamating or silver plating a portion of the copper bottom and keeping a little free quicksilver in the pan of the table, it will catch and hold all floured quicksilver, amalgam and free metal that may escape from the battery and plates. The wear and tear is nominal and the construction simple. Mr. F. A. Huntington, the manufacturer, at 220 Fremont street, in this city, where one may be seen in operation, says one machine will concentrate the tailings from a five-stamp battery, and that it will save enough to pay for itself ($300) in a very short time.

All Hands Discouraged.

A reporter of the Eureka *Sentinel* had an interview on Sunday with a gentleman from San Francisco, who visited the Comstock before coming to Eureka. He has dealt in stocks, and is intimate with leading operators at the Bay. In reply to a question as to what he thought of the Comstock situation, he said: "The outlook is very gloomy. During my visit to Virginia city, I had a talk with a number of prominent men, and they feel very much discouraged. The situation in the south end mines—Overman, Belcher, Crown Point, Jacket and Imperial—as well as in some of the middle group, is extremely critical. It is doubtful if any more assessments can be levied and collected on these properties. The price of these stocks is falling below the assessment figures, and holders will not pay out 50 cents or $1 to save 25 or 50 cents, as the case may be. The flood has created a panic among large dealers. One of them told me recently, and he a shrewd observer, that it was only a question of a little time before the south end would have to close down.

The expenses have been cut down in every way, but still they are enormous. Besides, the lower levels that are now flooded will be entirely ruined for work in six months. There are some who say that beneath the flood there is a job. I don't think there is a job. To raise that water requires more money than can be raised at present. The Jacket pump alone eats up about $15,000 a month. A strike in the upper levels, of which there is hardly any hope, would create sufficient interest to make assessments possible. But this is only wild speculation. The north end very naturally sympathizes with the south end. But I have very little faith in the developments recently made in Union. There is no doubt a very fair ore body in that mine, but the ore is not rich enough to create enthusiasm, and it is extremely doubtful if what is shown up will more than pay for extraction. That is the reason the stock don't move upward. The neighboring mines appear to have fair prospects—that is all." At the gentleman's request we refrain from giving his name, but the foregoing is almost the exact language he used.

The Engineer.

Iron and Wooden Bridges.

The recent accident on the Boston and Maine railroad, where a passenger train broke through the iron bridge, has called out some comments in the press concerning the relative value of iron and wooden structures. The position is taken that there is yet considerable doubt in the minds of conservative railroad managers whether the change from the earlier types of wooden bridges, which have been worn out in service, to the later, and certainly more pleasing in appearance, iron bridges, has been attended with due economy, all things considered, or attended with greater or even equal safety. The question of economy does not admit of the same general treatment that other branches of the subject do, although the substitution of iron for wood by nearly all the leading railroads of this country speaks very well for the economy of the change.

In no other country has wood been employed in bridges so much as with us. The success of American engineers with wooden bridges has been the subject of admiration of the engineering profession the world over. Why they were led to develop this class of bridge, perhaps, arose from the necessity of building cheap bridges when railroads could not pay for any other. It is hardly fair to assume that engineers who have done so well with a material like wood cannot distinguish themselves to the same extent in the construction of iron and steel bridges. In fact, with the many fine examples of engineering skill in large span iron bridges, this cannot be considered an open question.

A margin of safety of five is one that is very often supposed to be employed. It is comparatively easy to provide just that margin in the full section of the different tension members. Some uncertainty may exist with the compression members, but greatest of all is the difficulty of getting the joints throughout to have their proportional strength.

The facility with which iron can be brought into various shapes is an advantage not possessed by wood. The shearing strength of timber is so slow, as compared with its tensile strength, that it becomes quite a problem how to make use of the greater part of its tensile value. So far as we have actual proof of the ability of the material to do its work, the advantage is on the side of the iron. It is claimed, in favor of wooden bridges, that they give premonitory signs of failure, that engine-drivers will discover these signs in running over the bridges early enough to have the necessary repairs made. But a locomotive and well-filled train of passenger cars is a startling kind of test to apply to a decrepit wooden bridge! If we are to rely upon such tests, let us hope the engine-drivers are men of more than ordinary judgment.

As to the durability of iron, it has been found, by German experiments, extending over a term of years, that iron is practically indestructible when strained within the limits bridge engineers require of their metal.

Tests of iron from old bridges that have been strained repeatedly as high as 20,000 pounds per square inch, have not shown the metal injured. The durability of wood has not been the object of such searching investigation. The difficulty of getting several large sticks uniform in quality upon which to make a series of experiments, interferes with the success of such an undertaking. Data that are available upon this subject, go to show that wood, under high strains, has very little durability. — *Boston Journal of Commerce.*

Use of Petroleum as Fuel in Russia.—Upon the Balachanskio railway the locomotives are heated with crude naphtha, which ie introdnced into the teuder as it comes from the wells, and there have been no accidents resulting from its use. All the shipe upon the Caspian sea are heated exclusively with the liquid combustible, the cost heing only half as great as that of coal. Experiments which have been made upon some of the railwaye show that a kilogram of naptha is equivalent to 8½ kilograms of wood, although the theoretic heating power is only three times as great. The use of petroleum with injectors for introducing it into the furnaces is very convenient—the combustion can be regulated with the greatest ease; the furnaces last much longer on acconnt of the absence of sulphur; there are no cinders, smoke or sparks, and the work of the stokers is greatly simplified.—*Soc. des Ingen. Civils.*

An Electric Pile-Driver.—At Hatfield Park, England, the piles to support a cofferdam across the River Lea have just been successfully driven hy the power irom a waterwheel situated at a distance, which power was transmitted by two dynamo-machines and a couple of wires to the gearing connected with a pile-driver of ordinary construction, erected on a large floating in the river. The machinery, although rather roughly constructed, worked well, lifting a dolly, weighing from four to five hundred-weight, with ease and regularity.

The Vulture mine, Arizona, has just contracted for 30,000 cords of wood, at $6 per cord. The Vulture company are now crushing 240 tons of ore daily, and will soon have in operation 20 additional stamps, making 100 in all, the largest mill in Arizona.

Useful Information.

Ancient Steel, Etc.

"A considerable steel-making industry exists at the present day in China, on the Upper Yangtze, whence the steel is sent to Tientsin for shipment and distribution. It fetches much higher prices than the Swedish steel imported into the country. The Chinese metallurgists recognize three kinds of steel, namely, that which is produced hy adding unwrought to wrought iron while the mass is subject to the action of fire, pure iron many times subject to fire, and native steel, which is produced in the southwest. The different names for steel are twang kang, or hall steel, from its rounded form, kwan kang, or sprinkled steel, wei tee, or false steel. The Chinese apparently have known how to manufacture steel from the very earliest ages."—*English Journal.*

Demachus, in the fourth century, B. C., records that different sorts of steel are produced among the Chalybes, in Sinope, Lydia and Laconis. That of Sinope was used for smiths' and carpenters' tools; that of Laconia for files, drills for iron, stamps and masons' tools, and the Lydian kind for files, swords, razors and knives. In Laconia, iron is said to have formed the only currency in the days of Lycurgus.

Pliny mentions that the best steel used in Rome was imported from China, a country in which copper or bronze swords are said to have been in use B. C. 219,748.

Iron and steel are proved to have been considerably in general use at Rome during the period of her wars in Western Europe.

The Book of Job is among the very earliest of literary works, its date being not definitely known, but in it iron and steel are separately named in one verse, and considerable familiarity with other metals is shown in the reading: "Surely there is a vein for the silver, and a place for gold where they fine it. Iron is taken out of the earth, and brass is molten out of the stone." The Book of Numbers also deals familiarly with the metals; in fact the entire Hebrew scriptures do.

An ancient historical writer makes particular mention of the process by which the Celtiberians prepared the iron for the purpose of manufacturing swords, so tempered, that neither shield, helmet nor bone could resist them, hy hurying iron under ground as Chinese, Japanese and Spaniards have also done in making swords that would cut small bits of iron without injury to the edge.

Corrosion of Lead by Lime.

There is, perhaps, no metal in which not only chemists, but the general public, is more interested in than lead. Every lead pipe that enters into the construction of a house or laboratory, soon acquires a history of its own, and though instructive, this history is not always agreeable. If it is a water-pipe, it is apt to be burst during a frost, and lead to the inundation of the building when the thaw begins; if a gas-pipe, it may, after a while, give rise to minute leakages, difficult to discover, and often highly dangerous. If a soil-pipe, it invariably becomes more or less corroded in the course of 10 or 15 years, and then the noxious effluvia of the drain are insiduously infused through the house; children fall ill without apparent cause, and even the strongest adults suffer frequently from this dangerous source of infection of the air. Again, if the lead is employed to line cisterns for storing water, and the latter be very pure, a certain amount dissolves in the water, and may give rise to colic, neuralgia, or even paralysis, in those who drink it. In this manner also lead enters into medicines prepared with distilled water which has been stored in lead cisterns (slate or asphalt cisterns are to be preferred).

In 1869 a paper was read at the British Association, at Exeter, by a well-known London chemist, in which some of these facts were brought very prominently forward. Quite recently, another source of danger has been pointed out in the daily papers; and some letters have appeared in the *Globe* upon the effects of lime on lead. It would appear from these that, contrary to what is generally believed, the presence of lime in water does not prevent lead from being dissolved, but rather promotes the corrosion of pipes and cisterns. We know that chloride of lime, so often thrown into closets, with a view of disinfecting them, has a most injurious action, giving rise to chloride of lead, which dissolves and corrodes the pipes in every direction, so that in the course of a short time sewer gas easily permeates through them. Other disinfectants of an acid mineral nature would probably act in the same manner. It is now known that when lime, mortar, or plaster of Paris is left in contact with lead pipes, they corrode more or less rapidly in these parts, and another source of mischief is thus pointed out.—*Monthly Magazine* (Eng.)

A Happy Idea.—Forty years ago a Frenchman, with the usual practical views of the nationality, conceived a happy idea for easily creating intricate designs upon plush. This happy idea was simply the application of a hot iron to the surface of the goods. The discovery was made in an accidental way, and cost him the good looks of a velvet dressing-gown, which his over-zealous wife had attempted to iron. His experience, however, suggested what was afterward, and is still called embossed plush.

Artificial Leather.—Numerous attempts have been made in years past to produce a material bearing a resemblance to, and useful for the same purposes as leather. Nothing practical ever grew out of these efforts, so far as we are aware, until Mr. Evans, an Eastern man, took the matter in hand. Like all investigators in untrodden fields, he worked to little advantage for many years, but each effort was a step nearer the object aimed at, and finally, after almost innumerable experiments and many discouragements, he succeeded in producing a substance which not only looks like leather but wears as well and for many purposes is superior to leather. The new material, which is called Evan's artificial leather, presents a handsome appearance, is durable, is not affected by heat or cold, and is impervious to water. We have seen shoes made from it that were well, and, to all appearances, were leather. Makers of cheap shoes should make note of this fact. This leather is prepared in all colors, and being largely used for the tops of boys' boots, for which purpose its water-proof qualities and cheapness make it especially fitted. It can also be used for covering furniture, and for the tops of carriages it forms a durable substitute for leather, as well as for upholstering carriage seats.—*Blacksmith and Wheelwright.*

Metallic Cloth.—A new material is about to be put upon the market, in the shape of a metallic cloth. An invention has recently been patented for the production of this cloth, which, if desired, can be impressed with a pattern, or printed upon. The mode of manufacturing the material is as follows: The metal intended to be used is rendered into small particles, short or long, according to requirements, and is then mixed with a sticky material, such as India-rubber; this mixture is transferred to a fabric made from cotton, wool, linen, silk or other textile material; the fabric is then dried and calendered or dressed in any suitable manner, so as to produce a smooth metallic face. After this preparation the cloth can be impressed with a desired pattern by the process of embossing; or the pattern may be printed on its surface in the usual manner. The cloth produced as above, when finished, is soft to the touch, and is very pliable. The liquid charged with the metal does not penetrate to the under side of the fabric, but leaves it quite clean.

A new friction match has a quantity of explosive compound sufficient to protrude slightly beyond the end of the splint placed in a cavity in the end of the splint. The end of the match is then dipped in paraffine or other suitable material.

Good Health.

Health in Town and Country.

An extended series of observations seem to have warranted two conclusions, both adverse to commonly received opinions:

1. There are more persons in lunatic asylums from the country than from the town.

2. The average of human life is greater in the largest cities, than in the country adjoining; yet farmers eat plain, fresh food, take abundant exercise, retire early, and get up by daylight, breathing the pure out-door air for at least half their existence. On the other hand, citizens retire late, rise late, eat food and fruits one, two, or a dozen days old; are in-doors three-fourths, if not nine-tenths of their time, breathing an air vitiated hy furnace heat and a variety of other causes, and take comparatively little exercise.

It is practically useful to note some of the general reasons which may very rationally be considered as explanatory of such results.

The universal tendency of concentration of thought upon one subject is to monomania, madness. This is so palpable a fact that argument is not necessary. When, therefore, the subjects of thought are few in number, the same tendency exists. The weather, the crops, the market, are the idol trinity of most farmers; in a wide sense, they think, talk, dream about nothing else with any special interest: all besides is secondary, and if, by any novelty, the mind is compelled out of its wonted track, it soon relapses into the old tread-mill circle, into the same rut of ages gone. In great cities this destructive concentration is almost an impossibility: the morning papers, the prices current, the stock markets, the accidents, the wars of nations, the exhibitions of curious and stirring things, keep the mind on the look-out; in fact, almost too active; there is scarcely enough time for needed rest. The day begins with running over the state of the world, as exhibited in the newspaper. From nine until four the whole mind is absorbed in matters of business; from that until near midnight, there is a comparative abandon to dinner, to social ties, to giving or receiving visits from acquaintances, friends and kindred, in going to the concert, the lecture, the opera, to evening parties, or other sources of agreeable diversions or profitable intercommunications.

The farmer, glorying in his health and strength, thinks his constitution impregnable; scouts at method and system and precaution, considering them as nothing but doctors' whims and old women's notions. He believes in eating hearty suppers and late; he has done it all his life, and is not dead yet, and resolves so to continue until the end of the chapter, when some morning the news goes round, "Died last night" of apoplexy, cholera morbus, cramp colic, or the like. At other times, bilious fever carries him from health to the grave in 10 days, in consequence of going to sleep in the entry or on the front stoop after a hard day's work; or he brings on some other malady hy damp feet, bad cookery, neglecting the calls of nature, or deliberately postponing them.

The citizen, on the contrary, has more or less informed himself on these matters, both hy reading and observation; he is compelled to pay deference to nature's laws; he knows that their infraction is attended with certain penalties, and his better judgment leads him to estimate properly the value of a wise course of life; while all the time he is relieved from the necessity of encountering great exposure to heat and cold, of excessive and exhausting physical efforts, which accidents and the hurry of the seasons impose on those who cultivate the soil.

Farmers will become healthier in body and in mind, in proportion as agricultural papers are taken, for several reasons: These publications uniformly contain a large amount of unexceptionable family reading, as to health, temperance, and sound morals; they will also gradually waken up the mind of farming people to experiments, to what is often sneeringly styled "scientific farming." Every day the helter-skelter mode of agriculture is becoming less and less remunerative; every day it is becoming more and more necessary to study the laws of vegetable growth, the habitudes and needs of plants and grains and trees; and in proportion as this is done, and the analysis of soils becomes an indispensable pre-requisite, there will be a world of novelty and light to break in upon the farming mind, to interest, electrify, and enrich.

The time will come when, to attempt the successful management of a farm, large or small, without some considerable practical knowledge of chemistry and botany and geology, will be considered the extreme of Quixotism. Meanwhile, let farmers and farmers' wives, with their children, bear in mind that to diminish the chances of a dyspeptic or bilious madness, or a premature death from acute disease, they should practice habits of personal cleanliness and bodily regularity; should eat only at regular hours and never between meals or after supdown, eat slowly and of plain food; avoid damp clothing and cold or wet feet, and cultivate a cheerful spirit, a courteous temper, and a loving, generous heart.

A Telegraph Story.—One of the operators in the Western Union office at Boston had an epileptic fit. His medical attendant spoke to him, chafed him and made every effort to arouse him, but in vain. Subseqnently one of his fellow-operators drew a chair up to the bed, and took the patient's hand in his. As he did so, he noticed a feeble pressure by the fingers, which pressure presently resolved itself into dots and dashes, faintly communicating to the tactile sense the words: "W-h-a-t d-o-c-t-o-r s-a-y a-b-o-u-t m-e?" Asked whether he could hear what was said to him, the patient signified assent by a slight motion with the tips of his fingers, and the result was that his fellow-operator got from the patient enough dots and dashes to describe his feelings to the physician, who was thus enabled to apply the necessary remedies. It is certain that no other method of communication was possible under the circumstances, since the sufferer from epilepsy, although he could hear, could neither speak nor move any of his muscles, except those situated in the digital extremities, and those only with the faintest requisite in electrical communication.

To Kill a Felon.—A correspondent of *Hall's Journal of Health* says: To kill a felon, or bring it to a head if too far advanced to kill, take poke root and boil till soft enough to make a poultice, apply, and if the felon is not too far advanced it will scatter it; if it is, it will hasten suppuration. It will deaden the pain in a short time and save much suffering. I have used this myself and know it to be good.

Expectancy of Life.—The chances of life have been carefully studied and tabulated by life-insurance men, and, barring accidents, seldom prove misleading. The life of an ordinary man or woman is about as follows: A person of 1 year of age may expect to live 39 years longer; of 10 years, 51; of 20 years, 41; of 30 years, 34; of 40 years, 25; of 50 years, 21; of 60 years, 14; of 70 years, 9; of 80 years, 4.

Out to The Eastward.—A considerable number of men have already raided out into the Walker Lake region and to other mining camps along or within easy reach of the Carson and Colorado railroad, and more will go in the same direction as soon as the weather becomes settled and reliable. Already a good deal of ore is being sent in from mines in that section, and much of it is very rich. Some of this comes from mines but recently located, and there are doubtless "as good fish in the sea as have been caught."—*Virginia Enterprise.*

New Process.—A dispatch from Elkland, Ind., says: Some time since, the Eureka Smelting Company was organized here for the purpose of testing a discovery made by S. P. Bresser, foreman of the copper department of the Lake-Shore shops, by which he claimed to be able to extract the precious metals from the most rebellious ore. They immediately built a small furnace here, sent for a car load of the ore, and although it was a kind that no one has ever been able to work before, he succeeded, and fully realized his expectations.

MECHANICAL PROGRESS.

Lack of Care in the Details of Iron Work.

A paper on practical iron work was recently read before the Civil and Mechanical Engineers' Society, England, in which it was remarked that sufficient care is not taken in the details of iron work. The points of attachment will generally be found to be the weakest parts; the compression members are considered as being able to bear four tons per square inch, while experiments and theory both seem to show that the strain which wrought-iron columns, of the form in which struts are generally made can sustain, more nearly approaches 2.7 tons per square inch of section, and that this value is in many cases too great. The loss from riveting in small girders is greater than is generally allowed for. The present form of upper and lower members in girders might be altered with advantage, vertical plates being used in the tension boom and gusset plates employed for attachment, allowing rivets in double shear. In bridges of small span ordinary lengths and sections of iron should be employed; but in large span bridges, when dead load predominates, greater refinement in design may be used with advantage. All iron work should be designed with regard to its erection, and in that which has to be sent long distances, there should be no overhanging pieces of any length.

Continuous girders, though economical in first cost, are objectionable for use in road bridges, owing to vibration, and it is doubtful whether their use is economical or safe in the end. Repeated shocks or vibrations producing fatigue will eventually cause the failure of all iron structures in which corrosion is not allowed to alter the conditions under which they were built, and as it may be concluded that the vibrations in continuous girders are more numerous, with an equal number of shocks of the same intensity than in those of the non-continuous type, the life of the former will be shorter than that of the latter. Alteration in foundations which often change the condition essential to the safe working of continuous girders are less liable to exert their influence on non-continuous girders. Close spacing of the cross girders of a bridge increases the number and extent of the vibrations and has an injurious effect on the girders themselves. The ignorant use of continuous girders may constantly be seen in the construction of warehouses and houses, where no care is taken to space the supports properly, where the quality of iron used is poor, where the margin of safety employed, as found from merchants' lists, is only from 2.7 to 3, and where failure of foundations is probable.

Engine Economy and Economical Engines.

A wide difference exists between the two conditions above named, although they are sometimes used in a sense which makes them seem to have the same value. An engine may be economical in its place, and for a certain duty, but if it is taken out and put to other work it will be found wasteful.

Engine economy depends wholly upon and has reference to, the kind and amount of work it is doing. A case in point occurs to us, which came under our observation a few months ago. A person had a large engine set up in a building where but little work was required of it. It was rated at 60-horse power, but the needs of the place were only about five. It was the practice of the engineer in charge to carry high pressure and cut off short, so that at the end of the stroke the card showed back pressure of about seven pounds, if our information is correct. The expansion curve went much below vacuum line and formed a loop, for the work on the engine was but little more than a mere friction diagram would show. This was no fault of the engine itself, as it was capable of very good performance under proper conditions, but it was an error in judgment of the builder in putting in such an engine for so slight a duty. The engine was economical enough, so far as its adjustments and designs were concerned, but there was no economy, but extravagance, in using a 60-horse engine to do 5-horse duty. This is a mistake not unfrequently committed by persons who buy machinery and fit up factories regardless of anything but mere guesses at how much power will be needed. Engineers of experience should be consulted on such matters if parties wish to avoid expense.

It is much better economy to put in an engine suited for the present work and enlarge it when the time arrives, than to put in a big engine and boiler that are not worked up to half their capacity, with the expectation that it will be needed in the future.—*The Mechanical Engineer.*

SCISSORS.—A new method of manufacturing scissors or shears consists in casting the handles of iron, and rendering them malleable; preparing the steel blades in the usual manner; welding the steel blades to the malleable iron handles by hammers or dies acting upon the parts that are welded together; and subjecting each handle and blade when cold, to a powerful pressure between dies that act upon the malleable portion to consolidate the metal, smooth the surface, and remove any imperfections in the shape.

A NOVEL INVENTION, which has for its object the automatic setting out of the packing rings of a piston-head within the cylinder, has been devised by the master mechanic of the Pennsylvania R. R. Co., and will be adopted by that company for use on their locomotives. The improvement consists of a solid piston-head suitably cored out for the reception of the packing rings and their actuating levers, as also for the two adjustable bolts which center the piston and provide the bearings against which the weight of the piston exerts itself to set the packing out automatically. The two operating levers are each fulcrumed in a block resting on the packing rings at the bottom of the piston, and extend, one on each side, into the upper circumference of the head, where they rest against other blocks having their bearings on the packing rings and constituting the *resistance* of the levers. The *power* is applied through the two threaded bolts referred to, and which work adjustably in screw bearings in the solid head. These bolts are each arranged on an angle of 30°. Thus, it will be seen that the whole weight of the piston rests upon these two bolts, which, in turn, bear respectively against their levers, whose fulcrums are in the bottom of the piston, and whose resistances or operating ends are in the upper part of the piston, whereby the weight of the same is utilized, through said levers, to bear directly against the upper circumference of the packing rings to expand the same in the upper part of the cylinder.

COPPERING IRON.—For the past ten years M. F. Weil has been testing specimens of cast and wrought iron and steel which have been coated with copper by his methods, without requiring any intermediate deposit or any finishing touches. The homogeneity of the deposits reproduces the most delicate details of ornamentation, so as to give the articles the artistic value of bronze. The cyanides, which are injurious to the health of workmen and which greatly increase the cost of coppering, are replaced in his methods by organic acids or by glycerine, materials which are cheap and which have the advantage of not being decomposed. The baths require no renewal of organic materials, provided they are properly supplied with oxide of copper. The well-known property of alkaline-organic solutions, of rapidly dissolving oxide of iron without attacking the metallic iron, facilitates the perfect cleansing of the pieces. When the oxide of copper requires renewal, the exact amount which is needed is determined by a very easy test. Various other metals, such as nickel, cobalt, antimony, tin, etc., can be deposited upon iron and other metals by his processes.—*Comptes Rendus.*

A NEW ROTARY WATER MOTOR.—A recent issue of *Dingler's Polytechnisches Journal* contains a description and several illustrations of Mr. J. Spohn's (Stettin) rotary water motor, which is apparently a very compact and durable piece of mechanism. The piston, if we may so call it, is provided with eight vanes, capable of turning about axes passing through their respective centers of gravity, while to the inside of the cylinder are cast four projections slightly touching the piston, and provided with channels through which the water-producing motion is introduced. The channels are in connection with the main feed pipes passing through the two separate cylinder covers. The vanes, when passing the projections mentioned, are depressed, closing at the same time the exit channels in the piston through which the waste water escapes. Having passed the projections, the pressure of the water causes the vanes to assume their original upright position. Accumulations of water in the machine are prevented by an orifice in the lowest part of the cylinder.

A NOVEL STREET CAR, which carries its track, is about to be put in practical use in Chicago. The Accommodation Car Company has begun operations in that city, with a capital stock of $1,000,000. The object of the company is to build and equip 1,000 cars and put them upon the streets of Chicago. The car is the patent of Mr. Prosser, and as regards present appearance, is a queer-looking craft, which carries its track along with it, and to all intents and purposes, is designed to traverse any and all lines of streets. The car, which is of the ordinary kind, is mounted in the middle upon a truck which sits on four wheels, each about 1 foot in diameter. These wheels run around the inside of two steel tires, each 10 feet in diameter, and which rests upon the ground, and are held only to the car by a set of wheel clamps. The car is designed to hold 50 people, and the owners claim that the more it carries the easier it runs. It will be stopped in the usual manner, and two horses will be required to pull it. The company say they intend putting the cars upon the principal streets of the city.

UTILIZING EXHAUST STEAM.—According to the Boston *Journal of Commerce*, an American invention has recently been patented in England, which consists in the method of, and apparatus for driving back into the boiler the exhaust steam from the engine. The apparatus is formed somewhat similar to an injector, and is connected with the exhaust pipe. Steam is pumped from the boiler and forced through a superheater and thence passes into the injector, its velocity driving the exhaust steam into the boiler.

SCIENTIFIC PROGRESS.

Sound.

Sound as a substance is nothing; that is, you cannot see it. Sound is produced or generated by causing some substance to vibrate in the air either by shock or similar action. Without air no sound can possibly be produced. Air is as necessary to sound as it is to combustion. If we drop a solid substance into water we find that the water yields at the point at which it was first subjected to a shock. This swelling we call a wave. When the first wave has made way for the substance creating the disturbance, it causes the water next to it to form another wave, not so great as the one first made, and so on until the power expends its strength when at last all action ceases. If the body of water is not sufficiently large to allow of this succession of swells to exhaust themselves it is reflected back to the original point. If the water be confined in a square vessel the waves in meeting the sides are broken, resulting in confusion. As it is with water so it is with air. No matter how rapid air may move, unless it comes in contact with some substance no sound is produced.

In a clear, dry air sound can be heard a greater distance than when the air is damp or otherwise defective in its sound-bearing capacity.

Sound is due very materially to the atmosphere in which it is generated, and where the effects are to be heard. It has been an old theory, that if we take a sea-shell and hold it to our ears, we will hear the swell of its native ocean. It is true that if we hold the shell as mentioned, we do get the sound like the rushing of air. The same effect may be had by holding an earthen inkstand to the ear. In this case we might naturally suppose the sound emitted to be that of the waves breaking over the clay that was used in making the ink vessel.

In musical instruments the cylindrical form is important. Where this form is not preserved various modifications of it are employed. The violin, for example, is composed of two outer walls. Separating these two pieces, and uniting them in a general whole, is what we call the side walls. Then comes the finger board. Again we have the button at the lower end; then we have the sounding-post placed in the inner side, and immediately under this is placed the bridge, over which the strings are drawn and held in proper position. The inner partition presents a line of swells and sweeps. The strings are adjusted to harmonize. To the how we apply a resinous substance to produce friction. We draw the how over the strings, which produces a vibratory sound. If the body of the instrument were made of thicker material, or without sweeps or curves, unpleasant sounds would be the result.

In the piano we produce musical sounds by hammering on wires when in proper tension. This hammering causes them to vibrate, to send off their sound to the sounding-board, which is then reflected to the outer air. Another example which it is well to refer to, is the snare drum. We stretch across each head a piece of sheepskin. Across the lower head the snares are placed. An air-hole is made in the body. When the upper head is struck, the air in the cylinder hammers against the lower head, causing it in turn to hammer against the snares, while the sound reaches the outer air by means of the hole in the body. When the drum is muffled a dull sound is the result. The xylophone is a good example of the sound-producing capacity of wood. A small hammer striking the pieces of wood, of which the instrument is composed, causes them to vibrate, sending off their wavelets of sound.

To produce sound we require, in connection with air, substances that have density, elasticity and vibratory power. If we suspend a common brick and strike it with any substance, say a piece of iron, a very dull sound is the result. The brick has a certain amount of solidity about it, but no elasticity or vibratory powers, and consequently yields no sound at the moment. If we take a stone of the hardest species we get better results than with a brick, because of its density. Steel has density, elasticity and vibratory powers, and produces sound. If we form the steel into a circle, leaving the ends in contact, we get an increased amount of sound. So long as steel vibrates so long will sound be emitted.

A bell has density, elasticity and vibratory powers, and is capable of containing air in a condensed form. If the bell is formed so as to consist of angles, as, for instance, the cow bell, we get the same confusion of sound as mentioned in describing the action of waves in water, that is, of water placed in a square vessel. If the bell be fractured there is no continuation of the sound, vibration becomes suspended because suspended by reason of the fracture. A barrel, perfectly tight, with the hung inserted, if struck gives a hollow sound much subdued. If the barrel were loosely constructed, the sound would be similar to that of the fractured bell. If we strike a square box, the sound is momentary. Its many angles cause a confusion of the sound waves. It is an old theory that a clear, frosty air allows of a greater amount of sound than a clear, warm air. This is incorrect. No matter where sound is generated, it will ever travel in search of the higher, purer and more expansive atmosphere.—*Blacksmith and Wheelwright.*

THE ARTIFICIAL PRODUCTION OF CRYSTALLIZED QUARTZ.—Considerable attention has lately been drawn to the artificial production of crystallized quartz, which was first obtained by Senarmont by heating gelatinous silica with hydrochloric acid. Daubree obtained it by the action of superheated water on glass, and Hautefeuille by treating silica at a high temperature with sodium tungstate. C. Freidel and E. Serasin have now prepared it by heating to a temperature below dull redness in a closed steel tube, lined with copper, a mixture of potash, alumina and gelatinous silica, the last in excess, in presence of water. In this way, after continuing the heat, in one experiment, for 14 and in another for 38 hours, they obtained silica wholly, or almost wholly, crystallized. The first experiment yielded numerous very regularly formed crystals of the ordinary quartz form (prism with the two rhombohedrons), which acted strongly on polarized light in the manner of native quartz. In the second experiment the crystals were larger (up to 0.5 mm. long, and 0.1 mm. broad), but mostly broken off at one end. They sometimes had the form of more acute rhombohedrons, with indications of tetartohedral forms, and many of them exhibited striations and modes of aggregation well known in native quartz.

THE EFFICIENCY OF FAURE'S ACCUMULATOR.—Prof. W. E. Ayrton, F. R. S., read a paper before a late meeting of the Physical Society of London, on "Faure's Accumulator," giving the results of experiments made by him and Prof. Perry on the efficiency, storing power and durability of the battery. The efficiency was got by measuring the power put in and comparing it with that taken out, by means of Perry and Ayrton's voltameter and ammeter. The authors found that the cell has great resuscitating power if left insulated after all the current appears to have been discharged. Care had to be taken to see that the cell was quite discharged by letting it stand on open circuit for intervals, and discharging between whiles. When this was done they found that the total loss for charges up to 1,000,000 ft.-pounds need not be greater than 18%. With slower chargee they got a loss of only 10%. As to the storage, a mean current of 10 Amperee gave after 18 hours' discharge (six hours on three consecutive days) 1,440,000 ft.-pounds of work, equivalent to one horse power in 43 minutes. This cell contained 81 lbs. of red lead, thus making a capacity of about 18,000 ft.-pounds per pound of red lead. The cell showed no deterioration after two months of work.

POISONOUS EFFECTS OF METALS.—Some curious results relating to the comparative poisonous effects of different metals have been noted by M. C. Richet. He finds that copper is 600 times more toxic than strontium, notwithstanding that its atomic weight is less. Lithium, the atomic weight of which is but a twentieth of the weight of barium, is yet three times more poisonous. Even in the case of the same chemical family of metals, no relation exists between atomic weight and toxicity. Thus, cadmium (atomic weight 112) is just half as poisonous as zinc, the atomic weight of which is 65. Lithium, with an atomic weight of 17, is 70 times more poisonous than sodium. It may, therefore, be concluded that there is no relation between the chemical function of a body and its toxic power. Potassium and sodium, the properties of which are so similar, differ widely in their poisonous effects, one gram of the former being nearly 250 times more poisonous than one gram of the latter. The limit of toxicity assumed by M. Richet is the maximum quantity of the poison dissolved in a liter of water in which a fish can live 24 hours.

THE IMPROVEMENTS IN THE MICROSCOPE have been gradual. Singularly each step in improvement has led to changes in the theory of microscopic physiology, and yet it has, in some cases, been found afterward that the same facts could be observed almost or quite as well with the older form and arrangement of lenses. Quite recently the introduction of a system of lenses with short focal distances, one-sixteenth of an inch and less, has led to the discovery that human saliva is filled with flat, nearly transparent, irregular corpuscles.

THE EYE OF THE HOUSE FLY.—Prof. Fairfield thinks there are reasons to believe that the common house fly, with its numerous lenses, capable, as has lately been proved, of change of focus, like the human eye, by a circular muscle, overlooked by early entomologists, can avoid the serious difficulties we meet with in high powers, and could distinctly recognize objects only a twenty-millionth of an inch in diameter.

DR. LAMBERT says it is a common error that the joints of animals have always a synovial fluid which is in the nature of a lubricant. The elephant, with his relatively moderate motions and great weight, has admirable cartilages but absolutely no lubrication therefor.

The Mining Share Market.

There is very little to report new in the mining share market. The Comstook mines, the main prop of the share market, are not showing up anything.

Messrs. Patton, Taylor and Forman, the committee to whom was referred the work of perfecting a plan for the drainage of the flooded mines, had a meeting, and did some preliminary business. They arrived at the conclusion that the water is not so strong as has been supposed. It is quite probable that the Belcher pumps will be utilized. They will be set up either at the Bullion or at the Yellow Jacket shaft. There is room for them at the Jacket, and the plan of placing them there is now being figured upon. With the Belcher pump, there is no doubt that the water can be pumped out at once.

The *Enterprise* says: The Union Con. mine is looking well throughout. On the 2500 level the ore breasts are showing very rich ore to the south and east of the winze. It is also improving on the west, to the northward of the winze. On the 2600 level the outlook is good for finding a large body of ore. A drift is now being run northeast from the bottom of winzs No. 1, known as the wet winze, which has already passed through a streak of fine ore eight ft. in width. This lies west of where it is expected to find the main ore body, and was not looked for. This drift is to the southward some 140 ft. from the ore body that is being worked on the 2200 level, and is in the same ore channel, but it is now seen that it is not in the same ore body. It is a new streak that has come in on the west. According to the survey, they have yet some distance to go to cut the ore body of the 2500 level, and other streaks are liable to be cut before reaching it. The sump of the joint Union and Sierra Nevada east winze is completed, and the work of cutting out a station at the 2900 level will be commenced to-day. As soon as this station is completed, drifts will be started to prospect the ore bodies that have been found above. The progress of these drifts will be watched with great interest by mining men.

THE stampede to Wood River is becoming great, and the stage company are putting their line in order to meet the great rush. A gentleman down from Blackfoot, says the stampeders are going in on foot, in many instances, while others have their own conveyances, pack animals, etc.

THE Mammoth Mining company's furnace at Tintio is now turning out two tons of matte per day to the stack. Twenty stacks are to be put up, and there is ore enough to keep them running.

Roasting Telluride of Gold.

The roasting of the telluride of gold or of telluride of silver rich in gold (Petzite), is a most delicate operation. All the telluride combinations with gold do not show a loss of the gold to a notable extent while roasting, but some do, and that to a considerable amount, up to 20% and perhaps even more. The loss is no mechanical one occasioned by the draft of the furnace, but principally by volatilization. This occurs sometimes at a very low heat. As soon as the ore gets hot enough to show rising fumes, it is advisable to take a sample and assay it, and not to increase the temperature until the result of the assay is known.

Mr. Kustel, in his "Roasting of Gold and Silver Ores," gives an example as to the irregular condition the gold is in, in some combinations with tellurium, and cites Petzite containing 24.80% of gold and 40.60% of silver. Heating a small piece of this mineral on a piece of charcoal or on the blade of a knife to the temperature of about 323° 6', the melting point of lead, the bluish-gray mineral turns suddenly yellow, without changing its shape. Under the microscope this yellow color is found to be due to innumerable perfect gold globules which cover the surface. The gold separates from the silver and tellurium in a molten condition, while the two other metals remain unchanged. The gold requires 1200° 6' to become liquid, and in this case it melts even below 323°.

Concerning the wasting of these tellurides, Mr. Kustel says: If salt is present during the roasting, the chloride of tellurium volatilizes voluminously, and it is possible that under this condition the tellurium causes the gold to volatilize likewise. The author, by his own experience—having 4% of salt in the ore on account of silver—found the loss of gold amounting to 8% before the ore was properly red hot. This was two hours after charging. Under this circumstance the continuation of roasting was impossible; the ore, therefore, was drawn out and then chloridized with chlorine gas, and a good result obtained; not, however, without lixiviating for a while with chlorine water after the largest part of the gold was first extracted after chlorination with gas. Whether the above loss would have occurred in such proportion if no salt had been added, cannot be stated. It is indispensable, then, to have condensing chambers connected with the roasting-furnaces, if tellurides have to be treated, in order to condense the volatilized metals.

THE bullion receipts for the past week in Salt Lake were $180,000, including the Ontario.

MINING SUMMARY.

This following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

RICH STRIKE IN THE "LAST RESORT."—Monitor *Argus*, April 10: We understand from reliable sources that J. P. Ray, of Monitor, has struck some of the richest silver ore yet found in Alpine county. Mr. Ray had some samples assayed during the past week which assay $7,422 in silver and $836.25 gold, total $8,261.25. This character of ore he encountered in running his tunnel in his mine known as the Last Resort. Mr. Ray has also found a vein 3 ft in width assaying $38.58 silver, and $12.12 gold, and is now running a drift up on this vein which is running into Monitor mountain. The ledge is becoming wider as progress is made, and the ore improves in value. Mr. Ray is deserving of much credit for his perseverance in developing this property, having spent almost 4 or 5 years' work and a large amount of money in developing this claim. The present outlook for successful mining in Alpine county is deserving of the attention of capitalists. That we have rich ore and large deposits cannot be denied. We are happy to congratulate Mr. Ray on his strike and fully believe there is a grand future for Alpine in her bullion moduct nud other precious metals. The Alpine Gravel & Hydraulic Mining Co. are pushing the work on their ditch as rapidly as the weather will permit. Should the weather clear up and remain pleasant they will soon have the ditch completed to their claim.

COPPER SHIPMENT.—Isabello C. & S. M. Co. are shipping below over 4 tons of copper, saved from the workings of the Stella ore, at the Exchequer mill.

AMADOR.

MAHONEY.—Amador *Dispatch*, April 15: Yesterday was pay day at the Mahoney mine, and it caused a ripple of joy to shoot through the anatomy of the average citizen. The outlook for this mine is at present more encouraging than it has been for some time past, and a prosperous future can now be reasonably expected. Prospecting at the Con. Amador mine still continues, but with what degree of success we are unable to say.

BUTTE.

THE GARDEN RANCH.—Oroville *Mercury*, April 14: Some very rich quartz has been taken out of a ledge on Garden Ranch, the property of Mr. Chas. St. Sure of this place. The ledge is about 3 ft wide, and can be traced for a distance of half a mile. Mr. St. Sure says the rock will assay $50 to the ton, and he is making preparations to thoroughly prospect the ledge. Garden Ranch is bonded to Eastern parties for $20,000. Mr. St. Sure reserving one-half of all quartz ledges found on it.

CALAVERAS.

GLENCOE MINES.—Calaveras *Chronicle*, April 15: Excellent developments are being made in the Fidelity mine. Work is pushed with all the energy possible. A new pump is to be put in as soon as it can be delivered at the mine. Operations continue uninterruptedly in the Norwich mine with good prospects. The company's mill was started and run for a short time, but the impassibility of the roads for the teams cut off the supply of rock, and it had to be shut down until the condition of the roads would permit hauling to be resumed. The Valentine mill has commenced running again we are informed. A large amount of rock was about to be milled when the cold snap came on and cut off the supply of water, necessitating the suspension of operations until the weather had moderated sufficiently to permit the flow of water to run the mill. The season is too far advanced to apprehend any more delays from the same cause, however, and we hope to be able to chronicle good returns from this mine.

RAIN.—This section of country has been treated to copious showers at intervals of a few days for some time past. Although the great fall of rain and snow during the winter temporarily interfered with and retarded some of the mining operations, as a whole the season will prove very favorable to the mining interest, also in furnishing an abundance of water which will permit work to continue through the greater portion of the summer.

WEST POINT.—The prospect of the mines in this vicinity appears to be good. They have plenty of rich rock on their dumps, and it is likely to stay there if we don't get some good weather so that the teams can haul it to the mills. Ayers & Co. are running their hydraulic in full blast up at the "new diggings," where a number of new discoveries have been made. Mr. Wm. Crockett struck a well defined quartz lode at Hunter's flat, showing plenty of free gold. The vein is about 2 ft wide, and in places lead and iron sulphurets predominate over the quartz rock. Work will be resumed when the snow melts. The Lockwood mine has quite a patch of good rock on its dump, likewise the Canada mine. Mr. T. Porteous ground 7 tons of rock from the Florida mine which yielded $50 per ton. T. Sawyer & Co. are running a tunnel on the Nellie Mead mine, which is good property, having produced in by-gone days a goodly amount of bullion. The lead averages from 1 ft to 2½ ft in width, and has been worked for a distance of 300 ft above the water level; the tunnel taps the lode 25 ft deeper than the old workings, therefore we expect good results from that mine. Messrs. Rose & Jenkins have finished their new mill and intend commencing to crush rock as soon as the weather permits. The new air shaft on the Lone Star mine is nearing completion. Work is being pushed forward on the Champion mine by the owners; likewise the Riverside mine. Messrs. Smith & Gibson have had to close down the Pride of Somerville on account of the severity of the weather, but intend to resume operations again as soon as fine weather returns. They have about 25 tons of rich quartz on the dump. Domingo Rubio & Co. have struck a splendid lode near town which prospects big. Carey & Co. have struck good rock in their mine at Skull flat, but are delayed from further work on account of the unsettled state of the weather.

EL DORADO.

NEW FLUMES.—Georgetown *Gazette*, April 14: The Cal W. & M. Co. are constructing new flumes at Fraser flat, which will require 60,000 feet of lumber. The main flume will be 5 ft in width and 2 ft in depth. They are being enlarged to meet the increased demand for water. The work of enlarging the reservoir at Georgetown is about done for this season. The enlargement is from 6 ft to 12 ft in depth and nearly doubles its capacity. Work of development on several promising quartz mines is actively going ahead. Better times, boys, close at hand.

INYO.

DARWIN.—*Independent*, April 15: Mr. J. S. Gorman, accompanied by Mrs. G., paid Independence a visit yesterday. From him we learned the following items concerning mining operations in southern Inyo. In the last run of 48 days the Defiance furnace put out 188 tons of high grade bullion, mostly from Defiance and Custer ore. About 200 tons of screenings were run through from the old wash dump, or slag-pile. It is the intention to smelt over all of the dump as soon as sufficient lead ore can be obtained to work with it. The work of developing the Defiance mine is going on from the 300 level, from which an incline is to be sunk to a depth of 500 ft. In the north drift, 300 level, a new body of ore, which assays 101 ounces per ton in silver and 60% lead, has been struck. It is intended to start the furnace again about the last of next month. Work on the Phœnix mine—the old Promontory, now owned by Messrs. Reddy, Gorman, Eddy and Mee—has been pushed ahead. The main incline has been sunk 60 ft, making a total depth of 240 ft, at which point the ledge has been crosscut and north and south drifts started. In the former horn-silver ore was struck the day before Mr. Gorman left. During the last run a lot of ore from the Winnetts mines, in Slate range, was smelted which assayed 277 ounces per ton silver. At this place they have an enormous amount of 60-ounce ore, but the

cost of transporting it to Darwin—$25 per ton—precludes its being worked there. Somebody hunting a location for a quartz mill should look this thing up.

MONO.

BODIE.—*Free Press*, April 18: Good progress was made at all important points in the district last week. The Noonday and North Noonday joint incline was sunk 28 ft, making its depth 186 ft below the 512 level. It is the intention to continue the incline down to the water, which will probably be found 50 ft or more below the bottom of the winze. Hon. W. M. Stewart was in town Sunday, remaining just long enough to look at the development, as far as made. To the inquiry as to what he thought of it, he said: "I have never seen the Noondays looking so well. They assure the permanency of the district. The development is below the water line, and is very important." The Lent shaft was sunk 10 ft during the week, and is now down 847 ft. The winze on the rich vein in Bodie (No. 17) is now 33 ft deep, and the drift 132 ft in length. The average of the pulp run through the mill during the week reached the high figure of $115. In the stopes of Bodie tunnel considerable improvement has taken place in the quality of the ore. The east crosscut of the Red Cloud, at the 700 level is in 46 ft.

NEVADA.

MINING BOOM AT MOONEY FLAT.—*Transcript* April 13: Great excitement is occasioned at Mooney Flat, in the lower part of this county, over the discovery and location of some placer mining ground. A company from San Francisco, composed of Geo. Barstow, Peter Malley, Jas. B. Lee, M. W. Fox, Edward G. Stetson, Geo. H. Forster, Octave G. du Py and Alton H. Clough located about 160 acres. Another, the Bonanza M. Co., consisting of J. B. Fuller, W. A. Wilmer, John Clowth, B. Butler and Thos. Corrigan, located about 120 acres further north, and still another on top of the above 2 locations, who claim that the first 2 are null and void, as Mooney Flat mining district has never taken any action to conform to the Government mining laws. The district laws say that 20 ft frost, running to the center of the hill is the lawful location. The first 2 companies, thinking the laws had been changed, made their locations in conformity to the U. S laws. The last locators got away with the pie, which is a good one, well baked and well seasoned, a la gold-dust. There is much excitement over the locations by the old '49ers thereabouts, who now say, "dog gone it, why didn't I locate it 30 years ago. I always thought the channel went through that way." The liberal offers of the Excelsior Water Co. to prospectors will induce others to make locations, when we may expect to hear of good old times again in that part of the county.

SMARTSVILLE LOOMING UP.—A correspondent writing to the *Transcript*, from Smartsville, says: "For the last 3 months our village has resembled the habitation of the dead, and fears were entertained that it would always remain so. About that time the management of our mines changed hands, and unfortunately for the village and surroundings it did not fall into the hands that added any great energy to the working of the mines. Nine-tenths of our citizens had nearly given up the hope that we would ever recover our former activity and liveliness. But James is himself again, and all join in huzzas in the prospect that he will again bring our once prosperous village to its former self."

THE WIDE WEST.—The Wide West quartz mining company, at Canada Hill, are having about 40 tons of quartz crushed at Crosby's mill. It is expected it will go to about $20 per ton. A large number of very rich specimens were found and not included in the 40 tons. Before any more rock is taken out the hoisting works will be removed to a more eligible place, owing to the dip of the ledge.

THE O'CONNOR MINE.—Grass Valley *Union*, April 12: The gentlemen who have purchased the O'Connor mining property, which is situated east of the Idaho mine, have commenced active operations. Several companies of tributers, numbering in all 20 men, have commenced work on the line of the croppings, and will soon have a large quantity of quartz raised ready for crushing at the company's mill. To-day Mr. O. Crandall, of Oakland, who was the original contractor for building the mill and hoisting works, will arrive, and at once proceed to put the machinery in complete working order. This will require several weeks, when the mill will be started up to crush tribute and custom rock. This will be a great convenience to prospectors in that part of the district, and save a large part of the expense that they have hitherto had to pay for hauling quartz to more distant mills. After the hoisting and pumping works are put in order, the shaft, which is 1565 ft deep will be pumped out, the necessary repairs to the timbering made, and the work of extending the levels commenced. There is a drain tunnel 600 ft long on the ledge, which drains it to the depth of 100 ft, which will permit of tribute work being done from the surface down to the tunnel level, while more ground is being opened at a lower depth. The ledge in the mine is a large one—being from 3 to 7 ft in width, and can be extracted so cheaply that even if it be of low grade, with the excellent facilities at hand can be worked to a profit. Former crushings of quartz from the mine gave fair results, although no regular pay chute was found, but the present company expect to open up one in the explorations they have in view. Developments will be pushed energetically during the coming summer season.

PLUMAS.

SOUTHERN EUREKA MINE.—Greenville *Bulletin*, April 12: When the great storm had been raging some days, work in the drifts had to be stopped because the timbers were all snowed under, and for some time ore was taken from the stopes only. At present timbers can be had again, and now work is resumed in the drifts. The ledge still maintains a uniform width of about 13 ft. It is worthy of remark, that in each successive tunnel opened at greater depths, the ore becomes richer.

TAYLOR-PLUMAS MINE.—This mine is developing in a way to cause some surprise to the knowing ones. When the very rich ore was recently struck there it was a general remark that it was only a bunch, and as such bunches always robbed the ledge, as soon as this was passed the vein would be poor; instead of this, however, it continues to show a large vein of very superior ore. The upraise is now 40 ft above the level of the tunnel, and as it is advanced the width of the lode is fully maintained, and the quality of the ore averages better. The character of the walls in which this ledge lies is worth notice. The hanging wall is solid gray granite, from which the ledge matter parts, leaving a surface as smooth as if it were polished; the foot wall is a softer brown rock, from which the ore parts as easily as from the other. This is the lowest ledge yet opened in Green mountain, being at its base and nearly on a level with the valley; all the other mines are at a considerable elevation. If the mountain were divided lengthwise, this mine would be about the center

PLACER.

PINO MINING ITEMS.—Placer *Herald*, April 15: On the Klees brothers' mine, near Pino, a new shaft is being sunk, and the gravel is showing very encouraging prospects. This has been demonstrated to be a rich lead, but want of means has prevented the owners from properly developing it. Recently some Oakland parties have taken hold of the property, who intend to put it in good working shape. The Laird hydraulic mine, also near Pino, is in full blast; work a large force and 2 giants. The hydraulic elevator is used in this mine successfully. George Lee is running a tunnel to tap the same lead on which the Klees mine is located. He is now in about 300 ft, and expects to strike gravel and pay in 50 ft further.

SIERRA.

A GOOD PROSPECT.—*Sierra Co. Tribune*, April 13: A very nice prospect was found at the Ruby mine last week. About a quarter of an ounce of coarse gold was panned out from a small quantity of gravel taken from the winze that had been sunk to a depth of 25 ft from the drift above their main tunnel. The appearance of a prospect at this point is very encouraging, and great hopes are entertained of reaching the main channel in a short time. After this object is accomplished, the main tunnel will then be pushed ahead and connection made with the drift above, which has been run ahead of the tunnel, to the present time about 500 ft.

HYDRAULICING.—A force of men has been put at work in the American Hill hydraulic claim, and with a large head of water they are doing good execution in washing. The mine paid well last season, but the owners anticipate still better returns this summer, as the channel is widening out, and the gravel is apparently of better quality.

TUOLUMNE.

WATER.—*Independent*, April 15: After many freezings and delays in mining ditches, water now runs down hill in peace and plenty, and the miners are busy in gathering the gold harvest. Prospects are good for a long and prosperous season, as the Sierras are piled with snow—reservoirs which the summer's sun will gradually empty for the benefit of the toiling miner.

NEVADA.

WASHOE DISTRICT.

UNION SHAFT.—*Enterprise*, April 16: Are putting in a pump bob at the 2000-level, and repairing the 1000-drift to the Union-Mexican winze.

UTAH.—Timbering and repairing the incline near the 1350 level. The main south lateral drift on the 2500-level has been extended 28 ft.

CONSOLIDATED VIRGINIA.—On the 2500-level south drift No. 2 has been advanced 33 ft. On the 2700-level joint Cal fornia east drift No. 2 has been advanced 32 ft.

MEXICAN.—On the 2 00-level the main north lateral drift has been extended 20 ft, and the main south drift 25 ft. On the 2900-level the north drift has been advanced 27 ft.

OPHIR.—On the 2700-level the main south lateral drift has been timbered up and cutting the drain completed. On the 2900-level the main south lateral drift has been advanced 26 ft.

CALIFORNIA.—On the 2700-level the joint Con. Virginia east drift has been extended 32 ft. On the 2700-level the main south lateral drift has been extended 42 ft.

SIERRA NEVADA.—On the 2500 level the winze in east crosscut No. 2 has been sunk and timbered 8 ft.; north drift No. 2 has been extended 24 ft, and the main north drift 32 ft. On the 2700-level main north drift No. 1 has been extended 27 ft. The joint Union Con. east winze has been sunk 8 ft.

UNION CONSOLIDATED.—On the 2500-level the winze has been sunk 10 ft below the floor of the stopes, passing through good milling ore. During the week 511 tons of ore have been extracted from the 2300 and 2600-levels, and 682 tons have been sent to the mills. Bullion in office, $10,004.37.

BRADSHAW DISTRICT.

AT WORK.—*Silver State*, April 13: Some two years ago several ledges were discovered about 25 miles west of north from Winnemucca. A new district was organized and named Bradshaw, and though the ore assayed well in silver, the district, for some cause, was abandoned, barely sufficient work having been done to hold the claims. Last fall Messrs. Nase, Wilder, Pollock and Fagit went to the district and spent the winter there, developing their mines. They have 12 or 14 claims. One is prospected by a shaft to a depth of 60 ft, and shows a vein 6 ft wide, with rich ore; another is prospected to a depth of 25 ft, and a third to a depth of 20 ft, both showing ledges about 2 ft wide, and carrying rich ore. They purpose sending a lot of the ore to the Winnemucca reduction works shortly.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, April 15: The main drift from the 5th shaft level has been extended 24 ft during the week, the total distance from the station being 34 ft. The main winze from the 4th level continues in the same formation as last reported. About 60 ft above the 2d level a small chimney of very good ore has been opened into. There are no changes of note in the other shaft levels. The adit and the levels above present about the same appearance as last week, and are showing no diminution of ore production either in quantity or quality. The daily output of ore has been about 85 tons. Both mills are running steadily, and are doing the usual amount of work. Shipments of bullion for the week ending April 10 h amounted to $13,559 88; and the total shipments on April account unto the same date aggregate $20,118.50.

MOUNT DIABLO.—Everything in the mine is showing much the same as at the time of last report. The stopes near winze No. 1, from the west drift on the 3d level, are opening well, and showing a good body of first-class ore in several places. The stopes below the 2d level, near the center of the mine, continue to yield good ore, as also do the stopes west of the shaft on the 1st level. Shipments of bullion were made on the 8th inst., amounting to $8,001.82, and on the 11th inst. of a valuation of $8,810.61.

EAST MOUNT DIABLO.—The north crosscut is now in 40 ft, and the ground is very favorable. The south crosscut is in 12 ft, and every foot advanced shows a decided improvement.

GENERAL JACKSON.—The work at this mine is progressing as usual. The stope is still yielding ore, and some drifts are being run from it, and good results are expected.

ESMERALDA DISTRICT.

WIDE WEST TAILINGS.—*Esmeralda Herald*, April 15: In excavating for a cellar under the Court Exchange saloon building last Monday, Ed. Twohey and John Woodford struck a large deposit of Wide West tailings. In the days when the Wide West was running there was some very rich ore crushed, and a considerable of it. Willow gulch, from the mill to the court house, was covered with tailings from 2 to 6 ft deep. But the action of the water since then has carried away and covered them up until now there is no sign of them left on the surface. The discovery made last Monday caused many to visit the cellar, and some set to work with pans to see if they could get a "color." It is thought by some that by sluicing the main channel of the creek from the old Wide West mill site to the Del Monto station, a distance of about 3 miles, it could be made to pay handsomely, and we doubt not this will be done some time.

LEWIS DISTRICT.

THE MINES.—*Lewis Herald*, April 12: Owing to the shutting down of the Starr-Grove mine and the mine under the same management, but little has been done during the week in the mines up the canyon. On our last visit the Star-Grove mine had good ore in the south 300-level, increasing in thickness as the drift was advanced. The crosscut in the north 300-level showed stringers of rich ore, and the indications were favorable for striking a body of ore near the hanging wall. The ledge in the Bothwell winze was about the same as last week, no change having taken place. The indications in the chloride are very favorable; also in the Eagle tunnel.

BETTY O'NEAL.—The stopes in the Betty O'Neal are "away up." About 7 tons of first-class ore is being extracted daily. The drifts on the ledge on the lower south level look well, and are turning out some good ore. The superintendent, Mr. D. P. Pierce, expects to begin hauling the ore to one of the mills during the present week for reduction, and from the present appearance of the ore-piles at the mine the management have underrated its value. Native and wire, also ruby silver, can be seen in many pieces, and the pile of ore now on the Betty O'Neal dumps is by far the richest lot of ore that we have seen in the camp.

MORNING STAR.—The contractors are still sinking the Morgan incline on the Morning Star mine. The ledge looks well. We also hear that work will be resumed shortly on other parts of the mine.

MAMMOTH DISTRICT.

MARBLE FALLS.—Cor. Grantsville *Bonanza*, April 12: Marble Falls is situated in Mammoth district, 4½ miles west of Elsworth, 5½ miles east of Lodi and 10 miles north of Downieville, which makes it a central point. Thirteen years ago last month an incorporated company, known as the Marble Falls M. & M. Co., commenced operations at this point. The object of this organization was to mine for gold, not paying attention to the silver contained in the quartz. The great expense at the time of getting supplies in, and the old story of mismanagement made their stay short. The ore is free milling, and that, too, of the finest character, most of the ledges being large and well-defined. The average in gold is from $16 to $20 per ton, silver from $40 to $60 per ton, although there are several places that show a much better average; but I understand that all experienced mining men now claim that free milling ore that will pay $30 per ton is good enough, provided there is any amount of it. The wood and water is convenient and plenty. With all these advantages (and I ass re you that they are not overrated) people who wish o prospect can not find a better field, at any rate we cordially invite all interested in mining to come and see for themselves. Messrs. Frank McPherson and Wm. Anderson are faithfully working on the McPherson mine. They are sinking an incline following the ledge. In sinking they average a ton of ore per day that will mill at least $250 and probably $300 per ton. This prospect is pronounced by experts one of the finest and most valuable in the State to-day. The mine is open to all who may wish to come and examine it for themselves. Henry Dube and Albert Labeau have another prospect a short distance south of the McPherson that shows well. They are at this time engaged in driving a tunnel to cut the ledge; the ore body is about 20 ft in width and assays a way up in the hundreds. There are but few men working in this vicinity at present, but as the snow is off the hills and the weather splendid we expect a rush soon.

ARIZONA.

STRIKE IN THE AUNT SALLY.—Tombstone *Epitaph*, April 11: There is a block of mineral ground bounded by the East Side on the west, the Mizzen Top on the south, the Alps and Horseshoe on the east, and the San Rafael and Hard Up on the north, that, in our judgment, has no superior in the district, for the same area. This plot of ground is covered by the Independence and Aunt Sally locations. The whole surface shows evidence of strong mineralization underneath, and the limited development being done is proving that the surface indications do not belie the contents of the lower strata of rock. Near the south end of the Independence a vein of ore was found cropping out near the east side line of that claim and the west line of the Aunt Sally. This vein has a strike northeast and southwest; therefore it enters the Aunt Sally location on its strike and not on its dip. The owners of this location started in about four weeks ago, and have sunk a shaft down to a depth of 20 ft, following the ore from the surface. Last night, when work was suspended, the vein of rich ore was nearly 2 ft wide, with about 1 ft more of second class, somewhat mixed with porphyry and quartzite from the wall rocks. The ore is carbonate and chloride, contained in granular quartz of the finest possible texture, and characteristics which indicate great strength in the vein. If this vein continues to develop as finely, as they go down upon it, as it has in the past, it will prove the Aunt Sally and Independence equal in value to any mines in the district.

YAVAPAI COUNTY MINES.—Prescott *Courier*, April 15: It is patent to all old-timers here that the industry of mining is steadily coming forward as the greatest industry of Yavapai county. Regular shipments of silver from Humbug district, south of the Prietta mountains, tell the story of successful mining in that district. The move recently made in the direction of prospecting the largest ledge in the county, the Mammoth, of Silver Mountain district, makes assertion doubly sure that the great ledges of this long neglected district are at last attracting the attention of capitalists. E. S. Junior and other miners are proving to the world that there are in Bradshaw district as good gold and silver mines as exist anywhere. The Peck, Black Warrior, Prince and other mines in Peck district, all rich, fair-sized veins, tell the tale we wish told from one end of the country to the other. Messrs. Mee & Goblin have settled for a fact the existence of paying mines in Turkey creek district. The Dos Oris and other mining companies are sounding the praises of Hassayampa district, by bringing to the surface ton after ton of ore which will mill from $100 to thousands of dollars per ton. Groom creek district, it need scarcely be said, is about the richest gold district in the county. Walker, with its many ledges of rich and moderately rich rock, is good enough for men who have stood by her through evil and good reports and seasons of depression. Developments in the Belle, Flata Bonits, Middleton and other mines of Big Bug district give good proof of the existence of great wealth in the pine-clad hills of the district, while her lowland mine-owners point with satisfaction to the Silver Belt and other veins. Castle Creek, Black Hills, Walnut Grove, lower Agua Fria and Black Canyon districts possess great mines of gold, silver and copper. As incentives to working the mines, we have to offer abundance of timber for all necessary purposes, water, and a climate which for health cannot be improved on.

COLORADO.

LEADVILLE NOTES.—Rocky Mountain *Mining Review*, April 13: Manager Ford, of the Wolf Tone, shipped a lot of ore to the La Plata smelting works last Monday, running very high in lead. The shipment consisted of very desirable carbonate ore. The gross receipts from sales of Little Pittsburg ore last month will amount to about $18,000, netting the mine about $7,000. The new No. 2 shaft in the northern portion of the property, near the Amie line, was started up last Saturday. The Green Mountain lode, at the head of California gulch, is working two shifts of men, and accumulating considerable rich ore on its dump. Shipments will begin now in a very short time. The shaft and levels of the Little Silver mine, adjoining the Lee on the east, are undergoing repairs preparatory to the resumption of active exploration work. The mine will be worked by Mr. Kearny and others. The Leopard group of mines at the head of California gulch, is being worked, and producing some ore. At the Matchless mine, more attention is being paid at present to prospecting work than to stoping and extracting ore.

THE FLETCHER STRIKE.—Georgetown *Courier*, April 13: The Matilda Fletcher mine, on Democrat, is again in big pay. It is being worked by Warren Young, under lease, and in driving a level from a raise a distance of 25 ft, about $7,000 worth of ore has been extracted. The ore vein is in places 2 ft thick, and will average a foot in thickness, and as the vein is large in both the roof and bottom, and also the breast of the drift, but little idea can be formed as to the extent of the ore body. On the 7th of this month 71 tons of ore were milled, which was taken out during the preceding month, by an average force of 5 men employed at running the level. The lot netted $2 880.65, the returns being 854 ounces per ton for first class and 254 ounces for second class. The mine is owned by the Fletcher M. Co., of New York.

RED ELEPHANT.—A few days ago your correspondent took a stroll among the mines of Red Elephant that are in pay—the Free America Extension East, Bowldor Nest, Free America and White—all of which are producing large amounts of ore, and increasing each month. There is one thing encouraging about the mines of this mountain—they invariably increase in both quality and quantity of ore as depth is gained. Ore were milled, which was taken out during the preceding month, by an average force of 5 men employed at running the level. The lot netted $2 880.65, the returns being 854 ounces per ton for first class and 254 ounces for second class. The mine is owned by the Fletcher M. Co., of New York.

RED ELEPHANT.—A few days ago your correspondent took a stroll among the mines of Red Elephant that are in pay—the Free America Extension East, Bowldor Nest, Free America and White—all of which are producing large amounts of ore, and increasing each month. There is one thing encouraging about the mines of this mountain—they invariably increase in both quality and quantity of ore as depth is gained. The Free America, now at a depth of 600 ft, has proven this, as the gray and yellow copper increased largely in the last 100 ft. Taking the mountain all-in-all, we believe it is not excelled anywhere in the State for certainty of dividends; hence we believe that in the future this mountain will rank, in the production of precious metals, first in the county. The railroad depots at Lawson and Swansea, within one mile of the mines, render facilities for shipping ores almost unparalleled.

IDAHO.

NEW STRIKE IN THE ONTARIO.—Ketchum *Keystone* April 15: We have just received information to the effect that a new and valuable strike had been made April 4th, in the main shaft of the Ontario, one of the Rooks group of mines, situated up Warm Spring creek. Over 1,000 tons of high-grade ore can be seen already, and an extra force of men will be employed immediately to bring out the precious metal. This strike is, without a doubt, one of the richest made on Wood river, and fully substantiates the assertion, that in the vicinity of Ketchum the richest mines are to be found.

NEW STRIKES.—The Black Hawk, one of the Philadelphia, Co.'s properties, on Warm Spring creek, has a shaft in over 240 ft, and are getting out some very fine ore. Last week a 3 ft vein was struck on the 70-level, and several men added to the force. The Philadelphia M. & S. Co. have struck 138-ounce ore in the 70 ft shaft of the Deer Trail mine, up Warm Spring Creek. The North Fork, No. 1, has ore that assayed as high as $5,000 to the ton.

A $40,000 SALE.—Information was received here last Sunday that a group of three mines, on Warm Spring creek, known as the Erwine, Nos. 1 and 2, and the Tenbrook, owned by Ed. Moffit and Robert Erwine, had been purchased by Col. Greene for the Philadelphia M. & S. Co., of this place. The price paid over by Wells, Fargo & Co., of Salt Lake City, was $40,000. The mines were discovered by the owners in 1880, and shipped considerable rich ore to Salt Lake last season.

MONTANA.

BIG STRIKE IN ONLY CHANCE.—*Inter-Mountain*, April 12: It is learned this morning, from Hon. M. Saunders, superintendent of the Only Chance mine, at Highland, that within the past few days an important development has taken place in that once very productive property. The new shaft has been sunk to a depth of 500 ft on the east or foot-wall side of the vein. The air being bad in the bottom, it became necessary to make connection with the old workings at a depth of 450 ft. A crosscut west was accordingly started, which, at a distance of 14 ft, tapped a ledge of free gold-bearing ore of high grade. This new vein has been penetrated 7 ft without striking the hanging wall. The new strike is believed to be separate and distinct from the ledge as opened up in the old workings, and is evidently a continuation of a 6-ft vein which was penetrated by the new shaft at a depth of 185 ft from the surface. The 450 ft crosscut will be extended without delay to a connection with the old shaft, after which, the needed ventilation being secured, a second crosscut from the bottom of the new shaft will be run to tap the old ledge at a point below all former development. Then the extraction of ore will begin at a lively rate. It is intended to start up the mill on the 1st of May, with the certainty of an abundant and continuous ore supply.

OREGON.

PROSPECTING.—Jacksonville *Times*, April 14: Gus Leland correspondent says that E. F. Walker is prospecting about 4 miles above the Grave creek house, and is running a tunnel in a high bench, several hundred feet above the creek. Over 70 ft of this tunnel has already been dug. Most of the miners are still piping or ground-sluicing. The melting snow keeps up the water.

NOTES.—Miners of Jackass creek are favored with plenty of water yet, and make good use of it. Some of the miners have already begun cleaning up, as water has commenced to fail in many localities. Ingram & Dean still have a good head of water, but expect to commence cleaning up soon, after a fair run. The Squaw Lake Ditch Co.'s diggings are being operated on full time. Lannes Klippel is acting as foreman. George R. Justus, who was in town this week, informs us that the miners of Foot's creek have plenty of water, and expect to make a good run this season. Parties from below have located copper mines near Waldo and Illinois river, Josephine county, and we are assured that they will be thoroughly prospected soon. Thomas Carr, of Foot's creek, was in town Saturday, and exhibited two nuggets of gold, worth about $35 each, as also several smaller ones. They were taken out of a claim he is interested in. Charley Gilmore, a little son of D. M. Gilmore, picked up a nugget worth $80 in William Clarke's mine, situated near the head of No 7, a tributary of Althouse creek, Jos phine county. Several other pieces, worth from $6 to $19 each, were picked up the same day. This is one of the best pieces of property in that section.

NEW MEXICO.

ALL IN LUCK.—*New Mexican Mining News*, April 12: The mining districts in the vicinity of Santa Fe are all in luck just now. The starting up of the works of the San Pedro and Canyon del Agua company, on the 15th of April, will make things lively in the New Placers; the operation of the smelter at Cerrillos, which was put in motion a week ago, will make the lower end of the Cerrillos district boom, while the concentrator at Bonanza City, now in course of construction, and the smelter at the same place, the machinery for which arrived yesterday, may be expected to enliven the upper end of the district within a very short time. In two months more both districts will be on the high road to fortune.

VARIOUS MINES IN LOS CERRILLOS DISTRICT.—The present great influx of miners and investors at Los Cerrillos mining district, and the certainty that another smelter and reduction works will be speedily erected in the Vallecitos, indicate the near approach of a boom, and a big one. The erection of sufficient machinery to meet the requirements of the whole camp, which is all that has been needed to put the whole district in motion, is assured, and the camp is bustling in activity to-day. The Bottom Dollar, Little Freddie, Great Western, Ruelenia, and that class of mines, having enormous quantities of ore on the dump and in sight, will doubtless first reap the advantages of adequate machinery. The L. H. Whitson Co. is steadily developing the Ruelenia, and the Santa Fe Bonanza M. & T. Co. is preparing to prosecute work in driving its New England tunnel to meet the Ruelenia, when the latter shall have reached the depth at which the former will intersect it. Messrs. Rathbone and Johnston, the new President and Secretary of the Santa Fe Bonanza M & T. Co., are Eastern gentlemen, who have recently become identified with and interested in this company, and in whose hands the management now rests. The arrival of the machinery for the reduction works at Bonanza has given the enterprise which they have in hand a greater impetus, and the near future will find the mines of the company in a state of development not yet attained by any property in the district. The machinery alluded to above will be located near the Bottom Dollar mine, which is one of the most promising properties in the district, and from which there are now from 300 to 400 tons of ore on the dump. This ore will be reduced just as soon as the smelter is available, which will probably be within 30 days.

UTAH.

HORN SILVER.—Southern Utah *Times*, April 15: The Horn Silver Co., is shipping from 12 to 15 carloads of ore per day to their Francklyn smelters. The whole 5 stacks are running to their fullest capacity.

CACTUS.—The shaft is down about 18 ft on the Cactus mine in Copper gulch. Quite a good showing of copper pyrites was struck during the week, which continues to get better as the shaft goes down. This claim occupies the intervening ground between the New Haven and the Comet.

LULU.—The Lulu is still being pushed ahead vigorously, with the most gratifying results. Numerous reports of the most flattering character have been freely circulated about this mine during the week, for which there must be some good foundation; but we are unable to say at present just how far they are true.

SOUTH HORN.—Mr. M. L. Cody is still pushing work night and day on the South Horn, with an earnestness that shows he has gone to work with the intention of showing up a second Horn Silver. Mr. Cody was superintendent of the Horn Silver mine while it was under the management of the old company, and we predict that ere long he will be superintendent of another big mine on the same giant ledge.

A SHAFT is being sunk on the New Haven, a copper mine, just below the Cactus, in old Copper gulch. They have a body of ore about 4 ft wide, in which ruby copper shows thick. This is only on top of the ground, and as the croppings on this claim are immense, the prospect for finding a large body of high-grade copper ore below is good. This property is owned by M. L. Cody and the Mahoney brothers, and it is their intention to push the work of development as fast as possible.

California for Immigrants.

A Description of the State by the Immigration Association of California.

[The following description of California and the inducements offered to immigrants is prepared by the Immigration Association, and is published for that Society].

THE IMMIGRATION ASSOCIATION.

This Association is supported by and is under the control of the business men of San Francisco.

It is organized for the purpose of furnishing *free* information concerning California, and to assist immigrants in finding employment and permanent homes in the State.

All possible care will be taken to have the information given by the Association clear and *reliable*.

The Association is endorsed by the Governor of the State and by the Board of Trade of San Francisco, as follows:

INDORSEMENTS.

[From Governor Perkins].

SACRAMENTO, Dec. 17, 1881.

Arthur R. Briggs, Esq., President Immigration Association of California—DEAR SIR:—I notice with pleasure the formation of an Immigration Association in San Francisco; and it is gratifying to me, both as a citizen and as Governor of our honored State, that it should have fallen into such worthy hands. I congratulate the members thereof in their selection of its officers, and beg to add my endorsement thereto. Their names will give it strength and confidence in the community, stamp it with character, honesty and integrity, and result in advancing the best interests of the State. Very respectfully,

GEO. C. PERKINS, Governor.

[BY THE BOARD OF TRADE.]

At a meeting of the Board of Trade of San Francisco, held at the rooms of the Board, Dec. 9, 1881, the President, Jacob S. Taber, in the chair, the following resolutions were read and adopted:

Whereas, The question of Immigration is one of vast importance to the business men of this city, and we believe the time has come when it should receive intelligent consideration at their hands; and

Whereas, This Board of Trade has, through its action, directed public attention to the subject, and been instrumental in bringing about an organization calculated to do much good to the State; therefore be it

Resolved, That the IMMIGRATION ASSOCIATION OF CALIFORNIA, organized under the laws of this State, has the fullest approval of the Board of Trade of San Francisco; that the known character of the gentlemen composing the Association entitles them to the confidence and support of the business men and capitalists of the State.

Resolved, That, in the opinion of this Board, any information distributed by the IMMIGRATION ASSOCIATION OF CALIFORNIA will be wholly free from personal motives; and from its reliability and character will be worthy the confidence of all persons seeking knowledge of the State.

OFFICERS OF THE ASSOCIATION.

The Directory of the Association is as follows:

OFFICERS:

Arthur R. Briggs,.....President
W. Steinhart,.....Treasurer
W. L. Merry,.....Vice-President
A. W. Preston,.....Secretary
C. H. Street,.....Land Officer

BOARD OF DIRECTORS.

James R. Kelly, W. Steinhart,
Wm. L. Merry, T. L. Barker,
James Duffy, J. V. Webster,
Wm. Blanding, Arthur R. Briggs,
W. N. Hawley.

EXECUTIVE COMMITTEE.

James R. Kelly, T. L. Barker,
J. V. Webster, Wm. Blanding,
Arthur R. Briggs.

MEMBERS OF THE ASSOCIATION:

Jas. R. Kelly, J. A. Folger,
W. W. Dodge, W. N. Hawley,
Wm. L. Merry, W. Steinhart,
Jules Cerf, Henry Casanova,
Henry Payot, Geo. K. Porter,
M. Ehrman, Jas. Duffy,
T. L. Barker, Wm. Blanding,
Arthur R. Briggs, C. W. Whitney,
J. V. Webster, John C. Hall,
C. F. Bassett, A. A. Wheeler.

GEOGRAPHY OF CALIFORNIA.

It has been truly said that "California has a peculiar topography. No other State comprises within so small a space such various, so many, and such strongly marked natural divisions, isolated volcanic peaks, vast domes of granite, steep and rugged mountain ridges, fertile and beautiful valleys, bare deserts, spacious bays, magnificent rivers, unparalleled waterfalls, picturesque lakes, extensive marshes, broad prairies and dense forests—all these are hers." The State extends in a northwesterly and southeasterly course about 750 miles, with an average breadth north of Monterey of 200 miles, and south of that point of 300 miles, and comprises within its limits an area of about 155,000 square miles or 99,000,000 acres, and is the second largest in the Union.

POPULATION.

It has a population of only 850,000, much scattered, yet the total annual productions of the mines, farms and manufactories amounts to over $150,000,000. The people have nearly $150,000,000 in the savings and other banks, and are generally enterprising and prosperous.

TOPOGRAPHY.

There are two great mountain ranges running northwest and southeast, namely: the Sierra Nevada and the Coast Range. The former is from 5,000 to 8,000 feet high, and the latter from 2,000 to 6,000 feet. The two ranges are connected in the southern part of the State at Tehachapi and again at Mount San Bernardino. The Sierra Nevada extends along the eastern border of the State, and the Coast Range along the coast to the north and south boundaries of the State. The Sierra Nevada is about 450 miles long and connects with the Coast Range again by a latitudinal range running across the northern portion of the State. The base of the Sierra Nevada Range north of Fresno has an average width of about 80 miles. The Coast Range averages about 65 miles in width.

Between the two ranges are the great Sacramento and San Joaquin valleys, which are about 450 miles long, by 55 miles wide, and may be termed the heart of the State.

In the northern part of the State and north of the junction of the two great mountain ranges is the Klamath basin, through which runs the Klamath river in a southwesterly course, between steep hills and mountains and rocky cañons, for a distance of about 225 miles to the ocean.

The whole basin of the Klamath is very rugged for a distance of forty miles from the coast, and along the main river there is very little valley or bottom land. Near the lakes are large bodies of land. The largest tributaries to the Klamath, the Trinity and Salmon rivers, run through a country almost as rugged as that bordering on the lower mainstream. Scott and Shasta rivers—smaller tributaries—have fertile valleys of bottom land about five miles wide and forty long. Pine, cedar and fir forests cover the mountains, and there are other valuable trees both on the mountains and in the valleys.

In the extreme southeastern portion of the State is the Colorado Desert, which is about 140 miles long by 70 miles wide.

Another great basin, called the Mojave Basin, extends into the middle eastern border of the State, the surface of which is cut up by many irregular ridges of barren rocky mountains.

There are many rivers. In the central portions are the Sacramento and San Joaquin, each about 350 miles long in their meanderings, which are the only navigable streams in the State. There flows from the Sierra Range westward into the Sacramento, the Pitt, Feather, Yuba, American, Cosumnes and Mokelumne rivers. Into the San Joaquin, the Calaveras, Stanislaus, Tuolumne, Merced, Chowchilla and Fresno. Into Tulare lake, the Kings, Tule and White rivers, and into Kern lake, the Kern river. All of these are considerable streams, with an average length of about 120 miles. The upper half of each is in the steep and rugged mountains, where they are torrents. After reaching the plain their currents are gentle and the banks low, fringed with oak, sycamore, cottonwood and willow.

But few streams flow eastward from the Coast Range, and these are not all permanent. The rivers of this range flowing westward into the ocean, are necessarily short. Those south of San Francisco are the San Lorenzo, Pajaro, Salinas, Cuyama, Santa Inez, Santa Maria, San Buenaventura, Santa Clara, Los Angeles, San Gabriel, Santa Ana, Santa Margarita, San Luis Rey and San Diego, many of which are constant streams to within ten or fifteen miles of their mouths, and all of them passing through rich valleys. North of San Francisco the main streams of the Coast Range which empty into the ocean are the Russian, Eel, Elk, Mad, Klamath and Smith rivers, besides many others of less importance, all of which are permanent streams, bordered with narrow valleys at the foot of the mountains.

To all the rivers of the State there are many tributaries along which are good agricultural lands.

The Coast Range is composed of a multitude of ridges, and is intersected by numerous long, fertile and narrow valleys, such as the Los Angeles, Salinas, Santa Clara, Sonoma, Napa and Russian River. These are among the most fertile valleys in the State.

The Sonoma and Napa valleys are particularly noted for the production of grapes and wines.

There are many important lakes—the Tulare, Owens, Kern, Clear, Klamath, Goose, Fall, Honey, Elizabeth, Tahoe, Mono and Dry lakes. There are also many smaller ones.

Along the coast of 900 miles there are numerous good harbors, the most important of which are those of San Francisco, Wilmington and San Diego. The former is one of the finest land-locked harbors in the world, and the latter is not excelled by many.

THE FOOTHILLS.

The western base of the Sierra Nevada mountains, for a width of about twenty miles, and bordering the Sacramento and San Joaquin valleys is known as the foothill region, and is included in the estimate heretofore given as the width of the Sierra range. The "foothills" extend from the northern to the southern extremity of these valleys. The temperature, up to a hight of about 1,500 feet, is similar to places in the same latitude in the valley. In the latitude of Sacramento there is a slight increase of rainfall graduated by the increase in elevation. South of Sacramento the increase diminishes.

Throughout the whole of this region living springs are numerous. Every agricultural product that can be grown in the valleys may be produced with equal facility in these foothills. Ordinarily the land has to be cleared of trees. Fruit trees and vines thrive better than in the valleys. Wood is everywhere to be found.

There are more than 3,000,000 acres of these lands open to settlement under the homestead and pre-emption laws.

CLIMATE.

One of the chief advantages of California is its admirable climate. It is much varied, differing greatly in different localities. In many counties thirty miles travel takes one from the region of oranges to where only the hardy fruits thrive.

In the valleys the winters are mild. In summer the nights are cool, and cloudy days are few. Violent wind storms, thunder, lightning, hail, snow and ice are very rare.

On the foothills of the Sierra, after a hight of about 1,500 feet is reached, also northward, in the Coast Range, the climate as we ascend approaches more and more that of the north Atlantic States.

At San Francisco ice is rarely seen, and the thermometer never stays at the freezing point twenty-four hours. Snow has not been seen, except a few flakes, for twenty-five years.

In the Sacramento and San Joaquin valleys the winters are about four degrees colder, and the mean temperature in the summer is from sixteen to twenty degrees warmer than that of San Francisco. The weather at mid-day is very warm during the dry season. In the southern part of the State the winters are milder and summers warmer. A temperature of 100 degrees in the southern and interior part of California, owing to the dry atmosphere, is more endurable than 80 degrees in the States east of the Rocky Mountains. Sunstroke is unknown.

The following table gives the results of observations at various points on the Southern Pacific Railroad, as compared with some of the world's noted climates:

MEAN TEMPERATURE.

PLACE.	JAN.	JULY	DIF.	LAT.

San Diego, Cal	57	65	8	32.41
Sacramento, Cal	45	73	28	38.34
Stockton, Cal	49	72	23	37.56
San Mateo, Cal	46	59	13	37.00
San Jose, Cal	46	69	23	37.00
Salinas, Cal	47	65	18	36.00
Soledad, Cal	43	70	27	36.00
Savannah, Georgia	39	82	43	32.00
St. Augustine, Florida	59	77	18	30.05
Vallejo, Cal	48	67	19	38.05

The climate in the extreme northern part of the State is cold in winter and warm in summer, and is similar to that of the Eastern States.

The temperature of the coast is generally mild and pleasant in summer, but north of Santa Barbara is subject to chilly northwest winds. In winter the weather is chilly but not cold. The coast counties are subject to regular trade-winds and fogs for a distance of from six to ten miles inland. The fog at times is thick and wet, and is little less than a fine drizzly rain, beneficial to crops of nearly all kinds. These usually disappear about ten o'clock in the morning.

SEASONS.

The year is divided into two seasons, the wet and the dry. The wet season generally begins about the middle of November, sometimes a little earlier or later, and continues until April or May. There is occasionally a light shower in June or July. Between harvest and threshing time there is little danger of rain. Grain is often left lying in sacks upon the field for months, or until sold.

The wet season is much the pleasanter time of the year. It is called the rainy season, not because the rain falls continuously, but because it does not fall at any other time.

Plowing and seeding commence with the first heavy rains.

The average rainfall of the State is less than that of Liverpool and Rome, or of Chicago and St. Louis, and about the same as at Paris. In some localities, however, in the northern part of the State it is greater than in any of the places named.

The following table gives the average yearly rainfall by localities:

CITY OR TOWN.	COUNTY.	INCH'S.
Crescent City	Del Norte	34
Humboldt Bay	Humboldt	32
San Francisco	San Francisco.	23
Monterey	Monterey	15
Santa Barbara	Santa Barbara	14
Los Angeles	Los Angeles	12
San Diego	San Diego	10
Bakersfield	Kern	5
Fresno	Fresno	7½
Sacramento	Sacramento	19
Redding	Shasta	30
San Jose	Santa Clara	15

While it is raining in the valleys the snow is usually falling in the mountains. It is probable that as much snow falls on the mountains in the eastern and northern parts of the State as in any part of the United States. From the north part of Sonoma, Napa and Solano counties northward, light snows fall on the low lands every winter.

IRRIGATION.

If the rainfall is less than ten inches during any season irrigation is necessary. Although there are few localities in the State where the average rainfall for a long series of years does not exceed ten inches, yet, in nearly all the counties south of Sacramento and San Francisco, there are often years when it is less. In the San Joaquin Valley and further south in the State, irrigation is general. It is always beneficial, and when provided, adds much to the value of the land, and causes it to produce astonishing crops.

Artesian water, which is found at various depths in the valleys, varying from 50 to 350 feet, is largely used for irrigation purposes. Ordinary wells are sunk to a depth of from 10 to 50 feet almost anywhere in the State and abundant water is found.

HEALTHFULNESS.

The climate of California is generally considered conducive to health. The hills and mountains and their valleys are considered very healthy. In the low lands, where overflowed, there are at certain seasons some miasmatic diseases. But there are no diseases peculiar to California alone.

Portions of the State have long been visited as health resorts, particularly in the winter seasons.

Among the many places most noted as health and pleasure resorts, may be mentioned Los Angeles, San Diego, San Bernardino, Santa Barbara, Monterey, Santa Cruz, Napa, San Rafael, Santa Rosa and St. Helena. In the mountains, in different parts of the State, are many valuable mineral springs. These are much visited for pleasure and health.

TIMBER.

California produces many varieties of valuable trees which grow both on the mountains and in the valleys. The greater portion of the Sierra Nevada mountains is covered with timber. The oak, manzanita, nut-pine, and other varieties, grow to an elevation of about 2,500 feet above the sea, and dense forests of cone-bearing trees are found at an altitude of 6,000 feet. The redwood is the second tree in size in the State, and the first in commercial value. It is used for lumber, fencing, ties and fuel, and for all kinds of rough and fancy building. It grows on the coast from one to thirty miles inland, and the forests extend from the north boundary of the State to the south boundary of Monte-

rey county. The redwood tree is never found outside this State. The white oak grows to a considerable size, but it is of little value except for fuel. Laurel is one of the most beautiful trees of the coast, madrona the most striking. There are other valuable and beautiful trees in the State, such as the juniper, yew, walnut, cypress, poplar, willow, live oak, sycamore, buckeye, cottonwood, etc. The eucalyptus tree, or Australian gum, as it is sometimes called, when set out, grows in all the coast counties of the State most rapidly, and a grove of these in a few years becomes a forest. This wood is valuable for fuel.

SOIL.

The soil is much varied. In some of the valleys it is a loose, rich loam. In others it is an adobe soil which produces excellent crops when once under cultivation. The soil on the hills and mountains is rich and mellow, and is very easily worked.

The prairies are not covered with sod, and the first plowing is nearly as easy as the subsequent ones. The severe task of breaking prairie is not known in this State. The soil of the timber lands is similar to that of the timber lands in the Western States.

PRODUCTIONS.

The agricultural productions of California are more varied than those of any other State in the Union. The soil produces, with equal facility in the peculiar climates which are found here, the vines of continental Europe, the hardier cereals of North America, and the luxuriant fruits and flowers of the semi-tropics.

California is noted the world over for the excellent quality and size of her fruits.

The blooming of flowers in winter is the admiration of visitors.

Wheat, barley, oats, rye, buckwheat, Indian corn, broom corn and hops are extensively raised in nearly all parts of the State. California is the third largest exporter of wheat of all the United States. In quality California wheat is harder, dryer and stronger in gluten than that grown elsewhere in the United States. Fruits, barley, honey, wool and hides are exported in large quantities.

The State is also noted for its rich gold, silver and quicksilver mines, and is well supplied with coal, iron, copper, stone, and marble.

Garden produce of all kinds is easily raised everywhere. Peas, beans, onions, potatoes, pumpkins, squashes, melons, tomatoes, beets, carrots, radishes, cabbages, celery, sweet potatoes, etc.

The apple, pear, quince, peach, plum, prune, cherry, apricot, nectarine, olive and other fruits, and the English walnut, almond, chestnut and peanut thrive exceedingly well.

Blackberries, strawberries, raspberries, gooseberries, currants and other small fruits do well in very many parts of the State. The grape, both for wine and raisins, does exceptionally well, and raisins are competing successfully with the best brands of Malaga. France is also yielding the palm to California for the excellence of her wines.

The orange, lemon, lime, fig, pomegranate, etc., grow luxuriantly in the southern gardens and orchards. The fig does well as far north as Sacramento.

Tobacco and cotton are grown in the southern part of the State, and both promise to become important productions.

It has been demonstrated beyond question that California is well adapted to the raising of silk. Its equable climate and the rapid growth of the mulberry tree have proved in various parts of the State that the rearing of the silkworm will become an important branch of industry. It requires little or no capital, and can be carried on by the women and children of the family as an addition to other farm work. None of the diseases which have affected the worm in Europe have ever appeared in this State. Samples of the silk raised here have been sent to England, France and Italy, and the manufacturers have expressed the opinion that it is equal to that produced in the most noted districts of Japan and Asia Minor.

Alfalfa often produces three and even four crops of hay in a single season, and is considered invaluable for stock.

The climate is so mild that all vegetable life in ordinary seasons is almost as active in January as in July. Trees and shrubs have nearly twice as much time to grow and mature as in the Atlantic States.

DOMESTIC ANIMALS.

Horses, mules, cattle, sheep, goats and hogs are raised in every part of the State, and south of San Francisco can live through the winter months without shelter and without cultivated food. Fine blooded stock of all kinds has been introduced, and many farms are devoted specially to raising blooded animals. There are blooded stock farms in California unsurpassed in the world. Nutritious grasses grow voluntarily in abundance in the valleys and on the foothills and mountains during the wet season, and retain their nutritious qualities when dried by the summer sun; these make excellent feed for horses, cattle, sheep and hogs during the dry season. The late fall and early winter in California is the feeding season for stock when feeding is necessary.

MARKETS.

Good markets are to be found for all productions in the State. The mining districts furnish markets for farmers and fruit raisers situated within easy reach by wagon. Farming is generally profitable in this State, as elsewhere. Wheat, barley and various other crops can usually be sold on the land where produced, to the agents of millmen and shippers, who traverse the country making purchases. Wheat is shipped to Europe by sailing vessels. Fruits, honey, wool and hides are shipped to the Eastern States and cities by the overland railroads. The Southern Pacific railroad has also commenced carrying wheat, flour and other productions to New Orleans and the Southern States.

RAILROADS.

Although it is but thirty-five years since the discovery of gold in California, at which period the State was a vast wilderness, yet in that short time the progress of civilization has been rapid and permanent. Railroads have kept pace with the increase in population, and there are now twenty-three railroads in operation, including the main trunk lines and their branches, and many others are contemplated. Those in operation are the Central Pacific, main line; Central Pacific, Oregon division; Central Pacific, Western division; Central Pacific and Amador Branch railroad; Southern Pacific, Northern division; Southern Pacific, Tulare, Los Angeles, Yuma and Wilmington divisions; Los Angeles and Independence; California Northern; California Pacific and Northern Railway; Nevada County Narrow Gauge; North Pacific Coast; Northern Railway and Berkeley Branch; Northern Railway and San Pablo and Tulare Railroad; Sacramento and Placerville; San Francisco and North Pacific; San Luis Obispo and Santa Maria; Santa Cruz; South Pacific Coast; Stockton and Copperopolis; Vaca Valley and Clear Lake.

SCHOOLS, CHURCHES, AND BENEVOLENT ASSOCIATIONS.

Our common schools are the pride of the State. Free education is provided; so that it is within the reach of all. Wherever fifteen children can be gathered to form a school, it is entitled to support at the public expense.

In the large towns are first-class high schools. There are also a number of academies and colleges, some of them first-class institutions. There are also military, medical and theological schools. San Francisco supports three commercial colleges. Besides these are the State Normal School and the University, both supported by the State.

The leading church denominations are well established.

In all the leading towns the principal benevolent associations have organizations.

LANDS.

Private lands vary in price from two dollars and fifty cents an acre for unimproved lands remote from towns, to ten dollars an acre near towns; and from ten dollars to one hundred dollars an acre for improved land, according to value of improvements and proximity to large or small towns.

The IMMIGRATION ASSOCIATION is searching the United States Land Office records in California, to ascertain the exact location and quality of the millions of acres of vacant Government lands in the State, for the purpose of aiding immigrants to locate on them with the least possible expense and loss of time. There are Government lands in every county in the State, with two or three exceptions, but as to quality and exact location this Association has much yet to learn.

Title to the Government lands may be acquired under the Homestead, Pre-emption, Timber and Timber Culture laws.

HOMESTEAD LAW.

The word homestead, as now applied in the United States, signifies a tract of land given away by the Government as a free gift forever, on the single condition that the person accepting the gift shall live upon the land and cultivate it, and make it his home for five years. Any citizen of the United States, who is the head of a family, or an unmarried person over the age of twenty-one years, is entitled to a homestead of 160 acres. Persons of foreign birth may avail themselves of the benefit of this law by declaring their intention to become citizens; and this they can do immediately after their arrival in this country.

A person wishing to enter a homestead must go to the United States Land Office of the district, or to the Clerk of the county in which the land he wants is located, and file his application and affidavit in accordance with legal forms which will be furnished him by the Land Office. The Land Office fees are from $16 to $22, which must be paid at the time of filing the application. Within six months after filing his application at the Land Office the settler must commence living upon and improving the land, and thereafter, for five years, he must make the tract his actual home. A soldier who served not less than ninety days in the army during the late rebellion is required to live on the land five years, less the time he served in the army. At the expiration of five years, or within two years thereafter, on making proof at the Land Office by two competent witnesses, that he has complied with all the requirements of the law, and paying an additional fee of from $6 to $12, he will receive from the Government a complete and absolute title to the land.

Homesteads, until the issuing of the patents, are *free from taxation*, and cannot be taken away or sold for debt, but are absolutely secure to the settler so long as he *occupies and cultivates the land.*

If at any time after six months the homestead settler should desire to get a full title to his land he can do so by making proof of settlement and cultivation up to date, and paying the Government price of $1.25 or $2.50 per acre for the land, according to location—that is, within or without the boundary lines of railroad grants.

PRE-EMPTION LAW.

Any person qualified to take a homestead is also entitled to 160 acres under the pre-emption law (but not at the same time.) Within ninety days after settlement on the land he must file his application in the District Land Office where the land is located, which will cost $3. At any time after six months' settlement and up to thirty months after filing his application, the settler may pay for the land at the rate of $1.25 or $2.50 an acre, according to location.

TIMBER CULTURE LAW.

Under the timber culture act an applicant is entitled to 160 acres on any section naturally devoid of timber; the whole section must be devoid of timber. On one section, only one timber claim can be taken. It requires eight years to acquire a title. Actual residence is not required. The first year five acres must be broken. Second year must cultivate this five and break five more. Third year must plant the first five acres in trees and cultivate the second five acres. Fourth year plant the second five acres in trees, which make the ten acres. On the day of final proof 675 trees must be living and in a thrifty condition on each acre.

CAPITAL NECESSARY FOR NEW COMERS.

The question arises as regards the smallest sum considered necessary for a new comer to start with. An industrious man may come here almost without a dollar, hire out for some years, and work his way up by strict economy. But those who come here to make homes for themselves should have $500 to $1,000 to start with on even the cheapest foothill lands. There will be some years of close effort. Poultry must be kept, vegetables raised, odd jobs of work done for the neighbors. But thus, on even this small capital, a valuable property can be developed in the course of eight or ten years. A small piece of good land is better than a large piece of poor land. It is best to purchase only as much land as can certainly be paid for. Develop this thoroughly, and make it profitable, and more land can be had at some future time. Many failures have arisen from attempting too much. The new settler who deserves success, begins at bed-rock, keeps out of debt, buys as little as he can, wears his old clothes, works early and late, plants trees and vines for the future, leaves whisky alone, and has a definite aim and plan in life. Such a man can come to California with a small capital and find it a "good State for the poor man." Those who are content to work and be patient here will find the reward sure and ample. Is it not worth while to have a home in a land where there are no violent extremes of heat and cold, and where the farmer can work in comfort every month in the year?

WAGES.

Wages for ordinary day laborers range from $1.50 to $2.00 per day; good labor, requiring familiarity with the work in hand, brings $2.50, and skilled workmen, such as machinists, jewellers, etc., receive $3 and $4, and even more per day. Masons, carpenters, stone-cutters, etc., $3.50 to $4.00 per day. Harvest hands (with board), $2 and upwards. Regular farm hands, with board, per month, $20 to $30.

Wearing apparel is about as cheap as in the Atlantic States.

The following is a list of prices of some of the most important articles of immediate use to immigrants:

HOUSEHOLD GOODS.

Cooking stoves, furniture complete, $15 and upwards.
Tinware, about the same as Eastern prices
Queensware, same as Eastern prices.
Tables, $2 and upwards.
Chairs, 60 cents and upwards.
Bedsteads, $3 and upwards.
Common carpet, two-ply, 75c to $1.25.
Common carpet, three-ply, $1.25 to $1.50.

FARMING APPLIANCES.

Wagons, $100 to $175.
Harness, $10 to $40.
Plows, $7.50 to $22.
Mowers, $100 to $150.

STOCK.

American farm horses, $75 to $150.
Half-breed and Mexican horses, $15 to $75.
Milch cows, $25 to $75.
Hogs, $5 to $6.
Sheep Ewes, $1.50 to $5.
Rams, $10 to $50.

FRUIT TREES AND PLANTS.

Apple—1 and 2 years old, per 100, $12.50 to $50.
Pears—1 and 2 years old, per 100, $25 to $35.
Cherries—1 and 2 years old, per 100, $25 to $35.
Peach—1 year old, per 100, $20.
Plum and prune—1 and 2 years old, per 100, $20 to $35
Apricots—1 and 2 years old, per 100, $25 to $35.
Nectarines—1 and 2 years old, per 100, $25 to $30.
Quinces—1 and 2 years old, per 100, $20 to $35.
Figs—1 and 2 years old, per 100, $20.
Oranges and lemons—1 and 2 years, from graft, each 75c to $1.50.
Persimmon—1 and 2 years, from graft, each 75c to $1.50.
Olives—each 50c to 75c.
Pecan—each 50c.
Almond—per 100, $20 to $25.
Filberts—each 50c.
Chestnut—each 50c to 75c.
English Walnut—each 25c to 50c.
Grapes—Foreign, per 100, $6.
Grapes—Raisin, per 100, $10.
Currants—per 100, $6.
Gooseberries—per 100 $5 to $6.
Blackberries—per 100, $3.
Raspberries—per 100, $3.
Strawberries—per 100, $2. (and special rates for greater number)

OTHER TREES.

Blue Gum—per 100, $2 to $5.
Mulberry—each 75c.

FRUIT TREE STOCKS.

Pear—grafting size, per 1,000, $10 to $12.
Apple—grafting size, per 1,000, $12.
Cherry—grafting size, per 1,000, $12.
Plum—grafting size, per 1,000, $30.
Scions—pear, apple, plum and cherry, per 1,000, $5.

Trying to Steal our Climate

We object to spreading the climate of the Pacific coast all over North America. Climate is one of our peculiar "resources," and if ethereal mildness is made too common, its value will no doubt greatly depreciate. And yet, if we understand reports aright, an eastern meteorologist, with a taste for the vast in engineering, proposes a plan which will distribute the warmth of a California winter all over the continent, and perhaps rob us of what will not enrich him, while it may make us poor indeed. This is the plan to accomplish it: Professor Shaler, of Harvard University, has a dazzling scheme in his head which he has only to realize to give the entire American continent a brand new cosmopolitan climate. Professor Shaler's invention is explained in brief by a contemporary as follows: "Once on a time the Japanese current flowed through Behring's Straits into the Arctic ocean. Then the Straits were wider than they are now, because forces no longer existing caused the coast to gradually rise. The result of the narrowing process was the interruption of the warm current. The thing to do is to make an artificial channel through the Straits, so that the warm current may pass to ward the Pole again. Such an achievement would reclaim a vast stretch of land, giving North America a delightful climate, dispelling the rough winters and tempering the fierce heats of the summer."

All that has to be done is to widen Behring's Straits—perhaps lop off Alaska, or half of it, if the Russians could be persuaded to give enough of Siberia to make the project a joint one between the two countries. Thus set in the flow of the warm current, thaw the ice off the Pole, put it under bonds not to disappear, so that no more Arctic expeditions may be called for, and at the same time secure a climate which will lead to planting orange groves around Hudson's Bay. This will be fine enough if the change in the Pacific currents does not set the glaciers at work again in California. It is a beautiful scheme, but dangerous.

BRONZING IRON.—Iron has sometimes to be bronzed for domestic use. The following is a very simple way of obtaining a very good bronze: Mix an equal quantity of butter of antimony and oil of olives; put this mixture on the iron which is required to be bronzed, with a brush, the iron having been previously brightened with emery and cloth, and leave it for several hours. Then rub with wax and varnish with copal.

GAS-FITTERS have recently made a most useful application of photography. They photograph the gas flames given by different burners or jets, so that a customer can see if the shape and form of a light will suit him before he gives his order. As the flames are moreover depicted "life-size," the purchaser can always tell whether his jet is up to the standard.

Dividend Notice—Eureka Consolidated Mining Co.
Water Jacket Smelting Furnaces; Rankin, Brayton & Co.

Passing Events.

Men are beginning to crowd ahead for the Idaho and Montana mines, in spite of the fact that it will be several weeks yet before the snow is gone. All who are in Butte and Wood River unite in telling people to be careful about coming without money to maintain them; for while prospecting is brisk and lively, very many men cannot get work by the day in the mines.

The loss of the Arctic relief expedition vessel, *Rodgers*, near Cape Serdze, of which we have just heard, is only another evidence of the futility of Arctic research. Fortunately, in this case no lives were lost. The opinion strengthens every day that poor De Long, of the *Jeannette* expedition, has perished with that portion of his party with him.

The water is beginning to run in many of the ditches leading to the mines, and every week more and more mines are started up.

The outlook in California for the coming season is good, and provided there is no adverse decision in the debris case, this State will produce a very much larger amount of bullion than it did last year.

THE bullion output of the Columbus mining district averages from $25,000 to $33,000 per week.

THE land department of the Northern Pacific Railroad Company answered in March 3,000 letters of inquiry from prospective immigrants.

OVER 16,000 European immigrants landed in New York during the week ending April 8th.

Production of the Precious Metals.—No. 5.

[An abstract of the Census Monograph on the Bullion output of the country.]

The average product of the Utah milling ores and ores smelted, and the average yield of all the Utah ore reduced by either process during the census year, was as follows:

UTAH—Comparative Results of Treatment.

	Average yield of—		
	Ores milled.	Ores smelted	All ore treated.
Gold per ton	$ 2.33	$ 1.40	$ 1.90
Silver per ton	29.02	34.78	33.24
Total	$32.25	$36.18	$35.14

The next table shows the base bullion product of the Utah smelting works, with the precious metal contents. It includes the yield of ores sent from Idaho, Montana, and Nevada to the Utah smelters, and also the product of a small quantity of ore which was raised prior to the census year.

Deducting from the crude bullion product 322,170 lbs., produced from Idaho, Montana, and Nevada ores smelted in Utah, the remainder, 27,891,331 lbs., is the yield of Utah ores smelted in the Territory. To this should be added 865 500 lbs. of crude lead bullion, the estimated yield of Utah ores smelted in Chicago and Omaha. The total crude bullion product of Utah for the census year is, therefore, 28,756,831 lbs.

UTAH—Bullion Produced from Utah Ores and Matte Treated Elsewhere than in the Territory.

Ore and matte shipped to Chicago and Omaha	Assay value.			Estimated product, to be included in total production of Utah.		
	Gold.	Silver.	Total.	Gold.	Silver.	Total.
Tons.	Dolls.	Dolls.	Dolls.	Dolls.	Dolls.	Dolls.

UTAH—Base Bullion Production of Smelting Works for the Year Ending May 31, 1880.

County.	Refined Lead.	Crude bullion, including weight of silver and gold contents	Precious metals contained in base bullion.		Totals.
			Gold.	Silver.	
	Pounds	Pounds.	Doll's	Dolla rs.	Dollars
Beaver	.....	8,3+2,957	9,180	675,472	684,652
Salt Lake	2,586,370	16,781,778	77 1+5	1,499,225	1,576 360
Tooele	.....	3,118, 66	6,944	170,5o2	1,7,+46
Total	2,586,370	28,213,501	93,259	2,345,199	2,438,458

The gross precious metal product of the Utah smelting works, given in the preceding table, is segregated as follows:

UTAH—Product of Ores Smelted in Utah during the Year Ending May 31, 1880.

	Bullion.		
	Gold.	Silver.	Total.
	Dol's	Dollars	Dollars
Product of smelting works (precious metals contained in base bullion)	93,259	2,345,199	2,438,456
Deduct product of Beaver County smelting works	9,180	675,472	684,652
Product of smelting works, less product of Beaver County smelting works	$4,079	1,669,727	1,753,8.6
From this deduct: Dollars.			
Product of Nevada ores smelted in Utah (a)	19,386	.....	.....
Product of Idaho ores smelted in Utah (b)	21,870	.....	.....
Product of Montana ores smelted in Utah (c)	6,615	.....	.....
Product of Nevada sulphides or leaching works	20,000	.....	.....
Total	67,871	67,871	67,871
Net product of Utah ores smelted in Utah during census year	$4,079	1,601,856	1,685,935

(a) 359 tons containing 25% lead. Estimated product, 80.775 tons lead.
(b) 162 tons containing 45% lead. Estimated product, 65.61 tons lead.
(c) 49 tons containing 30% lead. Estimated product, 14.7 tons lead.

In addition to the bullion product from ores which were treated in the Territory, there was also considerable yield from ore and matte shipped to Chicago and Omaha and reduced at these points. As nearly as ascertainable this additional product was:

Utah Placer Gold.—The small placer product of the Territory ($20,000 in the census year) was from West Mountain district, in Salt Lake county.

Market Value of Utah Base Bullion.—The gold and silver contents of the base bullion are sold at a price which allows for the refining charge on each metal, with, of course, the market discount on the silver. Thus the gold contents brought from $19 to $20 per ounce, and the silver an average of $1.10 per ounce during the census year.

The average price of refined lead at Salt Lake City during the same period, was 4¾ cents per pound, and that of unrefined lead $47.50 per ton.

Market value of 2,586,370 lbs of refined lead	$122,853
Market value of 28,756,831 lbs unrefined lead	682,975
Total	$805,828

This represents roughly the value at the seaboard, after deducting freight charges, commissions, etc. There were also $14,160 worth of copper sold, the product of Utah ores worked for the extraction of the precious metals. Adding the market value of the lead and copper, all of it an accessory product of the precious-metal industries, to the mint value of the precious metals, the total product of the Utah mines is raised to $5,854,462. This does not include the value of iron ore sold for flux, and some other small items.

ARIZONA.

A marked impulse has been given to the mining industry of Arizona, by the fine showing of the new Tombstone district, in Pima county. The bullion production of this district had only begun in the period covered by the census year. A few months later, with increased milling facilities, a considerably higher rate of production was maintained.

Placer Mines.—The schedule data include 798.2 ounces, or $16,500, of gold from the Arizona placers, to which are added 653 ounces, or $13,500, by estimate, bringing the total product from this source up to 1,451 2 ounces, or 30,000. This was chiefly derived from Yavapai county.

(TO BE CONTINUED.)

The Little Giant Controversy.

Mechanical and Legal History of Hydraulic Nozzles.

A curious legal contest which has, for a number of years, been waged over a patented machine, has recently been decided by Judge Sawyer, of the United States Circuit Court, District of California. It involved the title and ownership of the famous hydraulic mining machine known as the Little Giant, heretofore made and sold by Richard Hoskin, of Marysville, Cal., but which was formerly made and sold by R. R. & Joseph Craig, of Nevada City. This machine has done more to encourage and develop the hydraulic mining industry of the world than all other causes. It solved the problem of practically handling large streams of water under great pressures, which is a necessity in working our large hydraulic claims on a profitable scale.

Some of our readers may not understand the nature of the work that such a machine is called upon to perform. Some idea may be gathered from a mere statement of the circumstances under which they are used. In some of our large mines the reservoir from which the water is taken is 300 ft. above the point where the water is to be used, and the water is conducted from this reservoir to the Little Giant, or hydraulic machine, through large sheet-iron pipes, which in some cases are two ft. in diameter. Before the water reaches the Little Giant it is under an enormous pressure, and it issues from the nozzle of the machine with such force that it is projected in a solid stream from 100 to 150 ft. against the bank to be washed and literally carries all before it. So compact and solid is the stream near where it issues from the nozzle, that a person could no more strike a heavy crowbar through it than he could through an equal body of iron or steel. Sometimes the banks are very high, in which case the Giant must be kept at a respectful distance from it, otherwise it is in danger of being buried when the bank caves or falls in.

The usual method of attacking a bank is to direct the stream at its base and wash out or burrow a tunnel so as to cut in under the bank until the upper portion falls or caves down in a broken mass. The stream then cleans up the debris which has fallen and washes it into the flume, down which it courses, depositing its particles of gold in the riffles which are distributed over the bottom of the flume.

Hydraulic mining was first carried on by conducting the water through an ordinary two-inch hose and projecting it through an inch nozzle, such as are now used by our fire department for conducting water from fire engines and throwing it upon a fire. This was necessarily slow business, as the stream would do but little execution against a tough cement bank. There was no scarcity of water, but there was no competent machine for handling a large stream. Even with a small hose and nozzle, such as we have described, the labor of holding and directing the nozzle was almost Herculean. The hose had a tendency to fly from side to side, especially when it got a little bent, and the nozzle-man was a lucky one indeed that didn't get thrashed by his pipe and nozzle several times a day. In 1864, J. M. Allenwood, of Timbuctoo, Yuba county, patented what was afterwards known as the "Gooseneck machine." It had two joints; a lower horizontal joint and an upper joint made of a short section of canvas. This machine was one step in the right direction, but the canvas joint was liable to get "kinked," and then the machine would fly around like a whirligig and knock everything over within its reach. This the miners called "bucking." The machine was, however, used in several mines by using a block and tackle for holding it to its work.

In 1867, Jenkin W. Richards, of Michigan Bluff, Placer county, devised a double-jointed machine to take the place of the usual nozzle. It was intended, with this machine, to get the desired range of motion from the two joints, and thus avoid the necessity of bending the hose in order to change the direction of the stream.

This machine never amounted to much, as its joints were found to be almost as unreliable as the hose. It was, therefore, abandoned as a failure, and inventors came to the conclusion that two-jointed machines would never answer.

In 1869, the Craigs—R. R. and Joseph—above mentioned, devised and patented a single-joint, ball and socket machine, which it was at first supposed would answer every purpose. Other inventors followed, all with single-jointed machines—except in one or two instances, where some sanguine inventor would bring out a non-descript two-jointed machine to be tested and then taken back to the foundry to be broken up for old iron. Such was the Shaw, the Rice, the Gorman and Hoskin and a number of others.

In 1870, Frank H. Fisher, of Nevada City, invented his famous "Hydraulic Chief." This was a two-jointed machine, and the first successful two-jointed machine that any one had produced. Its element of success was in its upper joint. Instead of the canvas or hose section used in the Allenwood machine, he substituted a metallic joint that worked on pivots on both sides, so that the nozzle could only be moved up and down on this joint, while it got its side motions from the horizontal, or lower joint. This machine was a success, and it became quite popular for the short time it had in the field. In the meantime the Craigs com-

menced suit against several of the machines, Hoskin amongst the rest, and threatened Fisher with a suit, alleging that all of the machines were infringements upon their Globe, or hall and socket single-jointed machine.

Instead of contesting the case with the Craigs, Hoskin compromised his suit with them and entered into a compact with them by which Hoskin was to be the manufacturer and seller and the combination was to drive out competition and control the market. Hoskin then got up the present Little Giant, which was simply a duplication of Fisher's Hydraulic Chief, with slight changes. They also purchased from the inventors, Macy & Martin, a patent which covered the use of riffles in a hydraulic discharge pipe. This "riffle" patent was the key to the situation. Without the riffles none of the machines could be successfully used, and all of their machines were using them. Craig then commenced suit against Fisher in the United States Circuit Court to prevent him from using the riffles and served a preliminary injunction on him *pendente lite*. Fisher was contumacious, and persisted in using the riffles, even after the injunction was served, and as a consequence he was brought before the court on an order to show cause why he should not be punished for contempt of court. Judge Sawyer, after due consideration of the case, fined Fisher $100 and gave him a severe lecture on the danger and possible consequences of violating an order of the court, and warned him to desist in the future from committing any further contempt. Fisher was not altogether subdued by this fine and lecture, but returned to his home in Nevada City, determined to get around the Craigs and the order of the court in some way; but, nevertheless, he did not act without the advice of his counsel. His business was in jeopardy unless he could use riffles in some way in his discharge pipe, because, without the riffles the water which issued from the nozzle would scatter and be ineffectual. He therefore purchased a number of old, worn-out pipes in which riffles had been placed by Macy & Martin, the inventors, and, taking out the riffles, placed them in the new discharge pipes of his Hydraulic Chief.

Again he was brought before the court for contempt, and Judge Sawyer, after considering the case, rendered the decision which has ever since been recognized as authority in like cases, viz: "In a combination of two elements it is an infringement to manufacture one of the elements and combine it with the other element, although the other element is purchased from the patentee himself." Fisher was therefore found guilty of a contempt of court.

This being the second offense, Fisher was fined $500 and ordered to be confined in the San Jose jail for 30 days. Fisher says his confinement was not irksome and not altogether without enjoyment. He spent most of his time in a steeple, with a spy-glass in his hand, from whence he became quite familiar with the landmarks around the bucolic city of San Jose. The balance of his time he spent on parole, wandering through the streets and taking needed exercise. After his release he one day happened into the MINING AND SCIENTIFIC PRESS Patent Agency in this city, where he was informed by Mr. Jno. L. Boone, who was at that time connected with the agency, that his patent could be reissued so as to cover the upper joint of the Little Giant machine. Munn and Co., of New York, had taken out the original patent, but had only patented the lever attachment by which the machine was handled. A reissue of his patent was then applied for, through the MINING AND SCIENTIFIC PRESS Patent Agency, and in due time the new patent was issued with a claim for the upper joint. Fisher then employed the law firm of Morgan & Heydenfeldt, and a suit was commenced against the Craige for injuring the reissued patent.

Meanwhile the Craigs had not been idle. They had purchased the old Alleuwood patent of 1864, and immediately they reissued it so as to cover broadly a two-jointed machine. With this patent they went into court, and defeated Fisher's suit by anticipating his invention with the Allenwood machine. This put a quietus on Fisher. He had become deeply involved financially in his several battles with the Craigs, and it now became necessary to seek other means to afford him a livelihood. He obtained employment in the San Francisco Mint, where he has remained ever since. About two years ago, he again reissued his patent with good success, and he then employed our friend, Jno. L. Boone, Esq., who had meanwhile commenced the practice of law, to commence another suit against Hoskin and the Craige. This suit was contested on the part of Craigs by the same attorneys who had successfully defeated the former suit, and the case was prosecuted before the same Judge. This time, however, Fisher was successful, and a decision was rendered in his favor in the early part of the present term, and as the Macy & Martin patent on the riffles has expired, Fisher now succeeds to his legitimate rights, and will hereafter furnish hydraulic mining machines.

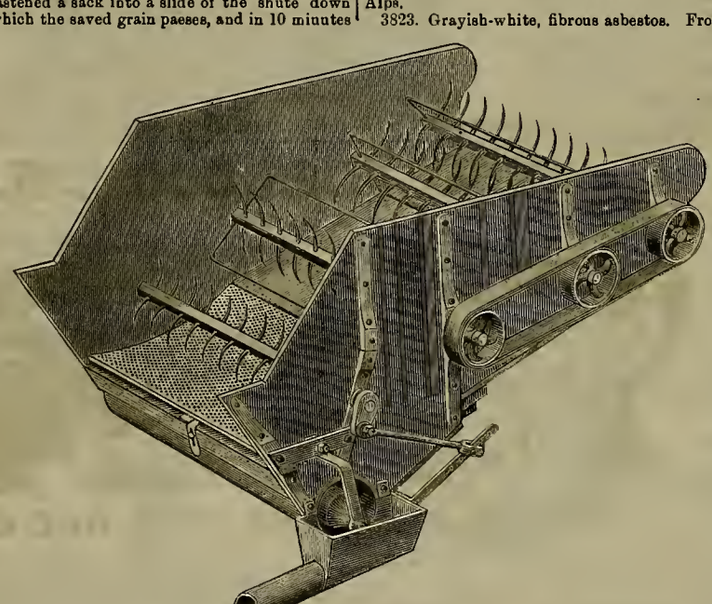
SOME prominent citizens of Chico, are discussing the project of building a narrow-gague road from that place to the Sacramento river, to furnish better facilities to farmers and horticulturists to get their produce to this market.

THE Red Rover mine, in Magazine district, is attracting a great deal of attention just now. It is about 42 miles northeast of PHŒNIX. The vein is stated to be 14 ft. wide, with streaks of remarkably rich ore running through it.

McLean's Grain-Saving Attachment.

We give on this page an engraving of a device of which we have received many good accounts from those who saw it in operation at the last harvest. It is an attachment, as is seen in the engraving, which manipulates the straw just before it goes over the end of the straw carrier. It is styled McLean's Straw Agitator and Grain-Saving Attachment. The agitator consists of three beaters situated near the end of the straw carrier, and worked by a two-inch belt. The straw, after it leaves the machine, is taken by these beaters and "agitated"—that is, the beaters, being constantly in motion, beat upon the straw as it passes over the carrier. The long straw is carried over, and the shorter straw, chaff and grain fall down on a sieve, which, by means of a crank, is kept in steady motion. The grain falls through the sieve into a semi-cylindrical box, and the chaff and straw work over the sieve and fall to the ground. In the apartment in which the grain falls, works a "worm," which forces the grain out into a shute, down which it passes into the main elevator, and from thence is carried on to the sheds, and the grain passes finally, with the other grain, out the grain shute. The attachment is simple, small and compact, and works easily. The beaters extend across the carriers, and though apparently weak and small, do their work effectually.

The editor of the Watsonville *Pajaronian* was present upon one occasion when tests were made of its efficacy, and his report was as follows: "While we were watching the attachment, Charlee Knapp and the writer fastened a sack into a slide of the shute down which the saved grain passes, and in 10 minutes



MCLEAN'S STRAW AGITATOR AND GRAIN-SAVING ATTACHMENT.

saved a bag full of fine straw, chaff and wheat. Afterwards the mass was cleaned, and the result was six lbs. of wheat—wheat which without the use of this attachment would have gone over into the straw pile. Six lbs. of wheat in 10 minutes is the lowest saving yet made with this attachment, and twice that quantity of barley or oats has been and can be saved, the machines' loss on those grains being greater than on wheat. Six lbs. of wheat in 10 minutes is at the rate of 36 lbs. an hour, or about 450 lbs. a day, quite an amount (at least worth $5) to save in a day, and conclusive proof that the straw agitator and grain-saving attachment is a complete success, and is something of great value to farmers.

During the coming harvest Mr. McLean's attachment will be used in different parts of the State, as he has received orders from threshermen who have heard of its work. Any further information which may be desired may be had by addressing N. McLean, Watsonville, Cal.

BUTTE.—The following extract is taken from a letter received by a gentleman of Ruby Hill: "Butte is quite a place. There is a large amount of building going on, and the immigration is immense, the cars being filled on each arrival. Those who come with the intention of getting employment will wish they had staid away. Already many are pleading hunger for the purpose of getting work. Most of the travel coming in from the East and Nevada, and it is reported that many more are coming. I would advise my friends to stay where they are. The show to get work for wages is slim, but for those wishing to prospect this is a good country."

A PRIVATE letter from an American traveler in Siberia strengthens the impression that Commander De Long and party have perished from hunger and cold in the delta of the Lena. The traveler met Danenhower, and, by his conversation, was led to the conclusion that the chances of finding the De Long party alive were very slim.

Italian Rocks and Contained Minerals.

(Continued from last week).

3813. Opaque, porcelain-white, semi-opal, passing insensibly in this specimen into sepiolite or Meerschaum. Caselette (Turin). Val. di Susa, Cottian Alps.

3814. Euphotide, containing crystals of brouzite; forms veins in the serpentine (see No. 3804); from immediate vicinity of the veins of giobertite. From the Mussine, Caselette (Turin). Val di Susa, Cottian Alps.

3815. Euphotide, containing large crystals of diallage, felspar, saussurite in proximity to former specimen, in serpentine. Caselette (Turin). Val di Susa, Cottian Alps.

3816. Compact white giobertite, forming reticulated veins in the midst of serpentine. Baldissero, Canavesa (Turin). Val Chiusella, Graian Alps.

3817. Bluish-white and dark-brown semi-opal, from the serpentine. Campo Canavesee (Turin.) Graian Alps.

3818. Semi-opal, of various beautiful tint from the serpentine. Campo Canavese (Turin). Graian Alps.

3819. Dark-green serpentine, somewhat greasy on the plane of fracture, and without distinct indications of stratification. Germagnano (Turin). Valle Grande di Lanzo, Cottian Alps.

3820. Bluish-gray steatite, forming stratified deposits in serpentine. Germagnano (Turin) Valle Grande di Lanzo, Cottian Alps.

3821. Greenish-white, aqua-marine colored steatite. Germagnano (Turin). Valle Grande di Lanzo, Cottian Alps. Found in the serpentine rocks.

3822. Light-green serpentine schist. Valtournanche (Turin). Val Tournanche, Pennine Alps.

3823. Grayish-white, fibrous asbestos. From the serpentine. Chatillon (Turin). Val d'Aosta, Pennine Alps.

3824. Fibrous amianthus. From fissures in the serpentine. Western Alps.

3825. Silky, white, fibrous amianthus. Found in the serpentine, generally between the walls of fissures or planes of fracture. Useglio (Turin). Valle di Viu, Cottian Alps.

3826. Silky amianthus, in long fibres of great beauty. Useglio (Turin). Valle di Viu, Cottian Alps.

3827. Silky amianthus, formed of masses of short fibres, matted together like felt. From the serpentine rocks. Useglio (Turin). Valle di Viu, Cottian Alps.

3828. Fine-grained magnetite. Constitutes stratified deposits without proper walls in the serpentine rocks. Champ-de-Praz (Turin). Val d'Aosta, Graian Alps.

3829. Massive magnetite. Larcinaz iron mine, Cogne (Turin). Valle di Cogne, Graian Alps. Forms very important stratified deposits in the midst of serpentine rocks. Is smelted with charcoal, and produces the most excellent iron for steel manufacture.

3830. Red jasper. Issiglio (Turin). Val Chiusella, Graian Alps.

3831. Garnetiferous talcose rock, formerly much used for making mill-stones. La Molera. Locano (Turin). Valle dell 'Orco, Graian Alps.

3832. Magnetite. Rich ore of the best kind. Traversella iron mines. Traversella (Turin). Val Chiusella, Graian Alps. This ore is smelted at Pont-Saint-Martin, in the Val d'Aosta, and from it is obtained the celebrated iron of that valley, which sells at very high prices, on account of its excellent quality, being all made with charcoal. It is remarkable to see the identity of the iron ore in some of the serpentine rocks of Italy with that of Sweden. The product, also, is of the same nature; both are excellent.

3833. Granular magnetite, associated with milk-white calcite and greenish mica. From the iron lode, Traversella iron mine, Traversella (Turin). Val Chiusella, Graian Alps.

3834. Brown spathose iron (siderite), associated with a little pyrites. From the lode of magnetic iron, Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3835. Pyrites, associated with magnetite. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3836. Gangue of the iron lodes, consisting of dolomite passing into siderite, quartz in limpid crystals of short pyramidal nature, with pyramidal terminations and a little granular magnetite. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3837. Compact white quartz, from the magnetic iron lodes. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3838. Crystalline pyrites, forming the gangue of part of the lodes of magnetic iron. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3839. Calcite of lamellar structure and impregnations of magnetite and chalcopyrite, associated with traces of serpentine, without diallage. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3840. Milk-white, crystalline, spathose dolomite, associated with a little granulated magnetite, pyrites, chalcopyrites and pirrotine. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3841. Cryscocolla, from the outcrop of the iron lodes. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps.

3842. Magnetite, from a part of the lode which contains a very minute proportion of chalcopyrites, reduced to slick, ready to be separated by Sella's electro-separator. Traversella iron mines, Traversella (Turin). Val Chiusella, Graian Alps. The quantity of copper found in this part of the lode is so small that no other plan than the one used would be remunerative. The magnetite is afterwards sold and used in offices instead of blotting paper, and for other purposes, but is not smelted.

3843. Finely crystalline pyrites, showing a tendency to crystallize in octohedrons. Bore pyritee mine. Brosso (Turin). Val d'Aosta, Graian Alps. Typical specimen of the great pyrite lode, the produce of which is largely employed for the manufacture of sulphuric acid in Turin.

3844. Pyrites in octohedral crystals, from the great pyritee lode. Bore pyritee mine. Brosso (Turin). Val d'Aosta, Graian Alps.

3845. Pyrites, with oligist. Bore pyritee mine. Brosso (Turin). Val d'Aosta, Graian Alps.

3846. Micaceous, pulverulent, specular iron (oligist). Saore (Turin). Val d'Aosta, Pennine Alps.

Prepalæozoic Group—St. Alban's System.

3847. Somewhat lamellar, fine-grained, crystalline, pearl-gray marble. Saore (Turin). Val d'Aosta, Pennine Alps.

3848. Pearl-gray, crystalline marble of fine structure, showing the mica schist in contact with the beds of marble with which it is interstratified. Saore (Turin). Val d'Aosta, Pennine Alps.

3849 Bluish-gray, crystalline marble. Pont Canaveee (Turin). Val Soana, Graian Alps.

3850. Saccharoid white marble of large crystalline structure. The beds of marble are interstratified with the other prepalæozoic metamorphic rocks, and the general direction is very apparent. Pont Canavese (Turin). Val Soana, Graian Alps. An excellent ornamental stone, but of more lamellar structure than any of the Carrara marbles.

(To BE CONTINUED.)

HORSES DOWN A SHAFT.—The *Inter-Mountain* (Butte, Montana) tells this: About noon to-day, had anyone cast his eye on the hill west of the Original Butte hoisting works, his blood would have curdled at the sight presented. Coming over the brow of the hill at a break-neck pace was the team of Tadder & Walker, pulling a load of wood upon which were seated two men, one of them endeavoring to bring the frightened animals to a halt, a result he was powerless to effect. When about half way down the hill, and while traveling at a fearful rate of speed, the horses suddenly left the road and ran in a bee line for a prospect hole 16 ft. deep which they did not see in time to avoid. Both horses went headlong down the hole, the driver followed suit, and the wagon would have fallen in had there been room enough. The driver was painfully bruised and he is now suffering considerably, but is not believed to be permanently injured. His escape from instant death is miraculous. The horses were not killed, but when extricated one of them was found to be severely cut about the flanks and was bleeding like a stuck pig. The wagon did not suffer serious injury. The injured man is receiving the necessary medical attention. His companion escaped unhurt.

DOG TRAIN.—The Wood River *Times*, of April 5th, says: "There is between five and six feet of snow in the Sawtooth range, on a level, and three to six weeks must elapse before it can be crossed by wagons. The only means of communication at present is on snow-shoes or by dog train. Mr. Smith, one of Dow's stage drivers, rigged up one of these a week ago. He left Ketchum Sunday night, with another man, six dogs and 500 lbs. of bacon and sugar on a toboggan, and made nine miles before the crust softened so that he was compelled to stop. The dogs were untrained, however, and will do much better as they become used to travel. They are fed on oatmeal mush."

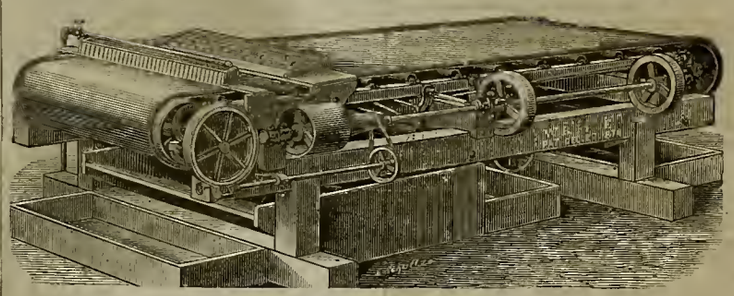
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

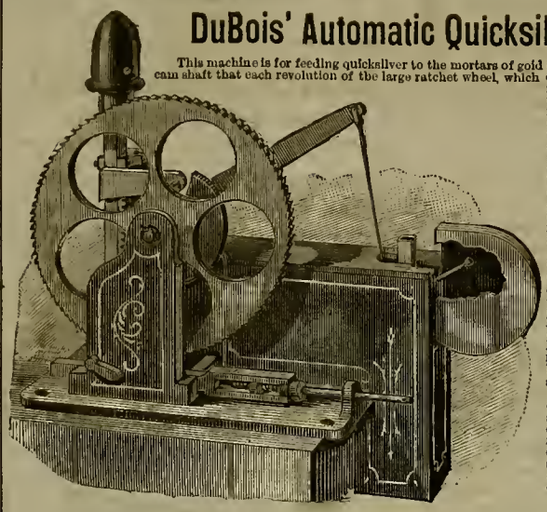
SHEET IRON PIPE.

FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.

For Sale by } **WHITNEY & MARSHALL,** { Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, No. 252 Market St., S. F.

FOR THE WEEK ENDING APRIL 11, 1882.

256 271—TRACE LOCK—Jas. A. Bassett, Windsor, Cal.
256 424—ADVERTISING DEVICE FOR STREET CARS—R. F. Bridewell, S. F.
256 283—AMALGAMATOR—Wm. T. Browne, Stockton, Cal.
256 284—VEHICLE SPRING—Geo. S. Buckland, Tulare, Cal.
256,180—ADJUSTABLE STOVE GRATE—De Goerre & De Lacn, S. F.
256,202—CAR COUPLING—Butte City, Montana.
256 304—HYDRO CARBON BURNER—Evan A. Edwards, Los Angeles, Cal.
256,354—SAFETY ATTACHMENT FOR ELEVATORS—Chas. B. Morgan, Oakland, Cal.
256 366—AIR SHIP—Carl W. Peterson, S. F.
Reissue 10 086—KITCHEN IMPLEMENT—John W. Ross, Santa Clara, Cal.
256 178—ROTARY ENGINE—A. W. Von Schmidt, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE SPRINGS.—George G. Buckland, Tulare, Tulare county. This invention relates to a new and useful spring and shackle for vehicles; and it consists in forming one end of the spring into a proper journal or bearing, wherein the shackle which is bolted or secured to the body or frame, may have a certain play to accommodate the rigid frame or body to the movement of the spring.

HYDROCARBON BURNER.—Evan A. Edwards, Los Angeles. No. 256,304. Dated April 11, 1882. This liquid hydrocarbon burner consists of a box or casing having within it a vertical longitudinal partition or diaphragm extending from the base to within a short distance of the top, dividing the box into two compartments, opening into each other over the top of the diaphragm, said compartments having separate entrances and a common exit or exits through a pipe or pipes leading from the upper part of the compartments and opening out under the casing or box. This burner is specially adapted for use in kitchen stoves or ranges. The heat from the device will carry on all necessary cooking.

TRACE LOCK.—J. A. Bassett, Windsor, Sonoma Co. No. 256,271. Dated April 11, 1882. This invention is an applisnce which the inventor terms a "trace lock," and which is intended to secure the loose end of a trace or tug of harness after the trace has been passed through the buckle. The lock takes the place of loops through which the loose end is usually tucked, and is adjustable, so as to be adapted to wide or narrow traces.

News in Brief.

SALOONS are hereafter to be closed by law in Ohio on Sunday.

PHILADELPHIA workingmen are indignant over the veto of the Chinese bill.

THE St. Louis Grand Jury recommends that saloons be limited to one in each block.

WAR is openly declared at Cairo against all Europeans engaged in official functions in Egypt.

FIVE thousand iron workers have struck in France against a proposed reduction in wages.

THE Methodist ministers of Philadelphia last week declared in favor of an Ecumenical Conference of the Methodists of America, two years hence.

FOUR excursion parties from the East, numbering in all probably 600 persons, are to arrive in Los Angeles soon, the first installment being due April 27th, and the remainder coming at intervals of a week.

THE new comet, according to the astronomers, will reach the perihelion passage on the 10th of June, and will be visible until September. The best observations will be granted to the people of the Southern hemisphere.

THE hearing in the matter of the contest of the will of Hon. Geo. F. Baker, deceased, took place before a jury in the Superior Court at San Jose. The jury were out 20 minutes, and returned a verdict that "at the time of making the will, March 8, 1880, decessed was incompetent."

AMALGAMATING PLATES.—Mr. W. E Shepman, whose advertisement appears elsewhere, informs us that he is filling many orders for silver-plated amalgamating plates, which he makes a specialty of manufacturing. He has been in business here 14 years, and having retained customers all that time, proves that his work gives satisfaction. Mr. Shepman plated the large steel hammer used for driving the "last spike" on the C. P. R. R., now on exhibition in the museum of the Pioneer Society.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

Laurel Glen Fruit Farm.

This place is beautifully located among the hills. A pleasant drive from railroad and beach. Deer and other game abound in the vicinity. A limited number of boarders can be accommodated for the summer and hunting season. The place is especially desirable for ladies with children. Address, for further information, Isaac Dakin, Soquel, Santa Cruz county.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

ANNUAL STATISTICIAN OF 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Bullion Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Storey county, Nevada.
Notice is hereby given that at a meeting of the Board of Directors, held on the 29th day of March, 1882, an assessment (No. 23) of Thirty (30c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 3, Safe Deposit Building, 328 Montgomery street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the second (2d) day of May, 1882, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the twenty-fourth (24 th) day of May, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
J. M. BRAZELL, Secretary.
Office—Room 3, Safe Deposit Building, No. 328 Montgomery street, San Francisco, Cal.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.
Send for circular.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. ☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT. No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., ENGLISH & WRIGHT, Agents

No 327 Pine St., San Francisco.

THE CONSUMERS' COMPANY.

VULCAN B B,

The Best Low Grade Explosive in the market. Superior to Black or Judson Powder.

MINERS' HORSE-WHIM.

One Horse can easily heist over 1,000 pounds at a depth of 500 feet. The whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame work. When required these whims are made in sections to pack on mules.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Heimosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

JOSHUA HENDY, Agent,

VOLUME XLIV Number 17

Marking Locations.

A carelees marking of the boundaries of a mining olaim when it ie taken up is liable to make endlese trouble for ownere, in caee the mine is rich and becomes well known. Then, when it is worth having, there are any number of people to try and eatablish claim to it.

A prospeotor ehould first try to find the vein, of course, and that heing found, shonld determine its general direction, hy which direction he will he governed in marking the houndariee of the claim on the enrface. Then when he records hie olaim he ehould give the couree and distance, ae nearly ae practicahle, from the diecovery ehaft on the claim to eome permanent, well-known pointe or objecte, euch, for inetance, ee etone monumente, hlazed trees, the confluence of etreams, pointe of intereection of well-known gulchee, ravines or roads, prominent huttes, hille, etc., which may he in the immediate vicinity, end which will eerve to perpetnate and fix the position of the claim and render it sueceptihle of identification from the deecriptiou given in the record of locatione of the dietrict.

In addition to the foregoing, the olaimant ehould state the namee of adjoining claime, or, if none adjoin, the relative positione of the neareet claime. He should drive a poet or erect a monumont of etone at eaoh corner of hie surface ground, aud at the point of diecovery or diecovery ehaft ehonld fix a poet, etake or hoard, upon which ehould he deeignated the name of the lode, name or names of locatore, numher of feet claimed, and in which direction from the point of diecovery.

It is very eeeential that the location notice filed for record ehall, in addition to the foregoing deecription, stete whether the entire claim of 1,500 ft. ie taken on one eide of the point of diecovery, or whether it ie partly on one eide and partly on the other side; and in the latter oase, how many feet are claimed upou each eide of the discovery point.

We have before noted theee pointe, hut deeire to impreee them on proepectore who are now heginning their eeaeon's work, hecause they are important for them to remember.

A recent ruling of the Commieeionere of the General Land Office makes manifest the importance of great care in making and deecrihing and marking mining claime in the notice of location for record. The Commieeioner rnles that an application for a mining claim eurvey muet he declined by the Mineral Deputy Surveyor where the location was not properly marked on the grouud and recorded; and when he makee such eurvey he must give in hie field notee thereof the hearinge and dietancee of hie cornere to thoee cited in the location notice, and the eame muet he ehown on the official plat of the eurvey to enahle the Department to determine the legal propriety of the eurvey.

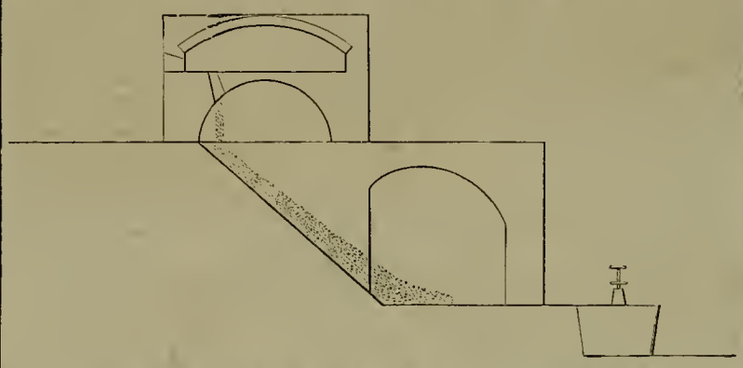
The ruling reenlte from that proviaion of the law of May 10, 1872, which requiree that "the location muet he distinctly marked upon the ground, eo that ite houndariee can he readily traced," and that euch deecription of the claim shall he given hy reference to eome natural ohject or permanent monument, ae will identify the claim. "The proviaione of the law mnst he strictly complied with in each caee to entitle the claimant to a survey and a patent." In all caeee if the location was properly made, it wae marked upon the ground. If the eurvey of it was properly executed it must have heen within the limite thue marked, and if the marke of the location and thoee of the eurvey are identical, the facts must appear etated in the official field notee.

Plans have heen drawn up for an electrical railway connecting the eastern and western ends of Berlin with each other. The road will he placed above the etreet on high columne, like the New York elevated roade, and statione will he erected at Lutzow equare, Magdehurg equare, Potedam etation and Donhof square. A curione point in the plane ie an arrangement for lowering the traine to the etreet level at etatione, thus allowing people to get out or in hefore the traine are raised again to the level of the track. Power eupplied hy electrioity will do the work of raieing and lowering the trains.

Ore Roasting Furnaces.

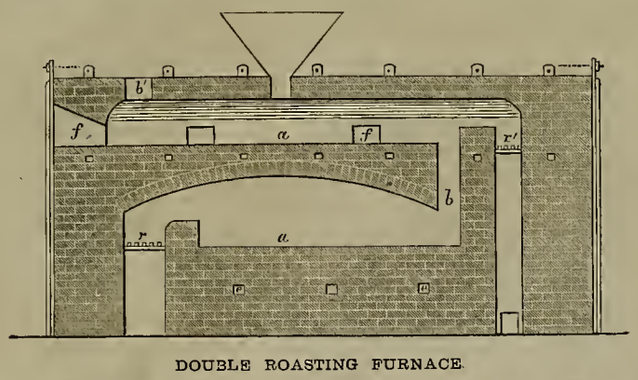
In huilding a roasting furnace, where the locality ie favorahle to euch an arrangement, it ie a great advantage to place the furnace eo that the floor on which the roaster etande ehould he 10 to 18 ft. higher then the cooling floor, wherefrom the ore cen he cerried to the amalgamating pans or to the leaching tuhe, ae repreeented hy the outline eketch on this page.

A douhle roasting furnace is repreeented in longitudinal croee eection in the lower one of the engravinge. It ie deecrihed in Kuetel's "Roaeting of Gold and Silver Oree" (for eale hy Dewey & Co.) as followe:



PLAN FOR ROASTING FURNACE AND COOLING FLOOR.

The lower hearth, *a*, ie 9 ft. long and 10 ft. wide. The roof in the center ie 28 inchee, and at the flue and hridge 14 inchee ahove the hearth. The fire-place, *r*, ie 20 inches wide, 8 ft. long, and 20 inchce from the roof. The flue, *b*, ascende to the upper hearth, *c'*; the working door, *o*, is on the hack eide. In case there should he required more heat than ie ohtainahle from the lower hearth, there is an auxiliary fire-place, *r'*. The flame goee throughthe flue, *b'*, into duet chambers. Theee chambere have croes partitione lengthways, hy which the draft ie forced to take a longer way hefore it entere the chimney. From the upper hearth the ore is drawn through the flue, *b*, to the lower hearth; *e'*, *e'*, are canals for the eecape of moisture, and *e' e'* for the tie-rode. The two hearths cen he ueed eeparately if needed. This fnrnace, although eomewhat inconvenient for the roastere, hae the advantage of taking up leee epace, and as the ore drope from the drying hearth on the eecond, and from there on the firet hearth, it effecte a good mixing of the not uniformly heated ore. The auxiliary fire is ueeful for eilver ores, whioh eeldom contain eo much eulphur as to hurn long enough without the help of a nearer fire than that from the lower hearth. In working ooncentrated eulphurete, the upper fire can he dispeneed with. Deetken, who has had long experience in roasting eulphurete, conciders thie kind of furnacee euperior to the long onee and to all othere he ever ueed. The arch in the middle ie only eight inchee thick, hut, heing made level, the thickneee increaeee towarde the eides. A few daye after etarting up, the whole roof ie sufficiently heated to keep the entire mase of the eulphurete red hot throughout, and the fuel ie hetter ntilized; one ton alwaye heing drawn from the upper hearth, when the preceding charge ie finiehed. The charge on the lower heerth requires, generally, from 8 to 10 houre hefore the roasting is completed. In conetructing a donhle furnace, in two etoriee, it is essential to uee a number of iron ties acroee the width of the furnace, hetween the lower and upper hearth; otherwiee, on account of the weight of the upper charged hearth, the side wall would invariahly give way in the conrse of a while. If used for the roasting of gold eulphurete, or such oree ae do not require the auxiliary fire, the working doore can he placed at *m* and *n*, and, at *m*, a hoe can he advantageouely ueed in drawing the charge to the lower hearth.



DOUBLE ROASTING FURNACE.

Depths of Shafts at Bodie.—It ie moet gratifying to obeerve that the hig ehafte are heing continued etraight down, and that new levels are to he opened at varioue pointe. During last week work wae reeumed at the Lent ehaft, helow the 800 level, and in a ehort time the 900 will he opened. The Standard ehaft ie now down 1,210 ft. The Red Cloud hae more water to contend with, and goee down eomewhat elower than the othere, hut hae attained the depth of 762 ft. The Tioga ehaft ie hut a few ft. ehort of 1,000 ft. deep. The Goodehaw ie 750 ft. and the Oro 714 ft. deep. Theee are certainly very reepectahle depths for an "ontside" camp; hut it wae at lower pointe than theee that the greateet ore hodiee on the Comstock were found—a district in many particulare very eimilar to Bodie. We feel aeeured that hetween the 600 and 1,500 levels of some of our minee ore hodiee will he developed far greater in dimeneione and value than thoee ahove that point—from which the not ineignificant eum of $13,000,000 hasheeu taken in 4 years.

Laying Dust in Mines.

It ie now pretty well eetahlished that coal duet in fiery coal minee ie an element of danger, and may, with an almostinappreciable quantity of free oarhureted hydrogen gae moving at a high velocity, explode at a Davy lamp. To render coal dust neutral in explosione, they muet not only prevent it from mixing with the free gae of the mine, hut they muet prevent it from mixing with the ventilating current. In all fiery seame they reqnire a etrong cnrrent to eweep out the geeee of the mine, and the deeper and more exteneive the coal winnings are carried, the more neceeeary it hecomee to increaee the velocity, more eepecially if the preeent eyetem of exhauetive ventilation continuee. And the more the velocity increasee, the more dusty, and conseqnently the more dangerous, doee mining hecome. To work and nee hlasting agents in euch a mine, ie, if anything, even more dangeroue than if the work and hlasting were cerried on in a huge gasometer filled with gae.

To find a reliehle meane of laying thie duet, nnmeroue experiments have heen made. Mr. R. Stevenson, a memher of the North Staffordehire Inetitute of mining engineere, described at a recent meeting the experimente he had made, and the method he had finally hit upon to remedy the evil. The hint given may he carried out in mines on this coaet wherever duet ie trouhlesome.

He had uuder hie charge some workinge, which, for eeveral reasons, could not he worked profitahly on the longwall eyetem, eo that the coal headinge had to he carried out to the extreme end hefore coal-getting could hegin, and the coal heing ehnt out hy faults from any higher workings where the gae might have escaped, and water fonnd its way into the coal to replace the exuded gas, the workinge were rather hot and dry, and the dnet wae eimply ahominahle. He tried eweeping and ehowering water along the roadwaye and headinge. It wae so difficult to get accuetomed to the conetant practice of ewallowing the duet that he reeolved to lay it. Water wae found to he of little avail unleee all the roadwaye were previouely ewept, and even then the heat and the velocity of the air-onrrent eeemed to make the water evaporate almoet as quickly ae it could he eprinkled over, unleee the floor wae drenched, when the fire-clay hegan to heave and give much tronhle. Having provided a few tons of soiled ealt, he tried it as a snhstitute for water, or at leaet ae an aheorher of moieture, thinking that a combination of the two might anewer. The uee of water had heen stopped a month when the ealt wae tried, and there wae a large accnmulation of coal duet in the mine. The salt wae ecattered on the top of the duet. The firet day it wae dieegreeahle to the trolly lade, and the colliere complained, hut eoon a different tale was told, and now the workpeople felt more ae if they were in a eanitarium by the eeaside than in a duety coal mine as it formerly wae. Heaps of duet, which with the least disturhance formerly roee in cloude and floated along the air current, would now lie as etill as damp sand. Salt, if used intelligently, in quantitiee of one ton per 500 yarde of six-ft. roadway once every week for the firet month, and once a month afterwards, would render the working in fiery eeame a pleasure and a profit, instead of heing what it now wae, an ahomination and a terror to every one interected.

The committee of the tradee aeeembly hae adopted a etamp or trade mark to he placed upon all goode manufaotured exclusively hy white lahor. Thie stamp is intended to he used hy all trades unione represented in the tradee aeeembly, and will he preeented to the forthcoming Anti-Chineee convention for indoreement and further action, ae it is intendod for general use throughout the Pacific coast.

The veto meesage of Preeident Arthur has heen translated into Chineee hy direction of the six companiee, for oirculation among Mongoliane of the npper cruet. The meesage occupies eeven columns, each containing five columne of chineee charactere, which are lithograph fac-eimilee of the meesage as it appeared in the Chineee newepaper ahout two weeke after it wae seut to Congreee.

Prospecting as an Art.

The Work in General and in Idaho in Particular.

The work of Prof. Clarence King, entitled "Statistics of the Production of the Precious Metals in the Unitsd States," compiled in connection with the tenth census, came to our hands a few days ago; and after scanning its elaborate tables and illustrative plates, various questions snggsstad themselves, of interest to the entire civilized world. The first was: How much of gold and silver will Idaho contribute in the futnre to supply the falling off of production in other quarters, notably in Nevada? Another presented itsslf in this form: Is not the time approaching when the national Government must do somethiug to sustain this industry, by rewards and bounties to those who devote their lives to the trying and perilous pursuit of hunting for and developing lods mines? The latter question will at some day, not very distant, claim attention from the publicist and statesman. The two questions hring to mind the subject of the ways hy which the desp mines, or quartz rock in place, are primarily taken; that is, discovered, msde known and opened up.

Since the search for the precious metals commenced on the coast of the Pacific, now a full generation past, mnltitudes of sturdy workers have hesn opening the hard leaves in the surfas of the earth, and the eye of the scientist has followed their labors, in the attempt to decipher some general laws or principles which nature may have pursued in the formation of ledges and the deposition of her mineral treasures. Mining has been sufficiently successful and profitable to stimulate the mightiest endeavors of American genius, and has given birth to mechanical devices for penstrating to great depths, and raising the solids and liquids thsrefrom, far beyond anythiug ever before contrivsd hy the skill of man. It is equally a fact that the processes for redncing ores have, during the same period, been carried forward to a snrprising excellence. But while the business has marched from one improvement to another, in the perfecting of machinery for working mines, and in ascertaining hetter methods for extracting ths metals from ores, all attsmpts to formulate rules or to deduce general laws to direct the prospector in his explorations have proved almost wholly valueless.

The experience of every man wbo has been concerned in this pnrsuit has furnished him with some ideas, snch as, thet gold and silver have an affinity for porphyry and granite, and that the hase metals, such as lead, have a partiality for limestone and shale. Even when adopting these general facts for what they are worth, he is compelled to let in such liberal qualifications that, at last, he is compelled to say that there is no maxim allowable as to the strain of rock formation in which the precious or hase metals are to be found, or from which they are excludcd. Silver quartz he knows to he impartially distributed in porphyry and lime, and that argentiferons lead may spring from almost any "country rock." Of one thing he can be quite certain, and that is that the precious metals are not cosmopolitan, hnt are confined and local to certain districts of the world; and that these metal-bsaring regions are marked hy featnres, in respect to the characteristics of which the ordinary practical geologist and observer of strata can rarely he mistaken.

There is one feature incident to the composition of the surface of Idaho which the prospector encounters more commonly than when doing his work elsewhere. It is not pretended that it is nnique to this country, hut it is surmissd that the work of ledge hnnting will begin here about where it has left off in other sections. The results will be instructive, if we mistake not; and, having mastered the lesson of unearthing hlind lodes here, he will he prepared to go hack to follow with greather success his exploratione in the older fields in which he has been gleaning. While elsewhere ledges have been sought out through an outcrop or reefing upon the snrface, in a great part of this Territory the pick must be more vigilantly employed. It will he fonnd that the presence of mineral deposits in any given locality is often only indicated by "float," and that the search for the ledge above gronnd is attended with ill success. In many cases where rich rock has heen discovered mingled with great masses of what is known as "slide," it has required a persistent toil and struggle with the gravitating debris to detect the source from which his specimen had become originally detached. In other cases a more tenacious covering of soil has had to be removed hefore the apex of the lode could be discerned and fixed. The serions difficulty, of course, where ledges are so capped over, is to find out where to apply the hands judiciously and most economically. The practiced eye and good judgment of the searcher comes into play in every such difficulty, and he needs to snmmons the aid of his hest faculties to make his work effective. His patience and strength must he widely wasted where he is incapahle of getting at right directions from very meager signs. To those familiar with the facts connected with the discovery of many valuable mines, it has become a matter of remark with what precision some men will follow the slightest indication and unearth the buried vein. The sleuth-hound is hardly more true to the scent of his prey than is the genins of some men on the track of a hidden bonanza. With them it appears something akin to an intuition to retrace the run of a fragment of vagrant rock hack to the spot of its origin. It is not, however, so much an indefinahle sense that guides, as it is the discipline of the reasoning faculty hy long and diligent exercise in this single direction. So that prospecting really may bs ranked as an art, skill or distinction in which is attained hy practice and experience, under vicissitudes, perils and privations to which the votaries of no other art are subjected. The labors of this host of independent adventurers have dons a great work for the advancement of the activities of the age; they have brought into being that wealth which has given new wings to commerce, which has been the fonndation to the credit of the Republic in a time of inestimable trial and danger, and supplied a constant motive power to tbe world, which cannot bs diminished without serions dstriment to our own country as well as to all civilized nations. We owe to this class, who founded in the mountains of California, a third of a century ago, the charter of this unorganizsd guild, whose membership has spread from the Pacific to Colorado, and from Alaska to Mexico, a debt of obligation, not less than that dne to tbe bravest of its soldiary.

In Idaho they enter the last field of unexplored domain belonging to the United States. When they shall have opened the rocks from the Snake river to the British line, there will he other fields for them. The vast realm over which they have been scouring in the past generation, will challenge their higher skill and larger expsriance; and they, and men of like tastes and attributes, will continue to explore and smite the rocks for streams of metallic wealth for immeasurable time to come. Were this not true, there would be an end of mining for the precions metals, and a period of exhaustion might be predicted.—*Wood River Times.*

The Reduction of Rebellious Ores.

In conversation with one of the best millmen in the State, this week, Mr. Thomas Mitchell, he observed that it was possihle to work hy mill process, no matter how rebellions, any ors that did not contain a sufficient percentage of lead to smelt. He has discovered a process of dsulphurating which, he claims, will save the precious metals, while freeing ores from the haser mstals. One of the greatest drawhacks to profitable mining in Eastern Nsvada has been the seeming impossihility of freeing the rebellious matter contained in the ores, and saving the gold and silver. Any process hy which this can he successfully accomplished will he hailed with delight by mine owners who are possessed of mines rich in these rebellious ores, from which assays can he obtained that go far up in the hundreds, bnt which prove, when the attempt is made to work them hy any mill eystem at present in use, disastrous failures, and smelting is out of the question, as they do not carry e snfficient percentage of lead. The ores that we refer to particularly ere those that carry a considerable percentage of gold, with silver and the haser metals, and these have never been successfully treated in eastern Nevada by the mill process. Mr. Mitchell acted as Foreman of the Alexander mill for a number of years, and was always very successful in his treatment of the base ores of this district. It is his intention to patsnt this new process, which he feels certain will render the working of rebellious ores, that do not contain a sufficient percentage of lead to smelt, profitable to mine owners.—*Grantsville Bonanza.*

The Spot where Gold was First Discovereo.—Dr. Holmes, the well-known dentist, has just returned from a two weeks' visit to Coloma, California, his old-time mining camp. Coloma is the spot where gold was first discovered in California, bnt its glory as a place of mines has long since departed. It is now a place of orchards and vineyards. Although surrounded hy snowy mountains, snow seldom falls in Coloma. There grow the fig and the almond tree, and there flowers bloom every month in the year. The people live in vine-embowered cottages, till their gardens, train their vines, prune their trees and are happy, giving no thought to undergronnd wealth that lies deeper than a hill of potatoes. The only miners now seen about Coloma are Chinese. Under the orchards and gardens is still a considerable amount of ground that the pick has never disturhed. The Chinese occasionally get upon leads of gravel that rnn into these, and the high prices they are willing to pay for a small strip off a garden or orchard shows that they find the ground prodnctive. One man has year after year disposed of slices of his orchard, and only the other day sold for $800 the ground on which stood four apple trees.—*Virginia Enterprise.*

Good Yield.—Forty tons of quartz taken from the Wide West mine, on Canada hill, has just been crushed at Crosby's mill. The clean-up amounted to 169 ounces of amalgam, which when retorted gave a 76-ounce har of gold, worth about $16.50 per ounce. This gives a yield of over $30 a ton, not including the sulphurets. The entire yield of the crushing will probably reach, $1,400. The owners of the mine are highly pleased with the returns. Heavier hoisting works will soon he put up over the new incline now being snnk. When the works atart np, from seven to ten men will be employed.—*Nevada City Herald.*

Lead is selling in London for £14 7s 6d to £14 12s 6d per ton for English, and £14 7s 6d for Spanish.

The State Bag Factory.

Work was hegun last week at the new hag factory at the State prison, San Quentin. The warden, Mr. Ames, has secured 500 lbs. of jute seed from India which he will distribute to all who wish to try the growth of the plant. Ths present expectation is that California cannot only make the hags hut can grow the fiber, and anyone desiring to plant jute, to test it as a crop, can obtain the seed by application to Warden Ames, San Quentin.

A resident of Napa who lately visited the State prison gives the *Register* the following account of his observations:

The fiber used at the prison is imported direct from Calcntta. It is quite coarss, is six or eight ft. long, and is tied up in bundles, each of which weighs about 400 lbs. Bsfore it is ready to he woven into cloth it passes through ssveral complicated machines, which reduces it to the fineness and softness of silk, yet when spun into yarn, it presents that coarss appearance all are familiar with who are acqnainted with hurlaps. There are 100 looms in the factory, hesides spinning and other machines, all of superior qnality and of marvelous workmanship. Only a portion of the looms are at present used, 115 convicts, 4 skilled foremen and 24 freemsn heing employed in running them. As soon as practicable all the looms will be put in opsrstion, when ahont 400 men will be employed in the factory. There heing but few workmen in the State skilled in weaving jute cloth, several Chinamen, who formerly worked in the Oakland jute factory, are and will he employed until the convicts are instrncted in the workings of the machinery. As a matter of coarss the employment of thsse free Chinese has excited much opposition from various quarters, hut it is the intention of Warden Ames to keep them only so long as is necessary for the instruction of others, when convicts only will bs employed. Fifty thousand sacks per day will be manufactnred when the works shall he run to their full capacity. After the cloth is woven it passes over and under a series of large rollers—termed a calendar—which exerts a pressure of 600 lbs. to the sqnare inch, making the fabric more pliahls, at the same time stretching it at the rate of one yard in ten. Then after passing throngb a finishing machine, it is run through a cutter, where revolving knives rapidly clip the cloth into suitable lengths for bags. These will all he sewed by hand in the best manner.

The opposition encountering the establishment of this factory has heen principally hy parties interested in the Oakland jute factory. hut such jealousy is needless. It became evident to the authorities that when the system of contract labor should cease (Decemher 31, 1881), that a large number of prisoners would have little or nothing to do. Aftsr much consultation, it was dscided to inaugurate the manufacture of burlap sacks, as that industry would interfsre less with the indnstry of the free lahoring men throughout the State than any other. Present appearances indicate that the plan was a wise one. There is little fear that the State factory will injure the trade of the one in Oakland, for both together cannot hegin to supply the yearly demands, which amounts to abont 30,000,000 sacks. The annual production of the Oakland works is abont 3,000,000.

Matting Copper.—Mr. Bowers is doing good service to the mining interest of Utah, by introducing the matting process for copper ores, at the Mammoth mill, Tintic. One furnace is in operation; a second will he in a few days, and three more are to be erected at once. A furnace reducee 10 or 12 tons of ore per day, requiring about one cord per ton of cedar-wood fuel, costing $2 to $3 a cord. The matte so far made is 60% to 70% copper, and $225 to $250 per ton of matte, gold and silver. Of course this will vary with the qnality of ore. The ore sbould he graded as to copper, too, so as to get 10 tous inetead of five into one ton of matte. Then it would he proportionately richer in the precious metals, and the cost of transportation would he comparatively less. The early completion of the railroad from Lehi to the mill will enable them to get coal if they desire to for $5 or $6 a ton, from Pleasant Valley; also, to carry in iron pyrites to give the snlphur required in the operation, and which is not abundant in Tintic district. What the cost of this work is, it is too early to figure on. We have little donht that it will prove to be profitable, however, to reduce the Crisman, Mammoth, Copperopolis, and other Tintic ores, and indeed ell gold or silver, or gold and silver ores carrying as mnch as 5% copper, found in the Territory, hy this process. The works, or some works, shonld he located at the Utah Swansea (Sandy), so as to he central to, and in mail connectiou with, all the mining districts.—*Salt Lake Tribune.*

Five thousand employes in Paris, representing every trade connected with the manufacture of iron, bave struck against the proposal of the masters to dednct 40 centimes to every hundred francs wages, to he applied to the payment of an insurance premium for the men against accident.

American cars, locomotives and railway appliancea generally, continue to increase in popularity abroad. Every month and every year gives American products a better standing, and our manufacturera may look forward to the future without anxiety.

Close Call of a Miner.

The Eureka *Sentinel* of the 14th says: A man hy the name of William Bennetts was at work in the K. K. miuc, on the fifth level, at 11 o'clock yesterday forenoon. He is a tributsr, and was working in a raise. He was approaching an old cave. He did not know how far off he was, hut thought he was a considerable distance from it, when all at once, without any warning whatever, the roof of the cave cracked and a mass of old ground was precipitsted upon him. There was no chance for him to get out. His only means of escaps was to climh as the dirt was falling, which he did. The manner in which he strnggled to save his life is something remarkahle. Some of the debris which fell ehout him wes in the shape of large howlders, many of them weighing at least 400 lbs. His candle had been knocked out of his hand and extinguished. Luckily he was not struck by the masses of falling rock, and kept on climbing upon thsm as they fell and settled ahout him and above him. He fought in this way againsta seemingly inevitable death for a distance of 20 ft. upwards, perpendicularly, when the caving ceasod. Then he struck a match and waited where he was for ahout an hour, inclosed hetween the roofing that had fallsn off in an arched wall above him and the loose dirt helow. He was literally huried alive for this time; hut fortunately a little air came through the ruhbish crevices—sufficient to sustain life. By this time his partner, who was working at a short distance from him, went to look for him, and discovered the cave. He, John C. Harris, communicated at once with the foreman, Joe Bice who, with a crowd of men, repaired to the scene of ths accident, for the purpose of removing the dirt and exhuming the huried miner, and having barely a hope to dig him out alive. They were on the spot sounding and calling for some time, when they heard a faint and smotbered sound, as of a voice proceeding from a distance. They finally selected the point nearest him. He spoke to them and told them that he would throw himself across the "gunnis," and that they should let the dirt drop three or four ft., and he would give way and fall on it. This operation was repeated several times, until he finally emerged from his tomb and stood once more on the level among his fellow-workmen, somewhat scratched and hruised, but with no bones broken. The report had gone abroad that he was buried alive in the cave, and a large crowd had gathered ahout the K. K. shaft, expecting to see his dead body brought to the surface. The agony that his wife endured in the time of suspense, while snch news as could he had from the mine was brought to her by a kind friend from time to time, can hetter bs imagined than described. The joy that prevailed on the hill when he was restored to life and his distressed wife was nniversal and unbounded. Bennetts is a good, cool-headed miner, otherwise he could not have survived. His presence of mind and mastery of the difficnlt sitnation alone saved him.

Deeds of Gift instead of Wills.

Those who wish te he sure that their property will go, after their death, to the ones they desire, should not make wills which involve going through probate and many legal expeuses. They should make deeds of gift, which they must personally deliver to the wife or other person to whom they wish the property to pass. We have repeatedly called attention to this matter before, hut almost every week our attention is called to cases where the making of deeds of gift before death would have saved hundreds of dollars in money, and in some cases, almost untold annoyance and delay in probate. Were all lawyers good probate lawyers, widows and devisees would not he so much harassed; hut the widow entrnsts her probate business to the first lawyer mentioned to her, or to some one whom she happens to know; and as probate proceedings are at hest hut a complicated system of red tape, lawyers thoroughly familiar with every detail are scarce. Probate business has, therefore, to he repeated two or three times. Deeds of gift render all probating unnecessary, and involve an expense not to exceed four or five dollars. They place the devisee in immediate possession of the propsrty, too. The following is the legal form of a deed of gift:

Blank Form of a Deed of Gift.

[Blank Published.]

This Indenture, made the *thirty-first* day of *April*, in the year of our Lord, one thou-and eight hundred and *seventy-four*, between *James A. Clayton*, of the county of *Sierra*, State of California, the party of the first part, and *William Clayton, his son*, of said county, the party of the second part, witnesseth:

That the said party of the first part, for and in consideration of the love and affection which the said party of the first part has and bears unto the said party of the second part, as also for the better maintenance, support, protection and livelihood of the said party of the second part, does by these presents give, grant, aliene and confirm unto the said party of the second part, and to his heirs and assigns forever, all—

[Description of Property.]

Together with all and singular tenements, hereditaments and appurtenances thereunto belonging, or in anywise appertaining, and the reversion and reversions, remainder and remainders, rents, issues and profits thereof.

To have and to hold, all and singular the said premises, together with the appurtenances, unto the said party of the second part, his heirs and assigns forever.

In witness whereof, the said party of the first part has hereunto set his hand and seal, the day and year first above written. James A. Clayton, [L. S.]

Signed, sealed and delivered in the presence of

Wm D. Bliss,
D. D. Cardes.

This should he acknowledged before a notary, as in the case of other deeds.

MECHANICAL PROGRESS.

The Art of Turning.

The art of turning consists of shaping articles in a lathe. To define the art more closely, we understand it to mean the fashioning of articles that are themselves revolved on the lathe, and which are acted upon by a cutting tool held in the hand, or by a slide rest.

Turning indisputably holds a forward place in the useful arts, and it is one of the oldest. The lathe has been aptly called the "father of mechanism," so much is mechanism indebted to it for its very existence. The date of the origin of the art is lost in antiquity. It was probably known before historians began to write. The potter's wheel is believed to have been the earliest form of lathe. This primitive lethe is now commonly used by the potters of the present day; it is, technically, "a throw." The work that a potter produces with his hands is called "thrown," and the turning is a subsequent process.

The oldest Egyptian monuments had representations of the potter at work with his lathe. This takes us back 2,000 years before the Christian era. Ptah, a god worshipped as the leader of mundane artisans by the Memphites—who flourished about 2,000 years before Christ—is represented in the act of moulding man upon a potter's throw. Thus, we find in the earliest records a special tribute to the art of turning, which, in that remote period, was evidently deemed the art by which man was fashioned. In Scripture history we have, in Jeremiah, a distinct allusion to the potter and his wheel. This date is about 500 years, B. C.

The processes employed by the Hebrews were probably similar to the Egytians, from whom they had learned the art. The wheel used consisted of a wooden disc placed on another larger one, and turned by hand by an attendant, or worked by foot by the potter himself.

Geologists have discovered potteryware in some of the oldest formations which contain human remains; but this pottery was, it is evident, made by hand-moulding, and not by being thrown or turned upon a wheel.

The turning lathe of modern form was apparently not known in those early times. Though many trades and occupations are vividly represented upon the sculptured records of ancient Egyptians, the turner—other than he working at the potter's wheel—is unrepresented. This fact leads to the conclusion that the turning lathe proper was unknown in Egypt.

Turning was evidently one of the arts practiced by the Greeks and Romans. Their writers mention lathes and turners frequently some 500 years before the Christian era.

The early practice of turnery was confined to fashioning wood. We read of bowls, also of flutes, and musical instruments that have been produced by the skilful turner. The application of the art to fashioning metal is of comparatively recent origin.

An attempt to trace the progress of the art of turning through successive generations would probably become wearying. The subject is a very speculative one. There are few indisputable date on which a connected history could be wrought. No treatise on the subject exists, and hence the difficulty in dealing with it.

Long before the fly-wheel, worked by a crank, was invented or used, lathes were driven with the aid of a spring pole, and also by hows; not used in the manner of the modern drill-bow. The pole lathe is still in use in some trades—amongst which that of the watch-case makers—but the alternating motion has been almost entirely superseded by the continuous fly-wheel. Pole lathes are drawn by the foot; an elastic springy pole is fixed by one end—usually to the ceiling—so that the free end is in a direct line with the mandrel pulley. A cord from the free end of the pole is passed around the pulley, and attached to the treadle. When the foot is applied, the mandrel is made to revolve in the direction necessary for cutting; on relieving the treadle of pressure, the elastic force of the spring pole draws the cord back, at the same time causing the work to revolve backwards. In this way the treadle is brought to its original position, ready for another effective stroke.

It is evident that this alternating motion is by no means economical. Every effective movement of the work is only the precedent of an equal amount of non-effective motion. To take the matter at its best, and allow that the speed is in both instances equal, half the time employed in turning is wasted in waiting for the backward motion. Despite this obvious and serious drawback, the pole lathe has been used ever since the invention of the center lathe.

Native turners of Africa and India still practice their art with the primitive pole lathe. A somewhat similar tool, worked with a drill-bow, is use by the Arabs and Persians.

The derivation of the word "lathe" has been attributed to the pole used for working the earliest turning machines. The pole, in order to render it fit for use, was pared down to a taper form, and thus made to resemble a lathe. The English word lathe is one that has been especially bestowed by us. "Turn" is the word applied, in other languages, to the machine. We yet call the smallest form of lathe, in common use among watchmakers, "turns."—*Mechanical World.*

New Friction-Gear for Wire Ropes.

The rapid wear and tear of steel wire ropes for winding at mines, has always been a constant source of complaint, being due, in a great measure, to the sudden checking of the movement by the use of friction clips, especially when there is a heavy strain upon the ropes. Since the latter are by no means cheap, it is important to treat them in such a manner as to keep them in working order as long as possible, and the preservation of wire ropes has, consequently, long been a momentous matter for the consideration of mine owners and mechanical engineers.

An invention has, however, recently been patented, which promises to be of considerable value to all interested. It relates to improvements in brakes for steel, wire and other ropes, and is of more than ordinary interest to those using them. The invention is designed to check the rope without any of the severe punishment caused by hard compression or attrition, and without sensible wearing friction on the rope. For this purpose a brake is fixed, not on the rope itself, but on mechanism connected with V-pulleys, round which the rope is twined, forming a figure 8. The friction on the pulleys is so great, by reason of the turn round each pulley given to the rope, that no appreciable relative motion can take place between the two. As the brake, however, is applied on the axles of the pulleys, or rather on brake wheels on these, or on one of the axles, whatever friction is expended on stopping the rope, is spent on the brake block or the belt and brake wheel, and not on the rope.

The apparatus is simple and effectual. Upon the overhanging ends of two shafts, having bearings in a stout frame, four pulleys are placed, two on each shaft, connected by spur gearing. On the other ends of the shafts are placed two brake wheels with a single brake strap, so arranged that a man, by means of a lever, can put a sufficiently powerful strain on the brake strap, so as to give the brake the requisite power. Upon one of the shafts is a worm wheel, or first wheel of other train of geering, and a clutch, so arranged that the geering can be connected with the shaft at a moment's notice.

The rope is passed from a reel through a guiding eye on to one of the other pulleys, around which it passes. It is then wound around the other outer pulley in the opposite direction, then around the opposite inner pulley, the direction being the same as in the first instance, and finally round the remaining pulley in the same direction as round the second pulley. The brake can be applied gradually or suddenly without any more friction or severe compression on the rope. By putting the clutch into gear the apparatus becomes a winch, and, the brake being thrown out of action, the rope hauled in. In lowering heavy weights the brake can be applied, the clutch thrown out of gear and the descent regulated with the greatest nicety by hand-pressure on the brake lever. The apparatus is no more severe on the rope when the brake is applied than at other times, excepting, of course, the increased tensile strain necessarily entailed when the lowering of a heavy weight is checked, and while in other winding apparatus, there is the riding of one turn over the other, to the great injury of the rope.

To Clean Incrusted Supply Pipes.—A correspondent of an exchange writes: "One of the most annoying accidents that can happen to the steam-engine runner, is to have his water-supply pipes choked up with lime and other solid incrustations. Especially in the hot-water pipe, lime is apt to settle and incrust on the iron pipes, till they become completely filled up, so that no water whatever can pass to the pump or injector which forces it into the boiler. In such cases it is customary to take up the pipes and try to loosen the solid matter by pounding on the pipe and breaking it out, or by making a fire along its whole length and burning it out. In a very recent obstinate case one end was stopped up with a plug, and, standing it upon end, coal oil was poured in as long as any would go in, and the whole was left to stand till morning, when the whole was slid out in a solid core. While this may not always work, it is certainly worth trial in obstinate cases.

Heavy Forging. — Roache's shipyard at Chester, Pa., has just turned out two monster steamboat shafts, for a new Long Island steamer. They are 40 ft. long hy 30 inches diameter, and weigh over 20 tons each. They are said to be the largest ever forged. The process in so large a work is interesting. The iron used is made up of scrape of boiler plates, nuts, and screws, and horseshoes. These are first run together into bars two feet or more in length. The shaft is built hy adding from four to six of these bars et a time to the end, welding them on in the furnace, and heating them into shape with the powerful steam hammer. Then more are piled about the end of the shaft at a white heat, and welded on in the same way.

Compressed-air Motor.—A trial was made in Philadelphia recently of a compressed-air motor for street cars. An exchange states that it worked very satisfactorily, running back and forth over 400 ft. of track without giving any trouble and without noise.

SCIENTIFIC PROGRESS.

Producing Artificial Indigo Directly on the Fiber.

The Baden Aniline and Soda Works, Mannheim, have taken out several patents, and made additions thereto in accordance with the German law, for the above purpose. Their invention is based upon the fact that by the action of concentrated sulphuric acid on orthonitrophenylpropiolic acid at a low temperature a product is formed, which, on treatment with ferrous-sulpbate (green vitriol), yields a blue coloring matter, similar to indigo. No statement is made as regards the composition of this blue substance. (Baeyer's more recent researches show that this blue substance is indoin, $C_{32}H_{20}N_4O_5$.) Numerous other bodies, such as metals, oxides, sulphides, and salts can be substituted for the ferrous-sulphate. The blue coloring matter dissolves in an aqueous solution of sulphurous acid and alkaline bisulphites. From this solution addition of salts throws down a blue precipitate, soluble in water, but which, on warming, or by contact with acids, is converted into another blue coloring matter which is insoluble in water. These reactions are made use of in the dyeing process. The goods are impregnated with a solution of the sulphurous acid derivative, and the color fixed by steem or a dilute acid bath. Besides grape sugar, or milk sugar in alkaline solution, the sulphides, sulphydrates, polysulphides, sulphocarbonates, and other sulphocarbonates of the alkalies or alkaline earths, and especially the alkaline xanthates, can be used for the reduction of orthonitrophenylpropiolic acid. These reducing agents act already in the cold, and more quickly on warming. They are employed in alcoholic or aqueous solution. In the case of xanthates being used, the formation of artificial indigo chiefly takes place after the solvent has volatilized, *e. g.*, on evaporating to dryness a solution of one kilo. acid (orthonitrophenylprop.), one-half kilo. potashes, and one and one-half kilo. potassium xanthate in one-half kilo. water. The same solution can be used for producing the coloring matter on the fiber, or, better still, alkaline solutions of the acids and the xanthates are successively employed. In this case the formation of the coloring matter takes place also in the cold after drying, and more quickly in a drying chamber.—*Journal of Chemical Industry.*

The Formation of Clouds.—The French Society of Aerial Navigation recently entrusted MM. Dutet-Boitevin and du Hauvel with different balloon observations, among which was the study of the formation of clouds, taking into account the vapor tension in neighboring strata of air, but of different temperature, and also the release of the latent heat of vaporization at the moment of precipitation. The observations yielded the following results: 1. The clouds are formed in the zone of mixture of two layers of air saturated with moisture. 2. The clouds originate in the warm layer and dissolve in the colder layer. 3. They move in the direction of the belt of air which has the highest temperature. 4. The winds which are observed at the surface of the ground, which are only effects of the reaction of the principal wind, may have a hight of several hundred yards, and may have different directions in neighboring localities, while the upper current has a great regularity of direction and intensity.

The Blue Color of Water.—The *Photographic News* states that Mr. Aitken has been studying the blue color so characteristic of the Mediterranean and the Lake of Geneva, and his conclusions are embodied in a paper recently presented to the Royal Society. Mr. Aitken begins by saying that two solutions have been offered of this puzzling problem—the one explained the color as due to reflection of small suspended particles which did not reflect the lower rays of the spectrum, and the other, that the color was the result of the absorbent action of the water itself upon the white light, before and after reflection of these particles. The latter theory Mr. Aitken holds to be the true one. The smaller the number of white reflecting particles the darker or greener the water appears to be, Mr. Aitken having been successful in turning the still green water of lake Como into a bright blue by scattering finely divided chalk in the middle of the lake.

How to Increase the Light of Gas Flames.—Mr. W. Lacellee Scott, lately stated that he had arranged an ordinary fish-tail burner at an angle of from 60° to 45°, and allowed finely divided alkaline earths to percolate through the flame; and he found that without any increased consumption of gas, a fairly marked increase of light resulted. The mean results of several experiments were as follows: With a normal flame of 16 71 candles, the addition of pure lime gave 17.95, of magnesia 17.13, and, curiously enough, of an intimate mixture of lime and magnesia, a larger increase than either separately, namely, 18 23. The same mixture, with the addition of 10% of another earth, gave 18.34. With a specially constructed Argand burner, the flame being conical, the light was raised from 62.4 candles, burning gas alone, to 67.3 with the addition of lime only, and with lime and magnesia to 68.5.

Disintegration of Tin.

The question of the real causes of the so-called desaggregation of tin remains still an open one. Thin sheets of the metal especially will sometimes, if exposed to the cold for long periods, be covered with blisters, become brittle, fall to pieces and finally to powder. The crystalline texture assumed under the influence of cold has been advanced as the probable cause of this peculiarity, while Prof. Rammelsberg suggested a dimorphism of tin based on investigations which revealed a decrease of specific gravity in the desaggregated tin, the common specific gravity being 7.29 and that of this modified tin only 7.14. A case was reported in which good commercial tin with the usual amount of .3% of lead was, during its transport from Rotterdam to Moscow in a very cold winter, changed into the gray powder described by prior observers. Discussing this and other occurrences, it was pointed out that continuous vibrations, such as would result from variations of temperature, probably exerted considerable influence in promoting phenomena as here mentioned. The following remarkable occurrence, however, clearly shows continuous concussions are not absolutely necessary to produce this phenomenon. In a corner of a window in Freiberg cathedral, that had been built up for a long time, a wooden box was found which, when opened, not without some shaking, showed the fragments of a tin medal and ring, small pieces af a reddish-gray color with the surprisingly low specific gravity of 5.8. In this case, as in the others mentioned, a metal with the usual brightness, specific gravity and other qualities of tin were reobtained simply hy heating the gray pieces to the temperature of boiling water. At present, attention is drawn to this phenomenon hy an observation of Mr. W. Markownikoff, of Moscow. Some of the tin cans kept in a cold room in one of the government buildings at Moscow showed blisters, then holes and finally fell to powder. Once set in, the process could not be stopped hy removing the cans to a warm room; the destruction ceased, however, if the attacked spots were cut out. None of the cans in use exhibited this desaggregation. Mr. Markownikoff thinks that more or less rapid cooling predisposes the tin to this decay, which is favored hy low temperatures.

Interesting Meteorological Collection.—Prof. F. Mandoj, of Albano, Italy, recently described a meteorological phenomenon which he observed at Noci, a village between the Adriatic and the Gulf of Tarentum. The sky, which had been clear the whole morning, with a cool and pleasant breeze, began to darken soon after noon, with clouds indicating a storm from the south. About 4 o'clock other clouds came rapidly from the northwest, from which a gentle rain fell. The south wind soon increased, driving its clouds before it, and accompanied by a violent rain and numerous terrible peals of thunder. When the clouds from the south passed those from the northwest, the flashes passed between the strata of cloud so rapidly and yet so silently as to produce the appearance of majestic columns of light, lasting in some cases as much as seven seconds. Prof. Mandoj supposes that the two clouds were charged with electricity of the same kind, but, as they were moving in different directions, they might he compared to an immense electrical machine, of which the upper cloud was the conductor, the lower the disk, and the wind the motive force. The moisture of the air served as a conductor for a continuous silent discharge of the electricity that was induced by the motion of the clouds. In order to test his theory, he connected an electrical machine with an insulated disk. Upon electrifying the disk with electricity of the same kind as that of the machine, and moistening the air between the disk and the ground, while the machine turned rapidly in a warm and dry air; he produced columnar flashes similar to those of the storm.

Effect of Manganese on Brass.—An alloy containing 70% of copper and 30% of manganese is employed in Germany as an addition to brass and bronze, in order to increase the density, the tenacity and the ductility of those metals. The manganese, in consequence of the ease with which it oxidizes, prevents the formation of the oxides of copper or tin, which, in the ordinary process, alter the nature of the product. The employment of metallic manganese is also recommended for the same purpose. The addition of from ½% to 1% of the manganese, or of from ¾% to 3% of the alloy of manganese and copper, produces castings without blow-holes. A larger proportion of manganese hardens the metal and gives to the bronze properties similar to those of steel.

Metallic Designs on Glass Obtained by the Aid of Photography.—An ingenious method of obtaining mirror-like designs on glass has been devised by Leclerc. The glass, having been silvered by the chemical process, is coated with a thin and uniform layer of sensitive bitumen, and this is exposed under a transparency, the next step being to wash away the unaltered bitumen with oil of turpentine, so as to leave the bituminous design on the silvered glass. The application of moderately strong nitric acid removes the silver, excepting where it has been protected by the bitumen, so that the metallic design shows like a mirror from the reverse side of the glass. The plate may be backed by paint or any other suitable material.

The Mining Share Market.

There has been a little spurt in mining stocks within a day or two, through it has not amounted to much. As to Comstock matters, Supts. Patton, Taylor and Forman, the committee appointed to draft plans for draining the flooded mines, have agreed that the cheapest and quickest, therefore the best, plan of draining the mines, is to move the Belcher pump and set it up at the Yellow Jacket shaft. The pump can he removed, set up and put in operation in about four months. Meantime the Yellow Jacket pump will have lowered the water to the 2300 level, which, it is said, may readily he done. The Belcher pump will then he ready to join in, and the two pumps will make very short work of the water. Also, while the Belcher pump is being set up, a drift will he run to connect the Belcher mine with the Sutro tunnel. This drift will he run from the nearest point on the south branch of the Sutro tunnel to the Belcher openings, and will he utilized in freeing the lower levels of water.

Dividends this month from prominent incorporated mining companies have amounted to $427,250, as against $457,000 for same month in 1881. Those companies paying this month were the Black Bear, Bulwer Con., Contention Con., Copper Queen, Deadwood Terra, Eureka Con., Homestake, Idaho, Northern Belle, Ontario, San Francisco, Silver King and Standard.

In the old bonanza mines work is going on as usual and at the usual points. Connection will shortly he made on the 2300 level between the Best & Belcher and the Con. Virginia.

At the Savage they are now getting into interesting sections of ground, both on the 2400 and 2200 levels. The Hale & Norcross, Chollar and the Potosi are vigorously exploring ground wholly new. In one or more of these mines ore is liahle to he found at any time.

The Mexican drifts on the 2700 level will soon he connected. They are now so close together that it is necessary to use some precantion in hlasting. This very important connection will undoubtedly he made within a few days. When it has been made, the work of exploring the ore cut some time since will he resumed. It may yet prove to he the continuation of the hody found on the 2500 level of the Union. The north drift on the 2900 level of the Mexican is fast moving up into this region.

THE city of Richmond, Va., will be 100 years old on July 3d, and is thinking about a celebration.

More Debris Suits.

It would seem, after all the time, trouhle and money spent on the famous Gold Run suit, that the Sacramento people might wait until that was settled before hringing new suits. The Gold Run suit has been argued and is now under advisement hy the judge who tried it. The case was well known to be a test one, and is so recognized hy hoth sides. Now, however, new suits are to be instituted, since Sacramento's Supervisors, hy a vote of four ayes to three noes, adopted the following:

Resolved, That George Cadwalader, our special legal counsel, institnte and take the necessary legal steps to enjoin and restrain all the hydraulic mines and mining corporations from nsing the hed of the American river and its trihutaries as a place for the deposit of their tailings or mining tiehris, also all the hydraulic mining companies operating on the Cosumnes river, from using the hed of Cosumnes river for the deposit of their tailings and debris in said river.

"The effect of this resolution," aptly says the Grass Valley *Union*, in commenting on it, "if injunctions can he obtained, will stop all kinds of mining on the American and its trihutaries—har and hank minings as well as that generally designated as hydraulic, where a large quantity of water under pressure is used. Bank mining on the American has been carried on for 30 years without interruption, and the only way in which such claims can he worked is hy tailing into the streams. These are generally owned hy individuals or partnership associations, and not hy large corporations, and they could not afford, of themselves, to defend in expensive suits. The proposition to hring a series of suits against the miners has a look of maliciousness on the part of the anti-debris people of Sacramento county. An important suit has been tried, and a decision is pending, in which the right of miners to use the streams for tailings is involved. It is an important legal question, and the final decision will establish the rights of all parties. Why not wait for the outcome of this case, instead of hringing a multiplicity of suits that can only resnlt in vexing defendants, proving very expensive, and creating further embittering feeling."

W. A. NEWELL, ex-Governor of New Jersey, and now Governor of Washington Territory, has hcen appointed President of the Seattle, Puget Sonnd and Bay Harhor Railroad and Transportation company, now about to he huilt along the Pacific coast in Washington Territory.

MINING SUMMARY.

The following is mostly coudensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

POTOSI.—Amador *Ledger*, April 22: Tbis miuo was shut down, temporarily at least, on Saturday morning. The mill was kept running for a few days longer. The state of affairs seems to he that so far the ore has net yielded sufficient gold to pay. It is claimed hy some that in previous runs a large percentage of the gold has been lost. In order to test this theory the last run was made under the supervisiou of another experienced millman, and on the clean-up will depend whether the mine will start up again or not. Parties interested left Saturday morniug to consult with other stockholdera in regard to the future course.

BUTTE.

SALE OF MINING PROPERTY.—Oroville *Mercury*, April 21: In November, 1880, E. M. Woodman, J. J. Wichmau, C. H. Rollins and John Bovey located the Baranka quartz ledge, situated about 3 miles west of Enterprise, near the Mooretown road, in this county. This claim they developed by tunnel some 200 or 300 ft in length, which disclosed a vein about 4 ft wide. A 4-stamp mill, no ey water, was erected and the rock crushed, which paid $17 a ton. Recently this property attracted the attention of Messrs. J. F. Knox and I. R. Hall, of San Francisco, who made an offer of $10,000 for it, and the property changed hands, the last figure on Monday last, having been negotiated by Major A. P. Jones. We learn that a company has been formed and incorporated, under the name of Baranka M. & M. Co., to work the mine, and that operations will forthwith hegin upon a more extended scale than formerly. The mine is highly spoken of by all who are familiar with it, and, as the new owners intend to work it for its merit, it will no doubt add materially to the bullion product of this section in the near future. The purchase includes a ditch about 1½ miles long, which conveys water from the South Fork of Feather river to the mill.

THE CHEROKEE STRIKE.—On Friday of last week a notice was posted up at the store of the Spring Valley Hydraulic Gold Co., in Cherokee, to the effect that no wages would be paid employees until the latter part of July or the 1st of August; that employees wishing to stay could get provisions and a limited amount of cash at the company's store, while those desiring to quit work could get their money by calling at the company's office. Nearly all the men quit work that day, but most of them returned to their labors on the following morning, and but very few of them left. There was no serious trouble, and everything is now satisfactory.

CALAVERAS.

MACHINERY.—*Mountain Echo*, April 16: We learn from Supt. Scribner that the Gold Cliff M. Co. has purchased and shipped from New York a steam engine, boiler, track cars and all necessary fixtures for a 60-stamp mill, and, if the ditch company can furnish water enough, they will put up another 40-stamp mill, to be run by water.

LINDSAY & Co. have spent considerable time and money in making the necessary preparations to work their mine to advantage. The present works are located upon the north side of the hill upon which the mine is situated. A track has been laid about 400 ft in length, entering an open cut about 40 ft in length where the tunnel starts, and will have to be run nearly 300 ft before reaching the main shaft. This company has gone to work in the right way to open the mine, and will evidently get well paid for this labor.

WILL START UP.—Calaveras *Chronicle*, April 22: We are informed that the Gwin mine, which has been idle during the winter months, will resume active operations about the 1st of next month. Last Monday men were set to work making repairs and getting things in readiness, which will probably take a week yet to do, when a force of 60 men will he employed and everything set to running. The rock will be taken from the 400 level.

GLENCOE.—Last Saturday we made a visit to the prosperous camp of Glencoe, and everything appeared active and lively. The mills at the time were not running, they had huilt just made a clean-up. Quartz was being hauled to the Nonwich mill, and it was expected to start crushing again in a few days. Prospecting is being pushed vigorously in the Valentine. The San Pedro is being worked. Clark's hydraulic was put in operation a short time ago, in Specimen gulch, and it is at present running in full blast. Lewis & Fairchild are still taking out rock that will pay handsomely to crush in a hand mortar. They expect to mill their rock in June. We predict that they will then make the biggest clean-up ever made in that vicinity. Work will be pushed in the mines of West Point and vicinity in about two weeks.

EL DORADO.

RICH GRAVEL.—*Mountain Democrat*, April 22: Quite recently fine strikes have been made in the Lyon gold gravel mine, at Prospect flat, two miles above this city, and in the Cedar Springs mine, in our immediate suburbs, of enormously rich gold-bearing cement. Both of these mines belong to a Boston company, and are under the superintendency of Capt. Samuel Hutchinson. Although the two mines are but a short distance apart, the gold they produce and the cement in which the gold is found are of a widely different character. The cement from the Lyon mine is clayey, and light gray in color; that from the Cedar Springs mine contains more sand, and has a reddish tinge. The gold in the former is found in exceedingly fine particles, thickly disseminated throughout the cement; the gold from the latter is coarse, the particles averaging about the size and generally bearing the shape of cucumber seeds, but ranging from the size of an ordinary pinhead to pieces weighing a half ounce or more. We have been permitted to inspect chunks of cement from the Lyon mine, 8 to 10 inches across in either direction, and where the surface has been made smooth and sleek, by contact with a bowlder, streaks of fine gold, 1 to 3 inches across, may be seen meandering like a stream across the masses. Chunks of cement have been taken from the Cedar Springs mine, from pieces of which, about the size of a man's fist, and weighing about a pound, coarse gold to the amount of $12 to $15 has been picked out with the point of a knife-blade. It is not considered extravagant to estimate that there is cement being taken from either of those mines that will yield $20 a pound. From present indications, we anticipate that within a short time crushings will he made at these mines that will surpass, for a single day's output, anything that has ever been witnessed in these parts.

ONION VALLEY.—Georgetown *Gazette*, April 21: The Onion valley miners are beginning to return to their claims. The snow is yet some 2 ft deep on all but some favored sunny slopes, where some of the mines have already been started up. The season will be a much hetter one than last for a free water supply, as the snow fall has been fully double.

SPANISH DRY DIGGINGS.—A great part of the time during the past winter, when the weather permitted, prospecting has been carried on in this district, with varied success, but generally favorable, for there are very few spots around here that do not show gold, and now that hetter weather is apparently with us, the prospector is rigorously at work—all the indications showing that life, activity and prosperity will once more hold sway, as they did in former days, bringing this favorite old mining camp again to the front.

INYO.

HOPE.—Inyo *Independent*, April 20: Reports reach us of the discovery of an immense mineral ledge in Wild Rose district, 81 ft wide and assaying 60 ounces per ton in silver. Fitzgerald intends putting a mill there as soou as his present Modock run is completed.

GOOD.—Whether mining business in this part of the county amounts to much or not this season, it is ovident

that there will be an immensely increased output of bullion from Beveridge, Darwin, Lookout and Panamint probably more than ever before in any one year.

Ivy Springs.—Messrs. Greenly & Broder are at work again sinking the shaft on the Indian Scout, with the most encouraging results. They have built a trail directly across to the mines from McMurry's ranch. The Half Dollar boys have developed a splendid body of ore in their shaft. Mr. Ellsee is getting out a lot of rich ore for shipment to the reduction works at Dayton.

Kearsarge.—Mr. Ward and his co-workers, who are rebuilding the old Pioneer mill in Kearsarge district, will have entirely completed the road by the middle of next week. The Kearsarge grade has been put in good order. Considerable parts of the mill are in place, and the new 20-ft water wheel will be finished within two weeks after the arrival of the necessary lumber, so that Mr. Sullivan intends having the works ready for operation about the middle of May. Several lots of ore will be worked, besides the Kearsarge tailings. Todd & Clinton have added 15 ft to the depth of the winze in the Kearsarge tunnel, making it about 120 in all. Both ore and mill found the same body continue to the full depth of 50 ft more there will yet be lively work on the big mountain.

The Modock.—Up to the 13th inst. the amount of ore delivered at the Modock furnace was 309 tons. Ore chutes at mine are all full. The 300 level of the East Lookout, north drift, is all ore of high grade. The old Confidence stopes are yielding the usual amount of ore. The prospect drift from the blacksmith shop is in 75 ft, and shows a little carbonate in the face. The furnace will be fired up at 6 o'clock A. M. May 1st.

Snow's Canyon.—Joe Le Cyr's big team was in town yesterday, loading with grain for Darwin and Snow's canyon. We learn that mining operations are being very considerably revived in the latter district. John Eddy, who has the mill and mines under lease, has about 15 men working the different claims. He reports a strike in the St. Louis mine, of an ore vein 2 to 4 inches in width of immense richness—from $12,000 to $14,000 per ton in gold.

MARIPOSA.

Good Ore.—*Gazette*, April 22: Col. Swalley and Geo. Schofield, who went out to the mine on Whitlocks yesterday, returned, bringing with them specimens of ore taken out some 20 years ago, which had been thrown aside with other refuse rock. The character of the rock is the same as that taken from some of our best mines, and it stands to reason, judging from the specimens shown us, that the rock selected must have been good, or so much labor and milling would not have been done at the time.

NEVADA.

Work.—Grass Valley *Tidings*, April 22: The Gray Hound company is pushing work forward with a vim out on their claim, on the north side of Alta hill. The Gray Hound was formerly the Jenny Lind diggings, and was worked with the view of striking gravel. There is a good quartz ledge on the claim, which will shortly be reached. Work on the O'Connor mine is going steadily forward, both tributers and millmen being constantly employed. Good rock is being taken out for milling by a tribute party. It is expected that the mill, which will be almost new, will be ready in about 5 weeks. The Town Talk gravel mine is being worked with energy and it was expected that gravel would be reached last night. This claim is located at Sutton's ranch, and promises are very favorable. There is an upper tunnel on the property 650 ft in length, and an incline in this 30 ft in depth in which a good bed of gravel was struck, but on account of water, work had to be abandoned in the incline. Another tunnel was run a distance of 700 ft and an incline 62 ft sunk from which an upraise is being made to strike the gravel. The Idaho is keeping up its regular lick of turning out gold. The ledge is somewhat improved in quality since our last statements. A new shaft is being sunk on the Ontario mine. Rock in the first shaft became so hard that it could not be worked, hence the new shaft, which is an incline one. The imperial Co. are still working on Deer creek. The ledge will shortly be cut. The Empire is looking as well as it ever did, and it is one of the oldest-worked mines in the district. The mill is running night and day on good ore. The New York Hill mine is improving. The ledge looks much better than it has of late. The ledge in the lower level is widening out and is of good quality.

PLUMAS.

The Bio Pipes.—Plumas *National*, April 20: Orr & Co., on Hungarian hill, have started up, and now have plenty of water, with acres of pay gravel to work on. They should make a splendid run this season. The Plumas Water Co. is also piping, but their water has so far been a little short, the cold weather having kept it back. They will have plenty from now on, and the big banks of snow in the mountains promise a good season yet. Many of the smaller hydraulics will soon start up.

Southern Eureka Mine.—Greenville *Bulletin*, April 19: Yesterday a chimney of very rich ore was struck in the Southern Eureka. Picked up at random on the dump, any piece of the rock shows rich.

Taylor-Plumas Mine.—This mine continues to develop a good wide ledge of rich ore. The gold is not found so much in bunches as before, but is diffused through the entire mass of ledge matter. There is now a good assurance that the erection of a 20-stamp mill will soon be begun.

Cherokee Mine.—On Sunday another battery of 5 stamps was started at the Cherokee mill. The plank road to the mine is now clear of snow and ore can be hauled easier and at less expense than ever before.

The Reservoir.—The water in the reservoir is rising steadily every day, against a full head of water flowing out in the ditch. An immense body of snow is still back on the mountain sides and is melting but slowly, owing to the clear weather and cold nights. Last year the snow was gone by the 1st of March; this season it will not be all gone before the end of May, unless heavy rains should come—something very unlikely to happen. The slow filling of the reservoir is very favorable, as the incoming water brings down but very little sediment and gives time for the new work to settle thoroughly solid.

Green Mountain Mine.—Visiting Green Mountain on Friday everything about the mills and mine was seen in excellent order. The daily cleaning of the plates is giving an excellent yield of amalgam; no retorting had yet been done since the lats start, but there was then a large amount of amalgam on hand, and, after the first general clean-up the produce of the run would be retorted and a large amount of bullion obtained. In a conversation with Mr Frank Rogers, the mine foreman, he confidently asserted that there was ore enough assured now to keep the mills running for the next two years without hanging up a stamp for an hour. The company has sent on two recently patented amalgamating machines, which will be put in position and started up as soon as possible; the machines are small and very little power will be needed to run them.

SAN BERNARDINO.

Calico Notes.—Cor. San Bernardino *Index*, April 22: The general feeling is that this is to be the best and biggest camp in southern California. More work is being done than at any time before, and nearly every man who wishes work has a chance to get good wages. The King Co. has now a well-developed mine, and under the direction of Sam James, is taking out and shipping the best ore that has ever been taken out of the mines. They have 12 men at work on the mine, and have a 3 ft body of ore that will mill in the neighborhood of $1,000 per ton. The drifts in the tunnel are showing good bodies of pay ore throughout their entire length. Their superintendent is the right man in the right place, and by his untiring exertions he has developed a prospect until it shows a mine of fabulous richness. The ore taken out has more than paid the expense of opening, and thousands of dollars' worth of ore now lies on this dump, awaiting shipment. The Moscow mine, which has been but little worked of late, is now being opened in good shape. They have 10 men at work, and are shipping ore to Somers' mill, which is about ready to run. The Oriental Co. has work going on in two of its mines, and it is rumored that it expects to purchase other property and erect a mill near the mines to work their ore. The Little Bonanza Co. are putting men at work, and intend shipping ore to Gra Grande.

SIERRA.

A Valcabe Mine.—*Tribune*, April 20: The Secretary of the Sierra Buttes Co. reports the result of the working at the Plumas-Eureka mines for February, as follows: Sierra Buttes mine—Total receipts, $24,373; total working expenses, $17,933. Plumas-Eureka mine—Total receipts, $26,062; total working expenses, $18,310. The Plumas Eureka clean-up for January was as follows: Total receipts, $35,173; total working expenses, $18,909.

The Wisconsin Owing to the hard rock that it has been necessary to contend with, progress on the tunnel of the Wisconsin mine, which is located in Caribou ravine, has been very slow. The parties who have the contract of running the 500 ft of tunnel do not expect to finish the job before fall, at best. At present the rock is somewhat softer than has heretofore been encountered, but there is no telling how long it will last.

Scales Diggings. The Fairplay M Co. commenced work on the 29th ultimo. About 25 men are employed at that mine. Joe Dean & Co. employ about 16 hands at their claim, and the Union Hill Co. furnishes work for from 20 to 25 men.

TRINITY.

Water.—Trinity *Journal*, April 22: Mr. E. M. Benjamin, mining superintendent, started for San Francisco Friday morning, on business connected with the mines in Junction City district, of which he has charge. We learn that Mr. Benjamin will make arrangements for bringing more water to the mines, and that the work will commence in earnest as soon as he returns.

From Deadwood. Alex. Love and George Hackett have been off for a week's visit, taking in Lowden's ranch, Lewiston, Deadwood and Jake Paulsen's. Alexander tells us that Deadwood quartz is very rich, and that there seems to be plenty of it. The richest he saw was in the Gibson Bros.' tunnel. Supt. Lambart has his mill running in good shape, and is making money fast.

New Riven.—Water is very high, and miners here are making up for lost time during the last three months. So far as heard from, clean-ups thus far have been good, though no one, as yet, has begun to bottom up, and everybody is of the opinion that the present season will be better than the average. The Portuguese Co., on Big flat, last Saturday made a clean-up of 20 ounces from a ten days' run in the upper claim; in another month they will be through ground-sluicing for the season. Carson & Donald will begin to work the bottom in a week. They have sluiced about half the depth of their bank, and this has cleared their expenses for the whole season, and whatever they take out between now and 1st of August will be clear profit. Some of the men who worked the bed of the river on North Fork last summer, with such good results, have again come back, and will put in a wingdam as soon as the danger of its being taken away by any sudden rise is past. S. F. Taylor, on behalf of parties from the city, has bought Mr. Owin's claim on China creek, two miles above Hoboken, and has a force of men at work digging a ditch to bring a good head of water on it. Mr. Brizard's pack train is expected in a few days from Arcata with hydraulic pipes and giant, which will be put in position as soon as possible, as Mr. Taylor is anxious to prospect the claim well before the season's water gives out. There is also considerable talk of renewing operations at Hoboken. Another project spoken of is that of taking water out of the North Fork, high enough to cover all the bars below the forks, including Big flat, Rattlesnake and a dozen other bars that prospect well, but most of which have never been touched for want of water.

TUOLUMNE.

Rappahannock. *Union Democrat*, April 22: Hoisting works in the Rappahannock mine were completed this week. J. A. Davis, the owner, will take the management. He is building a house, and, with his family, will remain until the mine is in thorough working condition.

NEVADA.

COLUMBUS DISTRICT.

Northern Belle.—*True Fissure*, April 22: The mine has shown but few important changes during the week. The main drift on the fifth shaft level has been extended 23 ft, the total length being 57 ft. The formation in the face of the drift is somewhat harder, and showing more quartz. The other shaft levels present about the same appearance as at the time of last report. The yield of ore has been about 57 tons per day. Both mills are running steadily, and are doing the usual amount of work. Bullion shipments amounted to $16 925 13 for the week ending April 20th, and aggregate $37,043.63 to the same date.

Mount Diablo.—The stope above the east drift on the third level does not show quite so well as at the time of last report. The stopes on this level from the west drift, and near winze No. 1, are showing a smaller amount of ore. The ore in the stopes from the second and first levels is much smaller than a week ago, and is of such low grade that it will not pay for the extraction and reduction. It assays about $40 to $50 per ton. There will be ore enough to keep the mill running the balance of this month, but probably no longer. Bullion amounting to $7,899.06 was shipped on the 15th inst., and $6,159.05 on the 18th.

General Jackson.—Work is progressing on this property, and a drift is being run west from the first level of the Silver shaft. Some small veins of chloride are being found as the work progresses.

East Mount Diablo.—The north crosscut is now in 55 ft, and in favorable ground. The south crosscut is in 22 ft from the main east tunnel, the face of which is looking well.

CRABB DISTRICT.

At Work.—Cor. Esmeralda *Herald*, April 22: A correspondent of the *Herald*, writing from Crabb district, under date of April 9th, says: The ditch for conveying water from East Walker river to run the mill, which is soon to be built for the district by H. N Thompson, is completed, and the men have commenced work on some of the mines. Mr. Crabb has three men at work on his Eagle Bird mine, extracting rich ore. This mine is looking well. Crabb says some may tell, on account of prejudice or spite, that this district is a poor one, or there are nothing but blanket ledges in the district, but that will not stop the work, neither will it keep the mines from paying. The work will go on all the same. The Eagle Bird mine cannot be beat in the country, for the amount of work done on it.

ESMERALDA DISTRICT.

The Camp.—*Herald*, April 22: The stormy weather of the past month has retarded the progress of mining and milling to a considerable extent. Although we did not have much snow, the roads were so soft that it made ore-hauling suspend, and the storms were so frequent that they prevented operations on prospecting claims, as the men could not stand at the windlass; but, notwithstanding the inclemency of the weather, some of our mines have made considerable progress. The season has now arrived when we can expect every morning to be a brighter one, and we hope the next thirty days will develop something of interest to chronicle. During the coming week the Silver Hill and Lewis Con. companies expect to commence extracting ore and opening up their mines. Both properties having very rich ore, we can expect developments at any day, whilst they are working, which will increase their value ten fold. The Humboldt West promises to be very profitable to the company. During the past 12 days they hoisted about 200 tons of ore, with 6 men, which is about 4 tons per day to each man, making the cost of breaking and hoisting a very little over $1 per ton, which enables the company to extract and deliver their ore at the mill at a cost of about $2.50 per ton. Their facilities for milling are such that the cost of reduction will not exceed $4.50 per ton, making the total cost of extracting, hauling and milling $7 per ton, which is a very great reduction from the workings of early days (thanks to ex-Governor Blasdel), when the miners had to pay $25 per ton for milling, and it is plain to us that the ores of the Humboldt West will pay a handsome profit over mining and milling. The owners of the Centennial property are busily engaged sinking on the ledge, which continues to improve in appearance with each blast.

EUREKA DISTRICT.

The Monumental Tunnel. Eureka *Sentinel*, April 20: The Monumental tunnel is situated on Prospect mountain, piercing it east of its highest point, and running due east and west. It has on the north contiguous to it two producing mines—the Fourth of July and the Excelsior; on the south it adjoins the Burning Moscow and the Secret Canyon T. & M. Co.'s claims. It is about 1 mile north from the Geddes & Bertrand and the Irish Embassador. The formation is similar to that of the Geddes & Bertrand. It is evidently on the same belt with the Geddes & Bertrand, Eureka Tunnel and other important claims. The Monumental tunnel has been run 115 ft into the mountain. Good indications were found all the way along, and at this point a seam or stringer of galena ore, carrying streaks of black metal, was struck yesterday. The ore has not yet been assayed, but it is evidently a good prospect. It was found in the face of the tunnel, and has not yet been penetrated, hence its dimensions cannot be known. The surface ground above the point of the strike shows a ledge which crops out across the tunnel 100 ft in width. This ledge is the same that was struck below. It is approximately estimated that the distance from the apex of the mountain to the tunnel level is 1,400 ft; the distance on the surface from the base to the apex is 1,800 ft, and the distance from the mouth of the tunnel to a point directly under the apex in a vertical direction is about 1,600 ft.

LEWIS DISTRICT.

Betty O'Neal.—Lewis *Herald*, April 19: The Betty O'Neal is fast coming to the front as the "dark horse" of Lewis. The stopes throughout the mine are working splendid; 6 to 7 tons of rich ore are being extracted daily, which yield could easily be increased. In the south lower level the ledge is now over 6 ft of good milling ore, with stratas of ore running through the ledge, some of them 7 to 8 inches in width, that will assay in the thousands. The ore on the dumps attracts the attention of all passers; it is almost all specimens. We would be glad to see arrangements made to reduce this ore, as we are confident that a large bullion output would be the result.

Morning Star.—The contractors on the Morning Star are making good headway with the Morgan incline.

Starr-Grove.—The pumps are kept running at the Starr-Grove mine, and the water will be kept out till further orders.

ARIZONA.

Groom Creek.—Prescott *Courier*, April 17: Gentlemen who visited Groom Creek district, 6 miles south of Prescott, yesterday, returned last evening well pleased. Mr. Merrington is happy. His new mill has, so far, done good work. An assay of tailings afforded but $2 per ton, so that both free gold and sulphurets have been saved. Assays of concentrations showed that they are worth between $900 and $1,000 per ton. They will, in all probability, be shipped to San Francisco or the East. Another stamp will shortly be added to the mill; it will do custom work and be of great benefit to this part of Arizona.

Bully Bueno.—Arizona *Democrat*, April 15: Mr. Oliver Perry, a gardener and a miner from the old Bully Bueno camp, on Turkey creek, gives a favorable report of the prospects on the creek. Henzey & Co., at the old Bully Bueno mill-site, are getting their mill in condition to start up, and have let a contract to sink 100 ft on the Imperial mine owned by them. If they rig up the mill so as to work custom ores, the old camp would be lively once more, as there are several very promising gold and silver veins near the mill. For instance, the Morning Glory, Yahoo, Holy Terror, Capital, Richmond, Trinity, Impe ial and enough others to make a lively place if the proper facilities for reducing ore are furnished.

COLORADO.

Robinson.—*Mining Gazette*, April 10: For the fiscal year ending March 1, 1882, the net production of the Robinson mine was $1,214,802 50; that is, the company received that amount from ore buyers for the product. The disbursements were as follows: Operating expenses, $416,701.66; purchase of smelter, $87,500.00; paid in settlement of Jacque suit, $100,000.00. Dividends $450,000; expense at New York office, $27,391.37; total, $1,141,596.03. In addition to this sum is an item of $31,000, advanced to Geo. Daly during his management by smelting companies and charged to mining expenses. The strong point in the report is the fact that the operating expenses at the mine consumed less than one-third of the product. While the sum paid for the smelter is properly chargeable to the mine it adds nothing to its value. The $160,000 paid in settlement of the Jacque suit is also chargeable to the property and was a judicious payment. These two sums aggregating nearly $250,000 were paid from the net earnings during the year, and represents an amount which might have been added to the dividends, hence shareowners ought not to waste their strength in useless kicks. It is reasonable to assume that the operating expenses this year will be increased, as the output must come from deeper levels, but so far as one year's history of a mine can be used as a criterion to judge of its future, the out ook of the Robinson is full of promise.

IDAHO.

Wood River Jots.—*Miner*, April 15: The Moffit & Irvine group are located on Warm Spring creek 12 miles northwest of Ketchum and were discovered and located by E. H. Moffit and Robert Irvine, who disposed of them to Col. E. Greene of the Philadelphia Co., about 2 weeks ago, for $40,000. The properties show large deposits of high grade ore, and are a bargain for the purchasor. Six men are now working the claims and are supplied with provisions, powder, fuse etc., by 2 men who make a trip every day between the mines and Ketchum, carrying supplies on hand-sleds, over the mountains. The new acquisitions to the Philadelphia Co.'s properties will receive as rapid development as is practical.

Supplies for the Muldoon.—E. E. Robinson, John Conner and Tom Covert have taken out a month's supplies from the store of J. G. Swift & Co., of this city, to the men working on the Muldoon mines, for the Philadelphia Co., of which that incomparable organizer and able business manager, Colonel E. Greene, is general superintendent.

Another Stack for the Ketchum Smelter.—The second stack for the Ketchum smelter, the property of the Philadelphia M. Co. is on the road from Kelton at this date, and is expected in Ketchum about May 1st. It is thought by those having the management of the smelter that the new stack will be in place and the smelter blown in by June 1st, at the latest. This will make the Ketchum smelter capable of running out 40 tons of bullion per day of 24 hours.

Still Another Sawmill.—A big sawmill outfit is on the road from Kelton to Wood River. It is to be put up some 6 or 8 miles above Hailey, and run at once. We have not learned to whom it belongs.

Hayden at Work.—Idaho *World*, April 18: F. Hayden has been running the pipe nearly 2 weeks in his claim between here and the Warm Springs. The ground below the road is being run off for the purpose of forming dump for that farther up. Moore creek the past few years has filled up with tailings so that the bar is almost level with it, and work is therefore being carried on under great disadvantages. Six hands are at work, most of them engaged in wheeling out, as the bedrock is so flat that the pipe does not work very effectually.

The Forest King.—The Forest King mine, situated about 9 miles northeast of town, continues to show up in splendid shape. Five men are at work stoping an excellent grade of ore. One hundred and twenty tons are already on the dump, and it is the intention of the company to increase the amount until about the last of May, when they will commence shipping to the Sub Rosa mill. Seventy tons of the same character of ore were milled last year and returned a yield of $45, to $50 per ton. The present works are 180 ft from the surface, and at this point the ledge is 22 ft between walls, and the main pay streak is 3 ft in width.

MONTANA.

A New Syndicate. *Inter-Mountain*, April 17: With much pleasure the *Inter-Mountain* informs the public that all doubt as to the immediate future development of the Mountain Con. property has been dispelled. Without going into the particulars of the arrangements, it may be stated that R. C. Chambers, of Salt Lake, and Messrs. Moore, Collingwood and Atwood, of New York, have perfected an agreement to take 175,000 shares of the working stock; that Mr. Walter McKay has been appointed superintendent of the mine, and that energetic operations will be resumed without delay. This information is important for it presages the erection at an early day of another 10-stamp mill in the Butte district. The substantial merits of the Mountain Con. are well known to our readers, and with Mr. McKay in charge of the work of exploration every confidence may be indulged as to the successful future of the company.

The Liquidator.—The Liquidator is a copper property lying east of and adjoining the Colusa. It is owned by Warren, Belk, Foster, et al., and has been under lease for several months to Wm. McDermott, who also had a bond on one-half of the mine. The showing made in the shaft, indicates the ore body to be extensive and to all appearances permanent, and the ore is of sufficiently high grade to insure a good profit over and above the expenses of operation. The lessee is so much encouraged by the appearance of the property that a few days ago he paid $6,000 for 2 quarter interests, and an attempt will be made to induce the parties who own the other half interest to put up their share of money necessary for the thorough development of the mine.

NEW MEXICO.

The Santa Rita Copper and Iron Co.—*New Southwest*, April 15: The mill of the company is working very successfully upon the Santa Rita ores, and now running regularly. It is found that the coarse copper as saved and cleaned up from the batteries twice a day, is running 95% fine and of sufficient purity to ship direct without smelting. The number two concentrations from Jigs run 95% to 75% fine copper, and the number three or slime concentrations run from 30 to 40% fine; both number two and three concentrations go to the smelter. Owing to the nearness of the smelter to the mill and the danger of fire, it has been found necessary to remove the smelting site, which has necessitated a stoppage in smelting of about 2 weeks. The smelter turned out in a few days from 15 to 20 tons of very fine copper, and the company is making its first shipment of 2 carloads of ingot copper to New York. Owing to the large quantity of ore ready for stoping and milling in the Romero mine, the company has suspended mining from the Guadalupe for the present, or until its milling facilities are increased. The company is completing its plans at the new smelting site to run a second smelter.

Pecos. *New Mexico Mining News*, April 16: Very good ore from the mines on the Pecos continues to come in. There is now no doubt as to the fine quality of the ore of the district, and the only question is whether or not there is enough of it. The miners are all very sanguine on this point, believing that there are large bodies of the mineral in the various leads. This, of course, is a matter of conjecture at present, but the character of the mineral is good beyond doubt. The Gonzales concentrator is reported to be running. Ore is being hauled to it steadily, and is accumulating rapidly. The boom at Bonanza has commenced.

Cerillos District.—Mr. Wolf, who is running the reduction works for the M R & Co., is still crushing ore. He says he will not commence smelting until he is ready to start up for good. He wants to be sure that he can run for at least three months when once under headway. The company has had some trouble in getting its Socorro ore which has also delayed its work to some extent. It is expected, however, that the trouble will be a thing of the past this week. Cerillos station now has 3 good hotels and all of them are filled with guests. The town is growing rapidly, and a great deal of work is being done by the miners. The coal company is a great help to the place, and is working steadily. Carbonateville is growing steadily, but not with as great rapidity as Cerillos. Everybody seems to have plenty of work and business is good.

OREGON.

Notes.—Oregon *Sentinel*, April 19: Dick Cook is now in 115 ft on his tunnel on the old Steamboat ledge. He expects to strike the bonanza now in less than 50 ft..... Green Bros. have not crushed any quartz from the Sugar Pine ledge this spring. They are still getting out a fine quality of rock and intend running a new tunnel to strike the ledge 100 ft deeper than where it is being worked.....A partial clean-up which was very satisfactory was made at the Star Gulch mine this week being nearly 40 ounces.....Sterling is running without interruption as also all the other large hydraulic mines in this and Josephine counties.....The late rains have given another start to miners whose water supply was failing.

WYOMING.

Alma Coal Fields—One of the Great Deposits in Wyoming Territory.—Salt Lake *Tribune*, April 19: Alma, Wyoming, on the Union Pacific, 75 miles east of Ogden, is noted for its immense coal mines, operated by the Union and Central Pacific companies. The former has several mines, which are worked to supply the road with coal, besides selling great quantities in Salt Lake and other cities and towns. Most of the coal used on the Utah and Northern is taken from the Union Pacific mines at Alma. The Central Pacific Co. own and operate two mines there, which are opened up to such an extent that when it is required they can turn out 700 tons of coal per day, but the quantity mined is graduated by demand for operating the road and supplying the shops and office with fuel. At present the output is 500 tons per day, which is taken to the various coal stations along the road, as far as Truckee, California, and is used for making steam to operate 600 miles of road. To mine, load and ship this quantity of coal each day requires the labor of 250 men in and around the 2 mines. The quantity of coal required increases each year, and yet the extent of the coal fields of Wyoming and Utah are so vast as to be practically inexhaustible.

UTAH.

Notes.—Salt Lake *Tribune*, April 23: There has been considerable quiet work going on in Ophir district during the winter, and several of the old mines thought to have been played out years ago, will make a big ore record this season. Utah never made a better bullion showing than it is making now, and the outlook for the mines this year was never so promising. Scott & Anderson shipped nearly 6,000 tons of lead last year. Lead is worth in this market $50 per ton, but as the bulk of lead produced in Utah goes direct to owners East, there is little if any in this market for sale. The Morgan smelter sends about 3 cars of bullion per week to Omaha to be refined. All the ore being shipped from the Bingham canyon mines is reduced at the Sandy smelters. The shipments of ore from the Telegraph west extension to Sandy amounts to 400 tons per month. The Yosemite mine, Bingham, is shipping from 200 to 300 tons of ore per month to the Sandy smelters.

The Comet has a good body of high-grade ore in the face of the tunnel. The parties who took the contract have nearly 20 ft to run yet to complete the tunnel, and the ore is getting better every foot. The owners are highly gratified over the result of what work they have done so far, and, as the mine will pay the working expenses, it will likely be pushed ahead the coming summer as fast as possible.

The Hecla mine, in Bradshaw district, owned by Louis Lessing & Co., is being developed as rapidly as possible, under the superintendency of Mr. Lessing, and promises to shortly be a bonanza. A sufficient working capital is already put up to develop the mine, and it is the intention of the owners to open it up and put it on a paying basis as rapidly as possible.

Italian Rocks and Contained Minerals.

(Continued from last week).

3851. Saccharoid, white marble of fine crystalline structure, exactly like some Cerrara marbles. Pont Canavese (Turin). Val Soana, Graian Alps.

3852. Crystalline, white, metamorphic marble, of large open structure. Maniglia (Turin). Valle della Germagnasce, Cottian Alps. The marble of this vicinity is suitable for making columns, and for various architectural works. But for the distance from a railway station, it wonld he largely employed.

3853. Very fine-grained, white, crystalline marhle, showing the contact with the etrata of mice schist. Pont Canavese (Turin). Val Soana, Graian Alps. The marhle of this locality was employed for the royal tombs in the hasilica of the Superga, near Turin.

3854. Open-grained, crystalline, metamorphic marhle, with slightly yellowish tinge and somewhat lsmellar structure. Mergozzo (Novara). Val d'Ossola, Lepontine Alps. The marble from this locality was employed in huilding Milan cathedral, which is entirely made of white marble, from quarries belonging to the church itself.

3855. Blackish-white dolomite of large crystalline structure, and with rhomboidal fracture, associated with talcose and micaceous schists, as. also, with white marhle. Saore (Turin). Val d'Aosta, Pennine Alps.

3856. Feldepathic, younger gneiss, principally formed of very finely crystalline, grayish-white feldspar and a little quartz. The most celehrated gneiss in Italy. Luserne San Giovanni (Tnrin). Valle di Luserna, Cottian Alps. This gneiss owes its great importance to the circumstance of its heing very easily quarried in immense flags or slahe of comparatively little thickness, suitable for balconies, footpavements and many similar uses. It ie employed in Turin for such purposes, and is invaluable to the citizens, as it never forms mud or greasy slime in rainy weather, like the mejority of flagstones. Such heing its excellent properties, it is likewise sent to many of the great cities of northern Italy, and is even exported largely from Gsnoa to South America. The quarries are very numeroue, and the trade in the gneiss flourishing.

3857. Very fine-grained, greenish-gray younger gneiss, containing hluish-white feldspar and dark greenish mica in minote particlee, together with opeque-white quartz. Torre Pellice (Turin). Val Pellice, Cottian Alps.

3858. Younger gneiss, containing granular white feldspar, very uniformly distributed through the mass of the rock. Angrogna (Tnrin). Valle d'Angrogna, Cottian Alps. This is one of the most heautiful varieties of the Alpine gneiss, and very rare.

3859. Qnartzose younger gneiss, consisting of opaque-white quartz and silver-white muscovite. Beura (Novara). Val d'Ossola, Lepontine Alps. This rock dividee with great facility into large slabs or flags, which are much employed in the large cities of Lomhardy for halconies, etc. It is much softer to work than the very feldspathic gneiss of the Valle di Lnserna, but quite unsuitahle for paving.

3860. Younger gneiss, containing grayish-hrown mica and much opaque-white quartz, often forming small nodnlee in the rock. Sparone (Turin). Valle dell'Orco, Graian Alps.

3861. Very quartzose, grayish-white younger gneiss, containing small crystalline particles of feldspar, opaqne grayish-white quartz and grayish-green mica, also, occasionally, small crystals of hornhlende. Bergone di Susa (Turin). Val di Susa, Cottian Alps.

3862. Pale grayish-blue, banded, feldspatbio younger gneiss, of minnte crystalline structnre. Luserna San Giovanni (Turin). Valle di Lnserna, Cottian Alps. A splendid etone for publie works, for paving blocks or slahs. for parapets, copings of walls, hridges, etc. Quarried on an extensive scale.

3863. Yonnger gneiss with slight tinge of yellow, consisting of feldspar and quartz intimately associetcd. and minute scales of yellowish-green mica. Vayes (Turin). Val di Susa, Cottian Alps.

3864. Banded, gray, micaceous, younger gneiss, showing plainly the planee of stratification. Bobbio Pellice (Turin). Val Pellice (Waldensian valleys), Cottian Alps.

3865. Bluish-gray younger gneiss of finely orystalline structure, divides into immense slahs, along the planes of which are accumulated in large qnantities minute scales of muscovite. Luserna, San Giovanni (Turin). Valle di Luserna, Cottian Alps. A magnificent and ueeful etone for making balconiee aud flagetonee for foot pavemente in citiee, ae at Turin. Employed in all the large citiee of Piedmont, and likewise exported from Genoa to South America (eee sample No. 73).

3866. Iron-gray micaceons younger gneiss, Perrero (Turin). Valle della Germeguana, Cottian Alps (Waldensian valleys).

3867. Gray and yellowish quartzose micaschist. Angrogna (Tnrin). Valle d'Angrogna (Waldensian valleys), Cottian Alps.

3868. Grayish-yellow mica-echist, consisting principally of mnecovite of large lamellar structure, and with silvery reflex. Ricleretto (Turin). Valle San Martino (Waldeneian valleys), Cottian Alps.

3869. Gray mica-schiet, with brilliant silvery reflex. Angrogna (Turin). Valle d'Angrogna (Waldensian valleys), Cottian Alps.

3870 Iron-gray quartzose mica-schist, paeeing into younger gneiss. Angrogna (Turin). Valle d'Angrogna (Waldensien valleys), Cottian Alps.

3871. Pale yellowish-wbite mica-echist, containing minnte crystsle of garnet. Angrogna (Turin). Valle d'Angrogna, Cottian Alpe.

3872. Gray younger gneiss, containing large crystals of bluish-white feldspar, qnartz, often vitreous, and a small quantity of mica. Borgone di Susa (Tnrin). Val di Susa, Cottian Alps. A eplendid, very hard and durahle stone, admirably adapted for puhlic works. Quarried on a considerable scale for such purposes.

3873. Actinolite-schist, containing very minute crystals of actinolite. Valtournanche (Turin). Val Tournanche, Pennine Alps.

3874. Lead-gray micaceous calc-schist. Pont Canavese (Tnrin). Valle dell'Orco, Graian Alps. Quarried for making steps, etc., for architectural purposes. A good, durable stone, of agreeable appearance. It is associated with the crystalline marbles, which lie almost contiguous to it in conformahle stratification.

Crystallioe Rocks—St. Alban's System.

3875. Sienite, containing light puce-colored feldspar, in small cryetals, from the quarries of La Balma Quittengo (Nouvarn), Valle del Cervo, Pennine Alps. This is one of the most durable sienites in Italy. It is employed for paving hlocks, as in Turin, in some cases, especially for crossings of tramways. It is also a splendid ornamental stone for architectural purposes. Contains small crystale of puce-colored feldspar, quartz and hornhlende. Derived, according to Gasteldi, from recent gneiss. It is hy no means an eruptive rock.

Palœozoic Group—Carboniferous System

3876. Slate-hlue argillaceous echist, Conrmayenr (Turin), Val d'Aosta, Pennine Alps.

3877. Bluish-gray, compact limestone, with very irregular fracture; eo mnch eo, that it is impoesible to work it into any given shape, and traversed by veins of opaque-white calcite. Courmayeur (Turin), Val d'Aosta, Pennine Alps. Used for making lime.

3878. Anthracitic coal. La Thuile (Turin), Vallone della Balma, Graian Alps. This coal is from the coal hasin of the Monte Bianco. It is very scaly and conteins much fine dust. When properly washed it is an excellent fuel. Gives 5 830 calorific units, according to Berthier's process. There are eix hede, the principal one of which is 7½ ft. thick. Belongs, in all prohahility, to the horizon of the millstone grit of England and Ireland; that is to say, to the hase of the carboniferons system. See *Jervis I Tesori Sotteranei dell' Italia* (article, Le Thuila) and *I Combustibili Minerali dell' Italia*.

3879. White gypsum of almost compact structure. Forms heds in connection with carhoniferous, cavernous limestone. From the neighhorhood of the Monte Bianco, Courmayeur (Turin), Val d'Aosta, Pennine Alps.

3880. Compact white gypsnm, with colored veine. Courmayeur (Turin), Val d'Aosta, Pennine Alps.

3881. Anthracite coal. Demonte (Turin), Valle del Stuva, Maritime Alps. From the coal hasin of Demonte. Forms five heds, of which one is four ft. thick. From the base of the carhoniferons system, prohahly the equivalent of the millstone grit. Gives 6,239 calorific units. See Jervis' *I Tesori Sotteraner dell' Italia* (article Demonte) and *I Combustibili Minerali dell' Italia*.

3882. Stalactitical crystalline calcite. From the carboniferous limestone. Demonte (Cuneo). Valle della Stura, Maritime Alps.

3883. Massive white quartz, forming immense strata from 200 to 240 feet thick, extending from northwest to eontheaet for several miles in length, and entirely consisting of pure quartz, like this sample. Demonte (Cuneo). Valle della Stura, Maritime Alps.

Appen'ne Region.

N. B.—The Apuan Alps form part of the Appenines; the word Alp does not refer in the remotest manner to the Alpine chain, which is in quite another part of Italy.

3884. Prepalœozoic Group, indistinctly. Pale yellowish-green talcose schist. Cogoleto (Genoa). Riviera di Poriente.

3885. Pale yellowish-white felspathic rock, with talc in minute quantities. Cogoleto (Genoa). Riviera di Poriente.

3886. Pale green chlorite echist, inclosing the copper lode of the Frigido copper mine. Massa (Massa and Cerrara). Valle del Frigido, Apuan Alps.

3887. Asb-gray talcose felspathic rock, heautifully veined. Massa (Massa and Carrara). Valle del Frigido, Apuan Alps.

3888. Gray quartzoee echiet, from the proximity of the copper lode, Frigido copper mine. Meesa (Maesa and Carrara). Valle del Frigido, Apuan Alps.

3889. Siderite of epathose etructure, with a little quartz and chalcopyrites. Conetitute the gengue of the copper lode. Frigido copper mine. Maesa (Massa and Carrara). Valle del Frigido, Apuen Alps.

3890. Pale gray talcose echist, the rock inclosing the lead load. Bottino lead mine. Stazzema (Lucca). Valle del Vezze, Apuan Alpe.

3891. Yellowish-brown argillaceoue echist, from the lead mine of Bottino; the rock in proximity to the lode. Bottino mine. Stazzema (Lucca). Valle del Vezza, Apuan Alpe.

3892. Galena of small cryetalline etructure, from the lode in the talcose schist, associated with argillaceoue schiste. Bottino leed mine. Stazzema (Lucca). Valle del Vezza, Apnan Alps.

(To be Continued.)

A Good Man Gone.

There have been many expressions of respect to the worth of Dr. Hamilton in the newspaper press. The following, by W. C. Bartlett, who knew him well, is copied from the *Evening Bulletin:*

The sndden death of the Rev. Leurentine Hamilton, in his pulpit, in Oakland, Sonday April 9th, is announced with full particulars in our local columns. If the deceased conld have chossn the manner of hie death it probably would not have been different. He preferred to die with the "harness on," in the midst of his labors and in the hight of his usefulness. Since the death of Starr King, it ie doubtful if any other minister dropping out of the ranks could have been more missed from public life. Hie place was larger than his parish or the city where he had wrought so meny years. He was not a pulpit orator, like King, hut he was herdly less a man of the people. There were no hounds to his parish. He was a sort of hishop at large, or, in homely phrase, a town pnmp, to which all could resort. And they did so with great freedom. They called upon him for all eorte of services. The afflicted sought him as the friend and counsellor, the dying preferred that he should say the last words over them. He responded to all sorte of calls, and prohehly knew more about the distress, destitution and the eecret trouhles of individnale than any other man in the community. He had a quick and tender sympathy, and an inexhaustible patience. He was unselfish, with a fresh and almoet child nature—indeed, in the quality of hie natnre, he was a child on one side and a etrong man on the other. He was not worldly wise, knew little or nothing ahout the arts of making money, was not an organizer, and had no special capacity for executive work.

His honesty of speech, and thonght and life were elements of his strong character. He knew nothing about guile or deceit. He trusted others as he would he trusted himself. He abhorred even the color of hypocrisy, and declared his own convictions of truth, as he felt and saw it from time to time. He had little tact, but spoke as one who felt that he hed some message which ought then and there to he delivered, and must, on no account, he withheld. Lacking the graces of oratory, he did not always draw large congregations. His discourses were addressed to thinking men and women, and he eometimes preached over the heads of his congregation. A volume of his disconrsee was puhlished a few months ago, comprising such sermons as he delivered from his pnlpit on Snnday mornings, which, in the range of thought, power of etatement and elegance of diction, entitled him to a place in the front rank of religions thinkers. He refnsss to he hound by any creed of humen construction, and for that reason was often accused of being heterodox. Yet, in many respects, he was the most orthodox of religious teachers, but thinking on a higher plane, and with greater scope to his investigations than hie critice knew. He was once tried by his ministerial associates for technical heresy, but not hy hie "peers," since none who acted as his judges, were his intellectnal equals. A man with snch experiences could not he otherwise than tolerant, and he had at all times the large catholicity which made him willing to fraternizs with all good men who, in their several ways, were trying to make the world hetter by patient and usefnl lives.

It was hecause of this hreadth and catholicity, and thie "tenderness of heart," that so many knew him in what might be called a secular diocese, which at times seems as large as the State. He had been a pioneer and had eeen the rough side of life. He had devoted more than a quarter of a century to work in the mountains and in the valleys. He often eeid that he would like to he a preacher at large, going np and down the coast, ahle to sustain hie work without any drafts upon his congregation, and thonght, in euch a field, with the large freedom and the ignoring of all pecuniary henefits, he might do the best work of his life. The very lack of organizing ability, so foreign often to the scholar and thinker, gave him a singular fitness for this wider field. He was in no way dependent npon the mere accessories of chnrch organization; the heautiful temple and ite appointments never seemed so much to him as the opportunity to utter to thoughtful men and women the thonghts which had heen ripening in his own soul. If he could not raise his hearers to enthusiasm hy fervent oratory, he conld make them think, and that was largely his office as a religious teacher. He planted the seed, believing that eooner or later there would be a fruitful harvest.

It will be a long time before the exact measure of euch a man can be taken. He wae greater and hetter than the community knew. His work was multifarioue and epread ont over a large territory; and it was eo nnobtrusive that many who knew him, knew little of the extent and variety of hie lahors. This work wae the hest seal of hie apostolic commieion. He cared little for the criticisme of those who did not agree with his viewe and methods, though he had a keen sense of the fact that he was often mis-judged. He preferred that his life, his einglenese of purpoee, purity of heart and devotion to hnmanity at large, should furnish hie vindication. And so he wrought patiently through good and evil report—the echolar in his library, much given to hooks; the religioue philoeopher, not afraid of speculative inquiry, if it promised to lead to any important truth; the teacher, earnest and hrave, giving hie beet, and with a modesty which forbade any idea of pride; the missionary at large, subject to everybody's call for counsel, assistance and comfort; the large-hearted citizen, whose plans for doing good alwaye outran his meaus, but who found meny because he had access to many hearts; the friend whose fidelity wae never doubted, and the preacher whose example was as pure and noble as the words which came from his lips. When euch a man departs, the loss of the community cennot be expressed in any terms. It is not altogether a departure, because the beauty of his life and character remain. And so he "being dead, yet speaketh."

The Census and the Forests.

Many of our readere will remember the visit of Prof. C. S. Sargeut to this coaet last summer. He came as a special agent of the U. S. Census Office to obtain information concerning our forests. We recently received some advance proofs of parts of his report alluding to some of the Eestern States, and ere long the Pacific Coest Statss and Territories will no douht be described and forest maps made. The reports which Prof. Sergent has already issued show that great prodigality hae been characteristic of the treatment of forest areas in the United States.

The maps of Michigan, Wieconsin and Minnesota, for example, show with etartling distinctness how repidly the pine woods of the lake region are melting hsfore the ax, and the figures appended enable us to calculate with reesonable accuracy how long the devastation can continue. New Eogland hes squandered her pine, and so have New York and Pennsylvania, and now are drawing upon the final reserve.

In the three states named Professor Sargent estimatee that 82,000,000,000 feet (hoard measure) of merchantable pine remain stending, while the cut for the census year ending May 31, 1880, amounted to over 7,000,000,000 feet. It must he assumed thet the lnmber marketed every year will increeee as the country growe, so that it is safe to assert that when another census comes to be taken there will he no pine forest remaining—or at least none of snfficient extent to make any show on the map. The lake region has heen so thoroughly explored that there remains no chance of discovering any considerable hodies of timher which have not been included in the count. We know just what we have, we know that thie must soon he lost, and we know, too, that no provision hae heen made for any fnture supply. We know that the great hrown areas of Profesor Sargent's maps, which are so rapidly encroaching upon the forest green, represents territory upon which nothing is left but stumps. Small trees and great have been indiscriminately elaughtered. No young trees have been left to grow up to their full girth and stature. The lumher has heen sawed in the most extravagant way, as if the purpose had been to get rid of the forest as quickly as possihle. Timher has been squared in the woods, leaving the ground covered with dry chips and score blocks to feed the fires which have desolated whatever the ax and saw may heve chanced to leave, and burned out of the soil itself its capacity to support pine growth.

It is useless now to mourn over what has been done, although it is plain to see that the snpply of needed pine could have heen sustained indefinitely in growing forests if trees below a certain etandard size had hesn left. But we have forests of other timhsr treee in the Pacific States, of yellow pine in the Sonth, and herd wood in considerable quantities scettered all over the Union. The warning sounded by this report ought to awaken public eentiment and hring about some concerted action for checking this wanton waste of the national wealth. If ownere of woodland fnlly realizsd what their property would be worth a few years hence, lnmhsr would not be exported at a price which barely pays for the lahor of preparing it for market. The Government, too, might be induced to throw some restrictions about the sale of its timber land. And if private owners and Government officers were properly instructed, we might hope for the adoption of some conservative policy, under which our remaining forests could he preserved to yield a rich annual harvest for an indefinite period. It is plain that if our forests are swept away at the rate of millions of acres every year, the white pine is only one of our trees which will be practically exterminated. It should be remembered, too, that the direct pecuniary loss to the country is only one of the evils entailed hy thie destrnction.

The rneh to Butte city, Montana, and Wood River, Idaho, is eimply immenee. A Reno *Journal* reporter, who wae at Ogden the other night, reports the Utah & Northern train crowded, a large nnmher of the paesengere being compelled to remain etanding in the care, the company not having coachee enongh to accommodate the travel.

Huntington Mill.—We are glad to learn that the Huntington quertz mill, which hae heen, for the last two monthe, in the couree of erection on Groom creek, commenced crushiog ore yesterday, and promises to be henceforth a permanent sonrce of profit to its owners.—*Arizona Democrat.*

Tie-cutting on the Crow reservation in Montana Territory has been etopped hy the Government.

Mining in Sonora.

A correspondent of the Arizona *Star*, writing from Caborca, Sonora, says:

Admitting the vast mineral wealth of this section of the State of Sonora, yet, the existing order of things has a tendency to make the observer skeptical. Every Don, cad, proletaire you encounter, owns one or more mines, with a wealth-giving capacity, calculated, if we may believe the owners, to make millionaires of the multitude. Yet, is it not strange that out of this wealth of mines there is not more bullion produced? Between here and the Arizona line are situated three stamp mills. One, of ten stamps, at Oposon, hung up for the past six months, and the most sanguine of its managers does not expect to hear its whistle blow for three months more; another of 20 stamps at Juarez, working an average of about four hours per day; still another here at Caborca possessing 20 stamps that have not made a noise for five months, and God only knows when they will. This is the hard, practical part of the business stripped of the garniture of honied words and extravagant assertions. If these ore reduction machines are all idle through accident, does it not seem a remarkable coincidence? Still I believe that

Sonora Possesses Untold Mineral Wealth

If the fates would allow its development. These fates are many and varied, some natural, others artificial. The natural fates against the development of Sonora are its barren, sterile soil and great lack of water. From Arizona to Caborca, 114 miles, there is not a bit of vegetation to be seen, and here only a narrow valley barely able to produce sufficient to supply the wants of its own immediate inhabitants. Thus it becomes necessary to haul the necessaries of life a long distance, entailing an immense expense and vast labor, well calculated to discourage most men from encountering it. Then again, water is very scarce. By sinking deep enough, water sufficient to defray the cravings of nature can be found, and by a judicious system of dams and reservoirs, the waterfall of the rainy season can be secured in sufficient quantities to provide for the wants of cattle, and in some places enough for the use of an ordinary mill. Admitting all these difficulties interposed by nature to be overcome, then perhaps

The Real Difficulty Begins.

Mexicans would like to see foreigners invest money in the development of their country's resources, but would like to retain the prerogative of having it invested under Mexican auspices and management. Few Americans, I opine, would be willing to risk their money under such conditions. Such is the real state of affairs here. That the irregular mountain chains and gulches are the homes of vast deposits of the precious metals, there is hardly a reasonable doubt, and that modern machinery and mechanical genius can overcome the obstacles of nature, in converting the mineral-bearing rock into bullion, I believe. But whether the investor can overcome the artificial obstacles with profit and honor to himself, others than the present writer must determine. Caborca is at present about as peaceful, quiet and tranquil a town as could be easily scared up on the American continent. The women are busy going to church, and the men are busy swapping lies. Business is not visible in any shape or form, and how the people subsist, would puzzle a conjuror. Nobody is working, nobody is hurrying; everything seems stagnant and depressed. A half a year ago this was a pretty lively town; the shrill scream of the steam whistle resounded through the valleys and gulches, and the thundering of the quartz stamps could be heard at all hours of the day or night. Here, too, it may be observed, there is no lack of water. In fact, for mining and milling purposes, it seems to be the garden spot of Sonora.

The Santa Felicita mine is now about 175 ft. deep and is being worked steadily, the superintendent hoping to have the shaft 280 ft. deep in three months, at which time it is expected to tap the shaft with a tunnel that is being driven into the bowels of the mine at present.

Men Wanted.—Workingmen are now scarce in this part of Arizona. Men are wanted to work on the railroad, in the mines, on farms, ranches, almost everywhere. We suppose that 300 men could find good paying work in Yavapai and Mohave counties. No nonsense about this; it is a fact, and a very healthy one at that. It shows that northern Arizona is progressing; that public works are being constructed, and that the industries of the section are being developed. There have been, in our history, times when we could not say so, truthfully. But we do not now hesitate to say so.—*Prescott Courier.*

Good News from Cambridge.—H. G. Blasdel, Jr., came up from Cambridge the other day, and reports a rich strike in the Blasdel mine there. The 10 stamp mill has just turned out about $3,000 in bullion from the mine. We are glad to hear that Col. Blasdel is about to be fully rewarded for the amount of work and capital he has put into Cambridge—*Esmeralda Herald.*

Good Showing.—The Ludwig copper furnace shipped 72 tons of copper as the result of their run in March. The Ludwig mine is situated on the range of mountains dividing Smith and Mason valleys, in Esmeralda county, and has an abundance of ore to keep the furnace fires burning steadily for years to come.—*Esmeralda Herald.*

Useful Information.

Where Buttons Come From.

The button trade of New York is estimated at from $8,000,000 to $10,000,000 a year. Last year the importation of buttons exceeded $3,500,000, the aggregate for the four years just passed being but a little short of $13,000,000. At American rates of wages many of the imported buttons could not be put upon their cards for the price they sell for.

Glass buttons are made mostly in Bohemia, and children are largely employed at the work, which they do as quickly and as neatly as adults. The children get 10 cents a day, men get from 40 cents to 50 cents, and women a little less. Pearl buttons are imported from Vienna, where they are almost exclusively manufactured; and the all-important shirt buttons are received mostly from Birmingham, England, where the majority of metal buttons are likewise procured. The most extensive of all the button manufacturing, however, is that of the Parisian and Berlin novelties. In one manufacturing village near Paris, where there are from 5,000 to 6,000 inhabitants, all the working people are engaged in making the agate button, which, even with 30 % duty added to the cost, sell, when imported into this country, at the extremely low figure of 31 cents per great gross. The material alone, it is reported, could not be procured here for double that amount.

While American manufacturers make no attempt, and probably have no desire, to compete with European producers employing band processes, they excel in making bone, composition, brass, ivory and gold buttons by machinery, and are able to export considerable quantities of these styles. In Providence, R. I., for example, sleeve buttons and jewelery buttons are largely manufactured expressly for exportation.

Floating Soap.—Messrs. Proctor & Gamble, of Cincinnati, have devised a floating soap, which will not sink in the water. When a piece of this soap is dropped into a tub of water, it goes under, but immediately bobs up again and floats upon the surface. The advantage of this soap to millmen and mechanics, who, in washing, make the water very dirty, is manifest, for no time is lost in fishing around the bottom of the tub for the soap, as it floats on the top of the water like a white chip. The soap is called "ivory," presumably on account of being of a creamy white color like ivory. French soap makers have from time to time made soaps that will float, but they lacked durability and strength sufficient to stand rough usage. The prime requisite for a floating soap is that it shall be made of oils, for oil may be converted into soap that will float as well as oil in its natural form, if the soap be free from adulteration. In fact, it must be a thoroughly clean, pure article. Such a soap will make a soft, creamy lather, easily rinsed off, not greasy or gummy, as is too often the case.

New Dyeing Material.—A beautiful golden-yellow dye is now prepared from the young wood of various poplars. The young branches and shoots are cut off, crushed and brayed, and then boiled in alum water in the proportion of 10 lbs. of wood and one pound of powdered alum to three gallons of water. The liquor is boiled from twenty minutes to half an hour, and then filtered. In cooling it thickens and clears, throwing down a greenish-yellow deposit of resinous matter. When sufficiently clear the liquor is again filtered, then left exposed to the air for three or more days, according to the weather and the atmosphere. It quickly oxidizes under the action of light and air, and assumes a rich golden tint, and in this state can be used for dyeing fabrics of all descriptions. For yellow and orange-yellow shades it is used alone; mixed with Prussian blue it gives green; with oak bark, brown and tan; with cochineal, etc., orange and scarlet shades. The coloring thus produced is said to be of superior quality.

Removal of Grease Spots.—Whenever oil of turpentine, benzole or ether is used to remove grease spots on cloth, the application should be made on the reverse side of the cloth, by moistening it with the solvent in a circle surrounding the spot, so as to approach it gradually, having blotting-paper in contact with the spot of grease, to absorb the fat immediately; otherwise the solvent will have the effect of spreading the grease over a larger surface instead of driving it out of the cloth. In the application of a hot iron to one side and blotting-paper to the other, the heat will drive the grease out of the cloth into the paper, because the fat has a tendency to move from the hotter parts toward the cooler.

The First Line of Telegraph was erected less than 40 years ago, and at the present time there are more than 100,000 miles in operation. The United States comes first, with 250,000 miles, with the immediate probability of adding another 100,000 miles; Germany comes next, with 150,000 miles, and the great Chinese empire last, with 1,200 miles.

Steel may be "blued" by heating it evenly in an ash bath—that is, a quantity of sand is spread over a sheet of boiler iron and heated up to about the boiling point of oil, say 600°. If a little oil is rubbed over the surfaces with a piece of waste, the color will be better. All articles to be colored should be polished.

Brightening Iron.—A Bavarian serial contains a method of brightening iron recommended by Boden. The articles to be brightened are, when taken from the forge or the rolls, in the case of such articles as plates, wire, etc., placed in dilute sulphuric acid (1 to 20), cleansing the articles, which are then washed clean with water and dried with sawdust. They are then dipped for a second or so in nitrous acid, washed carefully, dried in sawdust and rubbed clean. It is said that iron goods thus treated acquire a bright surface, having a white glaze without undergoing any of the usual polishing operations. This is a process that those interested can easily test for themselves. Boden states that the action of the sulphuric acid is increased by the addition of a little carbolic acid, but it is difficult to see what effect this can have, and it may very well be dispensed with.

How to Cleanse Mica.—Every woman who has been obliged to spend half a day several times during the winter cleaning plates of mica in her coal stove, usually by taking them out and washing them in soap suds, will rejoice to know that there is no need to take them out or let the fire burn very low in order to do it successfully. Take a little vinegar and water and wash the mica carefully with a soft cloth; the acid removes all stains, and if a little pains is taken to clear the corners thoroughly and wipe them dry, the mica will look as good as new. If the stove is very hot, tie the cloth to a stick, and so escape the danger of burning the hands.

The Modern Hat.—Bayard Taylor says: "It is a withering commentary upon our modern costume that no sculptor has dared, or ever will dare to model a statue wearing a stovepipe hat."

Good Health.

A Dangerous Curiosity.

It is the most natural thing in the world, when you have gone to bed, to get up, run to the window, hoist it and look out at an alarm of fire or any unusual noise or clamor going on outside. A lady was roused from her sleep by a cry of "fire;" her chamber was as bright almost as day when she opened her eyes. She went to the window, and soon saw that it was her husband's cotton factory. She felt on the instant a shock at the pit of the stomach; the result was a painful disease which troubled her for the remainder of her life, a period of nearly 15 years.

A young lady just budding into womanhood was called by the sound of midnight music to the window, and in her undress leaned her arm on the cold sill; the next day she had an attack of inflammation of the lungs which nearly killed her. She eventually recovered, only to be the victim of a life-long asthma, the horrible suffering from the oft-repeated attacks of which, during now these 20 years, is the painful penalty, to be paid over and over again as long as life lasts.

A letter just received from a successful banker, who has been an invalid for five years, every now and then spitting blood by the pint, with a harassing cough which makes every night and morning a purgatory, states that the immediate cause of all his sufferings, and the final blasting of life's prospects, was his getting up on a cool night, to look out of his chamber-window, his body being in a perspiration at the time. That sturdy old Trojan, Dr. Johnson, used to say that "mankind did not so much require instructing as reminding;" hence the present reminder, that it is dangerous for people to be poking their nightcaps out of windows after night-fall. Another mischievous habit in the same direction, may have pertinent mention here: Standing in the street doorway in cold weather, while the door itself is open, in taking leave of visitors. The cold air from without rushes into the dwelling, causing a draft, which chills the whole body almost instantly. It is a hundred times safer to close the door and stand without, bare-headed. Many a tedious case of sickness and suffering has been occasioned, and even life itself has been lost, by an exposure, apparently so trifling. May our readers remember these things, and teach them to their children on the instant.

Medical Virtues of Celery.—An English writer proclaims cooked celery as a cure for rheumatism, which it certainly will not harm if it fails to cure. We read as follows: "Celery, cooked, is a very fine dish, both as nutriment and a purifier of the blood. I will not enumerate the marvelous cures I have made with celery for fear the medical men should, like the corn dealers, attempt to worry me. Let me fearlessly say that rheumatism is impossible on such a diet. Plainly let me say, cold or damp never produces rheumatism, but simply develops it. The acid blood is the primary cause and the sustaining power of the evil. While the blood is alkaline there can be no rheumatism, and equally no gout. I must return to cooked celery. Cut the celery into inch pieces, and boil in water until soft. No water must be poured away unless drank by the invalid. Then take new milk, slightly thicken with flour and flavor with nutmeg; warm with the celery in the saucepan; serve up with diamonds of toasted bread around the dish, and eat with potatoes."

Diphtheria.

Dr. Franklin Staples, of Winona, Minn., after an extended correspondence with physicians in most of the counties of his State, has published a report on diphtheria, in which he classes the disease as contagious and infectious, and demonstrates that it is on the increase, a fact due, in his opinion, to failure on the part of physicians in recognizing its self-propagating properties; to want of systematic nursing of patients suffering with the disease; to incomplete disinfection of premises attacked; and last, but not least, to the frequent intercourse of convalescents with healthy persons. He maintains that strict regulations, rigidly enforced, are the only means adequate to cut short its career, and since individual power is unable to cope with it, urges that every city and town should devise efficient sanitary laws, and let them be enforced by intelligent medical officers, who shall also make it their duty to instruct the people in sanitary rules. To guard against the contamination, he believes that filth, whether from dirty rooms, soiled clothing, defective drains and cesspools, ill-ventilated rooms, poisonous inodorous gases, etc., should be regarded as conditions which invite the disease; that the apartment set apart for the patient should be divested of all furniture, carpets, curtains and fabrics of any kind not absolutely required; that discharges from the nose, mouth, and bowels should be carefully collected and destroyed, and that all personal clothing, bed linen, etc., should be thoroughly disinfected before being sent to the general wash. In case of death, all clothing and unimportant articles should be burnt, the body should be immediately disinfected and put into its coffin, which should be kept permanently closed. There should be no public funeral. He prefers disinfection by chlorine gas, which is to be set free in the room. Ventilation for a number of hours should then be insisted upon. Precautions falling short of these Dr. Staples considers to be useless in preventing the spread of the infection—*Report on Diphtheria to the Minnesota Board of Health, 1881.*

Malarial Germs.—M. A. Laveran has found, in the blood of patients suffering from malarial poisoning, parasitic organisms, very definite in form and most remarkable in character; motionless, cylindrical curved bodies, transparent and of delicate outlines, curved at the extremities, transparent spherical forms provided with fine filaments in rapid movement, which he believes to be animalcules; and spherical or irregular bodies, which appeared to be "cadaveric" stage of these, all marked with pigment granules. He has also detected peculiar conditions in the blood itself. During the year that has passed since he first discovered these elements, M. Laveran has examined the blood in 192 patients affected with various symptoms of malarial disease, and has found the organisms in 180 of them, and he has convinced himself by numerous and repeated observations that they are not found in the blood of persons suffering from diseases that are not of malarial origin. In general, the parasitic bodies were found in the blood only at certain times, a little before and at the moment of the accession of the fever; and they rapidly disappeared under the influence of a quinine treatment. The addition of a minute quantity of a dilute solution of sulphate of quinine to a drop of blood sufficed to destroy the organisms. M. Laveran believes that the absence of the organisms in most of the cases (only 12 in the whole 192) in which he failed to find them was due to the patients' having undergone a course of treatment with quinine.

Astounding Effects of Tobacco.—A veteran user of the weed in this city was recently taken sick and confined to the house. A physician was summoned and pronounced his complaint disease of the heart. He ordered the patient to be deprived entirely of tobacco, and said he would be able in a few days to tell what the man's chances of recovery were. The tobacco was stopped, and then followed a season of derangement and visions, less intense and terrorizing than those belonging to the alcoholic frenzy, but annoying and remarkable to the patient. He saw black flies in myriads on the walls of his room; then thousands of fire-flies, such as are seen in June. These were followed by millions of little golden, metallic-hued beetles. He sat beside a lovely stream of water that wasn't there, and gazed into its limpid depths. He saw crowns, queer garments covered with the heads of nails, all sorts of armor, and bric-a-brac enough to furnish every house in the State. During the whole day the atmosphere was so yellow that he could not see the neighboring residences; another day cloudy veils shut out from his view for brief intervals the objects about him. His experience, while it has satisfied him that tobacco affects the brain, has not destroyed his love for the weed, which he constantly desires, but is debarred from using because of his condition. The patient is out, and, we are glad to say, is doing well—*Norwich, Conn., Bulletin.*

Trustworthy merchants from Moscow, state that eighty workmen employed on the Usapanski cathedral, were arrested Holy Thursday in consequence of the discovery of a mine under that edifice, in which the intended ceremony of the coronation of the Czar was to take place.

Antimony is selling in London for £53 to £54 per ton for French Star regulus.

Saturday Morning, April 29, 1882.

TABLE OF CONTENTS.

EDITORIALS.—Markiug Locatlons; Ore Roasting Furnaces; Laying Dust in Mines, 273. Passing Events; Production of the Precious Metals, 280. Adjustable Rock Drill Rest; A New Sun Engine; The Roller System of Flouring, 281. Notices of Recent Patents, 284.

ILLUSTRATIONS.—Double Roasting Furnace; Plan for Roasting Furnace and Cooling Floor, 273. Gray's Patent Noiseless Double Roller Mill, 281.

MECHANICAL PROGRESS.—The Art of Turning; New Friction Gear for Wire Ropes; To Cleau Incrusted Supply Pipes; Heavy Forging; Compressed-Air Motor, 275.

SCIENTIFIC PROGRESS.—Producing Artificial Indigo Directly on the Fiber; The Formation of Clouds; The Blue Color of Water; How to Increase the Light of Gas Flames; Disintegration of Tin; Interresting Meteorological Collection; Effect of Manganese on Brass; Metallic Designs on Olass Obtained by the Aid of Photography, 275.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 276.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, New Mexico, Idaho, Colorado, Oregon, and Utah, 276-7.

USEFUL INFORMATION.—Where Buttons Come From; Floating Soap; New Dyeing Material; Removal of Grease Spots, 279.

GOOD HEALTH.—A Dangerous Curiosity; Medical Virtues of Celery; Diphtheria; Malarial Germs; Astounding Effects of Tobacco, 279.

Passing Events.

The rapid disappearance of the enow in the mountainous regione which ie now going on will, within the next few weeke, give an opportunity for the hundrede of men now waiting to again begin their search for hidden mineral. Prohably never before has eo large au army of proepectore advanced as thie year. The etride which the mining intereet hae taken in public estimation within the past two or three yeare, hae much to do witb thie; aud the fact that there are yet exteneive regione favorahle to prospecting has induced many to turn their attention to thie fascinating employment.

The rueh to Wood River ie now eo great that paeeengere hy the etagee from Blackfoot and Kelton are regietered eeveral daye ahead. No doubt many will he dieappointed, hut the region muet he well proepected where euch numbere of men work it over.

The committee appointed to present a plan for draining the flooded Comstock minee, have, as is etated elsewhere, agreed upon a plan. The officere and leading men of the eeveral mines are now heing conenlted. Some action will very ehortly he taken, ae it is hardly prohable that they will leave all the minee, or nearly a mile of the Cometock lode, flooded with water for any length of time, unlees they mean to entirely ahandon the lower levels.

The Indian outhreak in Arizona will he very injurious to that Territory, ae it will deter many from going there. Proepectore will prefer going to Idaho and Montana, as long as there is fear of Indiane.

A LOT of shoemakere who paseed through here from the Eaet for California, a few weeke ago, eaye the Elko *Independent* of Wednesday, returned on their route yeeterday, by the emigrant train. In convereation with citizene they etated that white artieans in their line had no hueinese in California, the Chinese having completely monopolized that trade.

Production of the Precious Metals.—No. 6,

[An abstract of the Census Monograph on the Bullion output of the country.]

IDAHO.

The tabulation of the output of thie Territory ia haeed upon reporte of the examining expert, Mr. Albert Williame, Jr., on 369 deep minee, 14 placer minee, 18 amalgamating mille, 2 arastras, and 2 smelting worke, heeidee eeveral general reporte on whole districte.

From 1876 up to the close of the censue year, the product of thie Territory hae heen mainly dependent upon the older mining districts, of which the placer minee of Boise hasin, have contributed a large proportion. The panic in the stock market of San Francisco in 1876, led to a euepension of operatione in the principal Owyhee mines, which for eome yeare previone to that period had yielded large returne. This crash wae due quite as much to miemanagement of the minee themeelvee, ae to canses inherent in the speculative market; bnt whatever the reaeon, the result wae the cloeing down of many minee which prohahly would have been etill largely productive if properly worked. Ae the case now etande, the Owyhee district, which formerly yielded hy far the greater part of the total output of the Territory, at preeent furniehee only about one-fifth of the aggregate. It ie to he hoped that at no dietant time in the future, this dietrict may again appear as a large producing center.

Had theee etatietice heen collected for a year ending only a few monthe later, the new Wood River country would have added largely to the total product. Operations in thie dietrict were only eeriouely hegun toward the cloee of May, 1880; hence the large product of ores shipped to Salt Lake during the fall of the eame year, doee not enter into the tahnlation for the ceneue year. In addition to the developments in the Wood River country, a number of other new localitiee appear ae future important productive eources, prominent among which ie the Sawtooth dietrict, which from the aheence of local milling facilitiee wae at a etandstill, pending the erection of reduction worke. Another year will witneee a coneiderahle hullion production from the minee of thie district. The same remark holde good with regard to Smiley's canyon, from which a emall amount of ore wae ehipped at great expenee to dietant pointe for reduction. The returne from theee shipmente were euch ae to give great hope for a large increase when it hecomee poeeihle to treat the oree at a greater advantage, in mille placed near the minee.

In the Yankeo Fork region a decided improvement in the eituation ie to be noted. Here the Bay Horee, and Kinnikinnick, will also add largely to the total product.

The period covered hy the ceneue year, while one of great promiee for the future of the Territory, nevertheleee ehowed a comparatively emall yield. The prohabilities are, that within two years the ontput of Idaho will at least have donhled.

The deposits of Idabo hullion (ao far ae it ie poseihle to eegregate them, a very large portion having passed through private refineriee and thus loeing their identity) up to the cloee of the fiecal year ending June 30, 1880, are atated hy the Director of the Mint, to have heen $24,137,417 gold, $727,296 eilver, and $24,864,713 total. Thie amount is far leee than the actual output up to that date, vague unofficial estimatee placing the total yield ae high ae $60,000,000.

Of the gold product for the censue year, 59,42 % ie from placers, and 40.58 % from the deep minee. Idaho furnishee 7.32 % of the placer output of the United Statee, 2.81 % of the deep mine gold, and 4.43 % of the total gold; 1.13 % of the silver, and 2.60 % of the entire product of the precioue metale in the whole country. Ae a gold producer, the territory ranke eixth, and in silver, seventh. The average yield per square mile ie $17.45 gold, $5.30 eilver, and $22.75 total. In thie reepeot Idaho etands fifth in point of gold, eeventh in eilver, and eixth in developed richnese in gold and silver. The average yield per capita ie $45.38 gold, $13.78 eilver, and $59.16 in hoth precious metale, placing the rank ae regarde product in reference to population third ae to gold, eixth ae to eilver, and fifth altogether. The comparison with regard to population is prohahly the moet reliable teet of the relative prosperity of a mining region.

OREGON.

Oregon ie one of the oldeet of the Weeteru mining States, the diecovery of gold within ite limite having followed closely upon that in California. Ite output hae never heen very large in oompariaon with the yield of ite neighhor State, hut although the minee have become eecondary to ite agricultural reeources in point of importauce, they etill furnieh occupation and profit to many of ite inhabitante. The quartz veine of Baker county, in the eastern portion of the State, adjoining Idaho Territory, continue to yield the larger portion of the total deep-mine product of thie State. The prevailing type of the Oregon oree is a free gold quartz, though rehellioue gold ores requiring epecial treatment are found in eome localitiee, and a emall amount of eilver ie produced in Grant county.

The latter county takes the lead in eurface mining, while Baker, Jackson and Josephine countiee are aleo productive of a coneiderahle amount of placer gold.

Oregon now ranks seventh on the roll of the mining Statee in production of gold, eleventh in outpnt of eilver, and ninth in ite yield of hoth metale. Ite quota toward the total production of the United Statee ie 7.75% of the placer gold, .80% of the deep-mine gold, 3 29% of the total gold, and only .07% of the total eilver. The percentage of the total combined gold and eilver product ie 1.49%. The average yield per equare mile is $11.43 gold, $0.20 eilver and $11.63 total. The product per capita ie $6.28 gold, $0.11 silver, and $6 39 total, giving Oregon a rank of seventh in gold, tenth in eilver and ninth in total hullion output, in point of production, ae relative to population. The small proportion per capita ehows how complcteiy mining has heen overshadowed hy other induetriee in thie State.

WASHINGTON.

Of the small product reported from the deep minee of Washington Territory, nearly the whole comee from Peshaeton district, in Yakima county, where gold qnartz mining ie conducted on a emall ecale.

The upper Columbia placere furuish over one-half of the total placer yield of the Territory. The Skagit mines, in Whatcom county, ahout which, from time to time, reporte glitteiing with golden promise bave heen epread, are not yet to he nnmhered among the important productive depoeite of the country. They have attracted much attention from the prese, and have been the ecene of several incipient "rnehee," hut the ehortneee of the eeaeon, inacceeeibility, and other natural dieadvantagee

have combined to retard operations, and the yield is still very scanty.

ALASKA.

This vast Territory, ooonpying an area of over half a million square miles, is for the most part still an unexplored region. The small amount of prospecting whioh has been done, has developed the faot that Alaska contains many gold-bearing localities, none of which, however, have yet yielded any considerable ontput. The climate and remotsness from oommunications, will always be obstaoles in the way of mining; but in spite of the natural disadvantagea of the conntry, it is reasonable to look for an increased product in the future. Recent reports, mnch exaggerated, of fabulona discoveries of mountains of silver ore, have attracted many adventurous miners to Alaska. Thus far only disappointment has resnlted. The Takou gold district, which has been explorsd to some extent, is, however, stated to have yielded $150,000 in the season of 1881.

The amall amonnt of placer gold received at the San Francisco mint from Alaska during the censns year, $5,951, does not perhaps represent the whole product for that period, as a portion may have found its way to Victoria, and thus have become identified with the prodnct of British Columbia. No means of tracing this small possible balance are at hand. The total was in any event insignificant.

Adjustable Rock Drill Rest.

Wm. T. Browne, of Stockton, has just received, through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent covering a new form of adjustable rest or support for machine rock drills.

It consists in a tripod snrmounted by a bearing block swiveled thereto, the block having a notch or slot with a friction roller, in which is fitted a strap or rod secured to the under side of the frame of the rock drill, thus affording a support or rest for the drill, and allowing it to be moved forward, while by the swiveling or turning of the block, it may be directed or adjusted in any desired position.

The devise may be adapted to almost any form of machine rock drill whether operated by ateam or by hand, but is more particularly designed to be applied to hand rock drills.

These hand rock drills, on account of their lightness, are frequently intended to be supported by the operator, and, in some cases, are desigoed to be supported from the shonldera by suitable straps, and the recoil resisted by the body. By this means, the drill may be operatsd in various directions. The difficulty of providing a suitahle rest or support for these machines has been because of the necessity of advancing the drill as it works forward, and of drilling in various directions. To stop each time and regulate or adjust the support would be too inconvenient. A two-legged device has been used, the principle of which has been to advance by leaning forward, its base remaining stationary, while its upper end describes the arc of a circle. It is obvious that this ia objectionable because of changing the inclination of the drill, while the hole in which it works remains the same, so that it must necessarily cramp or bind.

With the improved device, when the drill is in operation, the whole frame may be advanced, the strap traveling on the roller and being supported thereby. Its lateral inclination may be changed readily hecause of the awiveling hearing-block, while its vertical inclination may be varied by elevating or depressing its end. Its vertical position is adjusted by means of the extensible legs or props. The rest or support remains level all the time, and the drill frame is kept horizontal, so that it will not cramp.

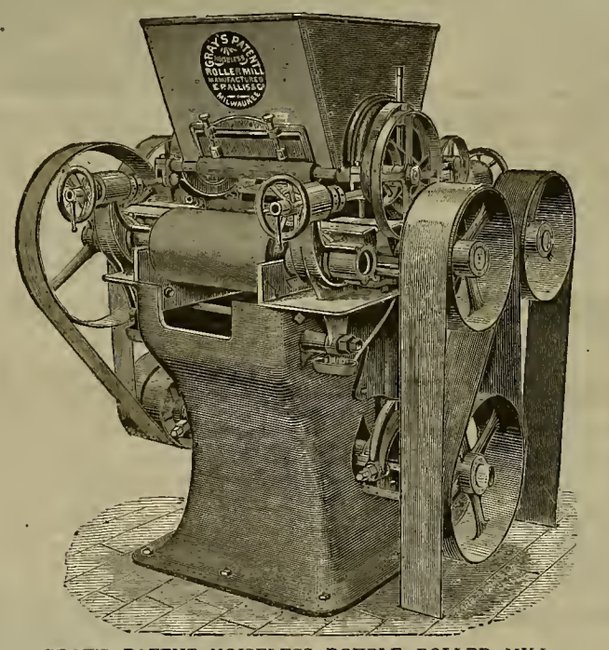
A New Sun Engine.

Attempts have been made from time immemorial to convert the heat of the sun into a substitute for fuel, with varying results. Archimedes (who burned the Roman fleet which waa blockading Syracuse, by a system of mirrors), Euclid, Hero, De Cans, Buffon, Ericsson, Muchot and others, bave made experiments in tho directiou of utilizing the heat rays of the sun as a motor for industrial purposes; but all of the devices heretofore usad, which have come under our observatiou, have been made after the same plan—*i. e.*, the reflectors are in the shape of inverted conss, or pyramids, or parabolic surfacsa of revolution, with the boiler placsd vertically in the axis of the reflector. Such constructions allow or permit only short and narrow surfaces of reflection, and the heat rays are thrown upon the boiler in concentric rings, or spots, a process quite limited in its practical application. No difficulty has heen experienced in collecting and concentrating aufficient heat rays to generate steam, and a pressnre of 7 to 9 atmospherss has been reached in from 30 to 60 minutes, giving from 1 to 3 H. P., and the well-known French enginser, Muchot, has succeeded in pumping water and performing other light work with an apparatus constructed on this plan, by solar force alone. But it is quite impossible to secure large and unintermittent power from devicea of the form described above, which are necessarily small, for obvioua reasons.

Gen. George W. Deitzler, of San Francisco, Cal., has just patented, through the Patent Agency of the MINING AND SCIENTIFIC PRESS, an improvement in solar reflectors and heat receivers, which promises very important results. This inventor has departed from the old style, and has adopted a reflector of parabolic section, which is placed horizontally, the lines of the reflecting surfaces being parallel to the axis of the boiler, which form of constrnction enables him to expose to the sun long and broad surfaces of reflection, within workable limits, and heat tubes, or boilers of great length, the heat-rays being concentrated in long lines on the whole of the under line of the boiler, with great evenness, each section exposed receiving the same amount of heat, the action being very much like the flame of the furnace of the ordinary steam boiler. As there is no limit to the size of this reflector, there is none to the amount and intensity of the heat that can be produced, and consequently no limit to the force of the steam that can be generated. The cost of the reflecting surface and of the boiler is quite reasonable, and there is no-mechanical difficulty in the construction and operation of this apparatns. The steam generated in the boiler is led by pipes to where it may be needed in the usual way. The apparatus is mounted and provided with special mechanism whereby the orientation, or setting to the east, of the apparatus ia made to move with the apparent course of the snn, automatically, or otherwise. The inventor furnishes us the following additional information on this subject:

A small working machine of this description has been constructed, and givea admirable results, producing steam in 20 minutes, the water boiling violently in 30 minutes. There are many other purposes to which it can be applied besides driving steam machinery, snch as roasting ores, distilling and rectifying spirits, etc., but it will he found particularly useful in our dry and hot valleys for pumping water, thrashing grain, etc. There are millions of acres of the finest land in the world in the San Joaquin and otber valleys of California and Arizona, which land only nseds to be "tickled with water to make it langh with the harvest." Only a small part of this land can bs irrigated by the usual methods, but water exists, in inexhaustible quantitias, in most localities, at from 10 to 100 ft. from the surface. By driviug a number of tube wells, say 15 ft. apart, and coupling them together at the tops and applying a sun engine, a supply of water can be obtained for irrigation and for cattle, which would raise the value of the land from $2 to $5, its present price, to $30 and $60 per acre, and fill these valleys with a prosperous and happy population. This is a phase of the solar engine business which should commend itself to the owners of the large ranches in the interior valleys, where the conditions are most favorable for the development of this enterprise. We are not unmindful of the objection that the aolar rays are sometimes interrupted by olouds, and that at best such an eogine would be available only in the day time, but we auswer that in the summer time, during our rainless season, when their need would be greatest, the sky is seldom obscured by clonds (it has been demonstrated that occasional passing olouds have no perceptible effect on the apparatus), and the power of the engine could be nsed for compressing air or generating electricity, which might he stored, and the elsctricity or compressed air would serve to run the machinery in the night. In this way the cities on the plains could also be lighted by electricity at a minimum cost.

All know that the sun generates immense quantities of heat, and nothing is wanted to utilize such heat except an efficient apparatus for collecting the rays and concentrating them upon a smaller surface. It has been demonstrated by Ericsson, Muchot, and othera that the heat of the snn, after absorption by our atmosphere, represents rather over one-horse power psr square yeur, and that we get more heat (other things being equal) on a day in winter than in summer, for the sun is nearest to us in onr northern winter.



GRAY'S PATENT NOISELESS DOUBLE ROLLER MILL.

In hia very interesting address to the British Association, in 1881, Sir W. Armstrong, C. B., D. C. L., L. L. D., F. R. S., referring to the proposition of utilizing the solar rays for generating electricity for light and for motive power, said: "In our climate (England), it is true, we shall never be able to depend upon sunshino for power; nor need we repine on that account so long as we have the preserved sunbeams which we possess in the condensed and portable form of coal; but in regions more favored with sun and less favored with coal the case is different. The actual power of the sun is enormous, being computed to be equal to melting a crust of ice 103 ft. thick over the whole earth in a year. Within the tropics it would be a great deal more, but some deduction must be made for obsorption of heat by the atmosphere. Taking all things into accouot, however, we shall not be far from the tnith in assuming the solar heat to be capahle of melting annually, at the surface of the ground, a layer of ice 85 it. thick. Now lot us see what this means in mechanical effect. To melt one pound of ice requires 142'4 Eoglish units of heat which, multiplied by 772, gives us 109.032 foot-pounds as the mechanical equivalent of the heat coneumed in melting one pound of ice. Hence we find that the solar heat, operating upon an area of one acre, would, if fully utilized, exert the amazing power of 4,000 horses acting for nearly nine hours every day.

Io dealiug with the snn's energy we could afford to be wasteful. Waste of coal means waste of money and permanent exhaustion of coal beds. But the sun'e heat is poured upon the earth in endless profusion—endless at all events in a practical sense—and we have, therefore, only to consider whether we can divert to our use so much of the sun'e motive energy as will repay the cost of the necessary apparatus; and when snch an apparatus is forthcoming we may expect to bring into subjection a very considerable proportion of the 4,000 invisible horses which science tells us are to be found in every acre of sun-kissed ground.

Professor Langley of the Alleghany, Pa., observatory, in closing an exhaustive report on the experiments of Ericsson and Muchot and the great need of a substitute for fnel, says:

"Engineers have done little to solve thia important problem, which problem is pursly mechanical, but we may be sure they will do more in the future, for the demand for motive power ia rapidly increasing, and the supply of coal and wood is approaching exhanstion. Future ages, it has been truly said, may see the seat of empire transferred to regions of the earth now barren and desolated under great solar heat—countries which, for that very canse, will not improbably become the seat of mechanical and thence of political power. Whoever finds the way to make industrially useful the vast sun power now wasted will effect a greater change in men's affairs than any conquerer in history has done."

We have on this coast a vast field in which an apparatus for utilizing solar heat, as proposed, would be very nseful and valuable.

The Roller System of Flouring.

Our readers are doubtless aware, from what has been said from time to time in these columns, that the roller system of flour milling is fast superssding the old method of stone grinding. Upon this coast, as well as at the East and in Europe, the new system is making rapid and wide advances. This being the case, we have secured for illustration one of the leading machines used in the new process, and one which is now being largely introduced into the mills of this State. It is used by the Golden Gate mills, of this city, where they have 48 double roller machines, giving a capacity of 1,000 barrels in 24 hours, and other mills are making the same reform in their operations by the use of the same rollers.

The machine shown in the engraving is styled Gray's Patent Noiseless Roller Mill, manufactured by E. P. Allis & Co., of Milwaukee, Wis., who have led in this country in the designing and manufacture of roller mills, and have sent many of their mills to foreign parts. The system of grinding embodied in the Gray Roller Mills consists essentially in gradually reducing the wheat to middlings, and the middlings to flour, by several successive operations, each followed by bolting and purifying while both the offal and flour particles are in large pieces and much easier to handle than the product of the old system; and when this is successfully carried out a perfect and clean separation of the bran, germ and impurities of the flour is obtained. The leading features of the system are: 1st. A thorough and systematic cleaning of the wheat with the most improved scouring and brush machines and separators, for the elimination of extraneous seeds and dirt. 2d. That the granulation of the wheat shall be done entirely by corrugated chilled iron rolls in four to six successive reductions or breaks; the rolls on the first break to have the coarsest corrugation, and increasing in fineness through the several reductions or breaks to the final bran-cleaning roll. There should be as little flour made as possible during this operation, as it will necessarily be of lower grade than middlings flour, and the bran should be finished up clean. 3d. The separation of the flour, middlings and chaff from the several breaks by means of metal and silk bolts and aspirators. 4th. The systematic and thorough grading and purifying of the middlings by means of graders and air and sieve purifiers. 5th. The sizing of large middlings on smooth chilled iron rolls, with but slight differential motion, in order to reduce them in size preparatory to flouriog, and to eliminate, by flattening, what germs and bran specks may have adhered to them. 6th. The final reduction of the fine, clean middlings to flour by means of porcelain rolls having light prsseure and high differential motion. 7th. A full and complete system of bolting. By this roller system from one-fourth to one-third more flour can be made with the same power, the yield is largely increased, and the flour of much higher grade than by the old system. These great improvements in the art of milling explain the general introduction of the roller system in the large milling establishments of the world.

NEW MONTANA MINES.—There promises to be a great rush, principally from the Black Hills, to the mines in the vicinity of Fort Maginnis. The mines are being quite extensively advertised outside the Territory; and those who have claims there appear to have almost unlimited confidence in the future of the camp. Two new towns were recently laid out in Spring gulch, named respectively, Alpine and Rustler; and corner lots in the last-named town are held as high as $1,500, so we are informed. There is little doubt but a number of rich quartz ledges have already been struck in the Maginnis district, but whether the present prospects and developments will justify the great boom that appears to be setting it remains to be seen. —*Bozeman Courier.*

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

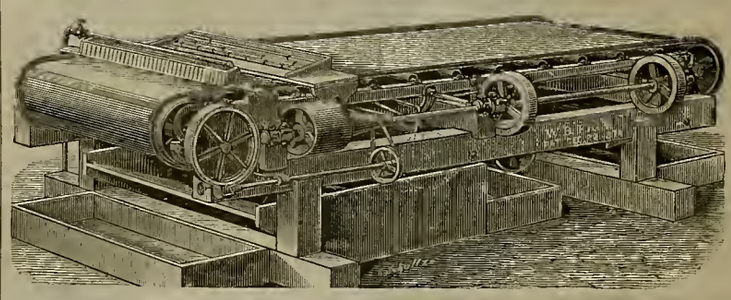
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents. Room 7 No. 109 California Street, S. F.

GOLD SAVED

BY USING MY

SILVER PLATED AMALGAMATING PLATES.

These Plates are used in Quartz, Gravel and Placer Mining with gratifying success. I am constantly filling orders for them, and when once used they prove themselves so superior to any other process yet discovered for saving Gold that my customers would not do without them. I have the best facilities on this coast for filling orders for these plates, and will guarantee my work.

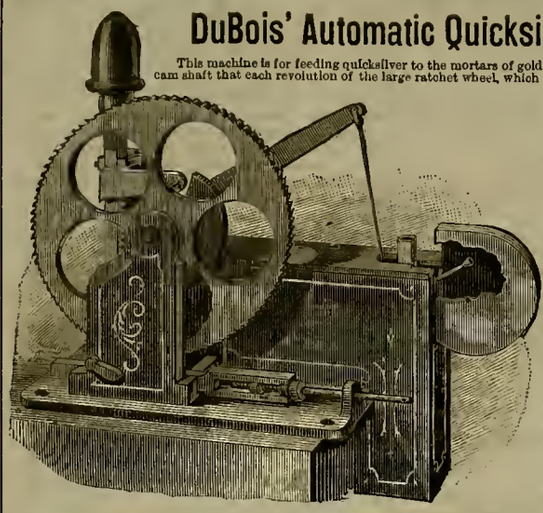
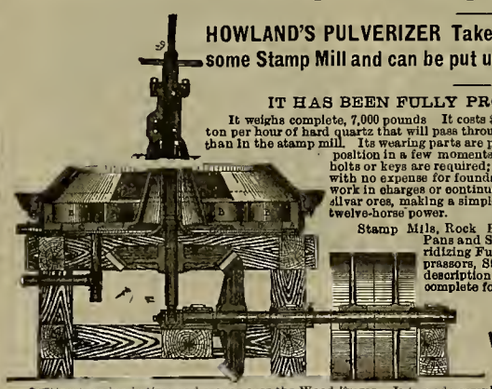
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery


HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

GLOVE.—Henry S. Flood, S. F. No. 256,558. Dated April 18, 1882. In the construction of heavy gloves for drivers, wood-cutters, and others who must labor in inclement weather, leather, buckskin, and similar materials are employed for strength and to resist rough usage, while woolen, knit, woven, or other similar material is employed for warmth. Those, however, who are obliged to drive in cold, wet weather, find their gloves soon wet through from the back, and the hands become benumbed. Mr. Flood's invention is designed to overcome this difficulty, and it consists in the application of a waterproof backing, of any suitable material, to gloves, mittens, gauntlets, or other hand-covering of whatever material, so that the hands will be protected from wet, and the material of the glove itself will keep them warm. The method of construction is such that while the inner part of the glove may be made of a cheap and flexible material, the inventor avoids incasing the whole hand in rubber, or other waterproof substance, which will retain the perspiration of the hands, and soon make the interior of the glove wet and uncomfortable.

FLOATING DRY DOCK.—Life C. Watts, S. F. No. 256,608. Dated April 18, 1882. This invention consists in a large lifting dock, or float, the whole bottom of which is an air-chamber. It has upright sides, divided into compartments, designed for holding water to sink the dock. Between the upright sides is a wide channel, or space, large enough to receive a vessel. A smaller float, or pontoon, provided with appropriate devices for receiving and sustaining the vessel is adapted to be sunk upon the large dock, and the vessel is hauled in upon this pontoon. The large dock is adapted to be raised or sunk in vertical ways, or guides, and between two wharves, on which are supported water tanks provided with gates, from which the upright compartments of the large dock are filled with water and sunk to the required depth. These compartments are provided with gates operated from above, which, when opened, allow the escape of the water and the consequent lightening and raising of the large dock, together with the small pontoon, from which the water is allowed to escape, and the vessel. There are minor points of construction which are required for the operation of the device.

LOGGING ENGINE.—John Dolbeer, S. F. No. 256,553. Dated April 18, 1882. In the logging business, after trees have been felled and cut up into suitable lengths, the logs often lie in inconvenient and inaccessible places, and as many of the redwood logs which are cut upon the Pacific coast run from 4 to 12 ft. in diameter, they are very unwieldy to handle. In order to bring them to a point where they can be loaded for transportation or brought to the mill, it is necessary to employ large teams of horses or oxen. This invention is designed to provide a convenient apparatus, which is mounted on a sled-like frame, and is provided with appliances for the guidance of ropes and tackle, by which the engine may move itself to any desired position, where it may be secured by suitable chains, by which it is anchored to stumps or trees. By means of attachments and guides, the tackle may be made to work at any angle and in any direction from the apparatus, so as to move a log to any desired point.

CHAIR BRACE.—John A. Gallagher, Chinese Camp, Tuolumne county, Cal. No. 256,562. Dated April 18, 1882. This is intended to hold securely the legs of chairs to prevent them from spreading. It consists of wires or rods attached to the bottom of the legs and to the seats above, said wires being made to converge toward the center under the chair and between the legs, and there adapted to be tightened or loosened by the separation or approach of two plates or disks operated by a thumb-screw.

COLLECTOR ROBERTSON, of New York, has instructed Special Agent Brocket to make careful investigation in regard to recent importations of sugar. It has been represented to the collector that certain parties, whose names are witheld for the present, have been evading paying duty, by bringing sugar from the East Indies to the United States via the Hawaiian islands. After being taken to the islands in a raw state, the sugar is put through the centrifugal process; then it is shipped to San Francisco, where it is entered as the Hawaiian product from San Francisco it is sent direct to New York.

THE NORTHERN PACIFIC.—The Northern Pacific has now built through Oregon into Idaho, and nearly 300 miles west of Bismarck, leaving a gap of 600 miles to complete the road. The company has used up $20,000,000 and called another $1,000,000 from its subscribers, and unless a panic can be precipitated by artificial means during the present spring, this railroad—which was the point that yielded and made the panic in 1875—will be a reality between the two oceans.—*Rocky Mountain Record.*

3757. Magnetite—Near St. Helena, Napa county, Cal. Dr. J. W. Hood.

3758. Metallic Iron Reduced from Magnetite—Found near St. Helena, Napa county. (No. 3757.)

3759. Magnetite—San Bernardino county, Cal., six miles from water.

3760. Iron Ore, Limonite and Hematite—San Andreas, Calaveras county, Cal. W. D. Allen.

3761. Iron Ore, Hematite—Near St. Helena, Napa county, Cal. E. W. Woodward.

3762. Iron Ore, Limonite—San Luis Obispo county, Cal., on the Rancho Morey county. E. J. Elsy.

3763. Iron Ore, Limonite—Township 4 north, range 10 east M. D. M., opposite section 3 in unsurveyed land, two miles in a southerly direction from Campo Seco, Calaveras county, Cal. A. M. Thrift.

3764. Jaspery Iron Ore—Near Campo Seco, Calaveras county, Cal. This is probably the same as No. 3763. J. L. Sanford.

3765. Iron Ore, Limonite—Iron Monarch mine, Campo Seco township, Calaveras county, Cal. (See No. 3763). C. Berger.

3766. Iron Ore, Hematite—Big Tree iron mine, Calaveras county, Cal. M. Attwood.

3767. Iron Ore, Magnetite—Grass Valley, Nevada county, Cal. M. Attwood.

3768. Iron Ore, Magnetite—Near Benton, Mono county, Cal. Analysis by Falkenau & Reese: Peroxide of Iron, 93.05; silica, 7.00; traces of sulphide of copper. This ore is said to be in very large quantities.

3769. Iron Ore, Magnetite—Compact variety. Texada island, Straits of Georgia, British Columbia. Redington & Co.

3770. Iron Ore, Magnetite—Cellular variety. Texada island, Straits of Georgia, British Columbia. Redington & Co.

3771. Iron Ore, Hematite (Bog Ore)—Chinicum mine, Port Townsend bay, Washington Territory. Redington & Co.

3772. Pyrolusite—Three miles from Cloverdale, Sonoma county, Cal. S. A. Raymond.

3773. Iron Ore, Hematite—Holden ledge, township 15 north, range 7 east, M. D. M., Nevada county, Cal. G. A. Holden.

3774. Iron Ore, Limonite—Twenty-five miles east of Visalia, Tulare county, Cal. Good road, plenty of wood and limestone; mine lies between two rivers (See No. 2287). Henry Miller.

3775. Diatomaceous Earth (Called Chalk)—Doolan mine, near Santa Rosa, Sonoma county. H. T. Holmes.

THE United States internal revenue cutter *Corwin* has sailed for the Arctic, under command of Lieutenant Healy. It is said the instructions from the Department at Washington to the commander are to the effect, if he is not able to communicate with the crew of the ill-fated *Rodgers* by water, to endeavor to do so overland, or across the ice. The *Corwin* has been preparing for some time for a six months' cruise in the Arctic regions, and all that was necessary to place her in immediate readiness to start was to take on coal and water, which was done, and in less than 48 hours after receiving her orders, she was steaming out of the bay.

THE "MINING AND SCIENTIFIC PRESS" OF SAN FRANCISCO.—This live and readable journal is fast reaching ahead of its Eastern competitors of a similar class, as it is eminently progressive and always filled with matter of a most interesting character. Evidently there is much care taken in preparing articles that are suitable and acceptable to the readers its kind of information is intended for.—*Arizona Quarterly Illustrated.*

AFTER expending several thousand dollars in experimenting on the one-track railroad in Tulare county, the enterprise has been abandoned. The track and rolling stock were sold under attachment, and the engine will be used in hoisting coal from a mine near Huron.

HEALTH AND RECREATION.—This State has long enjoyed the reputation of possessing some of the best mineral springs in the country, and this fact, together with its healthful climate, accounts for the beneficial results which have followed a visit to these springs by many invalids. Now is the time for those intending to take a trip to the country during the hot summer months to be looking about for a suitable place, and to such we would say, try the Siegler Springs, Lake county, which are situated in a beautiful location, with good hunting and fishing close at hand, where the best of accommodations can be secured at reasonable rates. The Springs can be reached in one day from S. F., the Springs coach connecting at Lower Lake with the stage from Calistoga on Monday, Wednesday and Friday, and at Glenbrook on Tuesday, Thursday and Saturday. Among the important improvements which have lately been made is a large swimming bath. Springs are flowing out of the ground in a great many places on the property, containing iron, soda, arsenic, magnesia, etc., and many remarkable cures have been performed from the use of these waters. Persons intending visiting the resorts, whether for health or pleasure, will do well to read the advertisement of the Siegler Springs in this issue of our paper, and send to Mr. W. T. Garratt, manager of the Springs, who will cheerfully give any information which may be desired.

THE Southern Pacific railroad company has inaugurated a complete system for taking care of sick or injured employes, and for providing those who are permanently injured with suitable employment. A tax for the Hospital Fund of fifty cents is levied on the monthly salary of each employe. The hospital is situated at Tucson, and all the sick on the line between Yuma and El Paso, are sent there and cared for free. About twenty patients a month are received.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing Press, Box 2361, S. F.

Laurel Glen Fruit Farm

This place is beautifully located among the hills. A pleasant drive from railroad and beach. Deer and other game abound in the vicinity. A limited number of boarders can be accommodated for the summer and hunting season. The place is especially desirable for ladies with children. Address, for farther information, Isaac Dakin, Soquel, Santa Cruz county.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If he comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter.*

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $8 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of this official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Bullion Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Gold Hill Mining District Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of March, 1882, an assessment (No. 23) of Thirty (30c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 3, Safe Deposit Building, 328 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the second (2d) day of May, 1882, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the twenty-fourth (24th) day of May, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. BRAZELL, Secretary.

Office—Room 3, Safe Deposit Building, No. 328 Montgomery street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE EUREKA CONSOLIDATED MINING COMPANY, Nevada Block, Room 37, San Francisco, April 15, 1882.—At a meeting of the Board of Directors of the above-named Company, held this day, a dividend, (No. 72), of Fifty Cents per share, was declared, payable on the 27th of April, 1882. Transfer books closed until the 28th inst. W. W. TRAYLOR, Secretary.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. ☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT. No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., ENGLISH & WRIGHT, Agents

No 327 Pine St., San Francisco.

THE CONSUMERS' COMPANY.

VULCAN B B,

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

MANUFACTURERS OF AND DEALERS IN

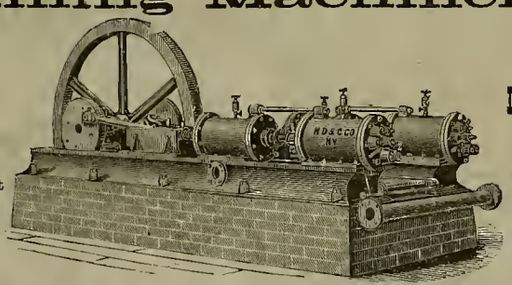
Mining Machinery.

We manufacture the

BEST

Air Compressors

Ever driven by belt from Water Power.



Hoisting Rigs.

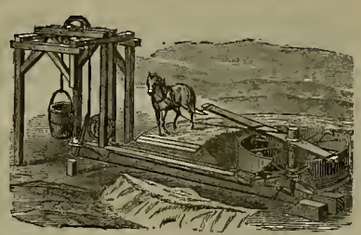
DONKEY ENGINES

For Pile Driving.

MINING CARS,

Ore and Water

BUCKETS.



MINERS' HORSE-WHIM.

—o—

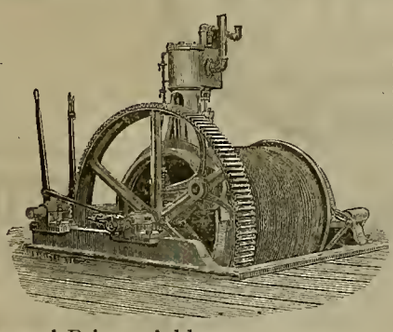
One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame work. When required these whims are made in sections to pack on mules.

Colorado Iron Works,

MANUFACTURERS OF ALL KINDS OF

Mill and Mining Machinery.

Engines, Boilers, Cornish Pumps, Hoisters, Crushers, Rolls, Stamp Mills, Smeltere, Furnaces, Ore Cars, Kibbles, Etc. Also, Saw Mills, Heavy Forgings, Bridge and other Bolts.



Machine Bolts and Lag Screws, at List Prices, with Freight added, less current discount.

THE OLDEST AND LARGEST MANUFACTORY OF MACHINERY IN THE WORLD.

For Circulars and Prices, Address

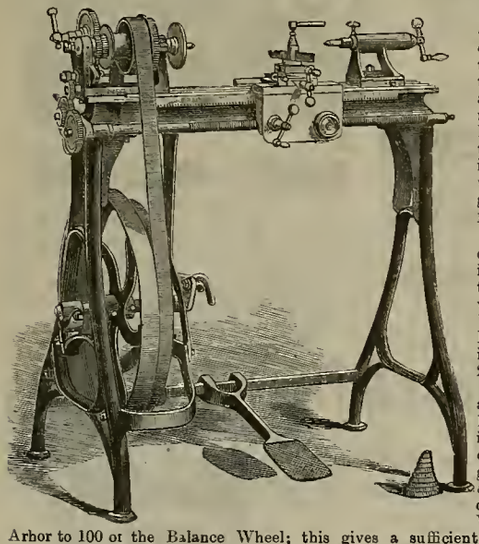
WOOD WORKING MACHINERY, MANUFACTURED BY THE H. B. SMITH MACHINE COMPANY,

And HAZARD STEEL Ropes and Cables.

SCREW CUTTING LATHE.



This cut represents a new screw cutting Foot Lathe which was put on the market about two years ago to meet the demand for a first-class tool at a low price, which will do a great variety of work, both in metal and wood, and is the best Lathe made, considering its capacity and price. The cut gives a good idea of its appearance, and below we give dimensions of parts and general description.

Description of Lathe, 4 ft. Bed.

The Lathe occupies a floor space of 28 by 48 inches, the centers being 44 inches high from the floor; the bed is 48 inches long, 6½ inches wide, 5½ inches deep, with double Vs. for Carriage and Tail Stock. It swings 10 inches over bed and 6 inches over carriage, and will turn 26 inches long.

The Head Stock is back geared, and the Cone has three speeds for 1¾ inch belt, the smaller being 3 inches diameter, the larger 6 inches diameter; this, with the back gears gives six different speeds, the fastest giving about 1,000 revolutions of the Arbor to 100 of the Balance Wheel; and the slowest, 75 of the Arbor to 100 of the Balance Wheel; this gives a sufficient range for all kinds of work.

The Arbor in Head Stock has a ⅝ inch hole through it, which is very convenient for turning the ends of long rods, making small screws, studs, &c. The Centres are ½ inch diameter. There is an attachment in Head Stock for reversing the motion of Carriage.

The carriage has a rack and pinion for moving it by hand, and a split nut moved by a cam on the face of Carriage to throw it in gear with screw; the reversing motion is in Head Stock.

The Tool Post has a slot for tools ⅝x1⅛ inches; the tool is adjusted by a wedge made on the arc of a circle and fitted to a convex washer. The leading screw runs the whole length of Lathe, and has 10 threads to the inch. A set of gears go with the lathe which will cut all common threads and a great variety of other sizes by compounding them; there is a screw stop on the Carriage for screw cutting, &c.

The Tail Stock can be set over for turning tapers, &c. The spindle of Tail Stock is 1 1-16 inches diameter, and has a motion of 3 inches. The center is fitted to a taper hole, which is the method adopted by all the best makers, and is the same size as the one in Head Stock, so that chucks and other tools fitted to one can be used in the other.

The Foot Motion, we consider the best made, the crank is adjustable and the shaft has swivel bearings; the balance wheel is 22 inches diameter and has 3 speeds to match Cone on Head Stock.

Send for Circular on Lathes.

Dunham, Carrigan & Co.,

SAN FRANCISCO, SATURDAY, MAY 6, 1882.

VOLUME XLIV Number 18

The Paper-Bag and Envelope Trade.

The paper-bag and envelope trade has grown to enormous proportions, and necessity has compelled the invention and adoption of many improvements in the mechanical appliances. Where, formerly, all the work was done by hand, machinery carries out the details more perfectly, rapidly, and with more economy. We illustrate, on this page, the most improved device employed in the trade—the Eureka paper-bag and printing machine. It is among the first successful paper-bag and envelope machines which does this class of work more neatly and quickly than by hand. It will work all kinds of paper, and make all sizes of bags or envelopes. A 12-year-old boy or girl, with a few hours' instruction, can run it, and make from 6,000 to 8,000 a day.

The machine folds, pastes, prints and counts the bags at the same time they are made. The engraving shows what the apparatus looks like. On the top of the table and hinged to its rear edge is a plate, which is called the "forming plate." This lies transversely on the table, and is adapted to have a vertical swing by means of treadle and connecting rod as shown. When the treadle is pressed down, the forming plate is drawn down flat on the table, and when the foot is taken from it, a weight, cord and spring return it to its place.

Upon the table, on each side of the forming plate, are the folding plates. These have guides on their lower surfaces, which fit in slots in the table, and they are thus adapted to slide toward each other, or to recede, one of them being made to start first and the other to move as soon as the first has started. The guides rest on rollers journaled under the table, and are thus enabled to slide easily, as well as being supported. They approach each other, but do not touch. Both folding plates pass above the forming plate. This movement is upon the ordinary principle of paper-bag machines of this class, but peculiar mechanism carries out the movement.

The paster consists of a trough, below which is the roller pad. The bottom of the trough has an aperture its entire length, so that the pasting material which is put in the trough passes through upon the pad. The trough has a shank, which is journaled upon a shaft attached to the table. Upon the same shaft is an arm, which extends forward under the horizontal arm of the bell-crank lever. When this arm of the lever is depressed, it presses down the arm and causes the pasting pad to descend and come in contact with the paper below. A raised ridge upon the plate holds the end of the paper up to receive the pasting pad.

There is also a device for folding over the bottom of the bag upon the sides, after they have been folded by the plates. It consists of a roller having an inclined front, behind which is another roller. This plate is adapted to slide forward upon the table, and, like the folding plates, it has guides, which pass down through slots in the table.

Other levers and arms act in a similar manner to paste the bottom of the bag.

The mechanism operating the plate which folds over the bottom of the bag upon the sides is quite ingeniously contrived, and would have to be seen in operation to be appreciated.

The printing attachment performs its work during the operation. In the top of the table is a hole, just about where the center of the bag comes. Beneath this hole, and secured to the under side of the table, is a vertical frame having suitable guides. In this frame is the printing stamp or form, containing any device or words found desirable for advertising. The printing form has secured underneath vertical rods, which pass down through the guides of the frame. The stamp, or form, is directly under the hole, and is adapted to be raised up through it to touch the bag above.

In order to keep the stamp supplied with ink, passing under the table transversely and lying upon appropriate guide rollers is a strip. One end of this extends towards the stamp and is provided with an ink roller. This is adapted to move back and forth over the stamp by peculiar and simple mechanism.

Another improvement in this machine is a device for counting the bags. The treadle and a ratchet wheel are so connected that, for every 50 bags made, a bell is made to sound. The forming plates can be changed to larger or smaller sizes, and the paster be adjusted to the changed sizes.

The device for automatically pressing and removing the bags or envelopes is a new feature also. A thrower marked *B* takes the bag after it is made and throws it on the endless belt, *A*. While the next bag is being made, the endless belt, *A*, carries it forward and passes it under the roller, *C*, and presses it out and then drops it into a box. Here it stays until the sound of the bell indicates that 50 are completed. They are then gathered up and put away in packages. This device is the invention of Anthony Beyer,

BEYER'S PAPER BAG, ENVELOPE AND PRINTING MACHINE.

of this city, who has recently obtained a patent for it through the MINING AND SCIENTIFIC PRESS Patent Agency.

A COMPANY of capitalists having recently purchased the Borax Lakes, are making arrangements to work them. There are two lakes, one at the head of Death valley, in Inyo county, and the other about 40 miles distant, near Resting springs. The surface of the earth is covered with a crust similar to Soda lake, and at a depth of about a foot the borax is encountered. These mines are very valuable. The nearest trading point is San Bernardino.

ESPERANZA mining district, at Jurupa, has been organized. Considerable excitement is prevailing at Riverside over the discovery of these mines. The mines lie in the hills north of Jurupa, and consist of a deposit of ore two and one-half miles wide by seven and one-half long.—*San Bernardino Herald.*

THE ten-stamp mill of Little Emma mine at Lundy, Mono county, will be brought in as soon as the snow gets off the Lake Canyon road, so that the machinery can be hauled direct to its destination.

The Kiss Process.

The use of alkaline or earthy hyposulphites for the extraction of silver from ores originated in Europe, having been suggested by Dr. Percy in 1848, and first applied in practice by Von Patera, in 1858, at Joachimsthal. Von Patera also used the sodium hyposulphite for the leaching and the sodium polysulphide for the precipitation. This method was modified by Kiss, who substituted the calcium salts for those of sodium.

The Kiss process, we learn, in Mr. Aaron's "Leaching of Gold and Silver Ores," was first successfully introduced on this coast by Kustel and Hoffman, in Mexico, after abortive attempts had been made by others in Lower California. It met with such success as to supersede amalgamation in the treatment of silver ores throughout the State of Sonora and the Territory of Lower California, and was even known among ill informed people as the "Mexican process." It has been gradually growing in public favor, the principal obstacle to its extensive adoption in the silver regions of Nevada being the circumstance that the ores of that State usually carry more or less gold, which, while frequently not justifying the application of the Plattner process, is but partially, and almost by chance, extracted in the Kiss silver process.

One great objection to the use of the Plattner process in these cases is the cost of acid, the transportation of which is troublesome and expensive. It is therefore desirable that some means of developing pure chlorine from salt cheaply, without the use of acid, should be devised.

BENJAMIN F. DELANO, formerly United States Naval Constructor, died in Brooklyn on Saturday, aged 75. He had a good deal to do with Perry's expedition to Japan and Kane's expedition.

The Anti-Debris Convention.

The following resolutions were adopted at the Anti-Debris Convention held at Sacramento this week:

WHEREAS, At least 100,000 acres of the finest lands in the Sacramento valley have already been destroyed, and hundreds of thousands of acres of such lands are now in imminent danger of destruction by the unrestrained flow of detritus from the hydraulic mines on the headwaters of the several tributaries of the Sacramento and San Joaquin rivers: and whereas, the said flow of detritus has already filled the channel of many miles of the navigable rivers of the State, and its continuance must result in a very short time in the complete destruction of said rivers and their tributaries, throwing them, in broad, shallow, muddy streams, over the fairest portion of the State, annihilating not only the productiveness of the lands, but the cities, towns and villages; and

WHEREAS, The navigation of the bay is now imperiled, and the harbor itself must at no distant day succumb to this devastating agency, and ruin overtake the metropolis of the Pacific, thus completing a picture of desolation never before beheld by the civilized world; and

WHEREAS, There are but few individuals or corporations comparatively engaged in this species of mining; and

Resolved, That it is the duty of the State of California, as a moral person, endowed with rights, and resting under obligations, to defend herself against such fearful mutilation, and protect the people of the valleys in the peaceful and undisturbed enjoyment of the fruits of their labor.

Resolved, That we indorse the action of Attorney-General Hart, in bringing suit against some of the hydraulic mining companies, in the name of the State, to test the right of one man in the pursuit of wealth to destroy the property of another, as well as the common heritage of this and future generations—the navigability of the rivers of the State.

Resolved, That, as experience has taught us that the water will readily carry off, without serious consequences, the washings of quartz and drift mining, we wish to say in the most emphatic manner to the miners of the State that we have no contest with any one engaged in such mining.

Resolved, That we have no contest with those hydraulic mines which take care of their debris, but it is against those, and those only, which wash great areas of earth into our streams.

Resolved, That the political party that does not recognize the just principle that every man must so use his own as not to injure his neighbor, is not worthy the support of the people.

Resolved, That the attention of the press of the State, especially the metropolitan press, is called to the immense importance of this matter, and to the fact that it has, in our judgment, failed to take that comprehensive view of the subject which its importance demands.

Resolved, That the people of the Sacramento valley demand of the executive, legislative and judicial branches of the State that just protection of our property for which governments are established and maintained.

Resolved, That the contest already begun against this system of desolation and destruction of our State is a sacred cause, which should enlist the sympathies and active co-operation of all her people; that the burden of the conflict should not be borne by the few who have heretofore struggled to stay this great destroyer, but should be shared by all the people of our great valley; that in order to reinforce those who are now at the front to concentrate all efforts in united action, we do most earnestly recommend that the several Boards of Supervisors present on this occasion meet together and take such action in the premises as will enable their several counties to contribute that aid and encouragement which only united action can bring; and we hereby pledge ourselves to the support of such action.

Resolved, That the action of the Board of Supervisors of Sacramento county, in calling this convention together, meets the unqualified approval of the people of this valley.

Italian Rocks and Contained Minerals.

(Continued from last week.)

3893. Galena of large, lamellar, crystalline structure, with chalcopyrites (one beautiful tetrahedral crystal), calcite in rhombohedral crystals piled one upon another parallel to the base, opaque-white quartz, etc., in talcose schist. Bottino lead mine, Stazzema (Lucca). Valle del Vezza, Apuan Alps.

3894. Chalcopyrite and panabase. Frigido copper mine, Massa (Massa and Carrara). Valle del Frigido, Apuan Alps.

3895. Pirrotina, from the lead lode, Bottino lead mine, Stazzema (Lucca). Valle del Vezza, Apuan Alps.

3896. Hetromorphite in magnificent capillary crystals. From the lead lode, Bottino mine, Stazzema (Lucca). Valle del Vezza, Apuan Alps.

3897. Lead-gray, argellaceous schist. Cogoleto (Genoa). Riviera di Ponente.

3898. Lead-gray, mica-schist. Savona (Genoa). Riviera di Ponente.

3899. Cassiterits, containing, as a mean product, 46% of tin. Richest ore mins of ths Cento Camarelle, Campiglia Marittima (Pisa). Ths nature of the lode and its geological relations are as yet unknown, but the lode is in the vicinity of granite, though not in it. The mine is supposed to have been worked at least 1800 years ago, hy the Romans, as an immense number of extremely ancient workings have been discovered all around.

3900. Cassiterite, from the mins of the Cento Camarelle. Rich ore. Campiglia Marittima (Pisa).

3901. Cassiterite of brick-red color. Mine of the Cento Camarelle, Campiglia Marittima (Pisa).

Prepalœozoic Group—St. Alban's System.

3902. Fine-grained, crystalline marble, of a delicate pearl-gray tint. Zantiscritti quarry, Carrara (Massa and Carrara). Apuan Alps. Termed in architecture Marmo hianco ordinario di seconda qualita. A very strong, good material for out-door work; not so beautiful in appearance as the following specimens. See Jervis' "Mineral Resourcee of Central Italy."

3903. Fine-grained, crystalline marhle of a pearl-gray or bluish tint. Termed in architecture, Marmo hianco ordinario di prima qualita. Zantiscritti quarry, Carrara (Massa and Carrara. Apuan Alps. See Jervis' "Mineral Resources of Central Italy." A splendid material for monuments and out-door architectural works in general; resists the atmospheric influenccs very well.

3904. Pearl-hlue, fine-grained, crystalline marble of great strength, admirably suited for architectural purposee. Piastra quarry, Carrara (Massa and Carrara). Apuan Alps.

3905. Pearl-hlue, fine-grained, crystalline marble, termed in architecture, Marmo hianco ordinari di seconda qualita. Canal Bianco quarry, Carrara (Massa and Carrara). A very excellent material for open-air architectural work, and one which admirably resists the atmospheric agencies. Less white than the other sample from this quarry. See Jervis' "Mineral Resources of Central Italy."

3906. Fine-grained crystalline white marble; termed Marmo bianco ordinario di prima qualita. Canal Bianco quarry. Carrara (Massa and Carrara), Apuan Alps. The best kind for architectural in-door purposes, hut less suited for exposure to the air than the former variety.

3907. Best pearl-gray, finely-crystalline marble; termed Marmo hianco ordinario di prima qualita. Ravaccione quarry, Carrara (Massa and Carrara), Apuan Alps. Mucb used for ordinary statuary and is highly esteemed for decorative purposes. Ravaccione marble is a well-known typical stone.

3908. Snow-white crystalline marble of saccharoid structure; termed Marmo bianco ordinario di prima qualita. Canal Grande quarry, Carrara (Massa and Carrara), Apuan Alps. This is a specimen of the best kind of marble qnarried at this point. Admirahle for in-door purposes, but does not resist the action of frost and otber atmospheric agencies sn well as some other types, and on exposure to such causes and to much moisture, it crumbles to dust.

3909. Fine-grained, crystalline, snow-white marble, traversed hy ahundant minute purple-hrown veins of great beauty; termed Marmo pavonazzo. Boccauaglia quarry, Carrara (Massa and Carrara), Apnau Alps. The peacock marhle (so-called) is one of the most splendid and gorgeons ornamental building stones; when properly polished it makes the most beautiful columns and halustrades for churches; also paneling and other work where sawed marhles may be employed. Beiog very hard, aud heing found in very limited quantity, it is a most expensive marble.

3910. Pearl-gray crystalline marble of larger structure than the nther sample from this locality (No. 125). Canal Grande quarry, Carrara (Massa and Carrars), Apuan Alps. Is a splendid material for all architectural purposes, ss it resists atmospheric influences admirably; termed, in architecture and the arts, Marmo bianco ordinario di seconda qualita. Can also he sawed for general use. One of the best kinds of marble found at Carrara.

3911. Finely-crystalline white marble, with delicate bluish-gray veins; termed, in architecture and the arts, Marmo hiauco venato di seconda qualita. Used specially for internal decoration and for furniture, and is cut into slabs. Para quarry, Carrara (Massa and Carrara), Apuan Alps.

3912. Very fine-grained crystallinc white marble, with delicste slate-colored veins; known ss Marmo hianco venato ordinario. Vara qusrry, Carrara (Massa and Carrars), Aupuan Alps. A mnch-ssteemed marble for ornamsntal purposes. Not good for monuments in cemeteries. All the snow-white marhles are bad for this purpose, and it is a popular mistake in Europe to employ them for such nses, since the frost, sun and moisture together injure and destroy the material in a short time, the inscriptions getting eaten out and obliterated. The pearl-gray marbles shonld he rather used. This articls shonld be well perused hy all who desire to perpetnate the memory of those dear to them, whereas, by the wrong choice of the marbles, they do everything in their power to use a bad material simply hecause it looks prettier at first. See Jervis' "Mineral Resources of Central Italy."

3913. Very best, fine-grained, crystslline, white statuary marhle. Termed in sculpture Marmo statuario hianco di prima qualita. Polveccio quarry. Carrara (Massa and Carrara). Apuau Alps. When freshly quarried it is translucent in the thin edges, but soon loses this propsrty on long exposure to the air; whereas ths statuary marble from Crestola quarry always maintains its translucency. See Jervis' "Mineral Resources of Central Italy."

3914. Very heautiful, fine-grained statuary marble of best kind, called Marmo statuario di prima qualita. Bettogli quarry. Carrara (Massa and Carrara). Apuan Alps. This marble is translucsnt in thin piece, and somewhat porous, whence it easily absorbs soot in cities, and when cut into thin slahs is somewhat elastic. It should be employed as soon as it is quarried, and not left lying out of doors, so as to avoid the loss of specific gravity, which tskes place when exposed to inclement weather.

3915. Carbonate of iron in contact with wbite statuary marble, togetber with other colored mineral matte.s Th s associoiation of extraneous elements is termed hy the quarrymen madremacchia. It is welcomed as the iodication of tbe sure vicinity of the best statusry marhle within a few feet. Crestola quarry. Carrara (Massa and Carrara). Apuan Alps.

3916. Best white, fine-grained statuary marhle from the celehrsted quarry of Crestols; supposed to he the first of all the Carrara statuary marble quarries, and also one of the moet ancient. Carrara (Massa and Carrara). Apuan Alps. This sample is intsnded to illustrate the nature of the contact with the veins of compact gray limestone found in connection with the crystalline white marhles slong with the madremacchie.

3917. The most beautiful waxy-white statuary marhle, showing the contact with veins or fissures filled with carhonate of iron and hrown spar, togethsr with varions minutely crystalline minerals. Crestola quarry. Carrara (Massa and Carrara). Apuan Alps.

3918. Fine-grained crystalline marhle of waxy-white tint. Crestola quarry. Carrara (Massa and Carrara). Apuan Alps. Marmo statuario carnicino. The most esteemed marble in Europe for statuary. Does not alter hy exposure to the air, provided it he kept indoors. Very tenacious, so that the sharpest edgcs can he obtained in works of art. Has been qnarried for nearly 2,000 years.

3919. Gray dolomite of open crystalline structure. Accompanies the white crystalline marhles, and forms certsin strata independent of them. From ahove the village of Forno. Massa (Massa and Carrara). Valle del Frigido, Apuan Alps.

3920. Extremely fine-grained, pearl-blue crystalline marblc. A common kind. Termed in architectnre Marmo bianco ordinario di seconda qualita. Lavagrino quarry. Massa (Massa and Carrars). Valle del Frigido, Apuan Alps.

3921. Extremely fine-grained, crystalline whits marhle, Marmo hianco ordinario di seconda qualita. From ahove the village of Forno. Massa (Massa and Carrara) Valle del Frigido, Apuan Alps. Serves for sawing into slahs and for internal decorative purposes. Being of a perfectly opaque white, it is very good for architecture and ordinary statuary, as it gives sharp shadows. The grain is finer than that of Carrara marble in general.

3922. Very fine-grained, crystalline, white marhle, termed Marmo biancn ordinario Puissant di seconda qualita; from the qusrries above the village of Forno, Massa (Massa and Carrara) Valls del Frigido, Apuan Alps. An admirahle marble for sawing into slabs, and wherever it is not to he exposed to the air.

3923. Finely crystalline white marhle, termed in the arts Marmo hiancn ordinario. Piastrone qnarry. Massa (Massa and Carrara) Valle del Frigido, Apuan Alps. Emloyed for sawing into slahs for furniture and for a variety of purposes, hut especially for in-door work. Nnt suitahle for columns, and can be had in hlocks of 40 ft. long. The strata are nearly vertical at this place, hence the columns made frnm thie locality retain the original position of the stone and last longer in consequence.

3924. Fine-grained, crystalline, pearl-hlue marhle, termed Marmo hianco ordinario. Corchio quarry, Stazzana (Lucca). An excellent material for out-door work, resists the atmospheric influences very well. See Jervis' "Mineral Resources of Central Italy."

3925. Pearl-gray, crystalline, metamorphic marble, termed Marmo hianco ordinario di seconda qualita. Costa quarry. Serravezza (Luccs). Valle del Vezza, Apuan Alps. Mnch used for steps snd paving tilee for honses.

3926. Fine-grained, crystalline, white marble, possessing very dccidedly a stratified character, hence it can he essily obtsined in thin slahs for paving stones. Termed Mnrmo hianco ordinario di seconda qnalits. Ceragiola qusrry. Serravezzs (Lncca). Valle del Vezzs, Apuan Alps. See Jervis' "Min. Res. Central Italy."

3927. Pesrl-blue, crystslline marhle of fine structure. Costa qusrry. Serravezzs (Lucca), Valls del Vezzs, Apuan Alps. Is found in heds or strata very distinctly marked, and furnishes slahs suited for paving purposes. It is principally cut into pieces of small size, into flags of octsgonal, hexagonal or equare shspe, snch as are most extsnsively used in warm climates. Termed Marmo hianco ordinario di seconda qnalita. See Jervis' "Mineral Resources of Central Italy."

3928. Best fine-grained white statuary marhle. From the quarry on the Monte Altirsimo, Serravezza (Lucca), Valle del Serra, Apuan Alps. This was discovered and first worked by Michael Angelo. Gives excellsnt sharp shadows, whencs it is much prized in statuary. See Jervis' "Mineral Resources of Central Italy."

3929. Best fine-grained, crystalline, whits marhls of a magnificent warm tint. Termed Marmo statuario di prima qualita. Falcovsja quarry, Serravezza (Lucca), Valle del Serra, Apuan Alps. Much prizsd hy sculptors, and of very homogeneons structure.

3930. Crystallins marhle. Termsd Marmo pavonazzo (peacock marhle). Boccanaglia quarry, Carraia (Massa and Carrars), Apuan Alps.

3931. Pale Bardiglio marhle. Discina quarry, Carrara (Massa and Carrara). A splendid ornsmental stone.

3932. Crystalline marble. Termed Marmo hardiglio zonato chiaro. Carrara (Massa and Carrara), Apnan Alps.

3933. Pale Bardiglio marhle, with only small traces of hlackish blue veinings. Colonnata quarries, Carrara (Massa and Carrara), Apuan Alps.

3934. Crystalline marble. Termed Marmo bardiglio chiaro. Colonnata quarries, Carrara (Massa and Carrara), Apuan Alps.

3935. Pale hluish-gray Bardiglio marble, with dark veins. Collonnata quarriss, Carrara (Massa and Carrara), Apuan Alps. A splendid material for internal decoration; takes an excellent polish.

3936. Veined crystalline white marhlo. Termed Marmo hianco venato. Vara quarry, Carrara (Massa aud Carrara), Apuan Alps.

Profits in Gold and Silver Mines.

The Tombstone *Epitaph* says: Were people as easily satisfied with profits in silver as they are in gold mining then we might hope for Tombstone district to eventually become the seat of the largest mining industry on the continent. Ahout 10 years ago English companies bought the Sierra Buttes mine, in Sierra county, California, and the Eureka mine, in Plumas county, paying an even million of dollars for the latter. They have heen working them with the most satisfactory results to tbemselves ever since. The returns have hsen very low on tbe investment—for mining property—probahly not averaging over 10% per annum, one year with another, and yet, with this the owners are content. The production of the Sierra Buttes for February last was $24,373, and the total working expenses were $17,933, leaving a surplns of $6,440. At this rate of working the gross profits will not exceed $80,000 or 8% on a capital of 1,000,000. Plumas, Eureka, gave a total yield of $26,062, at a total cost of $18,310, leaving a surplus $7,752. This same rate continued for the year wonld give between $90,000 and$ 100,000 or ahont 10% on $1,000,000 capital. Now it ie safe to say tbat there are dozens of mines in Tombstone district that, were they opened and worked with anything like the system and with the appliances tbat contrihnte to make the Sierra Buttes and Eureka mines paying investments, that could he made to do even better than those mines are doing. Unfortunately people who invest in silver mines are not so easily satisfied with a low rate of dividends as they are in gold minss. Why this should he so we are not ahle to understand. Take the history of gold quartz mining and it has never shown anything like so good a record as eilver mining, and yet people will content themselves with a much smaller return upon their investments.

Printed Words Vitiate an Olographic Will.—W. E. Milford wrote a will which douhtless he firmly believed would etand the strongest test; but, as the law in this State provides that an olographic will must he wholly in the handwriting nf the testator, and as, unfortunately, in the will in question, the date line was printed, Jndge Finn was compelled to declare the document invslid. It was consequently fnnnd necessary to fall hack npon a former will executed at Parie some years ago. The executors of the will, one of whom is at Paris and the other Rio Janeiro, have sent by cable a rennnciation of their trust, snd letters testamentary, with the wills annexed, have been granted to the widow.

The St. Gothard Railroad.—An important undertaking has been suggested hy the opening of the St. Gothard railroad. It is proposed to connect the Adriatic with the Lsgo Maggiore hy a system of canals, of which the terminal will hs at Venice and Magadino. This project presents neitber financial nor enginesring difficulties, and it will probahly he actually accomplished.

A New Tunnel at Cherokee.

About two weeks since, the Spring Valley company at Cherokee hsgan to wssh through their new tunnel. On the 13th day of Msrch, one year ago, the first drill was started upon thst work. It is 10x10 ft. in the clear, and over 3,000 ft. long. The mouth of the tunnel is located at a point in Sawmill ravine, just below the crossing of the Miocene ditch. The tunnel was driven from five different places. At a distance of 1,804 ft. from the mouth of the tunnel a shaft was snnk to a depth of 140 ft., and the tunnel driven in both directions. At another point, 2,963 ft. from the mouth, another shaft was put down 104 ft. deep, and work was also begun bere in both directions. The upper end of the tunnel is 96 ft. below the surface of tbe worked ground in Sawmill ravine, and 41 ft. in the hedrock—the gravel at this point being 55 ft. deep, as determined hy shaft. The grade of the tunnel is 6 inches in 16 feet. While driving the tunnel, there wero placed at each shaft hoisting gear and a safety cage, rnn hy a Knight water-wheel. At each shaft was an air compressor of sufficient capacity to drive four drills and a pump—each compressor heing driven by a Knight wheel; and at the mouth of the tunnel was a smaller compressor, with sufficient capacity to drive two drills. To accomplish this work there wers in use ten three-inch Ingarsoll "Eclipse" drills—two in each header. Thsrs are now two flumes laid through ths entire length of the tnnnel—one five feet wide. and the other of smaller size. The accomplishment of this work in so short a time is certainly remarkahle, and is no donht largely due to the faultless manner in which the engineering work was done. So nicely adjusted were the instruments of precision used, so carefully were the measurements taken, and so accurately were the calculations made, that at each connecting point the alignment was perfect; and in making one of the connections tbe two approaching drills collided in driving tbe final holes that broke through.—*Oroville Mercury.*

Quarterly Coinage Statement.

The coinsge of the four United States mints for tbe month of March embraced 1,211,400 gold pieces, 2,302,000 silver pieces snd 2,815,300 nickel pieces. The total was 7,328,700 pieces of a value of $12,009,024. This is the largest amount of coin turned out hy the mints in a long time, if not the largeet amount ever made during a single month. Tbe coinage of douhle eagles last month, tbough comparatively small, was actually larger than the combined amount for the previous two months. Eagles led last month in the gold coinage. All descriptions of coins now made hy the Government, with tbe exception of tbe lowest three gold pieces, were executed last month. In February the whole list wae represented for the first time in about a year. Following is a ststement of the coinage of all the United States mints for March and for the quarter ending March 31, 1882:

	March.	Quarter.
Double eagles	$1,040,000	$1,986,500
Eagles	5,608,000	10,580,750
Half eagles	2,993,000	11,808,925
Quarter eagles	.....	63
Three dollars	.....	75
Dollars	.....	25
Standard dollars	2,300,500	6,900,500
Half dollars	250	350
Quarter dollars	125	175
Dimes	50	70
Five cents	30,155	112,200
Three cents	33	53
Cents	30,911	118,018
Totals	$12,009,024	$31,507,794

This amount ie nearly as large as the coinage for 12 months a few years ago. The numher of half oagles coined for the past quarter is prohably larger than for any previous quarter. For general use this is the most convenient of all the gold coins, though in sections where metallic money is the dominant currency, as in Californis, bankers show a strong dislike to the multiplication of half eagles.

Mining Dividends for the Quarter.—The mining industry in some sections is not as prosperous as in former years. Tbe great Comstock lode is under a cloud, and has been for some time. It is nearly two years since the last dividend was received from that section. Of course, when such a prominent district drope out of the dividend list, it ie natural to feel thst everything in the mining line is doing poorly. Of late years a good deal of mining capital has heen absorhed at the East in the organization of mines in Utah, Arizona, Dakota and Colorado. This also has diverted attention from the profite of the business. It is no secret that California hss lost the control of most of the active dividend mines of the day. There is still a large interest here in the Comstock mines, hut it is not very attractive just now, and derives its only prominence frnm the assessment notices. The New York *Mining Record* has compiled a statement of the mining dividends for the quarter ending March 31st, the dishursements of which it apportions as follows.

At New York	$1,994 375
At Boston	893,750
At San Francisco	680 250
At Philadelphia	150,000
At London	135,000
Elsewhere	205,512
Total	$4,069,887

The above dividends have come from 41 mines, and others probably have heen unintentionally omitted.

MECHANICAL PROGRESS.

Bursting Saws.

A correspondent from Turnwood, N. Y., writing to Leffel's *Mechanical News*, takes up the subject of bursting saws:

The intense vibration of circular saws weakens them, but I do not know that they burst from long usage as much as from bad usage. In my opinion it is the latter. No tool gets such hard usage as the circular saw, and more saws are spoiled by hard usage than by all other causes put together.

In breaking a piece of cast steel, file a sharp corner in it, and when you strike it with a hammer it will break where it has been filed. Now if we file such a sharp corner at the bottom of the saw-tooth gullet or dust chamber, and the saw is not round, there will be an undue strain put on that portion of the saw where the teeth are longest, and by continued use it must break. Now if a saw has a crack in the plate, and we drill a hole at the bottom of the crack, it will prevent its cracking any farther. Suppose we had put that hole in the gullet, ten chances to one the saw would not have cracked at all. It will be seen that a saw that is out of round, with sharp corners at the roots of each tooth, is liable to fly to pieces at any instant, when the saw comes in contact with hard knots, long spikes, and pieces of drive hook broken off in the log.

Again, heating spoils saws. Some sawyers will run a saw until it is tremendously hot, and, to make it worse, they throw cold water on the side, thus causing sudden contraction on that part of the saw, and after a few such times the saw has to go to the factory to be hammered and put in order, and to come back to meet the same fate as before.

If the saw is round, hangs true in mandrel, is in line with the carriage, filed square at top and bottom, the backs of the teeth lower than the points, with the required amount of spread set, and the teeth kept well chamfered with a gummer, so that when the saw runs, only the points will come in contact with the lumber, then a saw will run free and cool, and there will be no extra strain on the plate, no heating, nor danger. The causes of bursting of saws, in my opinion, are:

1. Square corners at bottom of tooth.

2. Out of round, with the backs higher than the points, so that instead of cutting, they scrape the dust off with the back.

3. Undue strain put upon the saw by the plate rubbing against the log, causing it to heat, which takes the life out of a circular saw.

Where inserted teeth saws are used, and the power is light, every other tooth may be taken out, and a worn out tooth put in to protect the jaw. Mills with less than 20 horse-power, if the saw is put in good order, will cut 1,000 ft. more per day with every other tooth out than with the full set. Each tooth will take out one-eighth inch almost as easily as one-sixteenth—that is, a 16 horse-power will do with a half set nearly as much as a 20 horse-power will do with a full set of teeth. I have run saws where each tooth cut a trifle over one-fourth inch, in hemlock. Saws that lap over into the log when in line with the carriage want more set; saws are very apt to lay to the log when the set is out, especially on heavy feed.

Mechanical Terms.

The technical terms which are in use do not seem to be generally comprehended by the majority of our mechanics and engineers, from the fact that a large number of terms are in use which mean one and the same thing. The distinction particularly between the terms force, power and work is not clearly understood. Dynamics is the science of that branch of mechanics which treats of force in motion, power and work. It comprehends the action of all kinds of machinery, manual and animal labor, in transformation of physical work. Element is an essential principle which cannot be resolved into two or more different principles. The simple physical elements of dynamics are force, velocity and time; and the functions of those elements are power, space and work. Function is any compound result or product of two or more elements. A function is resolved by dividing it with one or more of its elements. Force is any action which can be expressed simply by weight, and which can be realized only by an equal amount of reaction, and is the first element in dynamics. All bodies in nature possess the inherent virtues of repelling and attracting one another, which action is recognized as force. Velocity is speed or rate of motion, and is the second element in dynamics. Time implies a continuous perception, recognized as duration, or that measured by a clock, and is the third element in dynamics. Power is the product of force and velocity; that is to say, a force multiplied by the velocity with which it is acting is the power in operation. Power is the differential of work or any action which produces work, whether mental or physical. Power multiplied by the time of action is work—work divided by time is power. Work is the product obtained by multiplying together the three simple elements, force, velocity and time.—*American Machinist.*

On the Dimensions of Cast Iron at Various Temperatures.

At a recent meeting of the Royal Society of Edinburgh, Prof. P. G. Tait communicated a paper by W. J. Millar, C. E., Glasgow, which was a detailed description of a series of experiments made by the author on the dimensions of cast iron and other metals at various temperatures, and more especially with reference to the phenomena of floating cast iron. It was pointed out by the author that various views have been held as to phenomena attending cast iron at extreme temperatures, as in the molten state, white-hot solid, and finally, the cooled solid condition. From experiments made by the author some years ago, he concluded that the cause of flotation was buoyancy derived from the expension which was due to the great heat of the molten mass in which the cold piece of metal was suddenly placed, inasmuch as the pieces, especially when large and heavy, disappeared beneath the surface, and thereafter rose and floated upon it. He found his views to be confirmed by the results of a series of experiments which he had recently carried out. By making careful measurements of the solid pieces of metal both before and after immersion, he had found that a large expansion took place, the amount of which was about equal to the whole of the original shrinkage from the molten to the finally cooling solid state. He had also observed that in every case the floating metal was at a comparatively low temperature. For example, a piece of cast iron 12 inches long was found to float after an immersion of a few seconds, when it was at once taken out and its length found to be 12⅛ inches, even though its own temperature was barely equal to that of the melting point of lead. The author had, therefore, formed the opinion that a large portion of the heat disappeared in the form of work of extension. By using pieces of lead, type metal, steel and bronze, in other experiments, he observed that the lead and type metal did not float, and that the other two bodies behaved in the same way as cast iron. Then, again, he instituted a series of experiments with the view of determining whether or not any expansion resulted during the solidifying of cast iron; but from the results which he obtained it seemed to be very doubtful if any such action took place, at least if the metal of the casting were not permeated by any air or other gaseous matter. In all cases, the author found that the results of his experiments corresponded exactly with the conclusion which he had based on those which he had instituted a number of years ago.

EXPANSION OF STEEL IN HARDENING.—It is well known to workers of steel that by the process of hardening it is sometimes expanded, so that in a job where two pieces are fitted accurately in their unhardened state they become so much enlarged that grinding is necessary to restore them to their former relative size. No rule has yet been found by which the amount of this expension can be actually determined before hardening. It may depend upon the amount of carbon in the steel, which varies in different specimens; on the degree of heat employed in the process, and also largely on the size and shape of the pieces treated. This expansion may, however, be reduced to the minimum by repeated annealings while the work is in progress at the lathe, vice or planer. It is also true that in some instances steel, having been hardened, will contract slightly when drawn to temper, the amount of contraction depending on the lowness of drawing.

THE HOLLAND PROCESS for using petroleum for fuel has had another, and apperently a more satisfactory test in public after a long period of silence. The new locomotive built at the Grant works for the especial purpose was used, and it is stated that "the experiment demonstrated the capacity of the process to get up sufficient heat for the ordinary locomotive within 12 to 15 minutes, and showed that this heat was under such command that a child could regulate the opening, closing and intensity." The process consists in uniting naphtha and water by means of an oxy-hydrogen blow-pipe so that the water itself becomes fuel. Great economy and absence of smoke and ash are among the evident advantages of this discovery, if its practicability shall be established.—*Railway Age.*

SOFTENING CAST IRON.—The surface of cast iron may be softened for turning or planing by immersion for 24 hours in a solution of one part aquafortis to four of water.

SOAPSTONE AND FERTILITY.—At the meeting of the Academy of Sciences on Monday evening, a large piece of soapstone from Elko, Nev., was also exhibited, and it was explained that the analysis of a Miss Ara Sessions of the University proved the mineral to be an essentially aluminum magnesium silicate. An extraordinary property of the soapstone is that it becomes of a gelatinous character upon the addition of water, and while it swells by such application, no amount of water can dissolve it. Prof. Hilgard had discovered the mineral in Mississippi, and ascribed the fertility of the land to the water-absorbing quality of the soapstone, in turn to be abstracted by the plant. In the manufacture of soap the mineral also makes a ready combination with water, and, unlike talc, leaves no precipitate, or at least an inconsiderable one of only 5%.

SCIENTIFIC PROGRESS.

Another Important Chemical Triumph.

Among the wonders of modern chemistry none are more striking than those which its magical touch has created from coal tar. Among the most important commercial products from so unpromising a source as coal tar would at first seem to be, have been carbolic acid, picric acid, paraffine, all the aniline dyes, artificial madder, artificial indigo, and a great variety of coloring matters in addition to those mentioned. Within the last year some reference has been made in public journals to the fact that a German chemist had succeeded in making a substance very strongly resembling quinine, by a process in which some of the elements of coal tar were employed. The body known as quinine, which is yielded by quinic acid, was obtained as long ago as 1861 from anthracine, a body which occurs in coal tar. The idea of manufacturing an artificial quinine by the use of coal tar has in late years, therefore, been familiar to chemists, and has been the cause of many experiments. The success of these efforts would be so very important a matter, and the public references to the alleged achievement had been so brief and vague, that a reporter of the N. Y. *Evening Post* recently applied for information on the subject to President Henry Morton, of the Stevens Institute of Technology, who was known to have given it much attention.

Prof. Morton said that artificial quinine had not yet been manufactured artificially, but that an artificial chinoline had been produced so much like the drug of commerce, that many persons believed it to be the medicinal equivalent of quinine. If it did not prove to be fully that, there could be no doubt that the progress thus made would be advanced till it produced quinine itself. By a process of destructive distillation, chinoline could be obtained from quinine, and, with the resources of modern chemistry, it was certain that this result could be reversed. The inventor of the artificial chinoline in question was Prof. Skraup, of the University of Vienna. Prof. Skraup had not made his discovery by accident, but by the intelligent use of means to that precise end. The invention was the result of experiments based on a system of reasoning in accordance with the modern theory of chemistry in regard to the structure and arrangement of atoms. The artificial chinoline was not *extracted* from coal tar, but was *constructed* from certain elements, some of which were derived from that substance. It was obtained by the action of a mixture of glycerine and sulphuric acid upon a mixture of nitro-benzole and aniline.

Prof. Morton said that he had manufactured the artificial chinoline in his own laboratory, a few ounces at a time, until he had produced probably some three pounds in all. He had succeeded in making some minor improvements in the process, as, for instance, in the purification.

A number of experiments to test the medicinal qualities of the new product have been made in Russia by Dr. Donath, upon both men and animals; but he was unable to try it in fevers, owing to a lack of patients. It is reported that in Germany a number of cases of intermittent fevers have been successfully treated with chinoline, but these statements have not been verified, and are not generally accepted by the medical profession. Experiments with the new substance have also been made by physicians in New York, but the quantities of it manufactured there, or received from abroad, have thus far been so small that it has not been possible to make tests of a conclusive character. It has been proved, however, that the artificial chinoline, when administered medicinally, had the effect of lowering the temperature, as quinine has, and that, like quinine, it is a powerful antiseptic.

In speaking of the great variety of products obtained directly or indirectly from coal tar, Prof. Morton remarked that, in addition to the important commercial products thus derived, "almost everything" had been made from it as a chemical curiosity. Even the flavor of vanilla had been secured from coal tar, but this was much more costly than the natural product of the vanilla bean. The first cost of artificial indigo, was greater than that of natural indigo, but the artificial product was, nevertheless, more economical for calico printing, as it could be printed directly on the cloth, while with the natural dye an elaborate and wasteful process was required. Consequently, the artificial indigo was now used at the rate of 500 lbs. a week at some of the large print works in this country, although its manufacture was still confined to Europe.

When asked as to the probable supply and cost of artificial chinoline, in case it should be proved the medicinal equivalent of quinine, Prof. Morton replied that it could easily be manufactured in great quantities at large works erected for that purpose, and that the actual cost of its production need not exceed one dollar per pound. Inasmuch as quinine had been sold at four or five dollars an ounce, and the supply of Peruvian bark was diminishing, the great importance of a cheap, inexhaustible substitute was apparent.

WAVE LENGTHS of the sounds emitted by a man's voice in ordinary conversation are from 8 ft. to 12 ft., and that of a woman's voice 2 ft. to 4 ft. per second.

Congenital Color-Blindness.

It is my belief that a large number, perhaps a majority, of the cases of congenital color-blindness have not their seat in the retina at all, but are cerebral in their character. In other words, I believe that in these cases the brain-center of vision has not the power to differentiate the various impressions it receives. This opinion will seem the more plausible when we remember that the sense of sight is a developed or educated one. Though we have received from our ancestors the potentiality of vision, every child that is born must learn to see for itself. Without here entering into a discussion of the question of the development of the color-sense, which has received much attention at the hands of Mr. Gladstone, Magnus, and others, it is safe to assume, with our knowledge of analogous matters, that the differentiation of colors is a power partly inherited and partly developed in the individual; and, moreover, we should expect to find this power, which is cerebral in its character, most strongly developed where the faculty was most used. And so we do find it. Women, who are much more concerned than men in the selection and comparison of colors, are rarely affected with color-blindness; and we all know how much quicker the feminine eye is in detecting slight differences in shades of color than is that of men who are not color-blind. In those cases of color-blindness which, for the sake of distinction, we shall call central, we believe that the brain-center of vision has not been developed to its full or at least to its ordinary power for discriminating between the impressions corresponding to the different colors. The retina may be capable of properly responding to these various impressions, and the optic nerve may carry them as separate impressions to the brain-center, but this has not the power of converting them into individual sensations.—*Popular Science.*

HOW ODORS ARE PROPAGATED.—According to this view, the odoriferous bodies, or their molecules, have no more to do (in the sense of physical impact) in producing the sensation of smell, than a luminous body—a candle or the sun—has to do (by impact) with the sensation of light. There is corporeal impact or touch in neither case. Of course, with each molecule as a center of activity, the effect will be more pronounced at the immediate surface (as with all radiant energies) than at any distance. And, undoubtedly, particles of disintegrating, odorous matter are often brought in contact with the Schneiderian membrane; but the sensation of that impact, if there be any, would be of touch, not of smell, as surely as that, from that point of contact to the sensorium, the effect or influence is conveyed by a vibration—a wave-motion in the "fluid" of the nerve-duct—as the undulations of the luminiferous ether are propagated along the course of the optic nerve to the seat of sensation, where they are translated into light and color. But, if, for any portion of the distance between the internal sense and the fragrant body, the odor, like light, is but a motion, it is safe to assume it for all. The analogy of this mode of odors to that of light and sound, is something in its favor.—*Popular Science Monthly.*

EARTHQUAKES.—Dr. K. von Fritsch, of Halle, maintains that the causes of earthquakes are much slighter than has generally been believed; that they may be sought at a depth of not more than 10 or 15 miles, and often of less, and that rather feeble forces may produce earthquakes which will be felt at great distances. The hammer in Krupp's factory, which weighs 1,000 centners, and falls from a hight of 10 ft., produces sensible concussions over a surface five miles in diameter; and a recent explosion in a dynamite factory was felt at between 25 and 30 miles away. Dr. Fritsch points out how earthquakes might and must be produced by the increase and decrease in volume of rocks under the influence of physical and chemical forces, by concussions, by the opening of crevices in rocks, and by the subsidence of masses of rocks due to these agencies.

EARTH-TIDES.—A committee of the British Association is investigating the question of the existence of earth-tides, or of oscillations in the crust of the earth similar to those which are produced in the ocean by the attraction of the moon. A pendulum is so suspended that its slightest motion turns a mirror and causes a perceptible movement in the spot of light reflected by it upon a distant screen. The pendulum is proved to be continually changing its position, for the reflected light is in incessant motion, and so irregular that it is hardly possible to localize its mean position on the screen within five or six inches. Mr. W. Mattieu Williams has suggested that the constant movements of the microscopic bubbles imprisoned within the cavities of gems and minerals are due to the same cause.

UNCONSCIOUS NERVE FORCE.—In his "Diseases of Memory," Ribot says: "When a child learns to write, according to Lewes, it is impossible for him to use his hand alone; he must also move his tongue, the facial muscles, and perhaps his feet. In time he is able to suppress these useless discharges of nerve force. And so, when we attempt for the first time any muscular act, we expend a great quantity of superfluous energy which we learn gradually to subdue. By exercise certain movements are fixed, to the exclusion of others."

Meetings and Elections.

Black Bear Quartz M. Co., May 1. Trustees—Thomas Bell (President), S. Heydenfeldt (Vice-President), Alpheus Bull, F. Locan, J. Daggett; Wm. Letts Oliver, Secretary.

Justice M. Co., May 1. Trustees—J. P. Cavallier (President), H. M. Levy (Vice-President), John Scott Wilson, W. Ayer, P. Ameraux; R. E. Kelly, Secretary; Bank of California, Treasurer.

Woodville M. Co., May 1. Trustees—J. P. Cava'lier (President), H. M Levy (Vice-President), John Scott Wilson, W. Ayer, P. Ameraux; R. E. Kelly, Secretary; Bank of California, Treasurer.

Buckeye Hydraulic M. Co., May 1. Trustees—J. K. Holman (President), Wm. A. Stephens (Vice-President), W. Bayard Cutting, James Heron, Henry Wadsworth.

Utah Extension M. Co., May 1. Trustees—J. Meyers (President), V. Ressayre (Vice-President), C. H. Redmond, J. H. Kavanagh, S. V. Hendenreich.

THE French and Englisb are getting hold of the good mines. The Enreka *Sentinel* says: The Phenix mine has been bonded to a French company in San Francisco, the agent of which will arrive here in a few days to examine the propsrty, and will probably buy it for his principals. The mine is now being worked under lease. The Phenix is situated between the K K and Jackson, on Ruby hill. It is one of the oldest locations, and was at one time one of the best paying mines in the district. It has fine hoisting works on the ground, and has been prospected to a depth of 630 ft.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

There has been a little spurt this week in Union Con., hnt small variations are the rule.

The following mining companies had cash on hand May 1st: Alta, $8,739.40; Alpha, $11,-924.46; Argenta, $210.28; Benton, $11,231.11; Bnlwer, $77,895 15; Bechtel, $970.71; Bodie, $65,207.01; Crown Point, $21,922.85; Chollar, $5,939.24; Exchequer, $9,652.42; Gould & Curry, $948.72; Grand Prize, $186.31; Hale & Norcross, $10,340.01; Justice, $6,900.57; Lady Washington, $1,688.75; Mexican, $15,804; Mono, $5,183.74; Northern Belle, $29,613.73; Ophir, $39,145; Potosi, $2,488.78; Sierra Nevada, $23,620.74; Standard, $241,008.41; Tioga, $6,161.21; Utah, $2,-641.91; Union, $35,088.37; Yellow Jacket, $80,-000; Belding, $506.76; Con. Virginia, $83 752; East Monnt Diahlo, $3,096.36; General Jackson, $3,713.93; Metallic Eqnator, $1,648.75; Mount Diahlo, $56,170.21; Saratoga, $7,524.33.

The following companies had an indebtedness May 1st: Belcher, 25.000; Best & Belcher, $21,422.67; Belle Isle, $299 93; California, $50,-000; Day, $89,000.77; N. B. Isle, $708.06; Savage, $30,516.44. May 2d: Betty O'Neal, $16,-391.03; Holmes, $1,919.78.

It is hoped that work will at once be commenced looking tn the draining of the flooded mines. Meantime some ore is being extracted from the upper levels hy the Belcher and Crown Point companies and the Yellow Jacket folks are about to begin the extraction of ore from the old upper levels, working through the old shaft at Gold Mill.

The ore stopes on the 2500 level of the Union Consolidated are yielding well, says the *Enterprise*, and the ore is improving in quality. The pulp assays have advanced from above $45 to $70 per ton. The winze has been snnk some 30 ft. below the sill floors of the 2500 stopes, and is still in fine ore. This shows the ore body to be of large eize. The ore deposit is widening toward the southwest, and is also improving in quality in that direction. On the 2600 level the northwest drift is still advancing in a promising vein formation. It will soon reach the point where it is expected that ore will be found. In sinking No. 1 winze (the wet winze) below the 2600 level some good seams of ore are being encountered. It is going down on an incline.

COLORADO IRON WORKS.—These works, at Denver, sent us an advertisement, which appears in another column, hnt our compositor gave them a wider scope than they claimed. They wrote, "the oldest and largest manufactory in the West," and the said typo makes them say "in the world." The page was printed before our attention was called to it. The works are old and large, hut not quite what was said about them. The proprietors are modest, if they are Colorado men, and we make this apology for them.

THE carpenters of Cincinnati have struck for 50 cents extra a day, and building has stopped.

Bullion Shipments.

We quote shipments siuce our last, and shall be pleased to receive further reports:

Northern Belle, April 24th, $4,009; Mt. Diablo, 26th, $16,127; Christy, 27th, $4,798; Standard, 25th, $25,420; Eureka Con., 22d, $22,501; Tiptop (for March), $23,576; Contention, April 27th, $10,992; Bodie, 30th, $10 873; Northern Belle, 27th, $5,645; Belle Isle, 30th, $4,000; North Belle Isle, 30th, $2,000; Christy, 29th, $4 373; Bodie Tunnel, May 2d, $3,583; Contention, 2d, $19,484; Horn Silver, April 26th, $22,500; Frisco, 25th, $5,038; Barbee & Walker, 25th, $1,067; Horn Silver, 27th, $15,-000; Copper Balt, 27th, $766; Horn Silver, 28th, $10,000; Stormont, 28th, $3,250; Crismon, 28th, $832; Horn Silver, 29th, 12,500; Frisco, 29th, $5,045; Horn Silver, 30.h, $7,500; Alice (for April), $90,000.

THE LATEST RUSH.—W. D. Knight, of the Yellowstone *Journal*, who recently returned from Maginnis to Miles City, gives a glowing account of the new mining district. He states that the placer diggings are worked every day, and will rnn $40 to the man in gold. Most of the quartz mines are silver, hut of a very high grade, averaging from $3,000 to $12,000 to the ton and free-milling. The gold quartz has not opened very extensively yet, but enough to know its true valne. The best developed mines are the Chollar and Montana, both of which now have over $100,000 on the dump awaiting machinery. The principal town is Maiden, sit uated at the head of Warm Spring creek, about four miles from Fort Maginnis, and town lots have advanced in valne from $50 to $1,500 within the past two or three weeks. There are now in the place abont 100 business houses, and enough saloons and other things usually found on the frontier for a city of 20,000 in tho East. They have one good hotel over 100 ft. long, and this and all others are crowded. Carpenters get $5 per day, miners $5 and $6 and common laborers $4 per day.

LIVELY LOCATING AT WOOD RIVER.—Within the past few weeks, that is since the snow began to disappear from the hillsides, a number of promising finds have been made within a short distance of the Keystone city. Some of these show a large vein of ore giving assays of 150 to 250 ozs. silver and 60% to 65% lead to the ton. The greatest share of the claims staked have been east of the town, and on or near a line running from the North Star and Elkhorn across and north of Lake Creek mines. There seems to be one continuons deposit of rich galena along this line, and wherever found is in paying quantity. Prospectors are following up the snow very closely, and the present indications are that a hundred locations will he made along this line during the next 30 days.—*Ketchum Keystone.*

BERTHS on the first-class transatlantic steamers from New York have nearly all been secured up to the 1st of July.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

KELLY.—Amador *Sentinel*, April 29: The mill at the Kelly mine was started up yesterday morning, and works to a charm. We are informed that a party stands ready to contract to work the mine and deliver ore at the mill for 50 cents per ton. We expect to hear of regular bullion shipments from this mine from now on.

CALAVERAS.

RICH GRAVEL.—Calaveras *Citizen*, April 20: Showalter & Hubbard have been at work for the last 3 months on Douglas hill, near town, sinking a shaft near some old diggings, which in former years were exceedingly rich. About a week ago they struck the ledge at a depth of 140 ft, and found a rich body of gravel.

ENTERPRISING.—Calaveras *Chronicle*, April 29: The Cary mine, formerly known as the Gouldson mine, is now in the hands of M. Cary, Esq., a man of energy and enterprise, and hoisting works are to be erected on the mine at once, and the mine worked. Mr. Cary also has the machinery for a portable sawmill, which he intends to run in the timber region in the vicinity of West Point. The greater part of the machinery is already on the ground, and the remainder is now on the way.

ROSE & JENKINS MINE.—We are informed that the Rose & Jenkins mine, at Skull flat, near West Point, is being energetically worked, and with splendid results. A 10-stamp mill has been erected on the mine, and is in operation. The vein of quartz is from 2 to 3 ft in width, and the rock assays all the way from $30 to $100 per ton.

CHAMPION MINE.—Arrangements are being made to prosecute work in this noted mine with renewed vigor. Having reached a depth of 700 ft, the indications at that point are such as to warrant the most sanguine expectations of the owners in the development of a rich, permanent and extensive mine. In sinking to the present depth the pluck and perseverance of the owners have been put severely to the test. The last 250 or 300 ft was through exceedingly hard rock, with no substantial returns for their labor, and very little encouragement. Nothing daunted, however, tho work of sinking continued, and at the depth of 700 ft very encouraging developments were made. Mr. S. Haskins, one of the owners of the mine, from whom we obtain our information, states that the formation from foot to hanging wall is about 70 ft, through which runs a fissure of talcose slate, from 5 to 6 ft in width. From the later developments it appears that the rock extracted all the way down to the present dep h constituted a cross vein through the formation. In sinking a winze, a new chute of ore was discovered, 3 ft in width. Eight feet to the right of this, on the hanging wall, was found another vein. Both run parallel with the formation, with every indication of coming together at a lower depth and forming the main body. The rock in the one prospects $30 per ton, and in the other $15. It is the belief, and the indications warrant it, that a further depth of 150 or 200 ft will bring the works into a heavy body of ore and the main lead. Some necessary arrangements are being made for carrying on the work to a further depth. As soon as these are completed sinking will be resumed. There are few mines that can show as good a record as the Champion. The owners were in debt when they commenced the work of prospecting, a few years ago, and depended upon the yield of the mine to carry on work. The returns enabled them to clear their indebtedness; erect hoisting works, dig ditches, of which there are 16 or 18 miles; build a sawmill, and pay the expenses of working the mine. We are informed that since the mine first started the yields have aggregated about $100,000.

EL DORADO.

QUARTZ.—Georgetown *Gazette*, April 29: Messrs. Jordan & Zimbro have been energetically prospecting a 12 or 14-inch quartz vein on Slate mountain, some 7 miles southeast of town, during the past 16 months, and from reliable sources we learn they have got a good mine. The rock prospects very evenly for a goodly distance, and is thought to be $15 rock. We learn that the mine is attracting considerable attention from visitors, and that the energetic owners have already put down quite a shaft. A number of others are also reported to be prospecting promising quartz lodes in that neighborhood. A short distance to the southward, T. F. Lewis has a mine which bids fair to become a good property. Much of his quartz pays him fair wages in a spring-pole mortar. Really there is quite a mining boom in that new district. Ten new stamps from the Placerville foundry came up on Smith's stage for the Josephine mine at Volcanoville, and Hi. Fuller took them up this week. Besides the 10 stamps now hammoring away on the Josephine at Volcanoville, active work on several other mines about that camp is going on.

ANOTHER RICH FIND.—*Mountain Democrat*, April 29: One day last week A. S. Bosqui, one of the Grays and the Horn brothers were scouting through the greasewood brush, on Arthur Litten's ranch, in White Oak township, when one of them stumbled over a quartz cropping that showed gold. After a little prospecting they became satisfied that there was considerable more of the same kind ther about. The next morning Archie called on Mr. Litten, and asked him what he would take for 5 acres of that land. Litten didn't care about segregating so small a tract at a less price than $100 an acre. This seemed a pretty steep price for a greasewood tract in White Oak; but Archie had set his heart on it, didn't haggle about the price, and promptly closed a trade for 5 acres at $500. The second day thereafter the young men took out more than the amount of their purchase money, and have opened up a lovely little ledge, a sample from which is before us, thickly studded with free gold, good for at least $150 per ton. It was brought to us by Deputy U. S. Mineral Surveyor J. M. Anderson, who has visited and inspected the ledge, and who fully corroborates all the reports that have been received relative to the richness of the find, as also does E. Cooley, a reliable resident of the vicinity, who has visited our office since the strike was made. Stimulated by this discovery, Mr. Litten has made another, of almost equal value, in the immediate neighborhood.

INYO.

KEARSARGE DISTRICT.—Inyo *Independent*, April 29: The prospects in this district for the present season look very flattering. The strike lately made in the Kearsarge mine has infused new life into this and other properties situated on Kearsarge mountain. The 50 ft. contracted to be sunk from the tunnel in the Kearsarge had not reached 10 ft in depth when a fine vein of ore was exposed. Samples assayed by Mr. Woodhull prove the ore to be first-class milling, carrying both gold and silver. The refitting and necessary repairs to the Kearsarge mill will follow as a natural consequence

MARIPOSA.

DILTZ MINE.—Mariposa *Gazette*, April 29: During the past winter the work upon this mine has been chiefly confined to washing the slate and vein matter upon the surface, which had accumulated from the shafts and tunnels run upon the mine. Water is brought to bear upon the mine by artificial means, and from several sources; but, except it is a rainy season, the reservoirs and ditches must necessarily go dry, and all mining dependent will have to remain undisturbed until a favorable rainy season can be had. Capt. Diltz has only had about 6 weeks' run of water this season; but during the time he has made available the water afforded him, by giving it a chance at his rich bank of dirt and accumulation of matter before mentioned, by sluicing off and sacking the gold, which amount, we understand, runs up into the pounds, and is a sight worth looking at. The 70-ft shaft on the north side of the mine, which had been closed up for the winter, was uncovered last Thurs-

day and examined, was found in an excellent condition, and the timbering intact, as when it was first put in. At the bottom of this shaft is the large vein of pay ore, which will, at no distant day, supply a mill of 40 stamps, and perhaps more.

MONO.

Bodie Con. *Free Press*, May 2: During the past week there were 38 tons of ore hoisted from the mine, of which 46 tons were from the sixth incline level, and 42 tons were from the fifth level; and 115.78 tons were hauled to the mill. The mill crushed 125.02 tons of ore. The average assay value of the pulp was $73.48, and the tailings assayed $7.89. The bullion shipment amounted to $10,873.95. The Lent shaft is 867 ft deep, having been sunk 10 ft during the week. The pumps are making 61 strokes per minute.

Union Con.—The south drift on the Banner lode is now 250 ft in length. The face of the drift shows a heavy deposit of manganese, with clay and quartz, the latter giving average assays of from $16 to $11 in gold, and from 60 cents to $1.25 in silver. About 1 ft of quartz on the west side of the drift is free from waste, and will pay well to mill.

Tioga Con—Upraise No. 1 was advanced during the past week 8 ft; total length, 30 ft. It continues to look well. East crosscut No. 3, from north lateral drift No. 1, is out 250 ft, a progress of 8 ft, with a general improvement in the character and appearance of the formation.

Bodie Tunnel. The ore breasts look well north and south of the tunnel, and yield the usual supply of ore for the mill. The mill is reducing from 33 to 36 tons of ore daily. The bullion shipment will be about $3,400.

Con. Pacific. The north drift on the 130-level was advanced 10 ft during the past week. It is now 236 ft long.

NEVADA.

Notes. *Tidings*, April 28: The O'Connor company is greatly encouraged at the excellent prospects. Two of the tributors have struck the ledge, and the rock taken from it shows well in gold and sulphurets. The ledge is a large one, and considerable rock has been taken out, and is now awaiting the completion of repairs at the mill, when it will be crushed. Work on the mill is not going on as rapidly as it might, on account of a scarcity of lumber. At the Washington, George Mainhart has taken a contract to run 2 drifts, 50 ft each. The company men are still working. The ledge in the north drift is looking much better than it did, and gives good promise. A fan has been added to the Washington, for the purpose of keeping the drifts clear of smoke and supplied with fresh air. The New York Hill mine is looking very favorable, the ledge in the winze being of good size, with good quality of ore. The winze is being put down by day's-pay men. A contract was let yesterday to run the 13 drift a distance of 50 ft. Affairs at the Empire are about the same as when we made our last report. The mine is looking as well as it ever did, and the mill is running night and day on good ore. The Gray Hound Co. is pushing work forward with a vim out on their claim on the north side of Alta hill. The Gray Hound was formerly the Jenny Lind diggings, and was worked with the view of stripping gravel. There is a good quartz ledge on the claim, which will shortly be reached. The Town Talk gravel mine is being worked with energy, and it was expected that gravel would be reached last night. This claim is located at Sutton's ranch, and promises are very favorable. There is an upper tunnel on the property, 550 ft in length, and an incline in this 30 ft in depth, in which a good bed of gravel was struck, but, on account of water, work had to be abandoned in the incline. Another tunnel was run a distance of 700 ft, and an incline 62 ft sunk, from which an upraise is being made to strike the gravel. The Idaho is keeping up its regular lick of turning out gold. The ledge is somewhat improved in quality since our last statements. A new shaft is being sunk on the Ontario mine. Rock in the first shaft became so hard that it could not be worked; hence the new shaft, which is an incline one. The Imperial Co. is still working on Deer creek. The ledge will shortly be cut.

PLUMAS.

Southern Eureka Mine.—Greenville *Bulletin*, April 29: The ore chimney lately struck in the Southern Eureka is opening out into a very fine body of ore. There is an immense body of it, and it works with remarkable ease; with a pick and shovel it can be taken out like gravel. The quartz is all decomposed, and looking in the vein as if it were subjected to some enormous crushing power, and when exposed to the atmosphere it slacks like lime. With the present milling capacity at this mine any further developments are comparatively of little value. A mine that now shows ore enough to supply a sixty stamp mill is kept puttering along with ten stamps. Such one-horse concerns as these are a no injury to the district. If a mill of sufficient capacity were put on the property, and placed below the ditch, every shareholder would receive dividends as regularly as the day came round.

Copper and Silver Mine.—The unexpected is what always happens is as true of mining as of anything else. Some time since several specimens of ore were sent from this office to be assayed for copper. One of the specimens was thought to contain silver, and the assay gave 54 ounces to the ton; this was much greater than was expected. No silver was looked for in ledges at a distance from the first, but this again proves to have been a mistake; the ore that was supposed to have no metal but copper, is found to assay 35½ ounces of silver per ton. This is a complete surprise, as no such result had been expected. About the accuracy of the assay there can be no dispute, as it was made by an authority that would be accepted anywhere without question. The ledges from which the ore was obtained are of great extent and easy of access. There is now an assurance that they will be opened during the coming summer and works erected for reducing the ores.

Indian Valley Mine.—At the Indian Valley mine the new water-power was turned on Monday. Everything worked well till a defective sheet in one of the pipes gave way and caused a temporary stoppage. The defect was easily remedied, and now the mill is running along all right.

Green Mountain Mine. The Orcen Mountain people made a clean-up last week that exceeds in value any made at the mine during a like length of time previously. The large stock of ore now broken out, and the fine condition of the mine, ensures a repetition of the same thing for a long time to come. It is worth mention that the amalgam cleaned up thus far is of greater value than during last year. Then the usual value was $4 an ounce; that retorted out during the last few weeks has been found worth $5 an ounce. The increased value is due to the coarser quality of the gold in the ore now milled.

The Reservoir.—The storms of Saturday and Monday have sent the water rushing into the reservoir very rapidly. The water now stands within 2 ft of high water mark, and should the present inflow continue, the waste gate will have to be opened in a few days; the return of fair weather will, however, reduce this until the supply will more nearly equal the demand, and then it will continue running in until far in the summer. This, with the increased hight of the embankment, gives a much greater supply of water than was ever had here before.

Beautiful Gem.—Plumas *National*, April 29: At the express office the other evening, we were shown something over 80 ounces of dust from the Leavitt claim, at Newtown flat. It is almost all coarse, the largest slug weighing $88, and ranging down from that to fine dust. If is the old lead, and there is no telling how much money the lucky owners will take out this summer. They are working 8 or 10 men at present.

SIERRA.

Savage.—*Mountain Messenger*, April 20: Mr. Ball, superintendent of the Savage mine, was in town this week. He has several men at the mine, but will not commence work until he is able to get supplies in, which will not be for a time yet. The company proposes to push the work as rapidly as possible this summer. During the winter several snow slides occurred at the works, but fortunately did no damage.

The Truckee drift gravel mine, in Mohawk valley, Sierra county, will commence work in a short time. They have 800 ft of tunnel run, and the gravel prospects well. Charley Byrn is superintendent.

TRINITY.

Good Clean-Up. Trinity *Journal*, April 29. Messrs. Baker & Hickey have a quartz mine on Eastman gulch, above Lewiston, which they have been quietly working for some time, and which promises to develop into one of the best paying properties in the county. As an instance of what the prospects are, they have just cleaned up, after crushing 20 tons of rock in their arastra, and realized 21 lbs of clear gold. This is at the average rate of more than $200 per ton, and much more than the lucky owners themselves expected. The vein or lode, we learn, is small, but increasing in size as well as in richness. Trinity will yet show up as a profitable quartz mining county.

Buckeye. After nearly two years silence, "the music of the giant" is heard again in the Bolts Hill claim. There has been a long time of preparation, and last year, owing to the disastrous storms and floods in the winter of 1881, the entire working season was consumed in repairs, and cleaning out ditch from Bolts hill to Van Matre creek, and in fitting up a new claim, known as the "Tolly," on Tolly hill, situated on Stuart's fork, between the Hotart and Cumming's ranches, though on the opposite side therefrom. The Tolly claim is fitted with a good hydraulic rig. This and the Bolts Hill claim are being run vigorously. The Bolts Hill tunnel flume was completed the 13th inst., and water run through the same day, and since has been thoroughly flooded and packed with gravel and rocks, and is now running gravel successfully and rapidly. The bed-rock tunnel, in which the flume is constructed, is 7½ ft by 7 ft, 1,525 ft long, and was begun some 5 years ago, and finally completed December, 1880, but was not flumed until this spring. On the Bolts Hill claim the company erected a sawmill, 18 months ago. All the lumber and one-fourth of the blocks for the flume and incline have been sawed in this mill. This is run by water dropped from the main ditch through the mill, so to speak, and into a reservoir, where it is used as an "under head," when piping is going on. The ditch has been cleaned out this spring from Bolts hill to Van Matre creek, 22 miles, and water is now running through it from the latter. The new portion of the ditch, from Van Matre creek to Stuart's fork, has not yet been repaired, the damage from slides and breaks of the winter of 1881 having been very severe on it. It has not yet been decided when this part of the ditch will be taken in hand. The water season on this property promises to be a good one, a heavy body of snow having been piled up in the mountains above the ditch during the past winter. The ground piping now has a good appearance, and the company is hopeful of results this season.

NEVADA.

WASHOE DISTRICT.

Alta.—*Enterprise*, April 30: During the week ending this date the west drift on the 2150 level was extended 50 ft; total length, 1,190 ft. The crosscut was advanced 42 ft; present length of same, 98 ft. The north lateral drift was advanced 30 ft; total, 206 ft. The diamond drill is in 66 ft in the main east drift, where, so far, no strong flow of water is encountered. Rock hoisted, 676 cars; wood consumed, 113 cords; strokes made by pump, 67 500.

Union Consolidated.—During the week 553 tons of ore have been extracted and 670 tons and 500 pounds have been sent to the mill. Amount of bullion shipped, $37,403 43; bullion in office, $14,390.74.

California.—On the 2700 level the main south lateral drift has been advanced 24 ft. On the 2700 level joint Consolidated east drift No. 2 has been extended 12 ft and is being timbered up.

Mexican.—The main north lateral drift on the 2000 level has been extended 28 ft.

Sierra Nevada.—On the 2700 level north drift No. 3 has been extended 24 ft. In the joint Union Con. east winze are cutting out a station at the 2000 level.

Yellow Jacket.—The water in the mine has risen 5 ft since last report, standing to-day 397 ft above our 2300 station. Have reached the 3100 level of Winter's shaft through old hoisting compartment and find the same in very good condition; are now overhauling the west compartment. Commenced to-day re-opening the old third station 452 ft from the surface, and will run drifts east from same to the old workings on that level. Also intend opening new station between the 4th and 7th stations, about 646 ft from the surface.

Sutro Tunnel.—Four repair men were employed during the first part of the week finishing repairs at this point. Two sets of new timbers were put in and one set removed. Also, lagged up the ground, braced the timbers and spiked down the roof. The force was then removed to the south lateral to assist repairing the heavy ground in that tunnel.

BRISTOL DISTRICT.

Bristol.—Piche *Record*: Of late the Bristol Co. have been working only their low-grade ore through the mill, taken from the top of the ore body, and this has caused the report that the Mayflower ore had greatly decreased in richness. Owing to the inadequate hoisting apparatus at the mine the rich ore at the bottom cannot conveniently be taken out. The ore in the bottom of the incline continues as rich as ever. Wm. Roe is of the opinion that when the well attains the additional 100 ft in depth, now being sunk, that a sufficient supply of water will be obtained to keep the mill running steadily. The work of prospecting is being vigorously carried on in the Day mine. The company keeps a full force of miners employed. The company has done nothing but prospect during the whole of the winter.

BELMONT DISTRICT.

Prospecting.—Belmont *Courier*, April 23: For the past few weeks Geo. W. Emerson has been engaged in prospecting the hill situated immediately east of town. Last Monday he set 3 men to work on one of the claims, and in a very short time the miners succeeded in striking the ledge which carries rich chloride ore. They are now down about 12 ft, and the ore encountered at this depth is of a high grade. The pay streak is about 20 inches wide. Practical miners who have inspected the property pronounce it a very fine prospect, and assert that, judging from surface indications and the developments, rich ore bodies will in all probability be encountered as depth is attained. Below we give the result of several assays made from large samples of ore taken from the ledge: $52.17; $104.33; $101.00; $140.63; $135.47. Mr. Emerson will push the work of development ahead at a lively rate.

EUREKA DISTRICT.

Notes.—*Sentinel*, May 2: Up to the 24th of April the Eureka Con. had shipped bullion amounting to $130,351.90 for that month. Sixty tons of high-grade ore from the Bald Eagle mine has just been shipped to the Eureka Consolidated works. The price of charcoal is just now the great absorbing topic among the Eureka coal kings. The Ruby-Dunderberg Co. is developing some of its old mines. It is also making arrangements to ship ore to the Richmond works. Steam hoisting works arrived several days ago from Detroit, Michigan, for the Alexandria M. Co., but are held at the depot, and will not be put up pending the present litigation. The works are of a capacity to prospect the mine 600 or 700 ft. There is considerable interest felt by the miners on Prospect mountain in the suit between the Alexandria and Pioneer mining companies, as the issue to be determined in this case may be ground for future lawsuits involving the title to several other properties.

ESMERALDA DISTRICT.

Middle Hill Mining Co.—Esmeralda *Herald*, April 29: J. H. Coulter, manager of the Middle Hill Mining Co.'s property, which embraces the well-known Live Yankee and Durand mines, visited Aurora this week and examined the property in question. He has some idea of going to work on the Live Yankee and taking out ore, but cannot say positively that he will until he returns from San Francisco, whither he went last Tuesday. He expects to return here in about 10 days. Mr. Coulter also visited the New Esmeralda and other mines in the district while here.

Humboldt M. & M. Co.—At the mine they are now drifting on the 100 level, getting ready to stope. Some of the ore looks exceedingly good, while some does not show so well, but it is thought it will all pay a fair profit to mill. If there is no bad weather between now and Monday, ore hauling will commence on that day.

GRANTSVILLE DISTRICT.

Developing.—Grantsville *Bonanza*, April 29: George Mitchell, O. B. Snow and John Quantz are hard at work developing their new discovery in this district. Work is progressing steadily in John Center's mine. The ore encountered continues of a good grade.

LEWIS DISTRICT.

Starr-Grove. Lewis *Herald*, April 29: The miners who had been working for the Starr-Grove S. M. Co. were paid off by J. Hill, on Friday last, less a reduction of 5%, on their duo bills. The pumps have been taken out of the Starr-Grove mine and all work suspended till the return of Manager Bothwell, from New York, when the mine will again be started up. The personal property of the Starr-Grove S. M. Co. sold at sheriff's sale, Thursday, brought $1,588.

Betty O'Neal. The stopes in the Betty O'Neal mine are still improving as opened up, and considerable nice ore being taken out. The ore body in the south lower level improves as extended and the quality of the ore is improving. An ore dump is being built alongside the wagon road, from which the ore will be loaded on the wagons with ease and dispatch, and from present appearances the Eagle mill will be kept running on ore from this mine for many months.

Morning Star.—The contractors are still sinking the Morgan incline on the Morning Star mine. The ledge still retains its size and quality. A quantity of the ore is being assorted and sacked. We hear that the company intend erecting a mill at or near the forks of the canyon during the coming summer.

Sunbram.—Work is progressing on the Sunbram mine. A crosscut from the winze is 12 ft in solid quartz and no wall in sight yet. The ore looks well but as no assays have been made lately we cannot state its value.

UNION DISTRICT.

Prospecting.—Grantsville *Bonanza*, April 29: Prospecting promises to be carried on at a lively rate in Union Mining district during the spring and coming summer.

Homestake.—Work goes steadily on in S. G. Post's Homestake mine, in Union district.

WASHINGTON DISTRICT.

Work.—Grantsville *Bonanza*, April 29: A. J. Franklin is pushing the work of development in his mine in Washington district.

ARIZONA.

Lynx Creek Smelter.—Arizona *Miner*, April 28: Much praise is due Major Dake for his persistent efforts to bring out the mineral wealth of Lynx creek. He put up a smelter last summer which, owing to a lack of knowledge how to treat the ores, did not work successfully. Prof. Shaffer, now in charge, has been overhauling the smelter, and will soon start it in a scientific manner, when we expect to hear good results.

The Arizona Queen M. Co., at its mill on Oroom creek, is prepared to do custom work for those who desire to have it done. They have placed the price at such a standard that all can afford to patronize them. Quantities of ore in 10-ton bulk or over, $10 per ton will be charged. Under ten tons, $12.50 per ton will be the price. This is quite a falling off from $60 and $80 per ton, as charged heretofore at other mills.

Desoris Mine.—This new mine has paid from the grass roots down, and is now one of the most promising properties in this county. A few months since 10 tons of ore from this mine were shipped to New York City by Messrs. Cox and Craigue, which netted them $10 320. The same gentlemen who own nearly all the stock are now shipping 18 tons of ore to the same destination, which is actually richer than that shipped heretofore. Besides the high-grade ore, they have over 100 tons of ore which will work $200 per ton. This ore, we understand, is to be worked at the smelter of C. P. Dake, on Lynx creek, by Prof. Shaffer. The ore now out of the Desoris—say 150 tons—will yield $50,000.

Tombstone.—*Epitaph*, April 20: Have struck good ore on the 300 level Tough Nut mine, south from main shaft, which bids fair to open out into a large and valuable body. In the east drift, same level, they continue to get bunches of ore, which shows them to be in ore-bearing ground.

Orard.—Continue to drift east on the 150 level in good ore. Winze from this level to connect with the 200 is down 30 ft, the ore continuing good all the way, with 4 ft in the face. On the 200 tbe north crosscut east is in 35 ft and looking well. At 55 ft north of this point are drifting west to connect with the Tough Nut.

Grand Central.—On the 600 level at the new shaft are in 65 ft. The rock is a very hard, short-breaking limestone, and slow progress is made. On the 600 level, old works, continue to drift north and south on the ledge, which continues strong and well defined.

Contention Con.—The north drift from the west will be pushed to intersect the joint winze on the line between Contention and Sulphuret, when the ore body in the latter mine will be prospected. Are accumulating ore at the rate of 10 tons daily at the mill, to have a surplus when the rainy season sets in. The bullion output will be equal to last month.

COLORADO.

Leadville Notes.—Colorado *Mining Review*: The Imes mine, situated on the crest of Iron hill, will begin shipping a large lot of ore, now on the dumps, in a few days. The Nevada mine, in South Evans gulch, owned by August Rische, is reported to be shipping about 6 tons of ore per day. The Cummings & Finn smelter is receiving 40 to 50 tons of ore per day from the Eagle Bird consolidation, on Battle mountain. The Yankee Doodle mine, of the Carbonate Hill M. Co., is looking well, and continues an output far beyond the expenses of the company. The owners of the Ohio Boy, located on Taylor hill, are reported to have purchased a 20-stamp mill, and and at present are making excavations for the same, near Cooper's ranch. Messrs. Berdell and Witherell have placed the major part of the La Plata stock in England. Mr. Thomas Rickard, of London, is now on his way to take charge of these works. The Long & Derry mines have shown up some very fine ore bodies during the past winter, and large shipments of ore from this hill are anticipated during the summer months.

IDAHO.

Poor Outlook at Banner.—*World* April, 29: The prospects of the summer's operations at Banner are not what all have reason to expect in a district of such a showing as the developed mines exhibit there, but we cannot see that the situation of affairs can be altered in the least by giving off a growl or making a wry face over the management of the properties of that district. From letters received at Banner last week, it is evident that the Elmira Co. do not expect to much more than prosecute the Banner tunnel during the summer, and it is not likely that the mill will start up before fall, if then. In fact, Mr. Brown, the president, writes that unless they make a run in the fall he will not visit Banner this year. J. L. Brown, superintendent, will be seen out to attend to all of the company's business. Thus, it must be seen, that Banner, one of the richest deposits on the coast, will be exceedingly dull this season, and all for the want of capital to erect hoisting works, set up mills, and carry ahead the mining business in an energetic manner. The Elmira is a small company with non-assessable stock and its members feel the necessity of moving at a moderate pace—too moderate for their own good, we think.

The Banner Tunnel.—The tunnel now driving to tap the Banner mine will be the longest one yet driven in Boise county. It will be 800 ft in length and will tap the vein 300 ft from the surface and about 200 ft below the old stopes. The Welch boys, who have the contract, have been pushing ahead remarkably fast, considering the size of the force engaged—2 shifts of 2 men each. Work was commenced about 2 months ago and the tunnel is now in 200 ft, but the prospects are that hard ground will be encountered before long which will lessen the rate of its progress considerably. It is expected that the vein will be reached about the 1st of October. The tunnel, besides furnishing an outlet for the ores above, will serve to drain the mine. The highest grade ore found in that district was taken from the Banner, and the prospective work in the shaft and levels above indicates that this tunnel will intersect an ore body greatly superior to that of the Crown Point. We learn that the large pump of the Gold Hill mine, at Quartzburg, which has caused the company a great deal of trouble since it was put in, is now working as smoothly as could be wished and doing good execution.

MONTANA.

The Alice Property. *Inter-Mountain*, April 21: The Alice Co.'s mines and mills are in successful operation, and the outlook for the future, there is every reason to believe, is exceptionally bright. During the past week no startling developments are reported in the Alice, but in all parts of the mine which are being worked satisfactory progress is being made. Between the 600 and 500 levels the stopes are being opened up by a force of 16 men, who daily extract a considerable amount of fair grade rock. From the 300 level, at a point 100 ft east of the crosscut, the big winze is being sunk on the hanging wall of the north vein with favorable results. The uniform width of this portion of the ledge is very encouraging and its value is a source of equal congratulation. No samples lower than $60 have been obtained since work on the winze was begun. The sinking of the main shaft will not likely be resumed at present, though the President of the company is seriously considering the feasibility of purchasing a Cornish pump, and then proceed with the work of deeper development.

The Main shaft of the Magna Charta has attained a depth of 500 ft. The station is now being cut out, but the crosscuts will not be started until a sump 25 ft deep shall be finished. The second, third and fourth levels are now producing 50 tons of ore per diem, which is shipped to the mills over the very substantial and creditable tramway recently erected.

NEW MEXICO.

Mineral Pick-Ups.—*News and Press*, April 22: Five silver mines are said to have been discovered in the Capitan mountains, 9 miles from Lincoln. The Grand View and Tenderfoot are spoken of as the most promising mines in the Gallinas mountain camp. The Jicarillas are full of prospectors looking for gold leads, which are believed to be numerous and rich in some parts of that range. Preparations are being made for litigation over the Pecos copper mines. It is thought the fight will be a strong one, as the mines are considered of great value. The mining boom at Bonanza is reported to have commenced. The Gonzales concentrator has started up, mining operations are greatly stimulated and ore is accumulating. The Homestake mine, at White Oaks, is reported to be yielding high grade gold ore in fair quantities. The new mill at that camp has some 400 tons of ore on hand ready for working.

OREGON.

Busy.—Jacksonville *Times*, April 28: W. H. Benner, of Willow Springs, called on us one day this week and informs us that the miners in that section were still busy piping and ground-sluicing, the late storms having furnished them plenty of water. John Beckner informs us that the miners of Forest creek have had a good run this season, and all of them will commence cleaning up soon. Vickroy & Reed have already started in gathering their gold, with favorable results.

Items.—The English Co. has about worked out its claims on Oalice creek, excepting one or two.....Peter Hansen, of Althouse, has washed off a large area of ground already, with favorable prospects.... The recent rains keep up the supply of water well. Especially is this the case in Josephine county.....Riley Hinkle, who is employed on Humbug creek by J. Johnson, reports good prospects in that claim.....The miners of Josephine county will make an excellent run generally, the spring being quite favorable.....The Wm. Clark, of No. 7, a tributary of Althouse, has struck an exceedingly rich pay streak, taking out $700 in a very short time. He is said to be averaging $40 a day.....Seven "little giants" are busily employed in claims whose tailings are dumped into the Applegate above Uniontown. As a consequence, that stream is quite muddy.....J. W. Howard has purchased L. McElvey's interest in the hydraulic claim being opened on Oalice creek by McElvey & Simmons. Excellent results are promised here.....N. DeLamater & Co.'e mines on Coyote flat are turning out very well. Several clean-ups have been made during the season, one of which reached the neighborhood of $2,000, we learn.....Some copper mines near Waldo have been bonded to Portland capitalists, who are also interested in the location of others. The prospects are favorable for a boom in that section in the near future.

UTAH.

Little Cottonwood.—Cor. Salt Lake *Tribune*: On a recent visit to Alta, a few facts were gathered that will perhaps interest your numerous readers. The tramway was opened for traffic on the 23d inst., and is in good order with the exception of the last 2 miles, the last named portions being more or less obstructed by ice. The outlook for the summer campaign is quite flattering, as compared with the last 4 years, and many a prospect that has laid idle for years will be probed anew. Already teams are busily engaged hauling the ore taken from the mines during the long winter, to the tramway for transportation to the smelters at Sandy, where it can be readily sold for high rates, it being a class of ore sought after by furnace men. About 200 men are engaged in prospecting and mining. At Cits ore and a number of men are employed and rumor says they are making splendid developments on the great mineral belt passing from L'ttle to Big Cottonwood district and the ce to Parley's park. As to the present workings we are not at liberty to speak, but it is sufficient to say that it will prove one of the greatest mines of Utah. The old and once famous Emma is now being worked on a lease; a part of the old upper works are paying a force of men a good per diem. The troubles between the old English and the new American company are not yet adjusted, although so reported last fall. Negotiations are now in progress in London that will doubtless soon release this valuable property from the entanglements of the law, when it will take the front rank among the producing mines of Utah. The Joab Lawrence (Old Vallejo) is being worked by about 25 men, and is said to be looking exceedingly well. Our old and genial friend Stevenson is in command, and being a full grown, we were afraid to put important questions. They have a large quantity of high-grade ore ready for shipment. The Flagstaff Co. employ at present about 25 men and are taking out some fine ore from a 3 ft vein. It is understood this company will push things this summer and make a showing worthy of their great reputation. The Frederick Co. are driving their tunnel as rapidly as possible. Watson & Douglass have a contract, and are working night and day to finish on or before May 20. The prospects of this company are among the brightest in the camp. The immense depth attained by their tunnel the case, and all of them will commence cleaning up soon. Vickroy & Reed have already started in gathering their gold, with favorable results.

Items.—The English Co. has about worked out its claims on Oalice creek, excepting one or two.....Peter Hansen, of Althouse, has washed off a large area of ground already, with favorable prospects.... The recent rains keep up the supply of water well. Especially is this the case in Josephine county.....Riley Hinkle, who is employed on Humbug creek by J. Johnson, reports good prospects in that claim.....The miners of Josephine county will make an excellent run generally, the spring being quite favorable.....The Wm. Clark, of No. 7, a tributary of Althouse, has struck an exceedingly rich pay streak, taking out $700 in a very short time. He is said to be averaging $40 a day.....Seven "little giants" are busily employed in claims whose tailings are dumped into the Applegate above Uniontown. As a consequence, that stream is quite muddy.....J. W. Howard has purchased L. McElvey's interest in the hydraulic claim being opened on Oalice creek by McElvey & Simmons. Excellent results are promised here.....N. DeLamater & Co.'e mines on Coyote flat are turning out very well. Several clean-ups have been made during the season, one of which reached the neighborhood of $2,000, we learn.....Some copper mines near Waldo have been bonded to Portland capitalists, who are also interested in the location of others. The prospects are favorable for a boom in that section in the near future.

UTAH.

Little Cottonwood.—Cor. Salt Lake *Tribune*: On a recent visit to Alta, a few facts were gathered that will perhaps interest your numerous readers. The tramway was opened for traffic on the 23d inst., and is in good order with the exception of the last 2 miles, the last named portions being more or less obstructed by ice. The outlook for the summer campaign is quite flattering, as compared with the last 4 years, and many a prospect that has laid idle for years will be probed anew. Already teams are busily engaged hauling the ore taken from the mines during the long winter, to the tramway for transportation to the smelters at Sandy, where it can be readily sold for high rates, it being a class of ore sought after by furnace men. About 200 men are engaged in prospecting and mining. At Cits ore and a number of men are employed and rumor says they are making splendid developments on the great mineral belt passing from L'ttle to Big Cottonwood district and the ce to Parley's park. As to the present workings we are not at liberty to speak, but it is sufficient to say that it will prove one of the greatest mines of Utah. The old and once famous Emma is now being worked on a lease; a part of the old upper works are paying a force of men a good per diem. The troubles between the old English and the new American company are not yet adjusted, although so reported last fall. Negotiations are now in progress in London that will doubtless soon release this valuable property from the entanglements of the law, when it will take the front rank among the producing mines of Utah. The Joab Lawrence (Old Vallejo) is being worked by about 25 men, and is said to be looking exceedingly well. Our old and genial friend Stevenson is in command, and being a full grown, we were afraid to put important questions. They have a large quantity of high-grade ore ready for shipment. The Flagstaff Co. employ at present about 25 men and are taking out some fine ore from a 3 ft vein. It is understood this company will push things this summer and make a showing worthy of their great reputation. The Frederick Co. are driving their tunnel as rapidly as possible. Watson & Douglass have a contract, and are working night and day to finish on or before May 20. The prospects of this company are among the brightest in the camp. The immense depth attained by their tunnel the case in Josephine county.....Riley Hinkle, who is employed on Humbug creek by J. Johnson, reports good prospects in that claim.....The miners of Josephine county will make an excellent run generally, the spring being quite favorable.....The Wm. Clark, of No. 7, a tributary of Althouse, has struck an exceedingly rich pay streak, taking out $700 in a very short time. He is said to be averaging $40 a day.....Seven "little giants" are busily employed in claims whose tailings are dumped into the Applegate above Uniontown. As a consequence, that stream is quite muddy.....J. W. Howard has purchased L. McElvey's interest in the hydraulic claim being opened on Oalice creek by McElvey & Simmons. Excellent results are promised here.....N. DeLamater & Co.'e mines on Coyote flat are turning out very well. Several clean-ups have been made during the season, one of which reached the neighborhood of $2,000, we learn.....Some copper mines near Waldo have been bonded to Portland capitalists, who are also interested in the location of others. The prospects are favorable for a boom in that section in the near future.

Annual Ring Growths and Rainfall.

The National Forestry Congress was in session last week in Cincinnati. The object was to promote the planting of foreet trees. The programme included a street parade and the planting of memorial trees for Presidents, authors, pioneers and others, in the public parke. Provision was mede for 93 papers to he read by different persons, selected from all over the United States and Canada. One of these papers is by Rohert E. C. Stearns, Ph. D. of Berkeley, Cal., and is of much local iuterest. The suhject ie "The Growth of Certain California Forest Trees and the Meteorological Inferences Suggeeted Thereby."

While in Napa county, during the month of October, 1881, I noticed in a clearing lately mede on the top of Howell mountain, that, in felling, most of the large trees had been sawed across at the butt, instead of heing chopped down with an ax, thus making an even cross-section or plane eurfece, and admitting of the counting of the rings of growth.

It was my intention at the time to have taken these notes myself, and, further, to have made a diagram ehowing the exact width or thickness of each of the annual rings, in order to make a comparison of one tree with another and to learn whether the annual rings or growths of each year, commencing with the last year and comparing backward, year with year and tree with tree, exhihited a coincidence in thickness or a coincidence in variation. Before proceeding further in the elaboration of this point, I will state that lack of time prevented my making the diagrams, and that the following measurements of four trees of the species known as *Pinus ponderosa*—or yellow pine—were made for me by Mr. A. L. Roache, who was then visiting the region:

	Inside of bark, Inches.	Outside of bark, Inches.	Annual Rings.	Average Annual Growth inside of bark—Inches.
No. 1	20½	24½	54	.3796
No. 2	27½	30½	75	.3666
No. 3	33½	38	80	.4187
No. 4	24	29½	72	.3333

Mean annual growth, .3745 of an inch.

The thickness of the bark, it will be seen, varies considerably. The differences in the diameters, as shown in the colnmns, "inside" and "outside of hark" heing that of the bark on the two sides of the tree, require, therefore, to be divided by two, to give the true thickness, and gives No. 1, two inches; No. 2, one and a half inches; No. 3, two and a quarter inches; and No. 4, two and three-quarter inches.

These trees stood in such a station or position, as to uniformity of conditions, *i. e.*, character of soil and surface, exposure, etc., as to furnish a fair hasis for a calculation of the kind herein made.

It will be observed, upon adding up tbe column of annual rings, and also the colnmn of largest diameters, and then dividing these totals by four to get the average, that in the region where they grow, about 70 years were required to make a yellow pine 30 inches, or two and a half ft. in diameter. The mean thickness of the annual rings in the above trees, .3745 of an inch is nearly three-eights of an inch, or .375.

If we had similar and snfficient data from various places, we might make a pretty accnrate approximation and generalizetion of the kind above illustrated; in this, the data being limited, the region to which they apply must also he limited, and to the species—the single species only—as above given.

The pines are quick growing trees, and, in common with other related forest forms, make a proportionately larger growth in their early years, or, in other words, make thicker annual rings when young than wheu old, tbongh in an equally vigorous condition; so that a measurement of young trees, thongh nseful as showing how loug we may have to wait to get a profitahle return in fuel or lumber from an artificial plentation, euch young trees would not answer the purpose of a standard of age or measurement for the large trees of natural forests.

In the neighborhood of Berkeley, trees of the Monterey pine, 9 or 10 years of age, show a maximum diameter of one ft. three inches, being a growth of over an inch a year, and a mean diameter, so far as I have measured, of nine inches, the result of eeveral trees. These were planted for ornamental purposee.

Sections of the following epecies of foreet treee, indigenous to the Pacific coast, are contained in the museum of the University of California, and yield the data given below:

Abies grandis, or white fir—Large diameter, 23 5-16 inches; smaller diameter, 22 11-16 inches; mean diameter, 23 inches; thickness of bark, three-fourthe of an inch; annnal rings, 146; mean annnal growth, .1575 of an inch, or a little nnder one-sixth of an inch per annum.

Abies Douglassii, or Tsuga Douglassii, the hemlock epruce, so called—Larger diameter, 17⅞ inches; emaller diameter, 16⅝ inches; mean diameter, 17¼ inches; thickneee of hark, half an inch; annual ringe, 96; mean anuual growth, a trifle nnder .18, or something over one-sixth of a inch.

Abies Mertensiana—Larger diameter, 18¾ inches; emaller diameter, 16⅜ inches; mean diameter, 17½ inches; thickneee of hark, a trifle over half an inch; annual ringe, 110; mean annual growth, nearly .160, heing eomething lese than one-sixth of an inch per annum.

These three speciee of *Abies* are represented in the ahove measurement hy trees which grew in or near Gualala, Mendocino county, an exceptionally favorahle station eo far as moisture is concerned, the country heing well watered, and the couuty, in common with the entire region from the Oregon line to and inclueive of Marin connty as the southern terminue, heing part of a meteorological province, which receives not only a greater average rainfall than other parts of the State, hut also the fullest advantage of the summer fogs, which, horne shoreward hy the trade-winds, are condensed by the lofty evergreens which here abound, and fall to the grounnd, dripping throngh the foliage of the trees, like a gentle ehower. A comparison of so moiet a region with the drier areas, ehows at a glance the neceeeity of a careful consideration of environmental conditions in connection with deductions from data, of the kind herein referred to.

A section of *Sequoia sempervirens*, our common redwood, shows, counting from the circumference toward the center, a growtb of three inches in 95 years, or, more particularly, 95 growth rings, averaging .0316 of an inch per annnm. Notwithstanding the majestic proportione which the *Sequoias* ettain, the above measnrement, as well as an examination of the ende of a large number of redwood boards, sbow that these trees are of slow growth.

The measuremente of a epecimeu of *Sequoia gigantea*, ae given with great particularity hy Prof. Whitney in the Yosemite Gnide Book (edition of 1870), pages 147-8, give a mean diameter of 23 ft. 3¾ inches, without hark, and 1,255 annual rings, a mean annual growth of only .2229 of an inch, very nearly, heing less than one-quarter of au inch a year.

It is not nnlikely that the comment may be made, that the data here presented are so meager as to be of little value, though perhaps interesting and suggestive. This I am quite ready to admit, and while doing so will revert to the point temporarily dropped near the beginning of tbis paper, and speculate a few moments in the direction which said point indicated.

Meteorological Inferences.

Any one who hae taken the trouble to examine the annual growthe, or width of the annual rings in trees, has at once perceived a great difference in their thickness in the same tree. If we may assume (leaving out young trees) that this variation is principally due to the amount or qnantity of the rainfall, and that rings which exhibit maximum thicknese have followed in their growth seasons of maximum rainfall, and the thinner rings are consequently the resnlt of the influence of seasons of a less or minimnm rainfall, we may assume that if, upon a given date, numerous trees were felled, so that we could have transverse sections of all of the principel species, such trees being located at various points in the State, great care heing taken that the trees so eelected should have heen snhject, as nearly as possible, to the same environmental conditions, we might obtain an aggregation of data of sufficient volume to render a deduction therefrom of great value, as to the meteorology of the Pacific coast. We might find so close a parallelism between rings of maximum thickness aud seasons of meximum rainfall, that we should he justified in regarding this parallelism as something more than a series of coincidences merely, by finding these coiucidencee so persistent as to prove a correlation; and we could, perhaps, base our weather prognostications upon something more than a gness, and learn whether or not there is a periodicity or cyclical terms of wet and dry years. Having the data before us according to the trees selected and examined—reaching back with the piues from 75 to 150 years, with the redwoods from 5 to 700 or more years, and with the *Sequoias* of the Sisrra from 12 to 14 ceuturies, to say nothing of the testimony of other trees, the madronas and oaks especially.

The forest monarchs of the Sierra Nevada and the Coast ranges offer a calendar, whose records have been written by the elemeuts; and so far as the giant *Sequoias* are considered, their evidence would certainly be that of the oldest inhabitants, substantially snpported by their first of kin, the magnificent redwoods of the Coast ranges.

Another matter of minor, though not of insignificant importance, would be the relation hetween greatest diameter and the points of the compass, as to whether the greateet diameter is persistently incidental to a certain aspect or quarter of the compaes. In the epecimeu of *Sequoia gigantea* above meutioned, Professor Whitney givee the greatest diameter, north and south, as 24 ft. and 1½ inchee, while the "shorter diameter, or that east and west, was 23 ft. divided exactly even on each side of the center." "Acrnse its longest diameter, eouth of center, 13 ft. 9½ inchee." "Across ite longeet diameter, north of center, 10 ft. 4 inches," or 24 ft. 1½ inchee, as before etated, a difference between the north and eouth eide of the center of 3 ft. and 5½ aud inchee in favor of the latter.

Difference in the diametere may be traced perhape to a difference in amonnt of heat and light, which oue eide of a tree receivee as compared with the other; to the influence of prevailing winde according to the etation, position or exposnre, or to local or general magnetic influencee—local as peculiar to emall areas, or general, ae pertaining to larger or exteneive regione. An accumnlation of data might ehow a marked and constent character in the relation of diametere to such factore of the environmeut; and also a marked character in the diameter of one region, as a whole, when compared with another region, wbere modified or different climatic conditions exist.

In a comparatively arid region, with a high mean temperature and infrequent rainfall, and a dry atmoephere, we mey suppose that the southerly half of a tree, following the curve of its circumference from east by way of south, to west, might, throngh excese of light and heat, suffer from desiccating influences, and make a less growth than tbe northerly balf, following the curve of the trunk from east by way of north, to west, as the northerly half would have tbe advantage, if advantage it be, in such a climate, of less light and heat and more shade; while in a region less arid with a much lower mean temperature, etc., the greater proportion of light and heat which the southerly half receives, would give that side of the tree an advantage over the northerly half.

Ae to the effect of prevailing winds in differentiating the diameter, we may suppose that the side of a tree most exposed might be affected, and the growth on the windward side much modified or repressed; wbile the leeward or sheltered, heing protected, would exhibit a greater diameter or semi-diameter, measuring from the true center of the tree, *i. e.*, from its initial ring.

In the "hig tree" measured by Prof. Whitney, the southerly half of the diameter shows the excess, indicating that heat and light were specially advantageons; but here altitude comes in ae a factor, as the hight of the Calaveras grove, or rather ite site, ie 4,759 ft. above the level of the sea, au elevation where, though the heat of the eix mid-day honrs in June and July ie 80° and upwards, the nighte are cool; and as Prof. Whitnev remarks, "during ordinary years, * * * the flanks of the Sierra are well covered (with snow) down to 4,000 ft. above the sea dnring mid-winter months, and a heavy body of snow liee on the passes until May, or even Jnne." So, after the snow has melted up to and above the altitude or eite of the grove, the atmosphere is cooled for a long period afterwards by the snow-clad slopes and the unmelted massee of enow upon the higher flanks of the Sierra beyond.

In the consideration of all the factore which suggest themselves, and which no doubt are more or less operative or interoperative, the least perceptible, thongh perhaps the most important, is that of compensation, which modifies or neutralizes what at firet appear to he conspicnone and dominating influences.

What is above presented, it should be understood, is simply hypothetical, and for the pnrpose of awakening discussion and calling attention to a moet interesting subject; one which, if generally understood, would he of great practical importance. At present the data are so exceedingly meeger as to preclnde anything more than spsculation, or to incite to or stimulate investigation.

From a knowledge of tbe various points of inquiry herein snggested, might he deduced a generalization, indicating a universal and preponderating law.

An Eastern View of the Situation.

The Eastern mining industry is on a eounder basis to-day tban at any former period in its history. It is more respectable in character, having enlisted the capital, eympathy and snpport of a large number of most excellent people. It is more intelligently conducted, having profited by the experience of the past, and attracted to its camps numerous able miners from abroad. It commands greater respect and confidence, for it now has sometbing to show for the time consumed, labor employed and money expended. Ite lodes have beeu exploited to hundreds of ft. in depth, determining beyond question their permanency; and the valne of its ore has been demonstrated by mill and furnace rune and nullion receipts. It has reached that point when critical investigation may be courted, confident that the results of such investigation will be eatisfactory. It has broken down the wall of prejudice, and disarmed its enemies. It has achieved success, and is on the high road to popularity. Henceforth progress will he easier and epeed more rapid. Few people realize the extent of the work accomplished during the past tbree years, and a still lees number comprehend the Eastern mining situation as it stands to-day. Two extensive redoction worke, onè in Portland and one in Eaet Boeton, are rnnning steadily on oree from the minee of Maine and New Hampshire, and thousands of tone are heing shipped to smeltere in New Jersey and elsewhere. There are now lying on the dumpe of the mines of thoee two Statee awaiting shipment or the completion of local reductiou works, fully 100,000 tons of ore, poesessing a value above the cost of prodnction, transportation and working. And a far greater amount of etill richer ore may be eeen and measured in the shafte and levele of these mines, ready, on the completion of proper reductiou worke, to be converted into bullion, pige, bars, bricke and ingots, having a commercial value in every financial center in the world. And theee resnlts have been attained in far lese time than our fathere required to clear their lands of rocks and timher; in lese time thau it takee a boy to gain hie degreee or learn a trade; in lees time than a corner-grocery etore can be put on a paying baeie.—*Boston Advertiser.*

Streams and Water in Shasta County.

The streams of the county are numerous, and all fall into the Sacramento—a name first applied to California's principal river about 20 miles north of Redding, at the confluence of Pit and Little Secramento rivers. The Pit is several times the larger stream. In what is known as "Big Bend" of this river is sufficient land of good quality for quite a colony. Pit river has ite source in Lassen connty, flows westward into Modoc, southwest back into Lessen, and thence into Shasta, near the northeast corner. Through Lassen and Modoc the Pit is a eluggish stream of watsr of poor quality, hut soon efter entering Shaeta county it receives Fall river as a tributary. This is one of the fineet streams in the world; beautiful, clear, cold, pleasant tasting water, cold enougb to drink in summer, and warm enough not to freeze in winter, the variatiou in etage being lese than two ft. Being a typical stream in that portion of the county the description of it may he referred to in connection with several others. The whole course is but 14 or 16 miles. The water rises through a great number of eprings in a emall area, and forms a lake about one-half by two miles. From the leke the river winds through a beautiful valley, having several small rapide in its course, until within about 200 yards of its mouth, where it passes over a ledge in a eeriee of cataracts and rapids, making a total descent of 60 ft. The river is 20 yards wide, 4 or 5 ft. deep, and flows with a good cnrreut. This and other streams near by are most probably fed from the great lava regione to the east and north. The next two tributaries, Hat creek and Burney creek, flow into the Pit from the south, and are in many respects similar to Fall river. Next, also on the south, are Roaring river, Hatchet creek and Montgomery creek; on the north, Squaw creek, McLeod river and the Little Sacramento. These tbree have many features in common: They take their rise in the high mountains around Shasta Butte, flow south, clear, very cold and very rapid, each about 100 milee in length, and fall into the Pit within a distance of 15 miles. The McLeod is the largest, and is almoet ae large as Fall river. The United Stetes fishery is located upon it, near the mouth, 21 miles from Redding.

From the entrance of Pit river into Shasta county to its confluence with the Little Sacramento aud change of name it flows in a general westwardly course, though making several bends, choked and turbulent through wild and glorious canyons; but with change of name it changes ite course south, and enters the bottom lands of Redding.

Below this poiut comes Clear creek from the west, Churn creek, Stillwater, Cow creek aud Bettle creek from the east, the last forming the boundary between Shasta and Tehama counties, on the east side of the river, as Cottonwood creek does on the west, the only remaining stream on that eide. Cow creek is a large creek, having many branches, all rising in the high Sierra Nevadas. Battle creek receivee tbe waters from west side of Lassen Butte, as does Hat creek on the east side. These two creeks have sourcee close together; each is about 30 to 40 miles long. The former empties into the Secramento, the latter falls into Pit river 80 miles above, at an elevation of more than 2,500 ft.

Besides the streams named, there are bundrede of others of smaller size. Water privileges exist to an extent practically unlimited, and edible fish abound in all the watere, trout aud salmon being the principal varieties. Springs are found at frequent intervals. The water varies greatly in character, bnt is generally healthy and pleasant tasting. In sinking wells the depth necessary to obtain a enpply of water varies from 15 to 50 ft., according to locality. No test has been made to obtain artesian water, but the geologic formation is of the most favorahle charecter.

From Redding, by the river, it is more than 100 milee to the entrance of the Pit from Lasseu county northeast, and 25 miles to the Tehama line south. The total length of the Sacramento, Pit, Little Sacramento, McLeod and Fall rivers in the county proximates 250 miles.

THE DAY CO.—The Pioche *Record* says: We have received a numhsr of communications from subscribers who reside in California aud from the western portion of Nevada, inquiring as to affairs pertaining to the Day company. Perconally, we know nothing about the affairs of the company, neither does any person in thie vicinity outside of the euperintendent, and as that gentleman appeare dieinclined to epeak upon the euhject, we have not questioned him in regard to the matter, ae we know euperintendente of miuee are not at timee permitted to speak of the company'e doings whoee property they are in charge of, and it would not he a pertinent queetion for us to pnt to the euperintendent of the Day under existing circumetancee. The furnace is not running, neither have they etarted in repairing it ae yet. The furnace may poesibly etart np between eixty and niuety days; then again the company may never start up their old furnace. It looke to ue ae thongh the company was as yet nndecided whether to etart up the old furnace or immediately erect new ones. At the mine, proepecting ie vigoronely going on, and the euperintendent, McNally, appeare highly elated. The only definite information we are ahle to give inquiring euhscribers, ie tbat the Day mine contains a large body of high-grade ore. No person is allowed in the miue.

The Engineer.

Expansion of Hard Caoutchouc.—Ordinary vulcanized caoutchouc should contain about one-tenth to one-sixth of sulphur, a greator proportion yielding a hard, horn-like product, which expands considerably when heated. It was established by Mr. Kohlrausch, some years ago, that this hard caoutchouc, while expanding equally with mercury up to the freezing point, expands much more at higher temperatures, so that in a thermometer consisting of a vessel of this material filled with mercury, the latter would appear to contract with an increase of temperature. Results of experiments made by Mr. R. Fuess, of Berlin, appear to confirm Prof. Kohlrausch's statement. Mr. Fuess placed a rod of caoutchouc one-fifth of an inch thick in a glass tube three-fifths of an inch in diameter, and filled the tube with mercury to a hight of three ft., exactly up to a little pin of platinum projecting horizontally from the caoutchouc. The calculations from 15 observations, in which he was assisted by Dr. M. Tiessen, gave an expansion coefficient of .000082 for each degree C. up to a temperature of 65° F.; higher figures resulting from observations at higher temperatures.

Reclaiming the Zuyder Zee.—According to recent reports it seems to have been definitely determined to reclaim the Zuyder Zee, Holland, whereby a large tract of land would be rendered available for agricultural and other purposes. The engineers in charge of this work have been engaged for 10 years past in preparing the plans, and the total cost is now estimated at not less than $46,000,000. The dyke will be about 24½ miles in length, and will extend from the city of Enkhuisen to the coast of the province of Overyssel. The top of the dyke will be built to the hight of 16 ft. above the level of the sea, which will bring it about 6½ ft. above the highest tide. The dyke will be formed from sand and faced with clay, and will be built of sufficient dimensions to resist the heaviest seas. It is intended to commence operations on the work at four different points, and the calculation is to have it completed in from seven to 10 years.

Compressed Air Motors.—The Mekarski compressed air motor is about to be tried on one of the Philadelphia street railways, and the claim is made that it is destined to supersede animal power on street railways everywhere, with a great increase of comfort to passengers and of dividends to stockholders. This motor has been used in Nantes, France, for over three years, running through the busiest parts of the town. In Paris it operated two lines, and contracts for its use are said to have been made in England with 17 horse-car companies. The plan is claimed to be also especially adapted to elevated railways, being cheaper than steam power. The invention simply consists in passing dry air through water heated to a temperature 330° Fahr. The air, after passing through the water, is expanded 100%, thus producing a motive power with an economy of 75% over that of steam.

Iron vs. Wood for War Vessels.—Some of the officers at the Brooklyn Navy Yard who are superintending the repairs of the wooden war-steamer *Tennessee*, which was run into by an iron merchantman, find an argument in favor of the adoption of iron in shipbuilding. One of them said: "Here was an iron vessel, moving only three knots an hour, and when she bits the *Tennessee* she very nearly sinks her. Think what would have been the effect if this merchant vessel had run against the man-of-war with malice prepense. And the *Tennessee*, though not so strongly built as some wooden vessels in the service, is so very little inferior to the best that the difference is not worth mentioning." Even in the navy, prejudices against iron vessels are fast disappearing.

Great Enterprises.—This is an age of great enterprises. A railroad is projected, at present on paper, from Jersey City to San Francisco. Capital, $150,000,000. Another company proposes to build a double-track from Jersey City to Washington. Another project contemplates furnishing a dozen Eastern cities with gas light from the mines. An irrepressible enthusiast proposes to bridge the Delaware at Philadelphia with a $4,000,000 bridge. It must be admitted, however, that the accumulation of wealth is so rapid that such enterprises may become practicable much sooner than old-time methods of calculation would admit of. Enterprises pushed to successful completion within five years would have been laughed down as chimerical 20 years ago.

Railway Wear and Tear.—A curious fact was lately mentioned by Mr. F. W. Webb, President of the Manchester Association of Employers, etc. The Northwestern railway company, he stated, used steel rails, and yet the wear under the ordinary traffic of the road was so great that one-third of a pound of steel was lost on every mile run, or, 1,500 lbs. every hour of the day. The collective wear of the locomotive engines, of which there are 1,679, was such that a new engine was required to be put into the traffic once in five days.

The Number of Vessels at the present time plying between the United States and Europe is 5,210, of which 4,655 are sailing vessels, and 565 steamships.

Useful Information.

The Willow as a Timber Tree.

And there are some trees which are deserving of more attention than has yet been given them in this country. The willows, for instance, have seldom been cultivated in a large way; and yet there are few trees so easily grown, or which will pay better for cultivation. They adapt themselves to a wide range of soil and climate. They grow on high ground and on gravelly soils not less than by the sides of streams, where we most commonly see them. They are of rapid growth and yield a large return. The osier-willow is especially useful, we know, for the manufacture of baskets, chairs and other articles of furniture, and we import it to the extent of $5,000,000 annually, when we might produce it easily in almost any part of our country. We hardly think of the willow as a timber tree or for the production of lumber, but only as yielding a cheap, poor sort of fuel. But in England the wood is greatly prized for many purposes. While it is light it is also tough; it does not break into slivers. Hardly any wood is so good, therefore, for the lining of carts and wagons used in drawing stone or other rough and heavy articles. It makes excellent charcoal, especially for the manufacture of gunpowder. It bears exposure to the weather, and boards made of it are very serviceable for fences. Some species of it are admirable for use as a live fence or hedge. On account of its comparative incombustibility, the willow is eminently useful for the floors of buildings designed to be fire-proof. It grows to a large size and furnishes a great amount of lumber. There is a white willow growing in Stockbridge, Mass., which, at four ft. from the ground, measures 22 ft. in circumference and extends its branches 50 ft. in every direction. Tradition says it was brought from Connecticut in 1807 by a traveler, who used it as a riding switch. The Hon. Jesse W. Fell, in giving an account of experiments in tree-planting on an extensive scale in Illinois, says: "Were I called upon to designate one tree which, more than all others, I would recommend for general planting, I would say unhesitatingly it should be the white willow." Prof. Brewer says: "In England, where it is often 60 or 70 ft. high in 20 years, there is no wood in greater demand than good willow. It is light, very tough, soft, takes a good finish, will bear more pounding and knocks than any other wood grown there, and hence is used for cricket bats, for floats to paddle-wheels of steamers, and brake-blocks on cars. It is used extensively for turning, planking coasting vessels, furniture, ox yokes, wooden legs, shoe lasts, etc." Fuller says: "It groweth incredibly fast—it being a by-word that the profit by willows will buy the owner a horse before that by other trees will pay for a saddle." The basket willow, well cultivated, will yield a net income of $150 a year to the acre. On the whole, therefore, it would seem that the various kinds of willow, the economic value of which has been hitherto entirely overlooked in our country, are eminently deserving of attention, and will amply reward those who cultivate them.—*Methods and Profit of Tree Planting, in Popular Science Monthly.*

The Danger of Chlorate of Potash.—The dangerous nature of the manufacture of colored fires is recognized in this country by their being included in the laws relating to pyrotechny. The following report, which we take from the Australian supplement to the *Chemist and Druggist*, may serve as a caution to experimenters and manufacturers: A shocking occurrence took place at Wellington (N. Z.) on Dec. 21st, by which a lady was literally blown to pieces and a building partially wrecked. The facts are as follows: At the shop of Mr. Barrand, chemist, Lambton Quay, some blue fire was in course of preparation for use at the theater. On testing a small portion of the mixture, it was found dangerously explosive, too much chlorate of potash having been inadvertently used in the composition. Accordingly, Barraud's assistant, named Anthony, formerly of Christchurch, took it out into the back yard and began to destroy it by slow combustion. He had occasion to leave for an instant, and before he could return his wife happened to go into the yard, and seeing chemicals on fire at once threw a bucket of water on the burning mass. A terrific explosion immediately took place, which shook the whole city and was heard at a distance of some miles. Poor Mrs. Anthony received the full force of the shock, and was frightfully mutilated.—*Chemist and Druggist.*

Chrome Leather.—Experiments show that the new chrome leather—the result of the new tanning process by bichromate of potash—exceeds in tensile strength the bark-tanned article; also that after it has set under the necessary stress, it still retains an extraordinary amount of elasticity, which is available for tightening belting on pulleys. As illustrating this statement, the fact is shown that a piece of chrome leather bore an ultimate stress of 3,297 lbs. per square inch, while a piece of bark leather only bore an ultimate stress of 2,672 lbs. per square inch—this example proving the samples of chrome-tanned leather to be stronger than the bark-tanned by some 15%.

How to Tighten Wagon Tires.—Apply some leather rings between the shoulders on the outer ends of the spokes and the corresponding portions of the felloes, which may be done as follows: Procure a number of small pieces of leather, from an inch and a half to two inches in diameter; with a sharp knife and a compass, or a cutting punch, make round holes in the center of these pieces, and make a straight cut from the hole to the outer edge of the pieces, so as to form open rings. The holes must be made of a size that will nicely fit the tenons on the out ends of the spokes. Place a fulcrum on the top of the hub, on which place your lever, with the short end under the felloe, near a spoke; have an assistant bear down on the other end sufficiently to raise the felloe, and expose the shoulder and tenon of the spoke, open your leather and fit it nicely around the tenon, holding it to its place while your assistant relaxes the lever and settles the felloe firmly upon the spoke by a blow or two upon the tire. Having repeated the process with a sufficient number of spokes to make the tire all right, trim off the projecting leather even with the surface of the spokes and your task will be done. If your pieces of leather should be spongy, hammer them down before using.

Cements.—The following observations upon cements may be found useful. It has been ascertained that cement that has been prepared by grinding with mill-stones has only half the firmness that it shows when ground in centrifugal machines. The difference is explained by the fact that the centrifugal mode of grinding yields a much more finely divided product, which increases the hardening quality of cement mixed with sand. Coarse sand gives the highest degree of solidity and firmness to cement. It is unnecessary, when coarse sand of one sized grain has been used with cement, to mix finer sand with it to fill up the interstices of the mixture, as other indifferent substances can be used with equally good results. Moist carbonic acid has been found to diminish the firmness of cement to a considerable degree, and in a short space of time. The great difficulty encountered in manufacturing marble imitations from cement, is to prevent the cracking of the latter. Cement cracks when it is made up with too much water. It then forms a vitreous crust, and is not homogeneous throughout its mass. By adding finely-crushed granite fragments to cement without sand, a material is obtained that has great hardness, and which is susceptible of taking a high polish.

Good Health.

How to be Happy and Long-Lived.

First, study to acquire a composure of mind and body. Avoid agitation of one or the other, especially before and after meals, or while the process of digestion is going on. To this end, govern your temper; endeavor to look on the bright side of things; keep down, as much as possible, the unruly passions; discard envy, hatred and malice, and lay your head upon the pillow of charity with all mankind. Let not your wants outrun your means. Whatever difficulties you have to encounter, be not perplexed, but only think what is right to do in the sight of Him who seeth all things, and bear without pining the results. When your mea's are solitary, let your thoughts be cheerful; when you are social, which is better, avoid disputes, or serious arguments, or unpleasant topics. "Unquiet meals," says Shakespeare, "make ill digestions;" and the contrary is produced by easy conversation, a pleasant project, welcome news, or a lively companion. I advise wives not to entertain their husbands with domestic grievances about children or servants, nor ask for money, or propound unreasonable or provoking questions; and advise husbands to keep the cares and vexations of the world to themselves, but to be communicative of whatever is comforting, cheerful and amusing. Self-government is the best step to health and happiness.

In this connection the following suggestions are apropos:

Eat slowly, as if it was a pleasure you desired to prolong, rather than a duty to be performed as soon as possible.

Don't bring your prejudices, your dislikes, your annoyances, your past misfortunes, or future forebodings to the table. They will spoil the best dinner.

Respect the hours of meals; you have no right to injure the temper of the cook, destroy the flavor of the viands, and the comfort of the family, by your want of punctuality.

Have as much variety in your food as possible, but not many dishes served at one time.

Find as little fault as possible with the food prepared, and praise when you can.

Finally, be thankful, if you have no meat, that you have, at least, an appetite, and hope for something better in the future.

Importance of Sanitary Regulations.—The deaths in the Peabody buildings, London, during 16 years, have been at the rate of 16 and 7-10 per 1,000 per annum, while the general death rate of the metropolis during the same period has been 23 and 4-10ths. The death rate in the crowded districts surrounding the Peabody buildings has been stated to be 30 or 40 to 1,000. Dr. S. Gibbon, medical officer for the Holborn district, London, says in his latest report that, whatever may be the cause, there is no doubt that a Jew's life in London is, on an average, worth twice as many years as a Christian's. The Hebrews of the metropolis are notoriously exempt from tubercular and scrofulous taint. Pulmonary consumption is very rare among them. The medical officer of one of the Jewish schools has remarked that their children do not die in anything like the same ratio as Christian children. In high street, Whitechapel, the average death rate on the north side, which is occupied by Jews, is 20 per 1,000, while on the south side, which is occupied by English and Irish Gentiles, it is 43 per 1,000.

Foods for Infants and Invalids.

It may be questioned whether there is any subject which comes more closely home to people of all classes than the character of the food supplies specially provided for infants and invalids. The increasing demand for this class of preparations (due partly to an actual need, but chiefly, we suspect, to the skillful advertising of manufacturers and the liberal margin of profit they offer to the retail trade), has led to a great number and variety of such competitors for public favor. Put up in ornamental boxes, they appear on the counters of every grocer and in the show-cases of every apothecary shop; and not unfrequently their actual value is in inverse ratio to the pretentiousness of the package and the price.

As a rule, purchasers are obliged to take the virtue of such articles upon trust, few having the means or the knowledge requisite for an analysis, microscopic or chemical, of the preparations which they are advised to try, perhaps by the family physician, and yet a mistake in this connection may be fatal.

For all young infants, and for adults in many cases of sickness, starch food is injurious; sometimes in being a source of intestinal irritation; sometimes, as in the case of very young children, in furnishing a semblance of aliment without the reality, such children being as unable to digest and assimilate starch as sand. Hence the usual claim with respect to prepared foods of the cereal class is that they are free from or contain very little starch, while they are rich in gluten and other food elements capable of nourishing the sick and the young. To discover how far these claims are well founded, Dr. Ephraim Cutter, of Harvard college and the University of Pennsylvania, has lately made microscopic examinations of something like 40 cereal foods, developing facts of the highest importance to physicians and their patients, as well as to parents having young children. The results of his investigation appear, with numerous illustrations, in the *American Medical Weekly*, and are worthy of study by all who are interested in microscopy or in the nourishment of invalids and children.

Novel Surgery.—An interesting surgical operation was recently performed in Philadelphia, which consisted in the dividing of the tendons of the third finger to give more perfect freedom in piano-playing. This operation is considered of great importance in a scientific point of view. It is well known that musicians have had difficulty in using the third finger with that freedom of force necessary for skillful operation on the piano. This is for the reason that the tendons connecting with the second and fourth fingers form over that of the third, and act as a martingale, restraining it. Professor Zickown, in his researches for a remedy for this difficulty, consulted Dr. Forbes, after having failed of encouragement from other eminent surgeons. Dr. Forbes confidently asserted that the remedy would follow an operation. The musician had in his employ a mulatto who was an expert in music, but who suffered the same difficulties that retarded others. This young man consented to have the operation performed. He was taken to the Jefferson medical college hospital. Two small incisions were made on the back of the left hand, on each side of the extension tendon, and the accessory tendon on each side was divided. The effect was electrical. The finger was at once released from its constraint and given equal facility of stroke with the others, and its strength was increased rather than impaired. It is asserted that the hand will be in no wise deformed by the operation, while the effect is that pupils in music who undergo the process will be in an instant advanced several years in power and facility of operation on the instrument. The colored boy will submit his other hand to the operation in a few days. The success is exciting very marked interest in musical and scientific circles here and elsewhere.

Soft Beds.—Why should soft beds be considered unwholesome? Certainly they afford more comfort than hard ones. Hard beds should never be given to little children, and parents who suppose that such beds contribute to health by hardening and developing the constitutions are surely in error. Eminent physicians—both here and in England—concur in this opinion, and state that hard beds have often proved injurious to the shape of infants. Birds and animals cover their offspring with the softest material they can obtain, and also make soft beds for them; why not do the same with our own young?

Tubercular Disease.—Prof. Tyndal recently contributed to the London *Times* a luminous exposition of Koch's remarkable investigation of tubercular disease, demonstrating by experiments on animals that the disease is caused and propagated by living parasites.

Assessment Notice, Gaudalupe Silver Mining Co., S. F.

Passing Events.

After struggling for years independently against heavy bodies of water, there is now to be a combined effort of the various companies at the south end of the Comstock to overcome the difficulty. The plan proposed we give the details of elsewhere in this number of the PRESS. It is one which will cost a good sum of money, but either this or some similar plan must be carried out, or the lower levels of these mines will have to be abandoned. Levying assessment after assessment, simply to spend the money in pumping, will not pay; nor will the stockholders stand it much longer. We are glad to see now an active movement made.

The Indian troubles in Arizona still continue, but active measures are being taken to settle them.

The President has issued a proclamation calling upon all bands of "cowboys" in Arizona to disperse to their homes. It is to be hoped that some active movement will be made to break up the cowboy nuisance.

We give elsewhere the details of what was done by the anti-debris convention which met at Sacramento this week.

The prospectors are following up the snow line, and as fast as the snow disappears they take possession of the ground.

ON Monday three cars of machinery for the General Custer mill arrived at Ogden from the East, and will be forwarded to Custer City, Idaho, via, Blackfoot.

Boundary Marks of Mining Claims.

In the last number of the MINING AND SCIENTIFIC PRESS we gave some directions as to the proper way of marking locations on the ground so as to comply with the law. One reason for again referring to the subject is that it is of the greatest importance when perfecting the title to the claim when it becomes valuable. The Department of the Interior has decided that an application for a mining survey must be declined where the location was not properly marked and recorded, and that bearings and distances must be given in a survey from the respective survey corners to the location corners, and the same must be shown on the plat.

The act of Congress of May 10, 1872, expressly provides that "the location must be distinctly marked upon the ground so that its boundaries can be readily traced," and "that all records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located, by reference to some natural object or permanent monument, as will identify the claim."

These provisions of the law must be strictly complied with in each case, to entitle the claimant to a survey and patent, and, therefore, should a claimant under a location made subsequent to the passage of the act of May 10, 1872, who has not complied with said requirements in regard to marking the location upon the ground and recording the same, apply for a survey, Surveyore-General are instructed to decline to make it.

To enable the Land Office to determine satisfactorily, and at a glance, that the provisions of the law and its instructions are obsyed, Surveyors-General have been instructed to require in the field notes a particular reference to all the data upon which a survey is based, to wit: From each established corner of the survey a bearing and distance must be given to the corresponding corner of the location. Upon the plat the lines of the location as found upon the ground must be laid down in such a manner as to contrast and show their relation to the lines of the survey. If the location and survey are identical, the facts should be clearly and distinctly stated in the field notes. The Land Office has determined that no survey not complying with these requirements will be allowed to go to patent.

Prospectore who are locating claims will do well to mark them properly, in accordance with law, and save trouble in the future.

A New Amalgamator.

William T. Browne, of Stockton, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an amalgamator which consists in the employment of a mercury-containing pan of considerable diameter, having a second pan or distributer so mounted as to rotate concentrically within it. This distributer has a central feed-pipe passing through its bottom, so that the ore or pulp may pass by gravitation between the bottom of the inner pan and the mercury, which rises to a small hight above the level of the bottom of the inner pan, and thus produces a certain amount of pressure which the pulp must pass. The rotary motion of the central pan or distributer gradually carries the pulp in spiral lines to the outside, where it rises in the space between the two. A scraper may be arranged to move the pulp to the point of discharge.

The pan is preferably circular, and shallow in proportion to its diameter, and it is provided with an outlet at one side. The smaller pan has a central pin, or pivot, upon which it turns on a suitable step in the bottom of the main or outer pan. From the center of this small pan is a feed-pipe, its upper end being adapted to receive the pulverized ore or pulp. This pipe passes or opens through the bottom of the inner pan, so as to discharge the pulp below its bottom. The space between the two pans is filled with mercury, which rises a short distance above the bottom on the outside of the inner pan, so as to produce a certain amount of resistance, against which the ore, or pulp, must enter, between the bottom of the inner pan and the mercury from the feed-pipe.

The operation will then be as follows: Ore or pulp is introduced through the pipe, and when its hight is sufficient to overcome the pressure of the mercury in the outer pan, it will be carried into the space below the bottom of the inner pan. This bottom is flat, and the rotation of the inner pan, which is driven by a belt, will distribute the pulp, and move it gradually, and in curved or spiral lines, to the outside of the pan, where it escapes and rises to the surface of the mercury between the sides of the pans.

The principal advantage that the inventor claims for this method over the ordinary devices for immersing ore pulp in mercury is that it is thoroughly distributed by the rotation of the flat-bottomed distributer and is kept in contact with the surface of mercury beneath the inner pan in a thin sheet and for a long time by this rotation, finally rising to the surface in a thin constant sheet, instead of being projected upward in masses, as is the case where no distributer is employed.

The ore or pulp is not forced into the mercury, as this is open to the objection that, when so introduced, the pressure of the mercury tends to retain the pulp or sand in a mass, which shoots to the surface without any intimate contact with the mercury, except on the outside; and it also has a tendency to entangle and carry off with it some particles of mercury. By this invention the ore is simply distributed in a thin sheet upon the surface of the mercury, and every part is brought into contact with the mercury under some pressure, so that the precious metal will be amalgamated.

Upon the edge of the inner pan is secured a sort of rake, or scraper, which may be adjusted to dip into the pulp around the sides, between the pans; and this rake assists to carry off the refuse which, having passed over the mercury, rises to the surface and is of no longer any value. The rim of the inner pan is somewhat higher than that of the outer one, and the outer one may also be provided with an outlet, so that the refuse may be discharged through it as fast as it is brought around by the scraper and the motion of the pulp and water between the rims and the pans. The rotary motion of the inner pan, or distributer, while gradually carrying the sand or pulp to the outside, also keeps it rolling over and over, and by its action may scour and polish any particles of coated or rusty gold.

Prospecting Quartz Mill.

At the Atlas Iron Works, 135 Beale street, we saw this week Day's vacuum attachment to quartz stamps, which we recently spoke of as having been patented through the MINING AND SCIENTIFIC PRESS Patent Agency a short time since. It is designed to cheapen and lighten the construction of stamp mills, and serve to prospect with, particularly as no great outlay is necessary to purchase one. The inventor, James Day, is prepared to supply mill men and prospectors with light-running mills which are low at first cost, cheap to transport, and can be readily set up in running order.

A mill of this kind is sold for $100, so that miners can select their rock and make a "grub stake;" and, if they are industrious, can make enough to enable them to purchase a larger mill, and fully develop the mine from the resources of the mine itself.

The mill now at the Atlas Iron Works is constructed on the plan and style of our best improved California stamp-mill batteries, with this exception: Instead of having long, heavy and slow-moving stamps, it has short, light and quick-dropping ones. Though these stamps are comparatively light (200 lbs. each), their crushing effect is great, as, by a simple device, they are propelled downward by the pressure of the atmosphere, thus striking a sharp and percussive blow on the rock, similar in effect as though it was shot from the barrel of a gun.

Its operation is as follows: The mill, as before stated, is constructed the same as an ordinary stamp mill; the mortar, stamps, stems, tappets, cams and frame are as usual. To the top of the frame are bolted cross-pieces; on these pieces are laid and bolted the cylinders, in each of which is a piston formed of leather and metal, similar to an ordinary pump; the leather is kept moist and soft by oil; the tops of the cylinders are open, to expose the tops of the pistons to the atmosphere. To the top of the piston-rod is secured a cross-head, in the ends of which are fitted rods. These rods extend downward through appropriate guides on the sides of the cylinder, and are again connected by a lower cross-bar. This lower cross-bar is so placed that the stamp stem will, when it is raised one-half of its required lift, impinge against it and so raise it up. In doing this it raises the piston, and so creates a vacuum in the cylinder. The piston, together with the stamp and stem, is now sustaining the weight of a column of the atmosphere equal to the area of the piston. The continued revolution of the cam carries the stem to its extreme hight. The stamp is then released, and descends with a force and velocity due to its actual weight, and that also of the column of the atmosphere added to it.

These stamps, the inventor informs us, will make 150 drops per minute, if the mill man desires to run them up to that speed. For the purpose of fully showing the value and utility of the vacuum attachment, the mill was operated with one of the cylinders hung up so that the stem did not impinge on its piston. The other had its attachment within working distance of its stem. There is a marked difference in the blow given by the stamp with the attachment on, and that given by the stamp with the attachment off. The one was merely cracking and hardly crushing the rock, while the other was swiftly crushing and making the rock fly.

The inventor informs us that this vacuum attachment can be applied to any form of stamp now running. We will shortly give an illustration of this mill, accompanied with a detailed description of all its workings.

IN the Golden Gate Con., Smartsville, there has been struck some of the richest gravel that has ever been seen in the district, not excepting the famous blue gravel in its palmiest days. This rich gravel was found eight or ten ft. above the bedrock, and they are likely to have quite a depth of it, as the bedrock is pitching from where the strike was made.

A Remedy for Flooded Mines.

It will be remembered that a short time since the managers and superintendents of the flooded mines at the south end of the Comstock met in this city and appointed a committee to suggest a plan for clearing the mines of water, which now floods their lower levels. The committee has made a report, which contains some interesting facts. At the 2700 level of the Yellow Jacket shaft, where the water was found, the influx was at the rate of 2,728,000 gallons a day. At the 2500 level the influx was 2,200,000 gallons a day. At the 2300 level the influx was 1,700,000 gallons a day.

The water is now about stationary at the 1900, showing that the head or level of the water is now about reached. The water was held stationary at the 2,300 level by the Jacket pumps alone, running at seven and two-tenths strokes. The Jacket Co. have pumped and hailed 44 days, during which time they discharged into the Sutro tunnel 52,832,360 gallons, and at the time the pumping and bailing was stopped there was an accumulation in the various drifts, winzes and shafts, from the 3000 to the 2000 level, of 23,018,000 gallons, making a total of 75,850,300 gallons influx during the time of 44 days, or at the rate of 1,723,863 gallons a day, average influx up to that point.

Assuming the influx at the 2700 level to be 2,728,000 gallons a day, the committee finds that that amount of water can be handled by the pumping machinery now on the Jacket shaft, with the assistance of the pumping machinery now on the joint Belcher-Crown Point shaft, provided a drift is run from the Belcher-Crown Point incline to the south laterial drift of the Sutro tunnel, to be used as an adit level, which would allow of the present capacity of those pumps being doubled, with also an additional 10-inch pump being attached to the present Yellow Jacket pumping machinery, and a set of large bailing tanks of a capacity of 1,500 gallons each being provided. The adit level mentioned above will take up all the water coming in above the Sutro tunnel level, discharging it directly into the Sutro tunnel and relieve the pumps of about 180 gallons a minute. The drift will be 2,180 ft. in length, and can be run in four months by working from both ends, by which time the alterations and additions to the pumping machinery at the Belcher-Crown Point and Yellow Jacket shafts would be completed.

After starting the full pumping and hailing capacity of both shafts, it will take about four months to remove the water down to the 2700 level, the point of influx, all of which we estimate can be done for the sum of $450,000. This estimate includes the cost of maintaining the machinery used in good working condition.

As the removal of this large amount of water (414,720,000 gallons) will undoubtedly largely decrease the influx at the 2700 level, the handling of it after that point is reached is a matter left for future consideration.

It has been agreed that the cost should be levied upon the companies in proportion to the number of ft. in their claims. It was ascertained that the ground involved embraced nearly 8,000 ft., and that to carry out the drainage plan it would be necessary to raise something like $460,000, or say $60 a foot. It would not be necessary to raise all the money at once, but it might extend over a period of from six to eight months, and he collected in three or four assessments. The mines involved in the proposed plan are as follows:

Mine.	Feet.	Amount to be Raised.
Bullion	1,100	$66,000
Exchequer	400	24 000
Alpha	300	18,000
Consolidated Imperial	470	28,200
Challenge	90	5,400
Confidence	130	7,800
Yellow Jacket	960	57,600
Kentuck	95	5,700
Crown Point	540	32 400
Belcher	1,040	62,400
Overman	1,200	72 000
Caledonia	1,200	72,000
Total		$451,500

The question of how the money was to be raised was left to the individual companies.

A DISPATCH from Bonny, on the west coast of Africa, dated April 23d, reports that there has been heavy fighting between the natives of New Calibar and the followers of Okojumbo. The latter were the aggressors. The slaughter is described as fearful. At least 2,000 persons were killed. It was feared that the Jaga would take part in the fighting, thus causing a war which would become wholesale carnage. There was much alarm among the English inhabitants. It is expected that two gunboats will be ordered to the scene.

A COAL mine has been discovered on the San Jose river, 43 miles from Albuquerque, N. M., on the Atlantic & Pacific railroad. It shows a vein of eight ft. or more. The mine is only one-quarter of a mile from the railroad.

THE General Custer silver stamp mill has been in operation only 14 months, and it has turned out bullion, the assay value of which foots up $1,400,000, or $100,000 per month.

MEXICANS are making $4 and $5 a day working the placers in Holcomb valley.

Production of the Precious Metals.—No. 7.

An abstract of the Census Monograph on the Bullion output of the country.

Colorado.

From an average annual production of only three or four million dollars, Colorado has suddenly risen to the first rank as a producer of the precious metals among the States and Territories for gold and silver combined, as well as for silver alone, while for gold it holds the fourth rank. In the relation of production to area it holds the first rank likewise for gold and silver combined and for silver alone, and the third for gold alone. In the relation of production to population, however, it ranks only third for gold and silver together, second for silver alone, and sixth for gold alone. The total value of its product during the census year in gold and silver was, in round numbers, nineteen and a quarter million dollars, and, if we add to this the value of lead and copper in crude metal produced, we have a total value of metallic product of twenty-two and three-quarters million dollars.

The collection of statistics of the precious metals in this State presents certain peculiar difficulties. First, from the fact that there are so many small mines which keep no accurate record of their production; second, because a very large proportion of its ores, being essentially heterogeneous in composition, have to be smelted, and are thus more difficult to trace than milling ores. The smelting ores are sold, it is true, mostly to smelters within the State, but the same mine often sells to different and widely-separated works, and the smelters themselves buy ores in small lots from many mines, of which no separate record is kept. Moreover, the check furnished in the more western States over the total production by the express returns is here wanting, since practically the whole silver product is shipped East in lead bullion, of which the transportation companies keep no record. Nevertheless, owing to the almost uniform willingness which the more important mine owners, samplers, and smelters have shown to afford the data which they possessed, it is believed that the totals attained represent a very close approximation to the actual product of the State, and that the figures given are, on the average, within 5% of the true amount, although in districts as yet incompletely developed this percentage may be greater.

To show the data from which the figures given have been obtained, the number of mines from which full schedules were received is subjoined, and the proportion thereof that have been bullion producers during the census year, as well as those producers of which data have been obtained otherwise than by schedules and visits of census experts:

Total deep mines scheduled	249
Productive mines scheduled	126
Productive mines reported otherwise	249
Total productive mines reported	375
Total all mines reported on	498

COLORADO—Production of Placer Mines for the Year Ending May 31, 1880.

County.	Gold
Chaffee	$ 26,357
Clear Creek	3,476
Lake	17,201
Park	20,672
Routt	5,000
Summit	23,979
Total	$101,745

In Colorado, moreover, owing to the fact that other gold bullion is produced so largely, it has been impossible to supplement these figures by express or mint returns. While the above figures doubtless very inadequately express the production of placer gold for the State, it is a fact that this production was relatively small during the census year, owing to the unusual activity in prospecting for and working deep mines.

Copper and Lead—Although these belong rather to the useful than to the precious metals, their importance among the mineral products of Colorado, and their intimate connection with the production of gold and silver, render their consideration here essential. In the table in next column only the crude metal obtained from ores actually smelted within the State is given, no account being taken of the copper or lead contained in ores which were shipped outside of the State for treatment. This amount is, however, of comparatively little importance, forming probably not over 5% of the total product. The lead product was all in the form of argentiferous lead bullion, which was shipped to various smelters in the East to be refined.

The copper product was partly as matte, but largely in the form of copper oxide. Of the actual shipments of the latter, a portion has been produced from ores raised in Montana; a proportionate amount of the total product has, however, been credited to that Territory in its appropriate place.

In calculating the value of these metals, the average market value of either for the year has been assumed as 4½ cents per lb. for lead, 20 cents per lb. for copper.

In the subjoined table are shown the relative amounts of ore treated by mill process and by smelting, and their average yield per ton. Its principal value is to show the average character of ore in each county in reference to its adaptation to either process of reduction. It would have been extremely interesting, had the data been such as would yield accurate results, to have given the assay value of the ore treated in either case, and thus compare the relative losses in either process; but the number of cases in which it has been necessary to estimate product from assay value, or *vice versa*, would seriously impair the value of such comparison. This subject will be found treated at length in the final census report.

(To be Continued.)

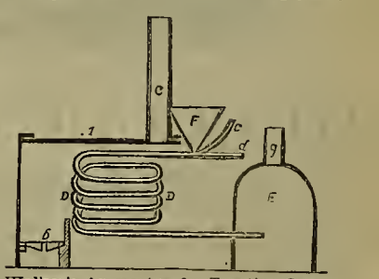
Walker's Process for Treating Ores.

In the ordinary processes for treating ores by oxidation a difficulty is felt in so holding the pulverized ore in suspension while being treated as to permit the thorough contact of each particle thereof with sufficient oxygen to support the combustion, and in securing at the same time the presence and suitable distribution of the proper amount of oxygen. Thos. G. Walker, of Morristown, N. J., has devised an apparatus for overcoming this difficulty, which we illustrate on this page.

A is an oven heated from the furnace, *B*, and provided with a chimney, *C*. Within the oven is a coil of pipe, *D*, passing from the hopper into the oven, *A*, near the top and passing out near the bottom, discharging into a preferably closed receiver.

The ore to be treated is finely pulverized and placed in the hopper, *F*, whence it passes gradually into an extension of the heated coil, *D*, from which point it is taken through the heated coil by a jet of steam under pressure from the pipe, *c*, and a jet of atmospheric air drawn or forced in from a pipe at *d*. It will be seen that the coil, *D*, has one inlet for the ore, another for the steam, and still another for the air, and that its connection with the steam pipe is an air-tight connection. The air-pipe is let into the coil, *D*, either in advance of or behind the steam pipe. The steam, while serving jointly



Walker's Apparatus for Treating Ores.

with the air as the conveying medium, holds the pulverized ore thoroughly in suspension and distributes it evenly throughout the heated space, thus permitting the thorough contact of each particle of ore with whatever oxygen is present.

For the purpose of holding the ore in suspension steam is considered greatly superior to air by reason of its greater expansive force and consequent carrying capacity that will hold the many particles of ore suspended while they are affected chemically by the mixed air and steam.

By the saturation of the air, which is effected by the presence of steam, oxidation is facilitated, as it takes place more readily in a humid than a dry atmosphere. The constant presence of a suitable supply of oxygen and its even distribution throughout the heated space is insured by the current of air, so that ignition takes place instead of fusion, which latter occurs when the supply of oxygen is deficient or is not suitably distributed.

The heated coil, *D*, having a free discharge into the receiver, renders possible the holding of the ore in constant suspension by the current of steam and air while passing through the heated space, and also enables the operation to be performed continuously as long as ore is supplied to the hopper. The heat within the coil, *D*, suffices to induce combustion of the combustible constituents of the ore when they are in the presence of oxygen. The sulphur, arsenic, antimony and kindred impurities of low oxidizing powers, uniting with the oxygen supplied by the air, are resolved into gases and escape with the steam and all volatile products into the receiver, and thence through a suitable flue, *g*, while the free metal, the oxides and all non-volatile products are continuously discharged into the receiver, *E*.

It is, of course, not new to treat ore in closed vessels, or in the presence of steam in heated vessels. The inventor claims his process utilizes the steam for two purposes: First, as a propelling and suspending medium, and secondly, to aid in inducing oxidation by the moisture which the steam imparts to air.

Steam has also been brought in contact with products of combustion and heated ore. This the inventor disclaims, as the necessary ingredient, oxygen, is not present in such cases, and as the products of combustion, when brought in contact with the ore in the receiving chamber, or in the flue of the furnace, as has heretofore been done, will consume or combine with the oxygen and prevent it from assisting in oxidizing the ore.

The estimated reduction in the public debt for April is about $14,000,000.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x00. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x30 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x30. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

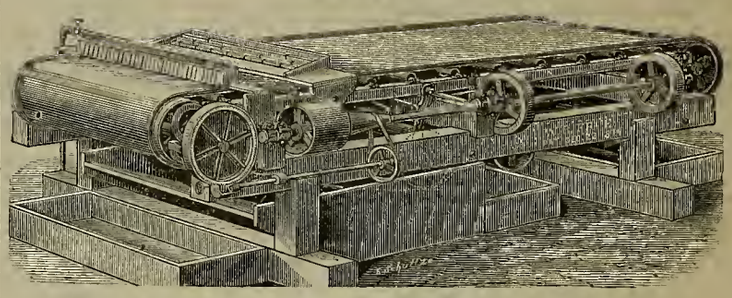
Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - - - San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

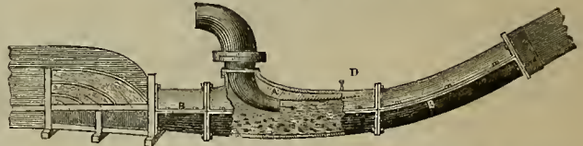
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

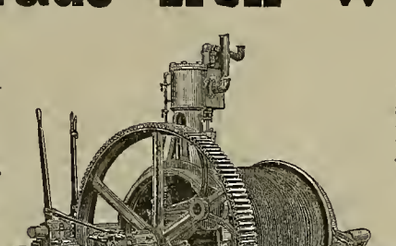
No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

Colorado Iron Works,

MANUFACTURERS OF ALL KINDS OF Mill and Mining Machinery. Engines, Boilers, Cornish Pumps, Hoisters, Crushers, Rolls, Stamp Mills, Smelters, Furnaces, Ore Cars, Kibbles, Etc. Also, Saw Mills, Heavy Forgings, Bridge and other Bolts.



Machine Bolts and Lag Screws, at List Prices, with Freight added, less current discount.

THE OLDEST AND LARGEST MANUFACTORY OF MACHINERY IN THE WORLD.

For Circulars and Prices, Address

COLORADO IRON WORKS,

Denver, Colorado.

Works, 33d and Wynkoop Sts. P. O. Box 1921.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.

INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

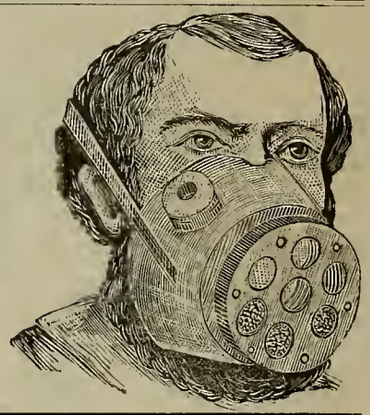
Address all communications and orders to

SETH MARSHALL, Grand Hotel,

Or of C. C. HARVEY,

309 California Street, S. F., Cal

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.



PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

TELEPHONE.—Subscribers, advertisers and others of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

1851. 1881.

DEPUTY U. S. MINERAL SURVEYOR.

Surveys for Location or Patent. Maps and Plans Drawn. Mining Properties of all kinds examined and careful reports made of the same. Consultations on Mining Investments. Address, THOS. W. REECE, CIVIL ENGINEER, Oroville, Butte Co., Cal. References given and required.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia, and 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 527 Commercial St., S. F.

GEORGE WILSON,

MINING ENGINEER and METALLURGIST,

Parral, State of Chihuahua, Mexico,

VIA EL PASO, TEXAS,

Mines examined, reported on and superintended in any part of Mexico. Will buy or rent good mining property.

FOR SALE.—Several groups of good mines in State of Durango. 1,450,000 acres ranches.

Terms Moderate

COPP'S AMERICAN MINING CODE.

United States, State and Territorial Mining Laws, and Land Office Regulations; Digest of Land Office and Court Decisions; List of Patents Issued, and Dr. Raymond's Glossary, with Forms for Mechanics' Liens, Location Notices, etc.

Price, postpaid, in paper, 50 cts.; in cloth, $1 25.

Sold by DEWEY & CO., S. F.

RICHARD C. REMMEY, Agent,

Philadelphia Chemical Stoneware Manufactory,

1100 E Cumberland St., Philadelphia, Pa.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists. Also, Chemical Bricks for Glove Towers.

LAND Good land that will raise a crop every year. Over 12,000 acres for sale in lots to suit. Climate healthy. No drouths, bad floods, nor malaria. Wood and water convenient. U. S. Title, perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta County, Cal

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

Metallurgy and Ores.

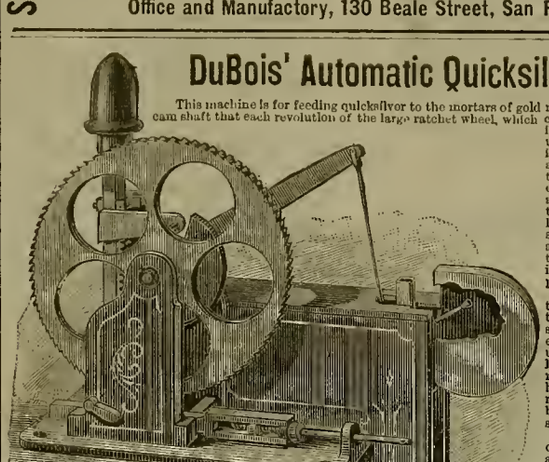
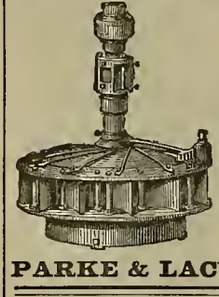
SHEET IRON PIPE.
FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores. Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.


PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address
JAMES LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.
PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.

STEEL CASTINGS
FROM 1-4 TO 10,000 lbs. WEIGHT.
True to pattern, sound and solid, of unequaled strength, toughness and durability.
An invaluable substitute for forgings or cast-iron requiring three-fold strength.
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.
15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.
CRANK SHAFTS, SHOES, DIES and GEARING specialties.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING APRIL 18, 1882.

256,539—MAIL BAG FASTENING—E. A. Brandau, Los Angeles, Cal.

256,540—REST FOR ROCK DRILLS—Wm. T. Browne, Stockton, Cal.

256,459—FRUIT DRIER—Burnett & Hill, Myrtle Creek, Oregon.

256,467—BUTTER MOLD—Josepb De Carly, Smitb's Ranch, Cal.

256,553—LOGGING ENGINE—John Dolbeer, S. F.

256,555—AMALGAMATING AND CONCENTRATING RIFFLE—George R. Evans, S. F.

256,558—GLOVE—Henry S. Flood, S. F.

256,562—CHAIR BRACE—John A. Gallagher, Chinese Camp, Cal.

256,479—CONDENSER—Wm. D. Hooker, Oakland, Cal.

256,735—SULKY HAY RAKE—W. P. Prall, Colusa, Cal.

256,742—WRITING IMPLEMENT—Samuel S. Rogers, Dayton, W. T.

256,749—ROCK DRILL—William H Silsby, Orleans Bar, Cal.

256,755—SWIVEL LINK—David F. Spangler, Dayton, W. T.

256,604—CAR BRAKE—A. C. Springer, S. F.

256,661—PORTABLE CORRAL—Charles A. Tarragon, The Dalles, Oregon.

256,769—GRAIN CLEANER—Sewall Truax, Walla Walla, W. T.

256 608—FLOATING DRY DOCK—L. C. Watts, S F.

256,524—TEMPERAMENT ADJUSTER FOR MUSICAL INSTRUMENTS—W. K Wheeler, S. F.

256,528—TIRE UPSETTER—Alex. Wornack, Emmetsville, Idaho.

256,464—MACHINE FOR SAWING AND GROOVING SHARES—Frank M. Covell, Olenmoore, Cal.

256 657—SADIRON—John M. Edmonds, Salt Lake, U. T.

256,677—ORE FURNACE—Hall & Haskins, Guerneville, Cal.

FOR THE WEEK ENDING APRIL 25, 1882.

256,946—STEAM ENGINE GOVERNOR—L. W. Andrews, Live Oak, Cal.

256,966—CAMERA ATTACHMENT—Wilfred L. Brown, Mare Island, Cal.

256,876—CAR BRAKE—Jesse H. Burks, Los Angeles, Cal.

256,971—NUT LOCK—J. H. Burrows, Boise City, I. T.

256,831—UNDERGROUND CABLE RAILWAY—Henry Casebolt, S. F.

256,992—SEWING MACHINE ATTACHMENT—A. A. Fisher and A. Hart, S. F.

257,000—STEAM BOILER FURNACE—C. I. Hull, S. F.

257,076—TWO WHEELED VEHICLE—Robert Ross, Santa Rosa, Cal.

257,081—IMITATION OF MARQUETRY BY PAINTING—Wm. Schroeder, S. F.

257,093—ARTIFICIAL TILES—Robert Skinner, S. F.

257,094 SAFE—David W. Smith, Port Townsend, W T.

256,942—FOLDING BEDSTEAD—Charles F. Youngberg, Salt Lake City, U. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

STEAM ENGINE GOVERNOR.—Lee W. Andrews, Live Oak, Sutter county, Cal. No. 256,946. Dated April 25, 1882. This governor consists of a two-part cylindrical valve, reciprocating in a cylinder so as to alternately expose and cover ports which open through the sides of the cylinder. The two parts of the valve close against seats at the center, and are caused to close against these seats by springs acting against their outer ends. A rod, which is caused to reciprocate by connection from the engine shaft, passes longitudinally through both parts of the valve, and another rod, which also passes through both parts of the valve, is connected with an oscillating balance-wheel having a coiled spring. The first rod has a collar fixed to it midway between the cross-bars which extend across each part of the valve, and pawls which are hinged to the inner sides of these cross-bars engage this collar at each end, so that when the engine moves slowly, the two parts of the valve move simultaneously, each moving the full stroke without cut-off. The second rod has two arms secured to it and projecting up beside the first, so that their ends are just beneath the pawls before mentioned. When the engine runs faster than the oscillation of the balance-wheel, these arms engage the pawls, so as to lift them alternately clear of the collar, when the exterior openings will close each part of the valve as it is released, and thue cut off the supply of steam to the cylinder.

IMITATION OF MARQUETRY BY WOOD.—Wm. Schroeder, No. 257,081. Dated April 25, 1882. This invention relates to a new and usefnl process for the ornamentation of wood, and it consists in a series of stepe—namely, in preparing the wood with sizing or shellac; in coating or graining it with water colors; in snbsequently removing part of the latter through the openings or stencils to make the proper ornaments or figures; in applying colors through secondary stencils for finishing the designs with darker parts or lines; and, finally, in coating the whole with shellao or varnish. This process of ornamentation is intended to be applied to the cheaper kinds of furniture, and where it is desired to prodnce a fine effect of inlaid work at moderate expense.

SEWING MACHINE ATTACHMENT.—Albert A. Fisher and Albert Hart, S. F. No. 256,992. Dated April 25, 1882. This is a darning and braiding attachment. It consists in a plate adapted to hold and direct the braid, so that it may he sewed on underneath the goods, and thus leave the stamp clear ahove for the needle to follow; and in connection therewith, and in order to render the use of this braiding plate practical and facilitate the operation, it consists further in a peculiar plate secured to the presser-arm, and adapted to he struck hy the oscillating needle-arm in snch a manner that the cloth will he immediately relieved from the presser-foot, and allowed to make sharp turns upon the needle as a pivot point.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

3776. Auriferous Quartz—Standard mine, Bodie, Mono county, Cal., 385 level. Walter P. Jenney.

3777. Auriferous Quartz—Syndicate mine, Bodie, Mono county, Cal. Walter P. Jenney.

3778. Auriferous Quartz—Bodie mine, east drift, Bodie district, Mono county, Cal. Walter P. Jenney.

3779. Wall Rock (Blue Dyke)—Jupiter mine, Bodie district, Mono county, Cal., 600 level, face of west drift. Walter P. Jenney.

3780. Wall Rock—Syndicate mine, Bodie district, Mono county, Cal. Walter P. Jenney.

3781. Silicified Wood—Dunyea hydraulic mine, Chile gulch, Calaveras county, Cal., one mile from Mokelumne Hill. L. P. Goldstone.

3782. Quartz Crysta's—Standard mine, Bodie, Mono county, Cal. Walter P. Jenney.

3783. White Mica—Black Hills, Dakota. D. T. Hughes.

3384. Genthite, Nickel Gimnite, Hydrous Silicate of Nickel and Magnesia—Oregon; exact locality unknown.

3985. Millerite, with Cobalt (?)—Half a mile from Chico, Placer county, Cal. O. C. Pope.

3986. Trigonia impressa—Jurassic fossil, Bath oolite, Stonesfield, England. (See Geol. Oxford, 181.)

3987. Terebratula maxillata—Jurassic fossil, Bath oolite, Stonesfield, England. (See Geol. Oxford, 181.)

3988. Pecten abrosus—Jurassic fossil, Bath oolite, Stonesfield, England. (See Geol. Oxford, 181.)

3989. Nautilus haberi—Jurassic fossil, Stonesfield, England. (See Geol. Oxford, 181.)

3990. Trigonia moretoni—Jurassic fossil, Bath oolite, Stonesfield, England. (See Geol. Oxford, 181.)

3991. Rhynchonella oh oleta—Jurassic fossil, Bath oolite, Stonesfield, England. (See Geol. Oxford.)

3992. Pecten annulatus—Jurassic fossil, Bath oolite, Stonesfield, England.

3993. Modiola imbrecata—Jurassic fossil, Bath oolite, Stonesfield, England.

3994. Slab with Fossil Plants—Jurassic fossils, Bath oolite, Stonesfield, England.

3995. Pholodomya acuticosta—Jurassic fossil, Bath oolite, Stonesfield, England.

3936 Red Silver Ore—Concordia mine, Bodie, Mono county, Cal. Walter P. Jenney.

3937. Rich Silver Ore—Alta mine, Comstock ledge, Virginia Nev. O. C. Pope.

3938. Pocket Knife—Found at the camp where the emigrants perished in Death valley, Inyo county, Cal. F. F. A. Connelly.

3939. Portion of the Capital of a Rude Column in an Ancient Church—East Cameron mountains, on the road from Santa Fe, New Mexico. The church is built of wood and adobe, and is fast falling into decay. O. C. Pope.

4000. Silver Ore—General Grant mine, New Mexico. O. C. Pope.

4001. Silver Ore—Lookont mine, Lookout mining district, Inyo county, Cal. O. C. Pope.

4002. Ore Containing Free Gold—Caledonia mine, Deadwood, Black Hills, Dakota. Walter P. Jenney.

4003. Fossil Oyster—Gabalan mountains, Santa Cruz county, Cal. O. C. Pope.

4004. Silver Ore—Santa Rita mine, Grant county, New Mexico. O. C. Pope.

4005. Hubnerite—Found in Polsdam sandstone, near Porphyry Dykes, Comstock mine Strawberry district, near Deadwood, Dakota. (See No. 2413.) Walter P. Jenney.

4006. Cerargyrite Crystals (Microscopic)—General Grant mine, New Mexico. (See No. 4000.) O. C. Pope.

4007. Azurite, Blue Carbonate of Copper—Burro mountains, Grant county, New Mexico. O. C. Pope.

4008 Silver Ore—Silver Cliff mine, Custer county, Colorado. D. T. Hughes.

4009. Lava—Mt. St. Helens, Washington T. J. Z. Davis.

4010. Yellow Ocher (Limonite)—Found in considerable quantities adjoining an iron mine (See No. 3765), Campo Seco township, near Campo Seco, Calaveras county, Cal. Valuable as a pigment. C. Berger.

4011. Burnt Ocher—Same as No. 4010. Near Campo Seco, Calaveras county, Cal. C. Berger.

4012. Electrum—Alloy or gold and silver, with chalcopyrite and other minerals. Black range, Socorro county, New Mexico. O. C. Pope.

4013. Portion of a Brick, Illnstrating the McCulloch Process—The Ores are mixed with clay and saw dust and formed into brick, which are then burned in a common kiln—a process similar to one common in the mines of Mexico and South America. The silver treated was from the Comstock. The silver is now in a state soluble in water, and the gold is free. Melvil e Attwood.

4014. Pyrolusite—Lower California; exact locality unknown.

4015. Ore—From Refugio mine, Temescal district, Durango, Mexico. Shows free gold. F. E. Monteverde.

4016. Talcose Rock—Wall rock of the Idaho mine, Grass Valley, Nevada county, Cal.

4017. Slab with Fossils (Carboniferous?)—Georgetown, Mimbres river, Grant county, New Mexico.

4018 Electric Dischargers for Firing Blasts by Electricity—Walter P. Jenney.

4 19. Iron Buttons—Obtain d in crucibles from the Campo Seco iron ore, Calaveras county, Cal. (See No. 3765.) C. Berger.

4020. Gopher Snake (Pitnophis catenifer)—B. & G. Sancelito. Melvi le Attwood.

4021. Oil Painting—(From Raffaelo Sanzio) by Montenegro. Max Burkhardt.

4022. Oil Painting—Lighthouse at Dieppe. Mrs. John H. Holt.

4023. Oil Painting—Tropical Scene in Mexico. Mrs. John H. Holt.

4024. Rock Specimen, Called Soap Rock—San Buenaventura, Ventura county, Cal. J. Z. Davis.

4025. Rock Specimen, Silicious Sinter—Contains 79% of silica. Determination by Dr. William D. Johnson. Silver ores are found in this formation. Custer county, Colorado. (See No. 4008.) D. T. Hughes.

SMELTING FURNACES.—The water-jacket furnaces, for both galena and copper ores, built hy Messrs. Rankin, Brayton & Co., of the Pacific Iron Works, San Francisco, have worked a revolution in the smelting business of the country. The advantages demonstrated in these furnaces are facility and cheapness of transportation and construction, economy of fuel, fineness of hullion produced and capacity for continuous and uninterrupted work. Any ore that can he smelted, it is claimed, can be worked cheaper in these furnaces than hy any other process. The mining interests of the country are largely indebted to the enterprise of this firm for working up to such a state of perfection this important branch of mining machinery. A large number of companies in Arizona, New Mexico and Nevada are operating these furnaces with most satisfactory results.—*Arizona Daily Star.*

News in Brief.

SEVENTY thousand emigrants arrived in New York during April.

CARP have been grown in Los Angeles county weighing as high as seven pounds.

ONE hundred thousand immigrants are expected at Castle Garden this month.

A GREENSBURG, Ind., moh took a prisoner from jail and hanged him for a crime of which he had just heen acquitted.

UTAH furnishes 40,000 head of beef cattle to Eastern markets every year, and cattle raisers have realized about $15 per head.

THE assessment on the broad gauge railway tracks in Colorado amounts to $8,250,000, and the narrow gauge to nearly $7,300,000.

A CHICAGO jury has awarded $3,500 to a tenant whose family was made ill hy sewer gas, the landlord having represented that the plumbing was perfect.

BEE men are making preparations to secure a large yield of honey this year. They all say there have never heen better prospects for their business than this year.

SUGAR cane cultivation bas been developed largely in northern Utah recently, because the sirnps which have been brought from the East are often inferior to the home product.

A REAL estate agent in Chicago says: "There are no cheap houses heing huilt now. Capitalists will not put their money into little cheap cottages while there are no laws for getting possession from non-paying tenants."

THE Board of Trade has adopted and transmitted to Washington a resolution urging Congress to take action towards preserving the navigation of the Sacramento river and the bay of San Francisco.

COINAGE at the United States mint, in Philadelphia, during April, aggregated 4,481,000 pieces, valued at $6 057,300, and made up of 315,000 eagles, 422,000 half eagles, 500,000,000 silver dollars, 433,000 five cent pieces, and 2,500,000 cents.

THE last incoming French steamer brought a numerous party of Frenchmen, who were under contract to proceed to the vine-growing districts of California, where full employment, at good wages, is guaranteed them. Protection gets encouragement from immigration.—*Philadelphia Press, 23d ult.*

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers hy letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Laurel Glen Fruit Farm

This place is beautifully located among the hills. A pleasant drive from railroad and beach. Deer and other game abound in the vicinity. A limited number of boarders can be accommodated for the summer and hunting season. The place is especially desirable for ladies with children. Address, for further information, Isaac Dakin, Soquel, Santa Cruz county.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first-class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If ie comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So he sure and send us notice by *letter*.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Guadalupe Silver Mining Company—Location of principal place of business, San Francisco, California. Location of Works, Urique, State of Chihuahua, Mexico.

Notice is hereby given that at a meeting of the Board of Directors, held on the 28th day of April, 1882, an assessment (No. 28) of Fifty dollars ($50) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 109 California street, Room No. 13, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifth day of June, 1882, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the third (3d) day of July, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. WM. BLACKWOOD, Secretary.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.

☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." t is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any correeponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

VOLUME XLIV Number 19

Mining Surveys in Mountainous Regions.

A rather curious case recently came before the Land Office, in relation to the Land Office regulations about surveys of mining claims when they are in high mountainous regions, inaccessible in winter. Mr. J. S. Wallace, of Hailey, Idaho, wrote to the Commissioner of the General Land Office representing, in effect, that there are mines located high up in the Sawtooth mountains, in new districts near the head-waters of Wood river, and that in case parties should make applications for patents of such mines during the period from about December to April, it would be impossible in a majority of instances, if not in all, for adverse claimants to procure surveys in accordance with present regulations within the period of publication, on account of the severity of the climate, deep snows, etc., in that locality.

In view of these facts, Mr. Wallace, who is acting as superintendent of mining property located in said mountains, suggests that the rights of all parties owning claims in the above mentioned districts would be most effectually preserved and protected, if the Surveyor-general of the Territory was instructed to postpone the granting of any order for advertisement of applications for patents, until the country is open in the spring, when adverse claimants can procure their surveys.

When this letter was received, the Commissioner suggested that the Land Office might issue instructions waiving the present requirements as to surveys of adverse claims in cases in which the adverse claimants shall show under oath that such surveys cannot be executed and platted within the period of publication, on account of climatic or other temporary difficulties, allowing adverse claimants to file such plats of surveys within a reasonable time after the obstacles to making surveys shall have been removed.

The matter then came before the Secretary of the Interior, who did not agree with the suggestion of the Commissioner of the Land Office. He thought that adverse claimants should be held to reasonable diligence under the law in taking necessary steps to protect their interests. If there is danger or likelihood of applications for patents being presented during a season in which surveys cannot be made, the parties might anticipate such proceedings by securing surveys of their claims during the season in which no obstacles to making the same are present.

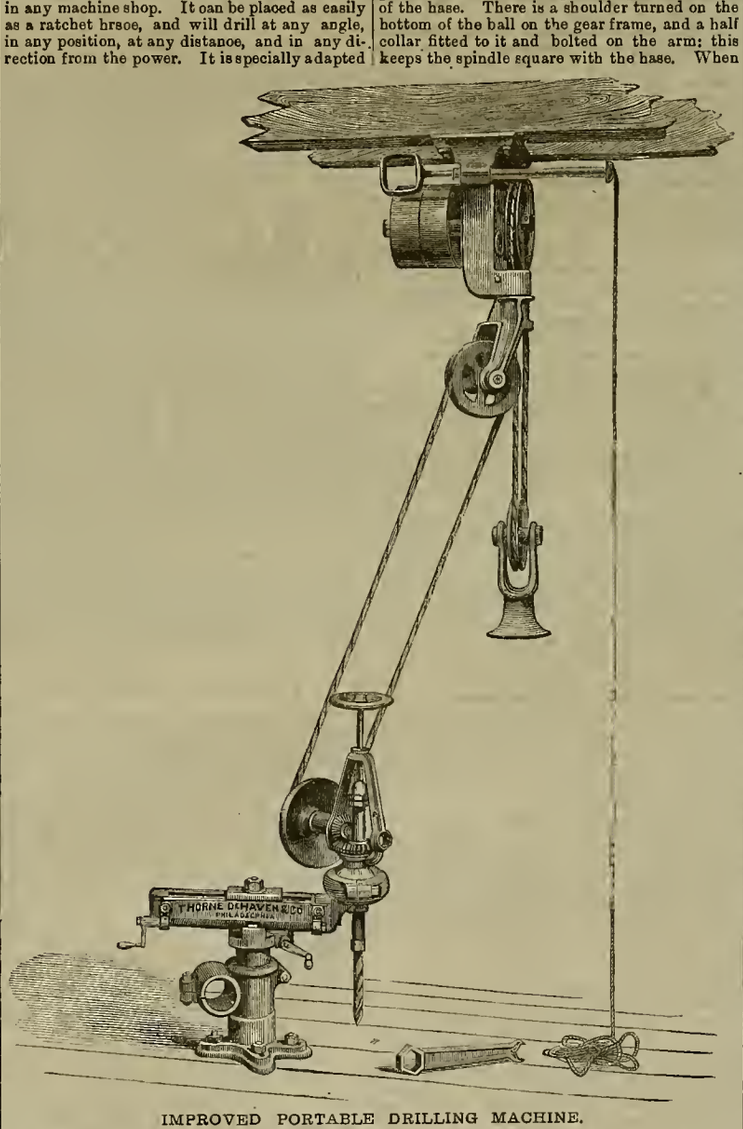
But, if application for patent in any case should be made at a time when it is impossible to secure a survey of the claim adverse thereto, then, as the law does not require impossibilities, the adverse claimant might show the nature, extent, and boundaries of his claim, as nearly as practicable from information within his reach, and present, under oath, his reasons for not following more clearly the regulations, and submit whether, under all the circumstances, he had not properly presented an adverse claim. This would give opportunity to waive the regulation requirement in a given case when the facts were presented justifying such action, and would be preferable to a general waiver of the rule in anticipation of a case calling for any such waiver.

To waive the requirement as to surveys of adverse claims in advance of the presentation of reasons therefor, would tend to encourage carelessness and indifference on the part of adverse claimants respecting such requirement, and would, the Secretary thinks, be equivalent to an invitation to adverse claimants to present excuses for laches, whereas they should exercise all reasonable diligence in their efforts to comply with the regulations.

White vs. Chinese Miners.—The Nevada *Transcript* says: The 26 white men who went to work at the Charonnat mine about three weeks ago, for $2.50 a day, in place of the 52 Chinamen previously employed at $1.50 per day, are proving pretty conclusively that Mongolian labor is dear at any price. The 52 Chinamen used to have hard work to extract enough ore to keep five stamps busy, whereas the 26 white men take out more than enough to keep 10 stamps going.

Portable Drilling Machines.

The engraving on this page represents a patent portable drilling machine, for which Parke & Lacy, in this city, are sole agents for the Pacific coast. The tool is specially useful in any machine shop. It can be placed as easily as a ratchet brace, and will drill at any angle, in any position, at any distance, and in any direction from the power. It is specially adapted to drilling all pieces which are inconvenient to move or which cannot be readily adjusted under stationary drilling machines.



IMPROVED PORTABLE DRILLING MACHINE.

The operation of the machine is as follows: The counter hanger is bolted to the ceiling or other convenient place, and receives power from the "line shaft" by a flat belt on the fast and loose pulleys. The frame carrying the "idlers" rotates on a hollow stud, through which the round belt passes to the grooved driving pulley. The rotation of this frame permits the belt to be led to the drilling machine in any direction, radially, from the hanger, while the rise and fall of the weighted "idler" permits it to be led to any point within the scope of this rise and fall—say 10 to 15 ft. or more. By inserting sections of belt, by means of the hook couplings, any distance can be reached.

The base of the drilling machine is intended to be bolted or clamped to the piece to be drilled. The hight of the post can be adjusted to suit the different lengths of drills and chucks used in the spindle. The radial slotted arm is fastened to the post by the stud and nut; the position of the drill being adjusted by the screw which travels the arm, and the worm and tangent-wheel which rotates it on the post. When it is required to drill parallel with the base, the post is held by the clamp bearing on the side of the base. There is a shoulder turned on the bottom of the ball on the gear frame, and a half collar fitted to it and bolted on the arm; this keeps the spindle square with the base. When this half collar is removed, the spindle can be set to an angle in any direction.

When the drilling machine is not being used on the floor, it serves the purpose of a bench drill press.

In the House a bill has been introduced by Calkins to aid in the making of further Arctic explorations, and detaining Master Lucien Young as commander of the expedition. It authorizes the Secretary of the Navy to purchase a vessel of the proper size and structure for the expedition, at a cost not exceeding $50,000, and appropriates $100,000 for the expenses of the expedition.

A gentleman who came in to Los Angeles from Calico mountains says that a tramp in wandering about purposelessly, unearthed a lump of native silver. Following up the clue, the tramp set vigorously to work, and soon uncovered a lode which, in extent and richness, bids fair to rival the famous King mine.

Ahead of the Miners.

It is evident this country is wrongly made up. The geological conditions are not what they should be in relation to centers of civilization, population and capital. The Creator put granite, sandstone and slate where they wanted it to build big cities, and they built big cities there. But then, he put the kind of rocks containing gold, silver, lead, etc., in an entirely different part of the country. Consequently, how can the citizens of the big cities, for whom, evidently, all the good things of the world are intended, manage the mineral-bearing regions and the mines, without the extremely disagreeable necessity of having to reside outside the borders of civilization, or having to entrust their dollars and property to others?

This simple statement will show that there was an evident lack of foresight in the arrangement of geological and geographical conditions. But the New Yorker, the Bostonian, the Philadelphian and the Chicagoan, each rubbing the side of his nose, said, "Have we not tunneled mountains, crossed oceans and annihilated space, and shall we rest quietly and see these millions taken by the unappreciative and untutored Californian, Nevadan, Oregonian, Idahoan, Arizonian and New Mexican? No, rather will we get to windward of the rough crowd, and take the profits of their mines to ourselves." And with shrewd foresight they thereupon organized mining stock exchanges in each of these cities, and issued small sheets of paper, representing each a certain portion of those said mines whose name they bore; and in a little while the people dealing in these pieces of paper became convinced that *they* were the mines, a fiction strongly encouraged by the said stock exchanges themselves, until finally the stock exchanges said: "What do we want with mines at all. The people are satisfied with the shares; they know about shares and know nothing about mines. Therefore, let us pay our entire attention to the shares."

And thus the object was accomplished, and a mining stock exchange took the place of the mines to so great an extent that capital was directed from the mining districts and kept in the cities among the people for whom money was made. Then, when there was nobody to buy the mines the prospectors discovered, and no money came to the camps, the owners went to the big Eastern cities, there to try to sell their claims. Straightway the people who had the money and not the mines turned up their noses at the rough western ways and snubbed them—termed them adventurers and hummers, and "sat on them," so to speak. Finally, becoming discouraged, these men came back to their prospect-holes, mines and camps.

Then the men who had got the money from the people who bought the shares said: "How about this; can't we get the mines now, too, having sold the stock and starved out the mine-owners?" And they dispatched emissaries who bought the mines cheap from the discouraged mine-owners and took the deeds back. A cry was then raised that legitimate mining was the only kind of mining. Shares were delusions and snares. People should only buy mines. Then the men who had bought mines for $1,000 sold them for $1,000,000, and so made a good thing out of it all around. Having, then, all the money, they cried out against mining of every kind, denouncing it as a speculation and a gambling scheme.

In this way have the accidents of geology and mineralogy been turned to account by the thrifty men to whom the world pays tribute.

Assassination in Ireland.—A profound sensation has been caused by the murder of Lord Cavendish and Under Secretary Burke, in Dublin last week. Gladstone had resolved upon a new policy toward Ireland, had released Parnell and others of the Land League and had appointed Lord Frederick Cavendish as Secretary to carry out the milder policy which had been determined upon. The cold blooded murder of this man who went bearing the olive branch is most vigorously denounced by all true Irishmen, and the cause of Ireland is injured by the deplorable occurrence. The assassins have not been found and it is not known who inspired the deed.

Italian Rocks and Contained Minerals.

(Continued from last week.

3937. Best veined white marble: termed Marmo bianco venato di prima qualita. Vara quarry, Carrara (Massa and Carrara), Apuan Alps.

3938. Veined white marble; termed Marmo bianco venato. Fossacava quarry, Carrara (Massa and Carrara), Apuan Alps.

3939. Veined white marble; termed Marmo bianco venato. Gioia quarry, Carrara (Massa and Carrara), Apuan Alps.

3940. Best veined marble; termed Marmo bianco venato di prima qualita. Massa quarry, Carrara (Massa and Carrara), Apuan Alps.

3941. Veined white marble; termed Marmo bianco venato ordinario. Carrara (Massa and Carrara), Apuan Alps.

3942. Spotted white marble; termed Marmo bianco ordinario moschettato. Gioia quarry, Carrara (Massa and Carrara), Apuan Alps.

3943. Common spotted white marble; termed Marmo bianco ordinario moschettato. Carbonara quarry, Carrara (Massa and Carrara), Apuan Alps.

3944. Best crystalline white marble with yellowish veins. Gioia quarry, Carrara (Massa and Carrara), Apuan Alps.

3945. Crystalline white marble; termed Marmo bianco chiaro ordinario di prima qualita. Canal Grande quarry, Carrara (Massa and Carrara), Apuan Alps.

3946. Crystalline white marble; termed Marmo bianco ordinario di prima qualita. Colonnata quarries, Carrara (Massa and Carrara), Apuan Alps. This marble is translucent when sawed into thin slabs.

3947. Dark bluish-gray crystalline marble with bluish-white markings; termed in the arts Marmo bardiglio scuro. Rocchetta quarry, Massa (Massa and Carrara), Apuan Alps.

3948. Dark bluish-gray crystalline marble with light-colored veins; termed Marmo bardiglio scuro venato. Rocchetta quarry, Massa (Massa and Carrara), Apuan Alps.

3949. Crystalline white marble containing a few gray marking and veins. Termed in commerce, Marmo bianco ordinario di prima qualita. Piastrone quarry, Massa (Massa and Carrara), Apuan Alps.

3950. Veined crystalline white marble; termed Marmo bianco venato di seconda qualita. Piastrone quarry, Massa (Massa and Carrara), Apuan Alps.

3951. Bluish-gray crystalline marble; termed in the arts Marmo bardiglio venato. Capella quarry, Serravezza (Lucca), Valle del Vezza, Apuan Alps.

3952. Crystalline veined marble; termed Marmo bianco venato di seconda qualita. Giardino quarry, Serravezza (Lucca), Valle del Serra, Apuan Alps.

3953. Veined white crystalline marble; termed Marmo bianco venato di prima qualita. Giardino quarry, Serravezza (Lucca), Valle del Serra, Apuan Alps.

3954. White crystalline marble; termed Marmo bianco ordinario. Tramhisserra quarry, Serravezza (Lucca), Valle del Serra, Apuan Alps.

3955. White crystalline marble; termed Marmo bianco chiaro ordinario. Falcovaia quarry, Serravezza (Lucca), Valle del Serra, Apuan Alps.

3956. White crystalline marble: termed Marmo bianco ordinario di prima qualita. Polla quarry, Serravezza (Lucca), Valle del Serra, Apuan Alps.

3957. Commouest statuary marble, from the Altissimo quarry, Serravezza (Lucca), Valle del Serra, Apuan Alps. This marble is much used for furniture. When cut into slabs, it is translucent hy transmitted light.

3958. Veined white marble; termed Marmo bianco ordinario di seconda qualita. Arni quarries, Vagli Sotto (Massa and Carrara), Valle d'Arni, Apuan Alps. This marble is translucent in thin slabs.

3959. Gray marble, with extremely heautiful anastomosing veins and spots, dark blackish-blue (due to the presence of organic vegetable matter?); termed in the arts Marmo bardiglio fiorito (or flowery bardiglio). Luchera quarry, Stazzema (Lucca), Valle del Vezza, Apuan Alps. This is one of the most splendid colored marbles of Italy, and sells at immense prices.

3960. Gray crystalline marble with dark, blackish-blue veinings, more or less, running in one direction. Termed Bardiglio fiorito. Luchera quarry, Stazzema (Lucca). Valle del Vezza, Apuan Alps.

2961. Dark crystalline marble. Termed Marmo hardiglio fiorito scuro (dark, flowery hardiglio marble). Luchera quarry, Stazzema (Lncca). Valle del Vezza, Apuan Alps.

3962. Light hardiglio marble. Termed Marmo hardiglio chiaro. Luchera quarry, Stazzema (Lucca). Valle del Vezza, Apuan Alps.

3963. Spotted bsrdiglio marble. Termed Marmo hardiglio moschettato. Luchera quarry, Stazzema (Lucca). Valle del Vezza, Apuan Alps. An extremely handsome ornamental stone. The only locality in Europe where it is known to exist. Sells at very high prices.

3964. Conglomerate, consisting of fine-grained, crystalline, white marble pshhles, cemented together hy hrownish-red mineral matter. Termed in architecture, Mischio di Serravezza. Rondone qnarry, Stazzema (Lucca). Valle del Vezza, Apuan Alps. This is a gorgeous marble when it is polished for monuments, columns and internal decoration, hnt not for out-door work. It sells at nominal prices, being hard to work.

3965. Conglomerate, consisting of pehbles of fine-grained, crystalline, white marhle, cemented hy peach-colored mineral matter. Termed Msrmo mischio persachino di Serravezza. Rondone qnarry, Stszzsma (Lncca). Valle del Vezzs, Apuan Alps. A magnificent ornamental marhle (see No. 3964).

Palœozoic Group—Cambrian (?) or Lower Silurian (?) Syetem.

3966. Slate. Stazzema (Lucca). Valle del Vezza, Apuan Alps. Used for rooling. May be bad in very large slabs, but is rather soft.

Palœozoic Group—Carboniferous Syetem.

3967. Anthrscite coal. Osiglis (Geoca). Valle del Bormida. Coal basin of Calizzano. Belongs in all probahlity to the millstone gritseries, the lowest memher of the carhoniferous system. The hed is in some places five ft. thick, as at Calizzano.

Palœozoic Group—Cretaceous Syetem.

3968. Pale, flesh-colored limestone; from the neighhorhood of Fano (Pesaro and Urhino), Valle del Cesana. A good building stone.

3969. Impure whitish limestone, very similar to gray cbalk of Eogland; from the neighhorhood of Fano (Pesaro and Urhino), Valle del Cesana. A good building stone.

Tertiary Group—Eocene Syetem.

(Possihly the link hetween the Mesozoic and Cainozoic rocks.)

3970. Dark greenish-gray macigno, a fine micsceous, arenaceous rock, very charaoteristic of the lower tertiary of the Appennines. Fiesola (Florence). Valle dell'Arno. A very useful hnilding and paving stone, muob employed at Florence.

3971. Lead-gray macigno, a rock containing minute, fragmentary particles of mics. Porretta (Bologna). Valle del Reno. A very strong, good hnilding stone, employed at Bologna. Capellini is rather disposed to consider it as helonging to the lower tertiary.

3972. Ash-gray mscigno. Brisighetta (Ravenna). A rook containing minnte particles of mica disposed in parallel series, so that there is great facility in ohtaining it in slahs or flags suitable for halconies and flagstones. It is much employed in neighhoring cities, heing a very nseful material.

Upper Miocene System.

3973. Diaphanous crystalline selenite, forming strata of considerable thickness, with hlackish gray marls. Monte San Donato (Bologna). Used for making plaster.

3974. Pale yellowish-brown molassa. Vergato (Bologna), Valle del Reno. A good ordinary hnilding material, hut soft.

3975. Fine-graiued gray molassa. Vergato (Bologna). Valle del Reno. A hetter hnilding material than the otber variety from this locality.

3976. Crystallized diaphanous selenite; found in the gray marls. From the neighhorhood of Voghera (Pavia), Valle del Po. Used for making plaster.

3977. Serpentine conglomerate, consisting of serpentine gravel hrought down from the Alpine chain by the agency of ancient glaciers during the miocene system (anterior to the glacial time), and subsequently cemented together in an imperfect manner hy calcareous matter; interstratified with grayish miocene marls. Turin (Colline and Torino), Valle del Po.

Pliocene System?

3978. Ash-gray marl of marine origin. Montepagano (Abruzzo Ulteriore primo).

Pleiostocene and Prehietoric Series—Quarternary Syetem.

3979. Serpentine conglomerate. Celle Ligure (Genoa), Riviera di Ponente. It is the detritus of prepalœozoic rocks hrought down to the sea hy ancient torrents.

3980. Compact white travertine, formed hy the secnlar deposition of the mineral matter left hy the sulphnrons spring of the Acqua Albula, Tivoli (Rome). This travertine forms extensive strata of great thickness. It was much employed hy the Romans in the puhlio huildings when they did not use hrick; for instance, for certain parts of the Coliseum. See Jervis' "Gnida alle Acqua Minerale, Provincia Centrali."

3981. Compact peat, from the now drained lake of Bientina, Castelfranco di Sotto (Florence), Valle d'Arno Inferiore. Prehistoric series.

3982. Recent alluvium of the Po. Turin Valle of the Po. This alluvium, derived from the rocks of the Apsnnines, comes from the affluents on the right of the Po. It is absolutely different from the alluvium derived from the Alpine rocks brought down hy the affluents on the left of the Po. Prehistoric series.

3983. Recent contemporaneous peat; very spongy, and showing the organic remains of the reeds and other aquatic plants of which it was formed. Argenta (Ferrars), Valle of the Po.

A Big Day's Cutting.—The Port Blakely mill, at Port Blakely, W. T., owned by Renton, Holmes & Co., on last Saturday, in 12 successive hours, cut 190,000 ft. of merchantable lnmber, and dnring the week closing with that day cut 1,000,000 ft. This is the largest cnt in one day at any one mill west of the Mississippi. The proprietors of this and other mills along the sonnd complain of the scarcity of mill hands.

Gas Jets.—A single plate of perforated zino about a foot square, suspended over a gas jet, is said to retain the noxions emanations from the hurning gas, which it is well known, destroy the bindings of hooks, tarnish the gilding, and vitiate the atmosphere for hreathing.

Glaciers and Red Snow.

In a letter from Visalia in the *Rural Press*, signed "J. W. A. W.," we take the following interesting points:

A Living Glacier.

Few of our citizens have traveled as extensively in the Sierra Nevada of our district as has Mr. Dusy, especially in the regions surrounding Mt. Goddard (14,000 ft.) on the headwaters of the middle fork of Kings river and the south fork of the San Joaquin. He describes as seen last summer hy himself and party, what is more like an Alpine glacier than anything I have seen or heard of in our Sierra, except the living glaciers found hy John Muir on Mt. Lyall. It was six miles east of Mt. Goddard, on what may he called the Goddard ridge—the divide hetween the south fork of San Joaqnin river and the middle fork of Kiogs. It was a mass of clear, hluish ice, estimated to he 80 ft. thick at its upper or deepest edge, where a vast crevice was found, 10 ft. wide, hetween it and the snow above it. It was about a mile long, and from 500 to 600 yards wide. On its edges were moraines, composed of shattered slate, which Mr. Dusy describes as forming there the upper portion of the slope. At the lower end was a great mass of this slaty debris, which was heing shoved along over a substratum of solid granite. He jndged that its movement down the oanyon last summer was about ten ft., as that was the width of the deep crevice on the upper edge hetween the ice and snow. I asked Mr. Dusy if he and his party saw the curious and interssting

Red Snow.

His answer was, "miles of it."

By the way, while lately in San Francisco, I had the pleasure of examining with Dr. Harkness, through his strong microscope, the odd and pretty glohnles of the very small microscopic water plant, *protococcus navalis*, which gives to this snow its red or crimson color. We examined what onr party hrought from the red snow fields of the Kern region, and what Dr. Harkness found last summer on the Wasatch mountains, Utah. These minute glohules appear as round as a ball. The Doctor iuforms me that they propagate hy snhdivision, and that the hest way to prosarve them for examination under the microscops, is to melt a hucketful of the red snow, let the coloring substance sottle, pour off the water and save the red sediment, of which yon will bave ahout a tahlespoonful. Dry this and it forms a pinkish powder, a few particles of which can he moistened and mounted for the microscope at any time. Wbat I had hrought from the mountains had heen kept uncorked for six months in the water melted from the snow. Some glohules from this had retained their red color; others had lost their color hut retained their form. Glohules Dr. H. had dried, had the hrilliant, translucent color of a rnhy. Except in richness of color the glohules from the two localities were exactly alike in shape, etc., showing, as Dr. H. said, that the plants from the Wasatch and the Sierra are identical, and are, heyond question, the veritable *Protococcus navalis*, discovered first in the Arctic regions and then in the Alps, and in late years found in ahundance on many of the higher mountains of Colorado, Utah and California.

Prospectors' Castles in the Air.

It is at this season that the old forty-niner hegins to talk of spots once known to him in California. Every spring he speaks of these pet places; hut they hear particularly heavy on his mind when, as is the case this season, there has heen a great fall of snow, and water will be tumhling down every ravine. He prohably did not think much ahout the spot when he was on the ground—prohably did not prospect it at all—hut as soon as he was out of reach of it the place began to work in his hrain like yeast in a hatch of dough, and time, more than distance, adds to the ferment. He can now see at the distance of 200 miles and after the lapse of thirty years, that in that certain little nook lies the fortune he has always missed securing. He wants to go hack there, and he always tells you he will go hack; not this spring, however; he can't go this spring, hnt next, or at least in two or three years.

You can't pick up an old Californian who has not, treasured up in his memory, such a pet place. He dreams of it hoth hy day and hy night, and of the two his dreams hy night are nrohshly the saner. That spot gives him comfort—is his comfort and stay. While he has it he still has hope. He can see the place just as he left it, and he is always sure that no human feet have measured or human eyes rested upon the ground since he tnrned his back npon it.

The chances are that not one in ten of the ancient miners could go within a mile of the places they dream of, and even though they should reach the very spot, the gronnd would donhtless he found so torn np and dug over that an angel from the realms above could not recognize it.

It is like a page from the "Arabian Nights" when three or four old forty-niners, each with his mug of heer hefore him, start in to astonish each other with stories of the good things they know of the secret places in the old camps of California. Millions on millions are yet resting in these places, and the indications are that their repose will not he disturhed, and that their whereahouts will go down to the grave with the generation who first panned the placers of the Golden State.—*Virginia Enterprise.*

The Shakespeare Parrot Copper Mine.

The Shakespeare Parrot, located a few hundred yards east of Butte, and which was pnrchased some time ago hy Mr. John Longmaid, is rapidly developing splendid productive capacity, and is entering upon a record of what promises to he a long and profitable operation. It is developed by a shaft 260 ft. deep, from which, at a depth of 170 ft., a crosscut 45 ft. long was extended to the ledge. A level east and west having a total length of 100 ft. was thsn driven, following a vein of copper ore, having a uniform width of eight ft. During the nast three months the work of extraction has heen going on at a lively rate, and 2,000 tons of ore have heen hoisted to the surface. Of this amount. 500 toos of first-class ore, assaying from 45% to 50% copper, have heen shipped east in a crude state for reduction, and the remaining 1,500 tons, assaying 20%, are now on the dump. The sinking of the shaft actively continues, and has now heen prosecuted to a depth of 260 ft. In a few days the 270-ft. crosscut will he extended to tho ledge, and the mine will he fully opened up at that depth. Near the face of the 170-ft. crosscut a winze now 30 ft. deep is heing sunk on ore, the ohject heing to make connection with the level to be opened np bslow.

The Longmaid concsntrator, which has heen in process of erection for the past six weeks, a short distance south of the depot, is finished, and the machinery was started into experimental operation yesterday. The 1,500 tons of ore now on the dump at the mine and the other lower grade ore to he extracted, will be treated at the concentrator, the intention being to work it to a value of 40 % preparatory to shipment. The capacity of the works will he about 80 tons per diem. The machinery consists of the usual jiggers and scresns to which has hsen added a patent revolving table, a very ingenious contrivance for the concentration of fine ore, invented hy Mr. Longmaid. The mine is under the supervision of Mr. Alex. Tarhet, who employs ahout 25 men in the work of development.—*Inter-Mountain.*

The Railways and Their Taxes.

It may bs cold comfort to know that the California railways are no worse than those of other States in their efforts to avoid the psyment of just taxes upon their property, hut such is the osse. It is also of interest that in other States, as well as here, strong efforts are heing made to force tbe corporations to shoulder their just share of the hurdens of Government. The *Grange Bulletin* says: In a late suit, in whioh the State of Pennsylvania attempted to collect taxes from the Standard Oil company, from the lawyers on the defense we glean some points as to how great railway corporations are evading taxation. It wss developed that the Atlantic and Great Western railway has escaped all taxation for several years, also the Delaware and Hudson Canal company and other large corporations. The Erie railway got a special act passed, and although it was only asked to pay a tax on the proportion of its road in the State, it has defeated the commonwealth in an attempt to collect the amount. The Auditor-General has the power to tax companies ahont what he likes. When the Standard is asked to pay on its whole capital, tbe Westsrn Union is only taxed an one-thirty-seventh part of its ospital. In this way great favors can he extended to certain corporations. A demand has heen made on the Pullman Car compauy for hack taxes and penalties since the passage of the act. Since 1868 only $550,000 of its capital stock has heen taxed. A similar demand has heen made on the Wagner company. The Americau Meter company, a foreign corporation, is asked for taxes and penalties on four-ninths of its capital stock since 1868.

California Lands.

Mr. Street, Land Officer of the California Immigration Society, in his monthly report to the Board of Directors of the association, made the following statsment relative to the present disposition of the agricultural lands of the State:

"The total area of the State is 100,000,000 acres, a portion of which has been disposed of in round figures, approximating as follows:"

	Acres.
Belonging to or claimsd by railroads, about	25,000,000
Private grants	3,000 000
Indian and Military reservations	300 000
To the Stats for educational and other purposes,	6,500 000
Lakes, bays, navigahls rivers and islands	1 500 000
Swamps and overflowed	1,700 000
Salt marsh and tide lands	100 000
Grand Total	43,600,000

Besides there was a vast amount sold for cash, and disposed of under the pre-emption, homestead and other laws of the United States, ostrainly amounting in the aggregate to several millions of acres.

Ancient River Channels and Ridges.—H. Clsndennen, the "hlind miner," of Randolph Flat, Nevada county, asks us to propound for him the following: Will any man tell us why ancient river channels follow ridges? and, if the ridge is wide, why there is none in the middle? This is a vital question for gravel mining, and, if understood, would save millions of dollars, and I challenge any man in this State to answer the question publicly in a few words. This would be science to some purpose.

MECHANICAL PROGRESS.

Improper Setting of Steam Boilers.

There being no law in regard to the setting of boilers, every one is free to set a boiler as he sees fit. As might be expected, boilers are set with the side or end against the brick wall of a building, so that the side or end cannot be reached. If the brick wall happens to be the wall of a basement or sub-cellar, there will be an accumulation of dampness upon the shell of the boiler, which will start a corrosive action, and in a short time render it dangerous. Boilers are often set resting upon the cast-iron front at one end and a pedestal at the back end, leaving them without any support in the middle. As the iron deteriorates along the seams and becomes thinned by corrosion, it is in time very likely to break in two and demolish the premises. We maintain that all boilers should be so set that all parts of the shell may be accessible for inspection and repairs, and we have yet to hear a substantial reason why this could not be done. We also believe that all boilers over 10 ft. in length should have supports at the middle, instead of only at the ends, as is often the custom.

Boilers could be set more economically, both in the first cost of setting and the use of fuel, if this idea were constantly kept in view. Internally fired boilers should never be bricked over the outside; in fact, there can be no good reason why a single brick should come in contact with the shell at any part. It is well known that where bricks and mortar come in contact with iron, there is almost certain liability to corrosion. We have known of several cases where internally fired boilers have been wholly bricked in, except at the front ends; so that their external condition must be mainly determined from inside examination. We have also known such boilers to explode; and when the shell has been carefully examined, it has been found corroded so nearly through the sheet that pieces could be easily cut out with a pocket-knife.

When a casualty makes the public acquainted with such facts, they are loud in their denunciation of the owners; or, if there happen to be an inspection law in that locality, the inspector has to bear the brunt of their censure. The truth is, they do not consider that, before the explosion, the corroded parts either rested upon or were covered by the brick-work, so that no person could reach them for examination.

Externally fired boilers are often all bricked in, top and bottom; then, if required, the inspector is called in and requested to examine or test the boiler, and make out a certificate. He accordingly goes through the form, but we wish to ask, in all soberness: What does such an inspection amount to? Can an inspector give a conscientious certificate for the safe condition of a boiler carrying a stated pressure of steam, unless he has made a critical examination of every part? He has to trust to his judgment, and, unless he has more than the average of this essential quality in an engineer and boiler inspector, there is great risk incurred.

We saw an exploded boiler some months ago in which the iron appeared to be good. It was stamped as the best; specimens were taken from the ruptured sheets, which, in testing, stood a tensile strain of 48,000 and 50,000 lbs. to the square inch of section. But these tests did not show the fact, that, in the same sheet from which the specimens were taken, there was a badly channeled seam, and the sheet was less than a thirty-second of an inch thick, being corroded where it had been in contact with brick-work.

Test pieces taken from boilers are usually taken from the heart of the sheet, and are not fair examples of the iron in the boiler. Some engineers have placed the life of a boiler at 17 years, and others at 12. We are convinced that no general rules will cover the requirements safely, as some boilers are rendered unsafe in a very few years. A thorough system of frequent inspections will be a great deal more satisfactory.

What is wanted as one of the most essential safeguards against explosions, is a law requiring a boiler to be set so that all parts may be accessible for examination. The top of a boiler may be covered with felting or with a sheet-iron jacket, having air spaces, as is done already to some extent, and with more economical results. When it is desired to inspect the boiler, the covering can be quickly lifted and replaced, involving no expense for repairs.

Until boilers are made accessible, and are properly and thoroughly examined, we may expect to hear of frequent boiler explosions.—*American Engineer.*

Porous Bricks.—The association of proprietors of steam engines in the north of France has made numerous experiments which show that many of the bricks that are employed in building furnaces are so porous as to allow an easy passage for the air. In consequence of these experiments, they advise that no bricks should be employed for the purpose which are not very compact and refractory, and that they should be either glazed upon the outside or covered with an impenetrable varnish.—*Chron. Industr.*

The Modern Sawmill.

Not the least among the wonderful improvements which have characterized the last century are those which have been witnessed in the sawmill. Should some Rip Van Winkle of the last century be suddenly awakened from his long sleep, still dreaming of the old mill which he once worked, and where 1,000 ft. per day was considered a fair average, and be ushered into a modern mill, he would surely think the world was turned upside down—he could hardly believe the evidence of his senses. Says the *N. W. Lumberman:*

The modern sawmill is indeed full of improvements, down to the last device for sorting by machinery. The production in one day, by one saw, of more lumber than was accounted the work of a year in former times, is not only the result of the genius of invention, such as marks the spirit of the age, but has rendered possible the remarkable development of the youngest in the sisterhood of nations, form no unimportant factor in the influence of this country among the people of the earth. All hail to the modern sawmill, and the wise intelligence of nearly every man who is connected with it, either in the production of logs from the forest, or the manufacture and sale of lumber, for each progressive step in the march of improvement has reduced the cost of manufacturing lumber, keeping pace with the inevitable increase in the cost of timber, due to the gradual decadence of the forest.

Belting.—It is economy to put on a wide belt rather than make a narrow one too tight. Vertical belts should be drawn moderately tight. Prof. J. Bauschinger publishes the result of a series of tests of the tensile strength of different sorts of belting made in the Mechsno-Technicsl laboratory at Munich. In making a graphic representation of the results by setting the loads per square inch on a horizontal line and erecting verticals corresponding to the elongations at the different loads, the curves thus obtained show considerable difference for leather, india rubber and cotton belts. All these materials stretch more at first, with light loads, than afterward. The lines, therefore, are more curved at the beginning, and afterward approach more to a straight line. But with leather belts the approximation to a straight line begins at once, and is more pronounced than with india rubber or cotton belts, showing that they stretch in the beginning more in proportion to the load, and possess a high degree of elasticity. The conclusion drawn from the tests by Prof. Bauschinger is that india rubber and cotton belts are inferior to leather, not only as regards elasticity, but also as regards tensile strength, for the same section, and only attain in strength that of medium or inferior sorts of leather. By cementing and sewing the ends, leather straps lose one-quarter to one-third of their strength, if the joints are not made with great care.

Iron Buildings.—Iron buildings often burn, yet wooden buildings may be made fire-proof, and frequently are so built. This statement is worth careful thought by all builders. It shows that an incombustible material is not needed for a fire-proof building. A slow-burning building is always better than the so-called iron buildings. One of the means by which wood may be made fire-proof or slow-burning is the exclusion of the air from it, as by sheathing with tin or covering with mortar. For security, we should have no flues or empty connecting spaces in walls, to carry flame where it cannot be reached by water, nor its exact position known. Floors are fire-proof where the timbers are incased in mortar and the air spaces closed, or where the floor is solid. A layer of mortar between double floor boards makes a floor nearly fire-proof from below, and in a dwelling, quite so from above. Is it not possible to build without making every wall a labyrinth of flues lined with tinder, and giving the utmost protection and draft to a fire that may once start in them? The danger of double wooden walls is reduced one-half when the air spaces are cut off from all connection with each other.—*Carpentry and Building.*

Properties of Malleable Nickel.—We have, on previous occasions, noted the efforts which have been made from time to time to manufacture malleable nickel. M. Garnier, of Paris, claims to have succeeded in making malleable nickel by the addition of 0.3% of phosphorus or manganese. Credit is also due to Mr. Fleitmann, of Iserlohn, Germany, for considerable work done in this direction. He adds one-tenth to one-third per cent. of magnesium, and has found that he can weld the nickel thus obtained to iron and steel and roll it out in sheets, and shape it into tubes and pipes. Dr. Collmann has made a series of tests of the solid malleable nickel produced by the Fleitmann process with the following results: A 0.465 inch round bar showed a limit of elasticity of 59,741 lbs., a tensile strength of 96,083 lbs., with an elongation of 17%, and a contraction of area of 50.6%. A second one, 0.44 inch in diameter, had an elastic limit of 40,609 lbs., a tensile strength of 78,957 lbs., an elongation of 20.25%, and a contraction of area of 45.5%. Nickel wire, 0.01615 inch in diameter, broke under a load of 1,565 lbs.

The Pittsburgh Bridge Co. has orders for 20 new bridges, and work enough ahead to employ its men for four months, day and night.

SCIENTIFIC PROGRESS.

The Development of the Senses.

In the fifth century before Christ, Democritus declared that the senses of sight, hearing, smell and taste, were merely modifications of the sense of touch. Aristotle ridiculed his theory, and so, stamped with his disapproval, it lay untouched for two thousand years, until Telesius, an Italian of the 16th century, revived it.

Strange to say, all that modern science has accomplished in embryology and zoology, tends to confirm this theory of Democritus, that these four senses are only specializations of the universal sense—sense of touch. In the embryo of all animals the organs of these four senses first appear as infoldings of the outer germinal layer, the ectoderm, from which the outer skin also develops. At an early stage they are all simple pockets in the outer covering. If the history of the embryo is to be taken as the miniature of the history of the race—that is, if the individual in its development follows the same course that the race has followed, and it seems reasonable to suppose that this is the case—it is easy to see the importance of this evidence.

In the animal kingdom the sense of touch is universal; it is even found in the lowest animals, the protozoa, which are only masses of simple protoplasm. But, if this animal with its one sense is to become higher, there must be a division of labor; there is too much work for one sense to do properly, and by a quantitative modification this primitive sense is to become qualitatively different in parts, and this qualitative difference is the difference which we notice between the sense of touch and the other senses of the higher animals; it has come about by an accumulation of the sense of touch.

The waves of air which fall on the body of this protozoan as heat are capable of a higher rendering, they will signify more than heat to the proper organ for perceiving them, they will give the sensations of light and colors. The simplest eyes are merely pigment spots in the skin; they merely distinguish heat from cold and light from darkness; but later, by the formation of a lens and sensitive membrane, the external world is revealed in all its variety.—*Popular Science Monthly.*

Relation of Brain Work to Blood Supply.—Even if it is true that the larger and healthier physique affords more blood for brain use, it does not follow that the larger the supply the greater the amount of brain work possible. The argument assumes that the brain has no limit to its activity, except in the quantity of blood that can be prepared for it. But it needs no scientific education to know that there are other influences which limit the thinker's activity, and that these limitations are somewhere in the mysterious recesses of the brain, or in the forces of which the brain is the organ. The physical health of the brain worker may be perfect, his digestion unimpaired, his power to assimilate food the same, and yet he may not be able to concentrate his thoughts or carry on a complicated train of reasoning. The defect is not in his body; that is as healthy as ever; nor is it in any of the processes of blood making—these go on as before. The trouble lies in the brain itself, whose capacity for work is measured by some hidden standard of its own, and which gives warning when a cessation of brain work is imperative. The body is a furnace whose power of consuming fuel is greater than the capability of its boiler, the brain, to generate power. To keep the latter in good working condition, something more is necessary than building and feeding the fires. A supplementary but important consideration is, whether the steam beyond a certain point will not be productive of unpleasant consequences in the form of an explosion.—*Popular Science Monthly.*

Comet's Tails.—Professor Ennis, of the naval observatory at Washington, believes that the tails of comets are electric light. "If these tails had any substance," he argues, "the laws of motion are constantly violated by them. The great comet of 1843 went so near the sun that it passed from one side to the other in a few hours. Its immense tail, 100,000,000 miles long, was shifted completely, so that it pointed directly in an opposite direction. Could that be so if it were composed of any substance? Could a comet swing 100,000,000 miles of tail around as quick as that? The electricity is generated by evaporation. As the comets approach the sun, the heat becomes more intense, the evaporation and accumulation of electricity more rapid, the repulsive force greater and the tails longer. Sometimes the material becomes completely evaporated. Then the comet has no tail."

A Use for Liquid Carbonic Acid.—Krupp, the great gun manufacturer, is said to be employing at his works a very ingenious way of recovering the coils of guns which have become useless. He heats the barrel to reduces and then introduces liquid carbonic acid. The cold thus produced causes shrinkage and allows the coils to be removed.

Platinum crucibles, on being ignited, suffer a greater or less decrease in weight when they are new, but after repeated ignition such changes no longer occur.

God and the Scientists.

The Bible knows nothing of severing nature from God, even in her minutest operations. He is everywhere or nowhere. The falling sparrow, the dying midge, the rounding dewdrop, the headlong tornado share his superintendence. Atheistic scientists are right in their insistence that if impersonal law rules an atom, they have demonstrated the origin and permanence of the universe without a self-existent, eternal, all-directing, Personal Intelligence. But the atom has always fulfilled them, and always will. They can never get done with it. Their deepest wisdom and most searching experiments have always left something unmastered, unreached, unapprehended in every particle of matter to which they ever applied their tests. When they are able to get to the bottom of their bread and butter, it is time enough to proclaim the non-existence of deity. Tyndall and his compeers can no more tell us what is the primary fact of the butter they eat or the coffee they drink, than the baby in the cradle. There is no greater inconsistency in praying than in eating. Tyndall and Huxley, and even the wild and daring Haeckel, and the bold, blasphemous Ingersoll, pray without knowing it every time they eat. They deal with the same mystery in all they do and handle, as that which evokes the Christian's prayer. There is as much room for the petition, "Give us this day our daily bread," as for the scientist's confession of a something that transcends the highest stretch of human wisdom. That something stares the scientist in the face everywhere, with all the attributes which the Bible ascribes to God. The fact of the Divine Omnipresence and the compatibility of prayer with natural law is nowhere more emphatically and comprehensively stated than in these words: "Give us this day our daily bread." Where does law reign more supremely than in the wide circle to which this petition refers? And yet prayer relates to every item in the vast category. Either Tyndall is a blockhead, or Christ was an impostor.

The Author of Nature should know how prayer dovetails into the law of the universe. He should be as wise and competent to reason as Tyndall. When the scientist wishes to produce new results by the voluntary co-relation of eternal laws, he is not hindered or troubled by the consideration of the stability of nature. But when the Christian prays a greater than Tyndall to do the very same thing, whether on a larger or smaller scale, he is pronounced a simpleton. There is not a more inconsistent class of men on God's earth than the God-disowning scientists

The Minute Size of Germs.

It is altogether beyond the power of the mind to conceive the minute size of some of the germs which in their subsequent development work such wondrous changes, and which have such important influences on health and several industrial processes. We read of the experiments of Pasteur, Tyndall, and others, but we seldom realize the infinitely small size of the organisms and germs referred to, for some are undoubtedly so minute that the most powerful microscope fails to detect them. There are some interesting remarks on this subject in a recent number of *Knowledge*, which we quote: "The minute organisms capable of inducing changes analogous to the fermentation caused by yeast, have received great attention of late years and several important diseases are distinctly traced to them. Bechamp estimated that 8,000,000,000 of germs of one micro-ferment only occupied one cubic twenty-fifth of an inch. Not one of these minute bodies could develop except by carrying on complicated processes of a chemical nature, involving very active movements of its atoms and molecules.

The mathematicians have made calculations founded on the pressure exerted by the gases, and other considerations, which show that a particle of the sort of matter, such as albumen and protoplasm, chiefly concerned in life processes, contains in a space of one cubic thousandth of an inch more molecules than any one could possibly form any conception of. Sorby, taking a probable mean of such calculations, supposes one cubic thousandth of an inch of water to contain 3,700,000,000,000,000 molecules. A sheet of ordinary note paper is about one-hundredth of an inch thick. One-tenth of this would, of course, be one-thousandth of an inch, and a little square box of that size each way would hold the amazing number of water molecules mentioned. Perhaps a few thousands of such molecules may suffice for some manifestation of life, but even if many millions should be requisite for the structure of the humblest and simplest germ, we could never expect to see the actual beginnings of life.

Bacteria in the Air.—After a method which he does not describe, P. Miguel claims to have succeeded in counting the number of bacteria in a certain amount of air, and he finds that the same varies with the season. In summer and fall they amount to 1,000 cells of bacteria in one cbm. of air; while in winter, the number of them in a cbm. of air is often only 4 or 5.

An Electric Light Buoy.—A large iron buoy was recently towed from the Government works at Tomkinsville, Staten Island, to the lower bay, where it is to be used to support an electric light. It is fitted with an apparatus intended to convert the power of wave motion into electricity.

Bullion Shipments.

We qnote shipments since our last, and shall he pleased to receive further reports :

Betty O'Neal, April 30th, $7,412; Silver King, 30th, $25,200; Mt. Diablo, May 2d, $6,548; Contention, April 29th, $19,484; Northern Belle, 30th, $17,707; Union, May 4th, $42,252; Contention, 1st, $11 688; Union, 5th, $56,649; Star, April 30th, $2,456; Christy, 30th, $4,155; Tiptop, May 5th, $9,000; Eureka Con., 2d, $8,539; Eureka Con., April 30th, $26,191; Horn Silver (for March), $23 219; Custer, Idaho (for March), $16,428, also, 62,596 ounces of silver; Indian Queen (for March), $20,440; Northern Belle, May 4th, $5,186; Bodie, 8th, $10,084; Christy, 8th, $1,626; Star, 3d, $1,084; Syndicate, 5th, $5,273; Mt. Diablo, 6th, $8,437; Bodie Tunnel, 10th, $3,500; Betty O'Neal, 5th, $4,281; Contention Con., 7th, $14,881; from Silver Reef (for March), $60,659; Stormont, 1st, $3 500; Hanauer, 1st, $2.350; Germania, 1st, $3,160; Bullionville, 1st, $2,062; Horn Silver, $5,000; Barbee & Walker, 1st, $1,378; Alice, 1st, $20,000; Horn Silver, 3d, $27,500; Bullionville, 3d, $2,020; Stormont, 4th, $3,900; Horn Silver, 4th, $10,000; Tintic, 4th, $1,168; Ontario (for April), $225,000; Mammoth, $4,000; Horn Silver, 6th, $10,000; Bullionville, 6th, $11,938; Horn Silver, 6th, $10,000; Stewart, 7th, $3,500.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

There is nothing much doing in stocks. With regard to the North End mines our "Mining Summary" gives all there is of interest. At the Union Con. the usual quantity and quality of ore has been extracted from the stopes on the 2500 level. Most of this has been taken ont of that section lying south of the winze. But little work has been done to the northward of the winze, and the indications, found some time ago, of ore making strongly to the west have not yet been followed up.

At the Bonanza mines all is going on about as usual. The drift on the 2300 level from the Best & Belcher and Gould & Curry shaft, which recently connected with the east crosscnt of the Con. Virginia, is being cleaned ont and put in good shape. It gives a good circulation of air. No crosscutting will probably be done in this section until a similar connection has been made on the 2500 level.

At the Savage they are running north along the east wall of the vein on the 2400 level. They keep the drift close against the east side of this wall in order not to lose sight of it. When far enough north crosscnts will be run west. Judging from the ore found to the southward some good ore should be found in running those crosscnts, as the ore is evidently making to the northward. They are also drifting north in a very favorable formation on the 2200 level.

There is nothing doing at the flooded mines. All are awaiting the action of the officers below. It is hoped that a start will soon be made. Men should at once be put to work on the drift which is to connect the Belcher with the south branch of the Sutro tunnel.

At the annual meeting of the Trnstees of the Northern Belle mining company, the dividend was passed for the first time in nearly two years. The managers of the property believe in holding fast to a snrplns.

PROF. OTTOKAR HOFMANN.—Mr. Hofmann's established fame as a metallnrgist, mineralogist and inventor is so widely known and firmly established that his personal movements have much more than a local significance. He came here abont a year and a half ago to erect lixiviation works for the Silver King company. The rebellious character of the Silver King ore required the employment of the best talent in order to produce the best resnlts, and Mr. Hofmann's skill has accomplished a solution of all difficnlties. His services have been in constant demand from several other large mining companies, which his engagement with the Silver King company has hitherto prevented him from considering. We have no doubt hnt his future career will be marked with that success which his reputation warrants. We only regret the departure of Mr. Hofmann, with his interesting family, from Final, and we share that regret with everyhody, as they have gained not only the sincere respect, but the affectionate regard of our community.—*Pinal Drill.*

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

4026. Silver Ore—Ontario mine, Park City, Summit county, Utah, 7th level. Walter P. Jenney.

4027. Silver Ore—Ontario mine, Park City, Summit county, Utah, 3d level. Walter P. Jenney.

4028. Silver Ore—Ontario mine, Park City, Summit county, Utah, 5th level. Walter P. Jenney.

4029. Silver Ore—Ontario mine, Park City, Utah, croppings. Walter P. Jenney.

4030. Cream of Tartar Containing 97⅞ of Bi-tartrate of Potash—Manufactured from California argols. (See No. 4044) Pacific Cream Tartar Works, San Francisco. Ad. Sommers.

4031. Ornamental Inkstand—Of undoubted Chinese origin, being made of agalmatolite, a variety of pinite used by the Chinese for carving figures and ornaments. Found at Lone Pine, Inyo county, Cal., several feet under ground, by Louis Munzinger, in digging the foundation of a brewery, and donated by him.

4032. Gypsum, Satin Spar—Cut and polished. Derbyshire, England. J. Z. Davis.

4033. Rough Diamond—Spring Valley hydraulic mines, Cherokee Flat, Butte county, Cal. Weight, 180 milligrams. Found in cleaning up sluices, associated with zircons, gold, platinum, iridium, etc. Diamonds in considerable numbers have been found at this locality, but none of large size or first water. G. F. Williams.

4034. Black Scorpion, The lyphonus exuhitor—New Mexico.

4035. Quartz Crystals, with Silver Ore—Sinaloa, Mexico. Mark Cornish.

4036. Indian Relics—Supposed to have been used by the Shoshone Indians, Devil's Gate canyon, White Pine, Nev. F. E. Staples.

4037. Pebble of Chalcedony—Which seems to contain a bubble of air or water, or both, but on polishing a similar specimen this appearance was found to be illusive, and is probably owing to the unequal retraction of light. Shoal Water bay, Washington Territory. Charles A. Hughes.

4038. Aquamarine, a Variety of Beryl—Siberia. Prof. H. A. Ward.

4039. Coral Gum, Including Insect—Burmah. Prof. H. A. Ward.

4040. Nephrite, a Variety of Amphibol (Precious Jads of Chinese—China. Prof. H. A. Ward.

4041. Epodite Crystals—Sulzbachthal, Tyrol, Austria. Prof. H. A. Ward.

4042. Agalmatolite or Figure Stone of the Chinese, a Variety of Massive Pinite (See 3004 and 4031)—China. Prof. H. A. Ward.

Meetings and Elections.

SCORPION M. Co.—May 10. Directors—Robert Sherwood, O. F Cnffin, H. F. Cutter, T. J. G. Margetson and J. P. Jackson. At a subsequent meeting of the Board of Directors the following officers were chosen to serve for the ensuing year: Robert Sherwood, President; H. F. Cutter, Vice-President; Geo. R. Spinney Secretary; R. P. Keating, Superintendent. The Secretary showed a balance to the company's credit on the 1st of May of $5,542.45 above liabilities.

MORGAN M. Co.—May 9. Directors—H. J. Tilden (President), Daniel J. Mahoney, Jos. M. Maguire, John A. Freuler, B. D. Bacon. C. L. Tilden, Secretary.

YELLOW JACKET.—At a meeting of the Board of Directors of Yellow Jacket it was resolved to inform the representatives of the mining companies of Gold Hill, Nevada, that it approves the report of Messrs. Patton, Forman and Taylor, and stands ready to pay its share toward the expense of draining the mines represented, as suggested in the report, or as may be advised in any supplemental report of the committee.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

Pioneer Iron Works, May 9. Capital stock, $300 000. Object—To manufacture, purchase and sell all kinds of stoves, furnaces, ranges, cooking utensils and other implements. Directors—Charles Holbrook, J. F. Merrill, J. B. Stetson, W. W. Montague, A. A. Watkins and George A. Low. Each Director subscribes for stock to the amount of $37,500.

Gambetta M. & M. Co., May 9. Location, Inyo county, Cal. Capital stock, $5,000,000. Directors—J. M. Raum, James M. Kane, Henry Krebs, Jr., I. N. Thorne and B. H. Klinger.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

DOWNS.—Amador *Ledger*, May 6: The mill of this mine has come to a standstill, not because of any exhaustion of ore bodies, but because the further efficient development of the property demands the sinking of a new shaft; and this is the enterprise that the management has now in hand. The company has purchased the hoisting machinery at the north shaft of the Oncida mine, and S. L. Breese, one of the best mechanics in the county, is now engaged in taking it down, preparatory to removing it to Volcano. It is expected to have the machinery on the ground some time next week. The new shaft will be perpendicular to the depth of 500 ft, and will strike the ledge somewhere about that depth. It is located about 300 ft north of the old shaft.

THE KELLY MILL is still pounding away on the ore from the tunnel. It is said by parties who have inspected the milling, that the rock, though of low grade, will pay more than expenses. Connection between the tunnel and shaft is expected to be made about the middle of this month.

CALAVERAS.

DOUGLAS FLAT.—*Mountain Echo*, May 5: Reports from the Douglas Flat mining region are very flattering.

CHISPA.—An Indian picked up a chispa on Six-Mile creek the other day, valued at $25. Foindley & Co. are arastrsing ore from the Dock Hill mine, which, it is said, pays them well. Work has been resumed on the Jones mine, which is situated at the mouth of Carson's creek, near Stanislaus river.

DITCH.—The owners of the Jupiter mine, near Dogtown, are digging a ditch to bring water to their claim, which, when completed, will be nearly 5 miles in length.

CLEAN-UP.—A $1,500 clean-up was made at the Gold Cliff mine this week, being the result of 17 days run. Pretty fair for a 10-stamp mill. We are informed by the superintendent of the Gold Cliff mins that a new mortar is to be put in the battery, and other necessary improvements made before starting up again.

AT WORK.—The Rasberry Bros. are busily engaged working their mine. The shaft is down about 20 ft, and the vein is from 12 to 18 inches in width. The ore yields from $12 to $15 per ton.

THE BLACK OAK MINE is still being vigorously worked, and the vein is becoming richer in gold daily. The tunnel by which the mine is worked is now about 80 ft into the hill and is well timbered. The owners of this mine intend sinking a shaft at the end of the tunnel, where the vein is nearly 3 ft wide, and prospects from 15 to 25 cents per pan. The quartz is of a light brown color and is highly impregnated with pyrites of iron.

DEL NORTE.

MINING PROSPECTS.—*Record*, April 29: The time will soon come when prospectors will be starting out into the foothills and mountains with pick and shovel to commence their summer's work. We anticipate some rich discoveries in this county during the summer, as a great part of the country remains unprospected, and the discoveries made last summer will have a tendency to bring hither miners of experience. A rich strike was made late in the fall by the Del Norte Gold Quartz Mining Co., but the season was so far advanced when the strike was made that but little work was done afterwards, but we presume that work will be resumed as soon as the weather settles sufficiently to work to advantage. Mr. Truett, manager of the copper mine known as the Condon mine at Big Flat, we hear, has purchased smelting works which will arrive and be put up at the mine as soon as spring opens sufficiently for the work to be prosecuted to advantage. The Big Flat gravel mine has been lying idle since the legal difficulty arose a year or two ago, which we believe was never settled. The Mountaineer Co., also situated at Big Flat, is composed of a set of go-ahead fellows, all old miners, but have been kept back by the Boston Co., who, report says, was determined to force them off their claims, but it seems did not "make the riffle." This company we may expect to hear from this spring, for their ground is said to be rich, and the "pay dirt" inexhaustible. The French Hill mine is said to be as good a paying mine as there is in this vicinity, but some difficulty having arisen in regard to the legal ownership, it has not been worked to any extent for some time. The great difficulty in placer mining in this county has heretofore been that extensive operations have been carried on by those who had had hut little or no experience in the business, and as a natural consequence expended large sums of money unnecessarily, and the result was a "crash" before the mines could be made to pay.

EL DORADO.

RICH.—Georgetown *Gazette*, May 5: T. Z. Armstrong has gone to work upon the Rich gulch seam mine with his partner, Mr. A. Baldwin, Mr. Adams' lease of his interest having expired May 1st. Adams done very well out of his year's lease, having cleared his $7 a day. The season on which Adams and Baldwin took out upwards of $5,000 last month still continues to pay good wages. John Corwin and P. H. Spencer brought in town yesterday 24 ounces of gold, the result of 3 days work on their placer claim a few miles from town. This mine is yielding handsome returns right along, equaling in richness the placers of early days. They have a considerable extent of channel yet to work, and have every reason to expect big pay for months to come. We are glad to learn that Walter Crover has struck some very rich prospects on the extension of Jordan & Zombro's quartz claim, a few miles southeast of town.

FOR some time past we have understood that T. F. Lewis, of Spanish Flat, had a quartz mine at the foot of Slate mountain, some 15 miles southeast of Georgetown, which yielded flattering prospects, but was requested not to speak of it until he had made some developments. Mr. Lewis is now satisfied that he has a good mine and one which promises permanency. He has a large mortar and works the pestle with a spring pole. He made a number of tests; one of 800 lbs. yielded him $21 and one of 500 lbs. $6 The pay seam varies from 10 to 15 inches in width, and the above results are considered a fair average of the rock. He has gone down 20 ft.

MARIPOSA.

THE YOSEMITE QUARTZ MINE.—Mariposa *Herald*, May 5: This mine, long and familiarly known as the No. 9, under the present management is rapidly taking rank as one of the very best paying veins in our county. The property belongs to M. Hulings & Co., and is under the immediate superintendency of Mr J. F. Thorn. Mr. Thorn formerly owned the mine, and knows how to work it to advantage. Prior to his assuming charge of the works, the mine was run at a great loss to the proprietors. Mr. Thorn has had sole charge of the property for over 7 months, and instead of being run at a loss it commenced paying a handsome profit to the owners from the day he took charge and has steadily increased in its yield, with prospects of paying still better as sinking on the vein progresses. We understand that the rock from the bottom of the shaft and lower levels crushed during April paid nearly $13 per ton, and that the expense of mining and milling the ore did not exceed $5 per ton—that the net profit to the owners during that month from the vein was not less than $8,000. This mine is a great benefit to the people in the west side of the county. It is safe to say that there are at least 100 low-grade mines in this county which could be made to pay handsomely if the owners would have the good sense to employ as practical and experienced a miner and mill superintendent as Mr. J. F. Thorn. In his selection, Hulings & Co. exhibited sound judgment, which other mine owners would do well to emulate. The success of this mine is due to good management alone.

IN GRUB GULCH the mines are steadily being developed. Messrs. Francis, Parker & Marsh, from Merced, have just erected an 8-stamp "Sweepstake" quartz mill on their mine. They are enterprising men, and all wish them success in their new undertaking. Harry Berman has just uncovered a 6-inch ledge of very fine milling ore, which is supposed to be the south extension of the Gambetta; and if prospected to the same extent, I think will prove to be a valuable property. The King's Gulch mine, owned by James Hamilton and others, is being developed with all energy. They have 2 shafts 70 ft deep, and are drifting to connect both shafts. They have a large body of rich milling ore in sight. This can truly be said to be a very valuable piece of property.

ASSESSMENT.—The Mariposa Land & Mining Co. of California has levied an assessment of $10 per share on the stock of said corporation, payable immediately. We hear through the most reliable sources that the property will be redeemed ere long, and the various works of the company will again start up. This will place our county on the same footing as a few years back.

NEVADA.

THE FORD & MULLEN MINE.—Grass Valley *Union*, May 7: A crushing of 14 loads of rock has just been made at Southern's mill from the Ford & Mullen mine, on New York hill and the company were calculating to have the crushing finished yesterday. Beside the regular crushing, some 8 boxes of very fine specimens were sent down to the mill yesterday morning to add to the gold in the general clean-up. A Union reporter saw some of these specimens, and they are as fine and rich as any ever taken out of Grass Valley's hills. The mine is looking splendid and there is every indication that there is plenty of gold yet in the little mine.

THE WASHINGTON MINE.—Work at the Washington mine is being prosecuted with vigor, and George Mahnhart has just been awarded the contract of running the north drift. The rock improves as the drift is run north, and some very fine rock was taken out of the mine on Thursday, showing an abundance of rich, heavy sulphurets and considerable free gold, one specimen found being very rich. The company has great confidence in the mine, and will take out a crushing of 100 tons or more, when in all probability a mill will be erected. The Washington gives every appearance of soon developing into a first-class mine.

PLUMAS.

THE RESERVOIR.—Greenville *Bulletin*, May 3: The Round Valley reservoir is now full to within 14 ft of high water mark. As the water rises the area covered is much increased, and, of course, the daily rise decreases, or would do so if the flow of water into the reservoir remained the same; but during the past few days the various streams flowing in have increased in volume, so that the daily rise is about the same. There is still an immense body of snow on the ridge between Round valley and Soda creek; parties going over some days ago found about 4 ft in the road.

GOLD STRIPE MINE.—The road to Gold Stripe is now opened so that teams can pass over it. On last Friday the butcher made the first trip since the snow season set in. On Monday there were 4 ft of snow on the flat at Wolf Creek village, and on the ground of the Goodwin ledge there were 5 ft. As soon as it is possible to haul rock the mill will be started, but from present appearances this cannot be done short of 3 or may be 4 weeks yet.

CHEROKEE MINE.—The Cherokee mill ran 15 stamps the last half of the last month. A clean-up was made on the 1st inst., Monday, and the results were found to be much better than any during the first half of the month. The remaining battery will be started up by the end of the present week.

TRINITY.

ANIMATED BIDDING.—Trinity *Journal*, May 5: The referees' sale of the Connor Ditch property on Red Hill which took place last Monday was an interesting event. There were in reality but two bidders, Messrs. Lorenz, Bartlett & Evans on one side and Barthel & Henry Jacob on the other. The ball opened with a bid of $5,000 and was rapidly passed from one party to the other, the bid being increased in amounts varying at times from $9 000 to as low as 5 cents rise, until it finally reached $29,020 bid by Mr. H Lorenz and at once increased to $30,00 bid by John Waldron, to whom and at which figure the property was knocked down. Mr. Waldron then undertook to withdraw his last bid in favor of Lorenz, but this was declared "out of order." As Mr. Waldron failed to comply with the "Terms Cash" proviso of the notice of sale, the referees have been forced to again offer the property for sale. The date has been fixed for Wednesday, May 31st.

NEVADA.

WASHOE DISTRICT.

NORTH END MINES.—*Enterprise*, May 3: The outlook at the north end is very encouraging at present. In the mines can be found no reason for the recent fall in the price of Union and other stocks in that section. On the 2500 level they have now stoped out a space of ground 80 ft in length and from 2 to 5 sets of timbers in width. The sets are about 5 ft in width. In going southward at this point—which is 25 ft below the 2500 level—the ore body is found to grow both wider and richer. The vertical winze sunk in the sill floor of the stopes is down 24 ft and is all the way in fine ore. This ore still continues at the bottom, with no sign of a west wall. Thus, the body of ore is known to extend from the 2500 to a point more than half way down to the 2600 level. The bottom of this winze is so wet that work in it has been stopped for a few days in order to allow it to drain out. On the 2600 level the northeast drift from the bottom of No. 1 winze is approaching the point where it is expected that the ore body found on the 2500 level will be cut. The face of the drift was yesterday showing vein material of an improved appearance—much clay and quartz—and the indications are that the ore body looked for is not far ahead. The inclined winze from the bottom of winze No. 1 (the wet winze) is passing into ground that is full of small seams of quartz, all of which appear to be mineral bearing, as the dirt as it comes out yields assays of from $2.50 to $5. If this shows nothing else it is proof that the ground that is being explored is of a fertile character—ground in which ore can live. East crosscut No. 1, on the 2700 level, is passing through a very promising formation of quartz, clay and porphyry, which appears to indicate its near approach to ore. Just where the ore may be from the present face of the drift it would be hard to say. It may be ahead or it may lie either north or south of the drift. Explorations in various directions will presently solve this question. We shall soon know more about the north end mines at depth. The north and south drifts on the 2700 level of the Mexican will be connected in two or three days, as they are now so close together that men can be worked only on one side; and when this is done the ore found in Mexican some time since on this level will be thoroughly examined. One streak 3 or 4 ft in width of good milling ore has already been cut, and before work was discontinued at that point a crosscut was started west in search of the main ore body. This week, also, will be completed the station at the 2000 level of the Union and Sierra Nevada joint winze. This will allow of the starting of exploring drifts and crosscuts at that great depth, and will also drain out the water that is impeding operations at points below the 2500 level. Because ore is not found within 10 ft of the place where it was supposed to be, or just to the day when its discovery was looked for, stockholders should not lose courage; they should bear in mind the vast width of the vein and the many waves in stratification and changes of dip that are liable to occur in the underground regions.

UNION CON.—*Enterprise*, May 7: On the 2500 level are stoping out ore. The winze in the stopes has been run 4 ft. On the 2700 level crosscut No. 1 has been extended 44 ft. In the joint Sierra Nevada east winze have completed the station and started a joint west crosscut. During the week 606 tons of ore have been extracted from the 2500 level, and 436 tons and 1,340 lbs have been sent to the mill. Amount of bullion shipped, $56,049.06.

ALTA.—The diamond drill reached 112 ft in the main east drift, when considerable water was found, so much, in fact, that it was deemed advisable to allow it to drain off before extending the drift further. An accident to our pump in the early part of the week detained us 24 hours. We hoisted 407 cars; wood consumed, 108 cords; strokes made by pump, 71,800.

YELLOW JACKET.—The water in the mine is to day at a point 406 ft above the 2300 level station, having risen 9 ft since last report. At the Winters' shaft have opened the old third station and are in 15 ft from the shaft. We find the station and drift badly caved and filled with rock. The next station (940 ft from the surface) is in 10 ft from the shaft. Are repairing guides and timbering below that level to reopen the old 1028 level.

CALIFORNIA.—On the 2700 level the main south lateral drift has been advanced 28 ft. The joint Con. Virginia east drift, No. 2, has been advanced 15 ft, and is being timbered up.

MEXICAN.—On the 2700 level the main south drift has connected with the main north lateral drift. On the 2900 level the diamond drill has been started in the face of the main north drift; are also cutting out a drain.

SIERRA NEVADA.—On the 2700 level main north lateral drift No. 1 has been advanced 21 ft. North drift No. 3 has been extended 27 ft. The station in the joint Union Con. east winze is completed and a west crosscut has been started.

CENTRAL DISTRICT.

LOOKING WELL.—*Silver State*, May 5: S. W. Hammand, of Central district, is in town. He says the mines down that way are looking well. Frank Clark is putting in his spare time on his mill, and will get it running before a great while. M. S. Thompson is at work on the Marietta, getting out more or less good ore.

COLUMBUS DISTRICT.

MOUNT DIABLO.—Caodelaria *True Fissure*, May 6: The work of extracting ore from this mine has been discontinued for the present, and that of prospecting is being resumed very energetically. Work at the bottom of winze No. 1 has been commenced, and there is a good body of $34 ore in the bottom. Bullion shipments were made on April 29th amounting to $8,467.39, and on May 2d valued at $6 458.35. The total output of bullion for April was $69 954.65.

NORTHERN BELLE.—The general appearance of the mine is much the same as last week. Both mills are running steadily and doing the usual amount of work. Bullion shipments for the week ending May 4th amounted to $13,387 24; and aggregate $60,085.27 for April.

ESMERALDA DISTRICT.

HUMBOLDT HILL M. & M. CO.—Esmeralda *Herald*, May 6: Good progress has been made on the mine this week. The north drift on the 1st level has been advanced 12 ft. On the same level the crosscut from the main shaft has been run 14 ft west to the hanging wall. There is now 200 tons of ore on the dump and 100 tons broken in the mine. They will commence hoisting early next week. The mill was started on Wednesday for the first time since the big storm. Gov. Blasdel has been fortunate in securing the services of Mr. Coombs, an experienced mill man, as foreman of the mill. By having such a man in charge it will enable the Governor to devote his personal attention to the mining department.

GARFIELD DISTRICT.

THE PROSPECTORS DISTRICT.—Esmeralda *Herald*, May 6: Probably there is more attention being paid to this new mining field just now than any district in Esmeralda county. In more ways than one it is deserving of notice at our hands. The ores are very rich, the claims easily worked, and their accessibility and nearness to the C. & C. railroad. In fact it may be justly termed the prospectors' district. The only drawback is water, which is carried in barrels from the railroad company's well at Luning, a distance of 7 to 10 miles. The ledges crop out boldly, and the ore pays from $20 to $1,500 from the surface. As yet these are but mere prospects, not sufficient work being done to call them mines, though the owners hold them at high figures.

JOHL & MCDONALD'S are the best developed claims in the district at present. At the 80 level of the Lottie they are now drifting and stoping ore which assays from $100 to $1,500 per ton. A tunnel is also being run to tap the Lottie ledge at a depth of 150 ft. Johl & McDonald are also running a tunnel on their Ellen claim, and have cut a ledge of very high grade ore. They now have out about 40 tons of ore from these two claims and are hauling it to Luning, where it will be sampled and sold to the Castle Dome Smelting Co.

THE Honest John claim, which buts up against the Lottie, owned and being worked by Joseph and Brooks, McClane and others, has a shaft down 50 ft, which has cut several veins of rich ore, assays from which run up to $900.

MEAD, MURPHY & JOHL have commenced work on the Yerington & Bliss claim, located about 1 mile east of Johl & McDonald's claims. They have about 4 tons of rich carbonate ore on the dump. Assays run from $25 to $150 in silver, 75% lead and a trace of gold.

THE Woodhouse & Olson claim, about half a mile south of Garfield peak, has a shaft down 30 ft, the ledge at the bottom showing ore that runs from $500 to $1,000 per ton.

SILVER BELLE.—S. R. Avery has run several shallow cuts on the Silver Belle, showing up the surface of the ledge nicely. The Silver Belle is on the same belt as the Woodhouse & Olson. Lige Ellis and several others are at work in the vicinity of the Silver Belle.

FARRINGTON & MOSS.—This claim, located about 4 miles southwest of Johl & McDonald's properties, is at present the best looking prospect in Garfield district. The incline shaft is now down 75 ft, in ore all the way. There are between 30 and 40 tons of ore on the dump, that they claim will average $1,000 per ton. The owners estimate the amount in sight in the mine at the present time at $50 000.

HIGHLAND DISTRICT.

A TOWN.—Pioche *Record*, April 29: There is quite a little town at the Mendha mine, Highland district, now. There are three families living out there, the men working in the mine have their own castles to live in, and the prospectors all dwell in palaces of their own.

DAY COMPANY.—Three men have been placed to work getting out rock for the repairing of the furnace. Prospecting is still being pushed ahead in the Day and Mendha mines. There is no telling at what time the furnace will start up. We learn from Supt. McNally that there is no truth in the report that ore was being taken out of the mine for shipment to the furnance.

LEWIS DISTRICT.

BETTY O'NEAL.—*Herald*, May 3: There is not much change in the stopes of the Betty O'Neal, they still produce the usual amount of ore and there is plenty in sight. From present appearances the Betty will keep the Eagle mill running for many months. The company intend sinking their shaft to a greater depth and opening up levels below. A sinking pump has been ordered from below, and on its arrival 3 8-hour shifts will be put on and the shaft sunk as rapidly as possible.

MORNING STAR.—The contractors are making good headway in the Morgan incline on the Morning Star mine. Several men are kept sorting and sacking ore, which is being packed to the forks of the canyon. The present calculations are to have a large quantity of ore reduced at one of the mills in Lewis.

EAGLE.—The ledge in the Eagle tunnel has been stripped for about 200 ft; a crosscut has not been started yet to test the width or quality of the ore vein, though some rich pieces have been broken off.

SANTA FE DISTRICT.

COMING TO NOTICE.—Esmeralda *Herald*, May 6: Santa Fe is coming in for a very liberal share of the attention now being paid to that section of Esmeralda county, and, from what we saw, we may say, without hesitation, the district is deserving of all the notoriety bestowed upon it. The mines are situated all the way from 7 to 15 miles northeast from the town of Luning. There are about 50 men at work in the district. There is a large scope of country in Santa Fe that has as yet not been prospected. New locations are being made every day, and the district yields a variety of metals, such as gold, silver, copper, antimony, etc.

THE Tip Top mine, owned by B. G Smith & Bros., and under the management of Johnny Powell, is the best developed mine. There is a force of 12 men at work. Recently a very important development was made on the 250 level, an 8-ft vein of $100 ore being cut at that point. The work at present is merely prospecting and developing.

THE ILLINOIS.—Col. A. C. Ellis, the owner of this mine, has started men to work, and they are taking out some very fine ore. Near Mitchell springs J. Thomas Bradley has a force of 20 men at work on some recent discoveries. Mr. Bradley is satisfied that he has some of the best prospects in the district. At Earlington springs Rhodes & Wasson are working 10 men on prospects owned by them. The present showing is fair. The Fagan & Glasser mine has a few men at work taking out ore for shipment. There is in the neighborhood of 60 tons now on the dump. In the Dunbarton mountains, Santa Fe district, some copper discoveries of importance have been made.

WARD DISTRICT.

NO CHANGE.—White Pine *News*, May 5: Sam Chipman has returned from a trip to Ward. He says there is no particular change in the camp yet, but all look for lively times this fall.

RICH ORE.—The ore now coming out of the Monitor mine at Taylor district, says the *Reflex*, is much richer than for some time past. It now ranges between $300 and $100 to the ton.

ARIZONA.

GLOBE DISTRICT MINING NEWS.—*Silver Belt*, May 29: The Topia, formerly the Peacock mine, 2½ miles east of the Pioneer and ¾ of a mile north of the Capitan, belonging to Messrs. Gary and Hardesty, has, under recent developments proved itself a promising property. A drift running east from the main shaft has shown a fine body of ore 3 ft wide, samples of which are now in our office. The ore carries galena, zinc, gray copper, silver and a modicum of iron. The Foot mine, first east extension of the Topia, although not as extensively prospected as the Topia, wherever tested shows gray copper of good quality. The Mark mine, a western extension of the Topia, can scarcely be said to have been developed at all, but where openings have been made the showing gives confidence of a good ledge.

MESSRS. FORD, BOOTH & HATCH are vigorously at work on the Apache. They now have a shaft 80 ft deep, in the bottom of which a vein 5 ft wide shows. The vein is supposed to be a continuation of the South Pioneer, having the same porphyritic formation as the latter vein.

PIONEER.—Since the commencement of work on the Pioneer by the new owners, a tunnel of 150 ft has been run at a depth from the surface of about 125 ft, in which a large body of ore, very similar to that found in the Contention and Tough Nut at Tombstone, has been struck. The ore is free from base metals; the silver being chloride and sulphide.

DISCOVERY.—Walter McKean and Billy Woods have made a valuable discovery about 2½ miles northwest of the Pioneer camp. The vein at the surface is strong and shows an unusual width. At the depth of 15 ft a body of ore was revealed filling the entire bottom of the shaft, and is pronounced by good judges to be very similar to that found in the South Pioneer.

THE contractors on the South Pioneer are now making a connection from the 100 level (about 25 ft) to the old workings. The object of the connection is ventilation.

THE Howard Co. has nearly completed the grading for the hoisting works and necessary buildings. A force of men is now engaged in sinking a double-compartment working shaft. The Howard certainly is a valuable property.

ITEMS.—Bullion shipments from the Mack Morris for the week ending April 29th, $5,877.26; total to date, $500,312.40. The Hoosier Copper M. Co. squared accounts with laborers and other claimants to-day. Work on the mine is progressing satisfactorily; ore is abundant. The Old Globe and Hoosier copper companies are steadily accumulating ore on their respective dumps. The mines represented by these companies have the reputation of being valuable properties.

FURNACE COMPLETED.—Prescott *Courier*, May 3: Mr. Spear, just from Walker district, informs us that the smelting furnace was completed several days ago. All miners have confidence in Prof. Shafer, who is to run it. Mr. J. C. Boblett, of Lower Lynx creek, says that prospectors over there, who are operating for Albuquerque capitalists, have relocated many old claims and appear pleased with the mineral prospects of the locality. Messrs. Bowers & Richards, two of Prescott's shrewdest capitalists, have made arrangements with John and Frank Akers to sink 100 ft and drift 50 ft each way from the bottom of the shaft on the ledge recently discovered by the brothers on Lower Lynx creek, 7 miles east of Prescott. B. & R. do this work, or rather have it done, for one-half of the mine. The brothers were offered $8,000 for the ledge shortly after having discovered it. But Bowers & Richards' proposition suited them better. The ledge is looking well; rock rich in silver.

TOMBSTONE.—*Epitaph*, May 6: Nothing of unusual importance has transpired during the past week in local mining annals. The output of ore and bullion continue about the same, and the only matter of interest was the decision of Judge Stillwell in the suit brought by the Tombstone M. & M. Co. against the Way Up. Though the result of the decision was not unexpected, still it formed the staple subject of conversation for mining men, since the decision was promulgated.

BOWERS & RICHARDS, two of Prescott's shrewdest capitalists, have made arrangements with John and Frank Akers to sink 100 ft and drift 50 ft each way from the bottom of the shaft on the ledge recently discovered by the brothers on Lower Lynx creek, 7 miles east of Prescott. B. & R. do this work, or rather have it done, for one-half of the mine. The brothers were offered $8,000 for the ledge shortly after having discovered it. But Bowers & Richards' proposition suited them better. The ledge is looking well; rock rich in silver.

TOMBSTONE.—*Epitaph*, May 6: Nothing of unusual importance has transpired during the past week in local mining annals. The output of ore and bullion continue about the same, and the only matter of interest was the decision of Judge Stillwell in the suit brought by the Tombstone M. & M. Co. against the Way Up. Though the result of the decision was not unexpected, still it formed the staple subject of conversation for mining men, since the decision was promulgated.

TOMBSTONE M. & M. CO.—Work continued on the 300-level of the Tough Nut and Good Enough, both drifts being in ground carrying bunches of rich ore. The Combination ore body is yielding about the same. The 100-ft Tough Nut and 250 ft Good Enough are the principal ore bodies. The West Side vein is yielding a fair quantity of high-grade ore.

GRAND CENTRAL.—The stopes are looking as well as ever. The bullion output for last month amounted to $154,650. Ore looking better than formerly and milling to better purpose. Mine down 600 ft; 125 miners employed.

CONTENTION.—The Flora Morrison shaft has been closed for the present. Will ship ore next week to Girard mill; sending the usual amount of ore to the company mill on the river.

THE GIRARD is partitioned into 4 levels at 150, 200, 270 and 329 ft. Work is being done on all levels, and each producing ore. The mine is looking well and yielding the usual quantity of ore. Ten stamps of the Girard mill will commence work on Contention ore to-day.

OLD GUARD.—The drift north from 80-level, 20 ft in first-class ore. Hoisting several tons of ore daily. About 175 tons now on the dump.

THE RANDOLPH.—This promises to be one of the great mines of the district at no distant day. Work of development is progressing rapidly, and large bodies of ore exposed to view. Working on the 100 level. Southwest drift in 105 ft. About 300 tons of ore on dump, running from $50 to $200. Quality of ore chloride, horn silver, carbonate and manganese. Mine looking fine and worked with avidity.

VIZINA.—The north drift of the 400-level is now in 60 ft; south drift, same level, 68 ft. The crosscut going west on the 100-level is now extended 110 ft. The stopes are looking as well as usual. There were only 120 tons of ore shipped from this mine in April, owing to the mill being running on Ingersoll ore.

BISBEE ITEMS.—Tombstone *Epitaph*, May 5: Col. Cordon, an old-time prospector, made his appearance in Tombstone yesterday, after several months' absence. The Colonel is operating in Warreu district, and is the happy owner in part of the Charter Oak mine. We were informed by him that the people in and around Bisbee were in a high state of excitement over the Indian question. The copper mines in the vicinity of Bisbee are coming out strong. The Ounsight, Charter Oak and others, in Warren district, are turning out rich copper, silver glance and gray copper.

COLORADO.

EMPIRE ITEMS.—Georgetown *Courier*, May 4: The new Carter process mill, at North Empire, is giving excellent satisfaction, with the exception of the amalgamating tube. The ore is roasted in a very thorough manner, and no doubts are now entertained in regard to the ultimate success of the mill. The ore treated is from the Silver Mountain mine, owned by the Great Republic Co. Mr. B. O. Russell has leased the Pioneer mine and mill and is working a force of 9 men. The lower drift on the Empire City lode is being driven ahead steadily with a double shift. The breast is in 278 ft, and shows from 6 inches to 1 ft of ore that carries from 2½ to 5 ounces gold per ton. The Upper Union tunnel, owned by Dr. Godfry and others, is being pushed ahead by 4 men. A lode was recently intersected in this tunnel that carries a vein of good-looking copper ore. The Murphy is being worked by 3 men. It shows a good vein of ore, that at the last mill-run returned 12½ ounces gold per ton. The Great Republic Co. has a couple of men driving the lower adit of the Great Republic lode. There is a large amount of ore piled up at this mine, ready for treatment. The water is being taken from the North mine, preparatory to the resumption of work. There is a large amount of concentrating ore piled up at this mine. The town of Empire is showing much more life than it has for years. Town lots are being taken up very fast, and lot-jumping—an unfailing sign of prosperity—has been indulged in to a small extent. Many strangers have arrived lately for the purpose of mining in that neighborhood, and, as a whole, the district is showing unmistakable signs of returning prosperity.

IDAHO.

SMELTERS FOR THE UPPER COUNTRY.—Wood River *Miner*. Col. E. Greene, of the Philadelphia Co., who was on Wood river during the early part of the week, informed a *Miner* reporter that a second smelter, of 40 tons capacity, is en route for the Warm Spring creek mines, and that others will be ordered if there is a demand for them. Within a few weeks two 40-ton smelters will be turning out bullion on Warm Spring creek. Over 1,000 tons of ore are now out and ready for reduction. The ore was taken from the Philadelphia Co.'s properties.

A PROPOSED RAILROAD.—Several gentlemen, possessing large capital, came to Hailey yesterday with a view of building a railroad between this point and Bellevue. Their plan is to lay a track of timber, faced with quarter-inch iron, flat rails, and to put on a passenger car with a capacity for 30 persons; also a flat car for the transportation of freight between the two towns; the cars to be drawn by a dummy engine. The cost of construction and equipment is estimated at from $6,000 to $7,000. The projectors propose to put up all the coin and to own and control the road. The home station and headquarters of the company will be Hailey.

THE NIGHT HAWK SOLD.—The Night Hawk mine, adjoining Col. Greene's famous Black Hawk, on Warm Spring creek, above Ketchum, was sold Monday to Angus McMasters and Sam Lichtenstadter. The owners of the Night Hawk were John Connor and Charles McCloud. About 25 tons of good ore is on the dump, and the 65 ft shaft shows up well in rich mineral. The new owners will put a full force of men at work as soon as the roads are sufficiently good to admit of taking up machinery, and the development will proceed as rapidly as admissible.

MONTANA.

HAWKEYE.—*Inter-Mountain*, May 4: The Hawkeye is a claim lying between the Alice and Belle of Butte mines, and is penetrated for a length of 900 ft by the Belle of Butte ledge. It is owned by the Alice company, and near the east end line a shaft has been sunk to a depth of 155 ft, the intention being to connect with the west drift of the Belle of Butte.

BELL.—The stopes in the 200 and 300 levels of the Bell never before were so productive as now, and it seems that were the capacity of the smelter twice what it is, the furnaces could be very easily supplied. The mine is now in good working shape. The output of the property is now 50 tons per day, which is being shipped to the smelter. The ore is of a somewhat improved quality.

MORNING STAR.—Over 100 tons of ore, which will average between 75 and 90 ounces per ton, are now on the dump of the Morning Star. Within the next week it will be shipped to the Colorado smelter for reduction. The daily production of ore is about 6 tons.

MOUNTAIN CON.—During the past two weeks the powerful hoisting machinery has been got in readiness to run, and the water has all been pumped out of the shaft.

NEW MEXICO.

SANTA RITA COPPER AND IRON CO.—*New Southwest*, April 26: This company expects to commence smelting again next week at the new site to which their smelter has been removed. This removal occasioned an unfortunate delay, which could not well be avoided, the old site being too near the mill for safety. In the meantime the company's mill is actively engaged in accumulating concentrations for smelting.

NOTES.—A lump of ore from Bremen's "76" mine, weighing 2 or 3 tons, was sent east last week. Its value is estimated at about $4,000. Shedd has received a 4-months extension on the Black Hawk and other properties in the Bullard Peak. The Blue Bell bond has not expired. The Income Co. has about 2,000 tons of good ore on the dumps of the various mines they own. They will begin to ship the bullion from their mill regularly after next week. The mill of the Silver City M. & M. Co., heretofore known as the Carrollton mill, was started up Wednesday last, on ore from Lone mountain, belonging to Frank Bisby. Mr. Henderson, the superintendent, expects to keep the stamps steadily at work on this and the Cosette mine ore. The main shaft on the Shermau is down to the 100-ft station. A drift will be at once started to intersect the vein. This level will be connected with the bodies known to exist above. The increased force of men has been put to work extracting ore for the mill. Some very high-grade ore has been found during the past week. The hoisting engine is now in good running order, and works very satisfactorily. Carpenters are at work framing the shaft house. Our Eureka correspondent writes us as follows: The M. & N. M. C. M. Co. are still finding large bodies of high-grade ore in the Hornet and King mines, and continue their weekly shipments. Of 40 tons shipped by them they received an average of $175 per ton net.

OREGON.

PROLONGED SEASON.—Jacksonville *Times*, May 5: The mining season has been prolonged considerably by the late spring rains, and proves to be a favorable one generally. Miners owning gulch claims have hardly been as fortunate as others, however.....Bybee, Newman & Hawkett, who own one of the best pieces of mining property in the State, situated near Waldo, will soon commence getting it in shape for next winter's run. They will repair the old ditch, and perhaps build a new one. .....McMullen & Johnson, of Silver creek, Josephine county, are doing very well. They have been picking up some good-sized pieces, one of which weighed $23. There is an unusual quantity of snow in that section, which retards expeditious mining.....A great many miners are now engaged in cleaning up. Osterhout & Co., of Foots creek, made a clean-up the other day, which resulted favorably.....John Atteberry says the miners of Jackass have moved more dirt than ever this season, with favorable results.....Saltmarsh & Co., on Sterling creek, continue to pick up chunks of gold in their claim. Last week they found a neat nugget, worth $80. A good clean-up is expected here.....O. Swacker informs us that the miners of Foots creek have plenty of water still, and are doing well. Lance & Co.'s hydraulic claim is being worked to perfection, and a good clean-up is expected.

THE proprietors of the iron works at Greenville, Plumas county, have constructed a steam launch, to be run on Feather river, at Big Meadows, for pleasure excursions.

Chemistry of Ripening Wheat.

Scientific Teets with Practical Bearings.

The discussion of hest methods of harvesting wheat involvee many considerations. Direct issue is now heing made between the result hy self-hinding reapere and hy the old header method of gathering. Very important are the cost of the work, the saving and waste of grain, etc. Another matter of importance is the composition of the grain at different times of cutting. Thie is a matter which only the chemist can accurately eet forth, and to assist those who are fully able to figure up the labor and gross weight items from their own experience, to arrive also at the chemical etatns of the queation, we reprodnce, below, the detailed chemical investigatione made last summer hy Prof. Kedzie of the Michigan Agricultural college, and read last August hefore the American Society for the Advancement of Science:

Prof. Kedzie's Report.

The wheat crop of the United States ie of great importance, hecause it is a etaple agricnltural production in nearly every State and Territory of our Union. The grain is also important, hecause it furnishes the leading article of food for civilized man. Both as cousnmers and prodncers Americane are interested in this leading cereal. Any circumstance, therefore, which may affect its production or modify ite nature as food hecomes a matter of general intereet.

One of the circumstancee which has a modifying influence upon the quantity and the qnality of wheat is the time of cntting the grain. There is eome divereity of opinion respecting the time when wheat shonld he cut in order to eecure the hest resnlts, eome advocating early cutting, and others recommending that the grain ehould become dead-ripe hefore harvesting. The plea for complete ripening, like the plea for flinty wheats as a class, is hased upon the claim that only the hard and flinty wheats have the desirable amount of glnten; that the early ripened and the eoft wheats are so deficient in gluten that good flour cannot he made from them, and only the hard wheats possess the requisite amount nf gluten.

The trne explanation of this exaltation of the flinty wheats, and depreciation of the soft wheats, is that there has heen a revolution in the methods of milling, hy the introduction of the patent process. Under the old method of milling, when the grinding was completed at one operation, the soft wheate were in demand, and early cntting, while "the herry was in the dough," was recommended. But since the new process has heen introduced, in which the grinding is accomplished in successive etages, and the highest prized and priced flour ie now made from the middlings, which formerly were discarded as unfit for human food, a very different quality of wheat is desired. The eoft wheate are no longer in demand, hut the hard and flinty wheats, which will produce the largest amount possihle of middlings for purifying, making the "new process flour." The farmer is urged to discard his white winter wheat, and to let his wheat stand till dead-ripe, in order to secure the hard aud flinty herry. This is fair and legitimate, and ehould give offense to no one, for the miller has the right to give the preference to one quality of wheat herry over another quality; hut ths case hecomes different when he alleges, ae the ground for enoh preference that the soft wheat is eo deficient in gluten as to he incapahle of making good flour, and that the formation of gluten is one of the latest acts in ripening of wheat, and that the early ripened herry is so defioient in gluten as to he unfit for milling. The question, then, hecomee one, not of physical tsxture, hut of nutritive value. The farmer resents the impntation that his grain is deficient in the most important nutritive principle, while the conaumer hecomes solicitons lest he may he using flonr not up to the standard in nutritive value.

There would have heen less heat in this disonssion if the miller had frankly said that in consequnce of a great change in the process of milling, wheat of a very different textnre is now in demand, without attempting to drive out the wheats which have heen standarde of excellence, hy representing them ae so deficient in gluten as to he unfit for his nse. The farmer replies: "My white winter wheat had enough gluten five years ago, and commanded the highest price. Why has it hecome so poor in gluten?" It ie hardly fair for the miller to attempt to cover his change of hase from white to flinty wheats hy this flank movement of asserting that soft wheats are deficient in gluten.

But if it is true that the hard and flinty wheats alone contain the desirahle quantity of gluten, and that glnten ie the last principle developed in the process of ripening, it is important for all clasees that the facts should he known, hecause in the long run the truth can wrong no one.

We are told that the wheat of warm climates is richer in glnten and more flinty in texture than wheat of cold climates. Some persons seem to aseume that the flinty quality of such wheat ie in consequence of ite large content of gluten, and that the hardneee of any wheat ie proportioned to ite content of gluten; that eince the wheat of thie climate hecomee more flinty hy over-ripening, thie change mnst he attended hy an inoreaee of gluten in the last etagee of ripening.

The oomposition of wheat at different psriods of growth, sesmed to me a snhject of so much importance that I determined to give it a carefnl investigation. In such a etudy it was not my desire to view the snhject from the standpoint of either the farmer or the miller. My aim was to establish data rather than to formulate opinions. It eeemed to me that for ench an investigation the most trnstworthy conditions would he farnished hy chemical analysis of the wheat at different etages of growth.

Selecting Specimens.

A field of Clawson wheat, which appeared to be very nniform in its growth and in the quality of its soil, was selected for one eet of specimens, and another similar field of Schumacher wheat for a parallel set of epecimens. I decided to take two sets of specimene of diffsrent varieties of wheat in order to eliminate the inflnence of individnal peculiarities in either variety.

I hegan to gather my specimens on June 26th, and gathered a specimen of each variety at 9 o'clock A. M. for 21 euccessive days, a period embracing the progressive changes of the herry from its early formation, and hefore the contents of the herry were milky in color, up to the time nf dead-ripeness. The Schumacher, however, was fonnd to he somewhat in advance of the Clawson through the whole eeries, and the herry was in the milk at the first cntting. It seemed to keep about five days in advance of the Clawson.

A emall hundle of the grain was cut, lahelled, and placed to ripen and dry iu an airy room, so as to give the hest possihle conditions in harvesting; and every hundle was snhjected to the same treatment in drying and ripening. When fully dry, the grain was heaten out hy hand, winnowed, and preserved in glase jars for chemical analyeis. The grain, thus ripened on the etalk, as it slnwly dried in the sheltered room, was different from what it wonld have heen if threshed out as soon as cut; hut the difference was the same for all, and the grain thns matured wonld represent the results secured hy ripening under the most favorahle conditions of harvesting at the several periods of cutting.

Condition at Time of Cutting.

The following diary will give some idea of the condition and development of the herry and the ripening of the stalk at the snccessive periods of cntting. I aleo inclnde a hrief etatement of the condition of the weather, which may assist in explaining the rapid changes which took place at certain stagss of growth:

Description of the Different Cuttings.

No. of Cutting.	Mean Daily Temperature.	Clawson Wheat.	Schumacher Wheat.
1	77½°. Cloudy.	Stalk green, berry watery and immature, a little milky.	Stalks green; herry milky, easily crushed by fingers, sweet.
2	75° Rain.	Stalk green; leaves rusted slightly; berry very immature, somewhat milky.	Stalk green; berry easily crushed by fingers, milky and sweet.
3	62½°. Rainy.	Berry milky and sweetish, color of berry, green.	Berry more milky, but greenish; can be crushed hy fingers; sweet.
4	68° Cloudy.	Berry milky and sweet; still green in color.	Berry, yellowish, milky dough; fingers stained hy milk when being crushed.
5	70½° Clear.	Berry milky, sweet, green, no dough.	Straw becoming yellow; berry in milky-dough condition.
6	72½° Clear.	Straw still green; herry milky, sweet, greenish in color, no dough.	Berry in the dough; crushed between thumb-nails, stains them.
7	77½° Cloudy and raining	Stalk green, hut leaves yellow; berry more milky, sweet, yellow-green.	Straw purplish, hut leaves green; berry in the dough and becoming yellow.
8	79°. Hot and close. cloudy.	Straw green; heads yellowish; herry yellow green tbick milk, sweet.	Head brown; herry deep yellow, stiff dough, can be crushed hy thumb-nails.
9	66°. Cooler and cloudy.	Stalks and heads turing yellow; herry milky-dough, sweet.	Berry brown, hard; difficult to crush between thumb-nails.
10	71°. Clear.	Stalks and heads yellowish green; oerry less sweet and more doughy.	Berry crushes dry; grain harvested today.
11	78° Rain in night.	Stalks yellowish; heads begin to bend; herry, thin dough, a little sweet.	Straw purplish-red and fully ripe.
12	73°. Rainy.	Straw yellow; heads hend more; berry, in the dough, only a little sweet.	Heads bend over; stalks hecoming brown and leaves dry.
13	75°. Cloudy.	Heads bent over; berry, stiff dough.	
14	74°. Clear.	Berry crushes dry between thumb-nails; harvested today.	
15	76°. Rain in night.	Berry nearly dry and becoming hard; straw entirely ripe.	
16	75°. Cloudy.	Berry dry and hard; stalks a full yellow.	Ripe and over-ripe
17	73½°. Clear.	Stalks over-ripe; berry shells on handling sheaf.	
18	79°. Clear.	Stalks become brittle.	
19	81°. Clear.	Stalks become brown and brittle.	
20	85½° Cloudy.	Manifest'y dead ripe.	
21	78°. Cloudy.	"Still dead."	

The Gross Product Per Acre at Each Cutting.

The amount of grain, ae influenced hy the psriod of cutting, is a qneetion of practical importance to the farmer. In making this estimate, I confined my attention to the weight of perfeotly dry herry, hecause I was satiefied that any variation in amount of grain attendant upon changes dnring growth arise from variation in the size and weight of the herry, and not from any change in the numhsr of grains growing on a given area, since new grains wnuld not form dnring the period of ripening, and all those already formed woud pass throngh the successive stagee of development more or less completely. In this way there were eliminated several sources of error incidental to meaeuring the grain produced on a given area, ench as the loss of grain in handling, and from incomplete threshing, varying productivenese of different plots of soil, eto. All hroken kernels and foreign substances of every kind were removed, hut no grains were removed in consequence of imperfect development. The grain was then poured into the scale-pan of a delicate halance, and ten grammee carefolly weighed out, and the numher of grains of wheat counted. This wae repeated ten times for each specimen, and one-tenth of the sum of the whole was taken as representing the numher of kernele of wheat for the weight of ten grammes.

The gross product of grain at the several stages of growth would he directly ae the weight of the kernels, and inversely as the numher kernels required to produce a given weight.

The average numher of grains of wheat required to weigh 10 grammes at the several periods of cutting is given in the following tahle. I have also estimated the number of hnshels of grain at the different periods of cntting on the supposition that each variety of wheat produced 30 hnshels to the acre as its maximnm. The tahle also contains the percentage of nitrogen, cellulose and ash, at the different periods of growth:

TABLE I.

Number of Cutting.	Clawson. No. grains for 10 grains.	Clawson. Bushels to acre.	Schumacher. No. grains for 10 grams.	Schumacher. Bushels to acre.	Clawson. Nitrogen.	Clawson. Cellulose.	Clawson. Ash.	Schumacher. Nitrogen.	Schumacher. Cellulose.	Schumacher. Ash.
1	764	11.23	484	16.11	3.62	4.03	2.72	3.72	3.40	2.20

21	268	29.55	276	28.26	1.92	2.39	1.78	2.21	2.36	1.8

The falling off in the seventh cutting of Claweon ie curious, and I can offer no explanation. After the complete ripening of the grain there is a sensihle decrease, showing that the common impression among farmers that there is diminished production of grain when harvesting is delayed too long, is well founded. This loes ie not from careless handling of the grain or from drying hy over-ripening The loss is a real one, thongh not large.

Chemical Analysis.

The wheat wae powdered hy prolonged hsating in an iron mortar, and sifting this in a wire sieve of 38 meshes to the inch, and this process repeated till the entire quantity taken had passed throngh the sieve. The amount of water in each specimen was determined hy prolonged heating in the steam hath, and cooling in a sulphuric acid desiccator till there was no further loss of weights, and the entire loss of weight was taken as water. The results of all analyses and other estimations are hased upon water-free material.

The ash was determined hy prolonged hurning in a shallow platinum dish, kept at a low red heat till the ash hurned white, and the ash was weighed with its natural contents of carhonic acid. The percentage of ash ie given in tahle I, which shows a regular decline as the grain develops hy formation of ash-free carhhydrates.

The cellulose was estimated hy hoiling in water containing 1¼% sulphuric acid, then with water, and repeating process; then with 1¼% canstic potash solution—then hoiling with water and washing the crude cellulose with alcohol and ether, following Henneberg's method. The crude cellulose was then dried in water hath to constant wsight; then incinerated and the weight of ash deducted, when the residual weight was taken as cellulose. No estimate was made of the small amount of nitrogen which it contained. The cellulose was of a light-hrown color.

The percentage of cellulose regularly decreased from the earliest formation of the grain np to the time of ripening, the amount heing greater in the first cuttings of Clawson than in those of Schumacher, hecause of its more immatnre condition. After ripening, there is an increase of cellulose, showing that over-ripsning is attended hy a loss of nutritive material, if we consider dense cellulose as indigestihle. Thie increase of cellulose seems to he in intimate relation to the process of hardening exhihited in dead-ripening.

The nitrogen was determined in the nenal way hy comhuetion with eoda-lime, and the amount of alhnminoids estimated hy multiplying the nitrogen hy 6.4. The percentage of nitrogen ie given in tahle I, and the estimated amount of alhnminoide in the dry euhstance ie given in tahle II.

TABLE II.

By tahle II. it will he seen that the highest psrcentage of alhuminoids is formed in the earliest stages of growth, and it falls off regularly to the complete ripening of the seed, which contains relatively less alhuminoids than at any previous period of growth. The claim that gluten is principally formed near the close of the process of ripening, and that the dead ripe wheat containe more glnten than wheat harveated at some earlier period of growth, receives no support frnm the results of these analyses.

The hard and flinty herry secured hy over-ripening is no richer in gluten than the softer herry secured hy early harvesting. I am now speaking of the percentage composition, and claim that a hundred pounds of early ripened wheat will contain a greater number of pounde of alhuminoids than will a hundred pounds of the same wheat at a later period of ripening, when the accumulation of starch and other carhhydrates will have lowered the relative amonnt of alhuminoids. But while the alhuminoids are centessimally greater at early periods of growth, the acreage produot increases with the growth of the crop up to a certain stage of ripening (when the grain crushee dry), and after thie period there is un increase either relatively or absolutely. This will he seen hy a glance at the tahle, which gives the acreage product of alhuminoids on each succesive day of cutting. If the dead-ripe wheat is hetter for the miller than wheat cut an earlier period, it is in consequence of the physical properties of the flinty herry, and not from any change in the chemical composition or increase of nutritive value.

Carhhydrates.

One significant change in the procses of ripening wae the rapid accumulation of starch. So rapid was the accumulation of the carhhydrates, that while the alhuminoids inoreased in actual amount the increase of carhhydratee was eo much more rapid that the percentage of alhuminoide fell off continually up to the period of ripening, and when the storing up of starch was completed the ripening of the grain was also complete.

Straw.

No effort was made to detsrmine the foodvalue of the etraw at the different periods of cutting. The grain eo far outranks the straw in money value, that the farmer is willing to sacrifice the straw, if therehy he may secure a corresponding increase of value in hie grain; hut the farmer is well aware of the rapid deterioration of the straw hy allowing it to stand till the grain is dead-ripe, and if the dead-ripening is attended hy no rsal increase of valne in the grain, hut an actnal loss in the amount of grain, and the etraw deteriorates greatly in the meanwhile, he may conclude that it is hest to cut hie grain ae soon as ripe, and thus save himself from needless loss.

A LARGE MINING SUIT.—A suit has heen commenced hy Morris Cohen, of San Francisco, in the Superior Court of Calaveras county, against the administrators of the estate of A. M. Mitchell, decsased, and Wm. Cline, to recover a large interest in certain mining property in Vallecito mining district, Calaverae county, which is said to have a speculative value. Some of the mining lawyers who fought the Alhion-Richmond litigation in Nevada have heen retained hy the plaintiff, whose complaint is in the nature of a hill in equity to oompel the defendants to deed him the premises in dispute, and, judging from the voluminous pleadinge and the reputation of counsel in the case, there may he expected a prolonged and expensive litigation. An injunction has already heen iseued which arrests all further proceedings in the estate. Inasmuch as the administrators had negotiated a sale of the property, this ties their hands and calls them to account for the *alleged* intereet of the plaintiff in the property hefore any further steps are taken by them to dispose of it to a third party.

A PLOWING PROSPECTOR.—This occurred in Amador county, in this State: Not long since, while plowing a vineyard helonging to Mre. Jonn Bales, near the old Hardenhurg mine, the plowman struck a small seam of rich-looking qnartz. Mr. A. Kessler has followed this seam down about two ft. and the rock is richly laden with the precious metal, showing free gold in liheral quantitiee.

FROM Mr. H. L. Nickels we learn that a hack channel hae heen struck by Superintendent Yule in the Lewiston company's mine on Park's har, and what is hetter, that the new channel prospecte well and promiees to he exteneive.—*Trinity Journal.*

Steady Progress in Tombstone Mines.

No mineral district within the United States has made so wonderful progress in development within the last four years as the Territory of Arizona. It only seems like a day when we look back to the discovery of the mines of Tombstone, which have proven the chief factor in working the great revolution in this then land of the Apache. It is true that before this most notable discovery there had been mines which had yielded large amounts of bullion, and that had paid their owners handsomely for a short season. Notable among these were the old Vulture, near Wickenburg, the Peck, near Prescott, and some of the Castle Dome mines, on the Colorado. Exhaustion had closed the Vulture, litigation the Peck, and other causes had lessened the product of the less noted mines of the early days of Arizona, until the whole country was looked upon by mining operators as being quite or nearly as destitute of valuable mineral deposits as it was desert and barren in its general aspect. The discovery of the bonanzas of the Tombstone company and that of the Contention created scarce a ripple in the Pacific coast mining circles, so prejudiced were the operators of San Francisco against anything east of the Colorado river, and in fact the tone of public sentiment there is but little better today than it was four years ago, notwithstanding the millions that have been poured into her lap from this adjoining country. The bullion product for the calendar year ending December 31st, 1880, is estimated by the Director of the Mint at $5,566,601. That for the year 1881 was nearly $13,000,000, or a gain of fully $7,000,000. This shows the enormous strides made in the short space of one year, which we expect to see equaled, if not exceeded, this year, which will make Arizona's output not less than $20,000,000, placing her second only to Colorado.—*Epitaph.*

The Rich Old Placer Diggings of Mono.

J. C. McTarnahan has for the past year been making preparations for hydraulicing at Dogtown gulch, in the old Mono diggings, where the ground in 1861-2 was very rich in places. He left Reno on the 22d, en route to Bridgeport, to commence operations, which will be continued until the ice and snow of next winter compel him to abandon the work. He has a long flume already constructed, and an unlimited supply of water from Green creek is ready to be turned on. Twenty men will be employed night and day upon a bank 12 to 20 ft. high. The ground is known to be good, and there are thousands of acres equally valuable in that vicinity.

Mr. McTarnahan told a Reno *Gazette* reporter that there would be no trouble about slickens, as the land below the tailrace is of an alkali nature, and will be greatly benefited by the sand and sediment which may be deposited on it. In fact, Mr. McTarnahan has been offered a respectable sum if he will divert his tailings upon a certain farm in the vicinity. The few small spots over which the slickens must necessarily flow, unless impounded, and which will not be benefited by them, have been bargained for at a fair price per acre, if damaged; so that everything between the miner and farmer has been amicably arranged prior to commencing operations. The gold obtained at Dogtown is very fine, worth $18 per ounce, while over the ridge, a mile distant, in Old Mono proper, it is worth not more than $13. Several citizens of Reno are interested in this venture. It is to be hoped that it will be a profitable one.

Mills in Douglas County.—The Ventura mine, at which a five-stamp mill is being set up, is in Burbank District, three or four miles east of the Mountain House, on the Aurora road. The property is owned by M. B. Dwelly, of Gold Hill, and M. C. Lake, H. H. Beck and others, of Reno. They have, says the Genoa *Courier*, about 200 tons of ore on the dump, which they estimate will work from $30 to $45 per ton. There are twenty men now at work, and as soon as the mill starts more men will be put on. The Orpheus mill, which is situated nearer the Mountain House, started up last Monday. The owners of the mine have heretofore paid expenses with a hand mortar, and good results seem almost certain. The Alda mill, which is situated some six miles further north, will start up in about a month, or sooner if the road can be cleared of snow, on ore from the Alda and Alpha mines. The Alpha company are also taking out ore that they estimate will mill over $50 per ton. It is said to be the richest ore ever found in the mine, and comes from a point 200 ft. from that portion of the mine heretofore worked. Two other mills will shortly be put up in that section.

What Our Coins Weigh.—One million dollars in gold weighs 3,685 5 7 lbs. avoirdupois; 1,000,000 trade dollars weigh 60,000; 1,000,000 of 412½ grains weigh 58,928 4-7; 1,000,000 in fractional coin weighs 55,114 2-7; 1,000,000 in five-cent nickels weighs 220,457 1-7; 1,000,000 in three-cent nickels weighs 142 857; 1,000,000 in one-cent pieces weighs 685,714 1-7. A coinage of 4,000,000 of the new silver dollars per month would amount in a year to 2,838,572 3 7 lbs., or over 1,414¼ tons, and if the pieces were laid side by side they would form a continuous string 1,136½ miles in length.

Useful Information.

The Dangers of Ignorance.

One cannot judge from the brief accounts given what are the precise causes of many disasters, but there is reason to believe that ignorance is prolific; that many persons have only a vague knowledge of the qualities of nitro-glycerine, cannot recognize it when they see it, and are not acquainted with the various forms in which it is compounded, or with the peculiar dangers of handling it carelessly. Nitro-glycerine itself is a dense, yellowish liquid, but in order to diminish the danger attending its use, fine earth, ground mica, sawdust, or some similar powder, is saturated with it, and thus the various blasting powders known as dynamite, mica powder, dualin, rend-rock, etc., are formed. These compounds can be transported with comparative safety. But the nitro-glycerine easily drains off from the powder and oozes from any crevice in the vessel in which the compound is kept. Drops of it thus bedewing the edges of a box may very easily be mistaken for oil escaping, and if workmen ignorantly endeavor to nail the box tighter or to open it for examination, there will be a disastrous explosion. Several have occurred in past years in this way. The victims knew, no doubt, that nitro-glycerine (or the compounds) may be exploded by a blow (contact with fire is not needful), but they did not suspect that the innocent-looking oil was nitro-glycerine.

Why should not youth be taught in the schools somewhat of the practical dangers of these substances which are coming into such common use? They would pursue the study with interest, especially if there were judicious experiments. A Missouri story is that a teacher confiscated a small metal box which a pupil was playing with in school hours, and, thinking it contained chewing gum, tried to break it open with a hammer. It was a dynamite torpedo of the kind used on the railroad track as a danger signal, and large bits of it had to be cut out of the lady's cheek. Would it not have been well if she had known somewhat of the aspect of torpedoes? Was it not more important to the journeyman plumber who threw the lighted match into the pan of camphene, mistaking it for water, by which the great printing establishment of Franklin Square was burned some 28 years ago, to know camphene by sight than to have memorized many of the matters prominent in a public-school course? Surely workmen, especially "raw hands," in establishments where these things are used, should be systematically instructed in advance, and the courts are now enforcing this principle.—*Benjamin V. Abbott, in Popular Science Monthly.*

Sweet Gum Timber.—The diminishing supply of black walnut for cabinet work and car-building purposes, makes it highly desirable that its place should be made good by other kinds of hard wood not hitherto used. Many inquiries are made as to the capabilities of sweet gum for this purpose—a kind of timber which is quite abundant in some of the Southern States. It is strong, close-grained, has a handsome color, is easily worked and holds a nail well, but has an inveterate tendency to spring and warp, so much so, in fact, that if used for coffins, it would, to borrow the expression of a dealer, "twist itself right out of the ground, corpse and all." It is said to give good satisfaction, however, where it has been worked narrow and well fastened. Any one who can discover a method of preparatory treatment that will overcome this difficulty, has a fortune within his grasp. There is an immense waiting market for the timber, in case it can be made available for the same general uses as black walnut. A writer in the *Northwestern Lumberman*, who has been in the lumber business for many years, says he has used it both for framing and finishing and finds that it does well in a twelve year's test, although it is only the old, well-matured trees that turn out good finishing lumber. These trees can be distinguished by their scaly bark. The older the tree the less is the liability to warp, and the better the color; but lumber cut from young smooth-barked trees will warp and spring badly.

Metalline.—The compacted material known as metalline is destined, it is believed, to effect a great revolution in both heavy and light bearings. Its moderate strength requires that for heavy work it should be supported by metal; it was introduced in the form of plugs thickly distributed in the bearing surfaces. The U. S. Government has recently ordered this material to be applied in five thousand bearings. It called for two millions of the plugs. An improvement was in progress which would allow oil to be used with it.

Successful Electric Lights.—Cleveland is now illuminated by electric lights on two tall masts, one of them 250 ft. and the other 200 ft. high, and it is demonstrated that at half a mile distant ordinary newspaper print can be clearly read. It is also said, says an exchange, that the higher the electric light the more distinct, the more penetrating and the more valuable will be its effects.

Iron or steel immersed in a solution of carbonate of potash or soda for a few minutes will not rust for years; not even when exposed to a damp atmosphere.

Fats and Fatty Acids.—To recover grease and fats from water or suds in which wool has been washed several processes may be employed. One of the best is to treat the water with sulphuric or muriatic acid, by which the grease or fat is decomposed, and the fatty acids separated. This should then be removed to a separate vessel, preferably a lead-lined wooden one, heated to 212° with live steam. A small quantity of chalk should be added to neutralize the free sulphuric or muriatic acid present, and the mass thoroughly stirred with the addition of hot water. It should then be left standing for some time to settle, and the fat can then be drawn off clear. It can be reconverted into soap by alkali, or may be further refined by the methods in common use and used for the preparation of candles. The following plan, according to Simmons, for recovering oils and other useful matters from soapsuds and other waste waters, in use in England, is to treat them with the exact amount of a mineral acid requisite to liberate the fatty acids in the form of magma (or paste). This is placed in filters and treated with acid and alkali, and pressed, with the aid of heat, to separate the fatty acids. The fatty acids are distilled in stills lined with a metal or alloy not acted on by oil, a steam jet or exhauster assisting in the discharge of the vapors.

India-rubber Varnish.—Dr. Elder gives the following recipe for making India-rubber varnish: Inclose 30 grams of finely-cut caoutchouc in a capacious linen bag, and suspend this within a flask containing a liter of benzine, by means of a thread held fast by the stopper so that the bag remains near the surface of the liquid. In the course of six or eight days, the soluble portion of the caoutchouc—about 40% to 60%—will pass into the benzine, while the contents of the bag will expand enormously. The clear solution, which is quite viscous, and contains 1.2% to 1.5% of caoutchouc, is then carefully separated. The swelled contents of the bag retain one-fourth to one-third of the benzine used, and may be utilized for the preparation of an inferior kind of varnish. A solution of India rubber in benzine, kept in half-full bottles, is decomposed on exposure to light, which may be seen by the change in the solution from a viscous to a thin fluid condition. Even in the dark this change goes on, but it takes about three times as long.

Good Health.

Pin Worms and How to Get Rid of Them.

A correspondent of the *Scientific American* propounds the following: It is exceedingly desirable that people should know more of the history of *Ascaris vermicularis* (pin worm). Encyclopedias give everything about them excepting what we ought to know, even the pictures. Please give us a paper on the subject, not for scientists, but for parents. I am a man 60 years old, and shall die of them. I know of no relief for their poison but cool injections. Every few weeks they produce diarrhœa, and the visible surface of my outflow will give 50 to the square inch, to say nothing of the millions out of sight. After these liberal outflows there is a *short* relief, but only *short*. We wish to know:

1. Where is their original home?
2. How do they enter our body?
3. How many days' incubation?
4. How many days' life?
5. Are not the eggs laid inside as well as outside the bowels?
6. Is it certain that they occupy only about five inches of the rectum?
7. How to be rid of the few left for seed after every looseness?
8. If derived from food, why all persons are not infected?

A correspondent of that paper replies as follows:

I take pleasure in giving your correspondent the benefit of a protracted investigation of pin worms, which resulted in their complete and permanent extermination in the case in which I was immediately interested.

Like all the myraid parasites which afflict humanity, the pin worm probably came to man by migration from some of his poorer relations of the strictly animal world; it is not reasonable to suppose that Adam had them all.

It is commonly held that transmission is now made by the mouth, the eggs being taken in water or on infected food handled by persons afflicted with worms.

The eggs have been found under the finger nails of children and others troubled with pin worms. It is also on record that the worms have been found in the intestines of infants dead *in utero*, indicating either spontaneous generation or the circulation of the eggs in the blood of the mother.

The period of incubation is uncertain, probably three or four days, as it takes about a week for the intestinal tract to become infested after a thorough evacuation of its contents.

The belief that the worms inhabit the rectum only is a mistake. The breeding place of the pest is the cæcum, whence the worms descend or are involuntarily carried to the lower bowels and rectum. For this reason ordinary injections and medicines taken by the mouth afford only temporary relief. To exterminate the pest they must be reached (and the females killed) in the cæcum, particularly in that portion not purged when the intestinal tract is cleared in the ordinary way.

The simplest means of killing the worms the writer discovered by experiment to be by their immersion in *pure water*. Used to the denser secretions of the intestinal tract, the worms absorb water by endosmosis until they burst. Hence the rational and effective remedy by drowning the pests with copious injections of tepid water after the intestinal tract has been thoroughly washed out, the injections being ample enough to surely flood the cæcum.

The injection should be made while the patient is lying on the back; perhaps most comfortable and effectively while lying in the bath. It is best not to depend upon a single irrigation of the cæcum, or some worms may escape in folds of the lining, or eggs enough may be left to perpetuate the pest. A second flooding should be resorted to in three or four days, and to make assurance doubly sure, the flooding may be repeated once a week for several weeks. With patience and care a perfect and permanent cure can be effected. If your correspondent's physician finds nothing to render the treatment suggested inadvisable in his case, he can count on certain and immediate relief.—*Experience.*

Air Disinfection.—There is much ignorance in regard to the proper disinfection of the air of rooms, etc. *Good Health*, in speaking upon this subject, says: The prevalent idea that the odor of carbolic acid, chloride of lime, creosote, or tea, is a disinfectant, is productive of mischief, sometimes of very great injury. The fact is, they are all worthless as air disinfectants. They produce what many seem to regard as a "healthy smell," but there is abundant evidence that such a smell, while comforting to the mind, may be wholly devoid of protecting value for the body. Disease germs thrive as well in the presence of such odors as when they are wholly absent. The only satisfactory methods of disinfecting the air of a room are the generation of ozone and producing a disinfecting spray with an atomizer. A strong solution of permanganate of potash, sulphate of zinc, bromo-chloralum, or carbolic acid may be employed. The spray should be kept up for some hours. In fact, in a sick-room it is well to keep such a spray in operation constantly, avoiding, of course, so continuous a use or such strong solutions as may become a source of irritation and annoyance to the sick one. Scrupulous cleanliness and thorough ventilation are means of disinfection which are both the best and the cheapest.

Gas Works as Health Resorts.—A few years ago there was quite a mania for frequenting gas works among persons afflicted with any sort of pulmonary disease, particularly bronchial troubles, asthma, chronic bronchitis, etc. The odors always present in the vicinity of these establishments was also recommended for whooping-cough. An eminent French physician has been investigating the matter in a common-sense manner, and reports that animals subjected for some time to the odors referred to, in the purifying chambers of gas works, were found after death to have their lungs filled with tubercles. This is certainly not a very powerful argument in favor of gas works as health resorts. We cannot recommend them, notwithstanding the opinions of an esteemed correspondent.—*Good Health.*

Baldness.—There are several varieties of baldness which are not equally curable. The baldness which results from a fever or other acute malady usually disappears in a few weeks or months. Baldness resulting from dyspepsia is usually curable after recovery of the general health. Patchy baldness, a baldness which appears in spots, is a nervous disease, and usually incurable. When the bald spot is smooth and shiny, with an entire absence of hair, or nearly so, recovery may not be looked for from any remedy or plan of treatment known. Improvement of the general health, with daily friction of the scalp with cold water and a soft brush, will accomplish as much in the line of permanent benefit as can be done in any case. Hair restoratives are nearly all poisonous and dangerous.—*Good Health.*

The Eye in Insanity.—The London *Lancet* states that there are "no appearances of the eyes worthy of a moment's notice in the diagnosis of insanity. The "wildness," "unnatural brightness," "dullness," "vacancy," etc., so frequently mentioned in certificates of insanity, are utterly groundless as evidences of mental "unsoundness." The writer adds that "there is incomparably more restlessness, vacuity and the like in the eyes of the sane than in those of the insane."

Antagonistic Woods.—It is said that certain kinds of wood, although of great intrinsic durability, act upon other woods of equal durability in such a way as to induce mutual destruction. Experiments with walnut and cypress, and cypress and cedar, prove that they will rot each other while joined together, but on separation the rot will cease, and the timbers remain perfectly sound for a long period.

The most unhealthy city in the world is St. Petersburg, in which one-twentieth of all the inhabitants die annually.

Dividend Notice—Silver King M. Co.
Dividend Notice—Standard Con. M. Co.

Passing Events.

There is just now going on a great rush to Wood River, Idaho, and to Butte, Montana—particularly to the former. We mention some facts connected with the mines in another column. The Wood River *Miner* says that so great is the rush into that section at present that the stage lines running between Wood River and the railroads are unable to carry more than half the passengers booked for towns along the river. At Kelton the hotels are full of people awaiting their turn for transportation, while at Blackfoot it is the same. Many private conveyances have been brought into use, and they are now on the way loaded with human freight. Pedestrians in large numbers are scattered all along the Blackfoot and Kelton stage lines.

Dispatches from Siberia announce the finding of Captain De Long and 13 of his companions, dead in the Siberian wastes. The fate of the adventurous men has called forth the deepest regret throughout the country. There is still another boat load of the men who were in the ill-fated *Jeannette*, who have not yet been found and search is being made for traces of them.

The signing of the Chinese Bill by the President was hailed with joy by all classes of the community, and now California can look forward to more permanent prosperity.

The Indian troubles in Arizona are going to keep that region back this summer badly, and the attractions of Idaho and Montana will drive those who intended going north in the opposite direction.

Lead, $90 per ton. Copper, $400 per ton.

THE Directors of the Hibernia Bank reduced the rate of interest on loans to 6% per annum, the bank paying the mortgage tax. This tax this year will amount to about 2½%, so that really the bank is letting its money at the rate of 3½% per annum. This rate would not be a high interest return in Europe.

ABOUT 3,000,000 Jews live under the government of the Czar, and it is said that "America" is the word oftenest on their tongues. This is the Promised Land to which they look forward, and a plan is on foot to bring 10,000 more of them to this country this year.

A WEEK ago Saturday the Port Blakely mill, at Port Blakely, W. T., eclipsed itself. In twelve hours it turned out 190,000 ft. merchantable lumber. During the week ending on that day, the mill cut a little less than 1,000,000 ft. of lumber. This is claimed to be the largest cut ever made by any one mill west of the Mississippi river. The lumber mills along the sound are all complaining of the great scarcity of hands, white men not being obtainable, and none of them desiring to hire Chinamen.

THE public schools of Gold Hill have closed for want of funds to pay expenses. The district is in debt nearly $4,000.

Production of the Precious Metals.—No. 8.

[An abstract of the Census Monograph on the Bullion output of the country.]

DAKOTA.

The metallic production of Dakota is derived from the region of the Black Hills, and in greater part from Lawrence county, where free-milling gold-quartz ores of low grade are reduced in amalgamating mills of great size. The perfection to which the milling process has been brought is shown by the large percentage of the assay value extracted. Custer and Pennington counties are opening new mines, but had scarcely become producers during the census year.

Dakota Placer Mines.—The following table gives the production of placer mines so far as could be ascertained by the expert in charge of this district. The amount seems very small, compared with the supposed value of the surface deposits in this region. This may be in part accounted for by the fact that several important companies were making ditches, and preparing for work on a large scale, but had not become producers during the census year.

DAKOTA—Production of Placer Mines for the Year Ending May 31, 1880.

County.	Gold.
Lawrence	$47 700
Pennington	3,159
Total	$50,859

MONTANA.

Montana has within its boundaries the elements favorable to a large production of the precious metals—rich and varied ores and abundant fuel, both coal and wood. As yet, however, owing to the lack of development and want of sufficient transportation facilities, it has not taken its proper rank as a producer. Owing to the great extent of territory over which its mines are scattered, and the fact that, from circumstances beyond our control, the collection of statistics was not completed until the winter was far advanced and travel rendered thereby very difficult, the data leave something to desire in point of completeness.

The double-column table in the preceding columns gives the production of the deep mines of Montana by counties, and the yield of the ore treated, as far as could be ascertained, though some small lots of ore are known to have been shipped East, which could not be traced.

The next table shows the relative amounts of ore reduced in stamp mills and by smelting works, with the average yield per ton, and total contents in gold and silver in each case.

Hydraulic and Placer Mines.—The gravel deposits of Montana form an important source of its wealth, and their product is known to be very considerable. The figures for this product have been assumed, in the absence of more reliable data derived from direct information, and are $1,162,908.

The counties from which hydraulic mine returns were received are Deer Lodge, Meagher, Beaver Head, and Lewis and Clarke, the relative amount of production reported from each standing in the order in which they are named above.

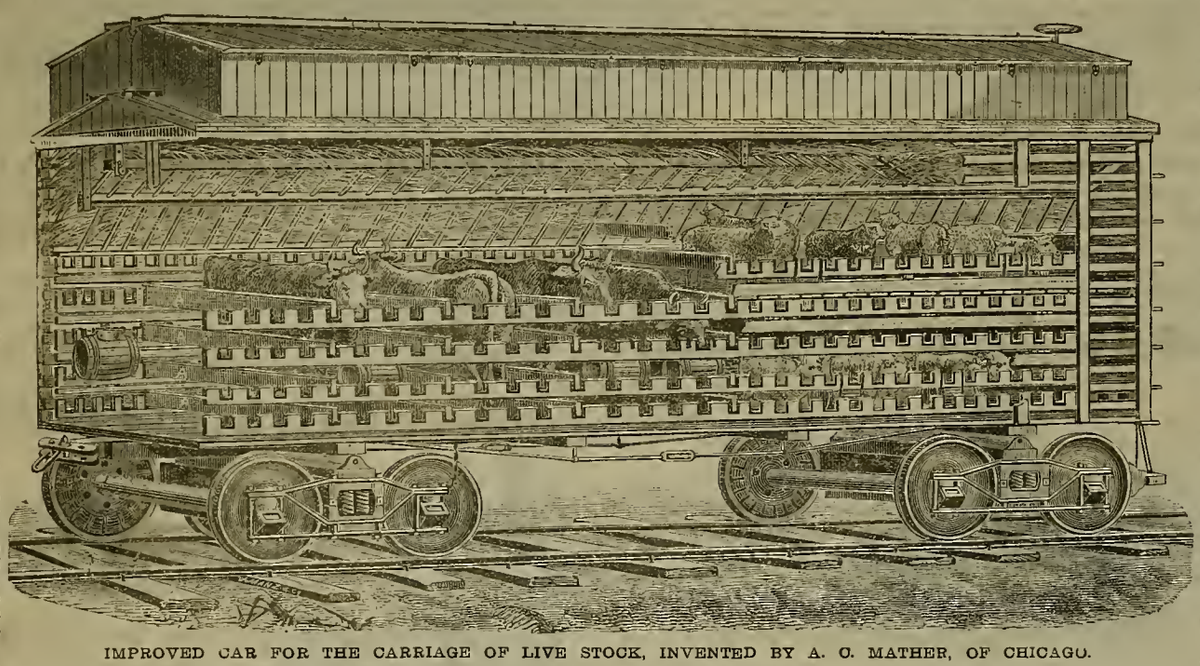
The ores of Montana, like those of Colorado, contain considerable amounts of copper and lead, which cannot be neglected in considering its production of metals. The table below gives the amounts which could be traced, a portion of the copper having been reduced to copper oxide in Colorado. The figures quoted are for crude bullion which was not reduced to the metallic state within the Territory. A certain amount of copper ore was shipped directly East from Montana, but its value or contents could not be ascertained.

AN OLD STORY.—The case of J. Alphonso Carit against William Williams and Andrew Charles, an action for $25,000 damages, is occupying the attention of Judge Allen in Department 3 of the Superior Court. The complaint alleges that the defendants, by aid of exceedingly rich ore, specimen rock and false representations, induced plaintiff to buy stock in the Gold Lead gold and silver mining company, the mine being situated in Nevada, near Virginia City. An expert was subsequently sent up to examine the mine, but the defendants, it is alleged, would not permit him to enter, giving the reason therefor to be that the mine was so rich that the Bonanza firm, upon becoming aware of that fact, by aid of their great wealth, would steal the property; a further reason for refusing entrance to the expert was that he was a friend of the members of the Bonanza firm, and would report to them the immense wealth in sight in the Gold Lead. After the return of the expert the plaintiff, Carit, bought more of the stock, bringing the amount of his investment up to the handsome figure of $21,290. In November, 1880, becoming suspicious that the mine was kept closed for other than the reasons given by defendants, the expert was again sent up to examine the property, but that party met with a rough reception and was driven away. The trustees then took forcible possession of the mine, and upon examination discovered that it was worthless. There was no permanent vein, and the rock was barren. The complaint further alleges that the rich rock, by which the plaintiff was induced to purchase the stock, was taken from some other mine. The case will probably take up the time of Judge Allen for three or four days, and it is said all the mining experts in the city will be called upon to testify.

An Improved Cattle Car.

Our readers will remember the accounts we have published of the efforts made by the American Humane Association to secure a car for the carriage of live stock which would free the animals from the cruelty which attends shipment in the cars usually employed for this purpose. The Humane Society, it will be remembered, did not find any car completely filling their demands, which did not trench upon the rights of inventors, and, therefore, they withheld their award. But their inquiry has brought the abuses in the cattle traffic into prominent notice, and must, therefore, be accounted of public service, for it has stimulated invention, and the result will, doubtless, be great reforms where reforms are sadly needed.

In order to show our readers what has been done in the way of securing a comfortable dining-room and sleeping-car for live stock, we have secured an engraving of one of the most famous devices of this kind, patented recently by A. C. Mather, of Chicago. The advantages claimed for this car are chiefly that it avoids the necessity of unloading stock to feed and water; that stock cannot trample upon or otherwise injure each other, or crowd, or be thrown to one end of the car by sudden stops and starts; that the hay-rack occupies space which is not needed for the stock, and can be raised or lowered to suit the kind of stock desired to be shipped, and put up close to the roof, out of the way, when the car is desired to be used for carrying merchandise, that the water-troughs are simple, strong and easily adjusted or cleaned; that these troughs, and also the bars used for separating the stock, are put out of the way of merchandise, being locked in a box on top of the car; that by avoiding the necessity of stopping or unloading repeatedly to feed and water, much time is saved in transportation, and by providing against hunger, thirst and the infliction of injury by stock upon each other, stock will not lose in weight or in quality of the meat when killed; that by loading the cars as ordinary cars are loaded, and placing the bars between stock afterwards, from outside the car, no trouble is experienced, time lost or danger incurred from entering cars with the animals: that these bars have the advantage of being both light and strong, so no car space is lost, and are so fastened as to prevent all possibility of their becoming loose, and that, as will be seen by examining the illustration, different kinds of stock can be safely and comfortably carried in the same car at the same time. That provision is made against the possibility of fire, by having the space between the five upper slats closed; that extra hay and water is carried in a tight box on top of car and fed through the roof to the animals twice a day with regularity during the entire journey. That these improvements can be put on the present stock-cars, and that the car has shown its value by practical tests en route.



IMPROVED CAR FOR THE CARRIAGE OF LIVE STOCK, INVENTED BY A. C. MATHER, OF CHICAGO.

An experimental trip with one of these cars from Chicago to Boston is described as follows: The car was loaded with 15 large fat cattle, weighing in Chicago 23,210 lbs., as per certificate signed by two witnesses: that none of these cattle were taken out of the car from the time they left Chicago until they arrived in Boston; that they were fed about 18 lbs. of hay per day each, while the car was running, and given from 8 to 10 gallons of water; that they laid down, got up, and were apparently as comfortable as if in a stable; that they were weighed and sold early the following morning after their arrival in Boston, weighing 22,950 lbs., making a total loss of only 260 lbs. on the entire load, or 16½ lbs. per head, where the average loss is from 40 to 60 lbs.; and one car arrived on the same train which was said to have shrunk nearly 90 lbs. per head, but they were unloaded only once between Chicago and Boston, and then given only a bite of hay, as they had to be there for a certain market.

The growing cattle shipping interest on this coast should lead public attention to the claims of improved cars, for it is positively necessary in order to secure good meat for the consumer and the highest profit to the stock grower that the present methods and practices in cattle shipment should be superseded by more humane ways and means.

Foundry Notes.

The foundries of the city are pretty busy just now on mining and other machinery, and some of them are crowded with work. At the Pacific Iron Works the following comprises some of the work which has been recently shipped and in process of construction:

A 30-ton galena furnace and outfit for the Barrangilla company, to be erected near Durango, in Mexico, and a similar-sized copper plant has been furnished to the Castle Creek Copper company, on the Gila river, in Arizona.

There is being furnished another galena smelting furnace of this size, together with refining works, 10-stamp mill, 50 H. P. Wheelock engine, boilers, etc., for the Plumas mine in Sonora, Mexico. Messrs. Nebeker & Eilerback have ordered a 20-ton copper plant to go to Utah. Among other orders received are the following: Three 40-ton copper smelters for the Philadelphia company, Wood River country, Idaho; 40-ton copper smelter for the Pima company in Arizona; 20-ton copper smelter and complete outfit for the Bagudrachi mine, Mexico; 40-ton galena furnace for Bonanza company, New Mexico.

These Water Jacket furnaces for both galena and copper ores, built by Messrs. Rankin, Brayton & Co., have revolutionized this branch of business and added much to the value of this class of mining properties. The advantages demonstrated in these furnaces are facility and cheapness of transportation and construction, and capacity for continuous work. One important feature recently introduced in these Water Jackets is the circulating plates, which increases the durability of the parts, besides lessening the liability to injury and the consequent expense and loss of time for repairs. By the adoption of this invention the circulation of the water is so rapid that the inner surfaces of the plates are kept scoured and entirely free from any incrustation, and also perfect protection is afforded from the effects of mineralized water and also from overheating. There are also several other improvements which make this smelter the most complete and effective of any now made.

These works have also under construction for the Pyramid mine, in New Mexico, a 20-stamp silver mill, which will include a full outfit. They have also been supplying lately a number of hoists and a large amount of miscellaneous work for various localities.

Among other things made a specialty of here are the Wheelock automatic cut-off engines. They have arranged to manufacture these engines for the trade of this coast, and have received numerous orders for engines of this make to replace those of other styles. Messrs. W. B. Hooper & Co., of Guaymas, Mexico, have recently been supplied with a 50 horse-power engine, and another has been furnished the Hollister Flouring Mills, of 100 horse-power capacity. The California Flour Mills in this city have also ordered a 150 horse-power Wheelock.

This engine has some qualities that specially commend it to the mining and manufacturing interests of this coast. It is claimed to approach more nearly the line of theoretical machinery perfection than any other, and its simplicity of construction and perfect automatic action challenge admiration. It is warranted to run for years without any expense in regard to repairs, and without any other attention than such as an ordinary fireman can give it, no mechanical skill being necessary, as they are run with the throttle wide open, and under all conditions of load or pressure are under control of the governor. It is provided with a stop motion, so that in case any derangement occurs in the governor or its attachments, the engine is immediately brought to a stand-still.

The Seventeenth Industrial Exhibition.

The seventeenth industrial exhibition of the Mechanic's Institute will be opened in the new pavilion, in this city, on August 15th, and continue until Sept. 16th. The official notice to exhibitors is as follows.

Applications for space can be made at any time, and should be made as early as possible, at least two weeks previous to the opening of the exhibition.

The pavilion will be opened for the reception of goods from and after Tuesday, August 1st.

Articles can be entered for exhibition or competition, as desired.

No charge of any kind will be made to exhibitors for space. Steam and water will also be furnished free, in reasonable quantities.

Space allotted to applicants and not taken possession of by the arrival of their goods, or otherwise, on or before Friday, August 11th, may be assigned to other exhibitors.

No article on exhibition can be removed until the close; but reasonable facilities for making sales for delivery at the close of the exhibition, will be afforded.

Power will be furnished for driving machinery, from the main line of shafting, which is 2 15-16 inches in diameter, and will make about 110 revolutions per minute. Driving pulleys, 30 inches in diameter, will be furnished free, and in operation three days previous to the opening, and exhibitors of machinery in motion will be required to have their machines in running order on that day.

Pulleys for the main line, if furnished by exhibitors, must be accurately balanced, and have the owner's name plainly marked thereon, and should be received and placed in position by Friday, August 11th, as, up to that time, it can be done without unnecessary labor and inconvenience.

The Board reserves the right to direct the general arrangement of the articles on exhibition, and to regulate the dimensions of all signs and advertisements.

The most effectual means will be taken, through the agency of the police and otherwise, to guard and protect the property on exhibition; and it will be the purpose of the managers to return all articles to the owners without loss or injury. Still, all articles deposited will be at the risk of the owners.

A liberal number of premiums will be awarded, consisting of gold, silver and bronze medals and diplomas.

The announcement of awards will be made by the Board of Managers, on Saturday, September 9th.

All boxes and packages containing articles for the exhibition should be marked: "Seventeenth Industrial Exhibition," San Francisco, with the name and address of the sender. If the freight thereon is paid, it will be taken charge of by the Board, and removed to the exhibition building. Cartage at the expense of the exhibitor. A detailed statement of the contents of each box or package should be enclosed with the same, or sent separately by mail or express.

Blank applications for space, a copy of the rules and regulations, and any other desired information, will be given on application to the Secretary, J. H. Culver, or the Superintendent, J. H. Gilmore, at the office of the exhibition, 27 Post street.

As a result of the boycotting of G. L. Rist, a business man of Turner's Falls, Mass., by the Irish population, on account of his having served on the McMillan grand jury, the Protestants have withdrawn their patronage from all Irish dealers, of which there are a number.

Idaho Mines.

We had a conversation this week with Messrs. D. M. O'Sullivan and J. F. Kramer, of Rocky Bar, Idaho, who are passing through the city on their way to the Santa Rita copper mines, N. M., where they are to erect some machinery. In coming over the road from Rocky Bar to Winnemucca, they met hundreds of men on their way over to the Wood River country, and they give it as the opinion of Idaho men that the region will be overrun this season with a great crowd of people in search of employment, who will be disappointed. There is plenty of room to prospect, but there is not much for laboring men to do. The present supply in that line is sufficient already.

They say that the road from Rocky Bar to Winnemucca—about 370 miles—is pretty rough in places. From Boise to Winnemucca—270 miles—all but about 40 miles is in a fair condition. The distance along the road to Wood river from Winnemucca is a good long one to walk, yet some men are walking it, most men, however, going in on cayuses, with pack animals. From Winnemucca to Boise is 270 miles; from Boise to Mountain Home, 50 miles, and from Mountain Home to Wood river about 75 miles more. This road is lined with men on their way to the Wood River mines.

There is undoubtedly a great extent of country in Idaho to prospect, as most of it is only "coyoted" or scratched over, and there will probably be many discoveries made this season.

These gentlemen say that at Rocky Bar there is only one mine of much prominence—the Ida Ellmore, working systematically. This has been worked at intervals for the past 20 years. It is near the bed of the river, and is troubled with water to a great extent. The mine is now working another new level and will crosscut and drift on the ledge. The company is deserving of success from the expenditures it has made. Last summer they milled some ore; the ore is free milling and easily worked. They expect to start up the mill by the first of July, or possibly in June. They have a nice little mine, well equipped with a good mining plant. Another mine within a few miles is the Vishnu, where they are working a shaft and drifting. They have a nice 2-ft. ledge of free-milling ore, averaging about $40 to $75 per ton. There are a number of prospects around Rocky Bar, but none of prominence.

In the immediate vicinity of Rocky Bar, the gentlemen met Messrs. Thompson and Graham, who were going to Hardscrabble, a few miles from Rocky Bar, with some Burleigh drilling machinery. Col. Graham was going on some 16 miles further to Atalanta, where he has charge of the Last Chance mine, of which they have great expectations.

Some considerable attention is being paid to Snake River again this spring. The gold there is very fine, but of high grade. Some work is being done there now.

Daly Camp.—George Daly, the well-known mining superintendent who was killed by the Indians not long since, has had a mining camp in New Mexico named after him, as will be seen by the following item from a Territorial paper: There is a prospect of a very decided and stirring boom in the Lake Valley mining district, Dona Ana county. The operators are George D. Roberts, of New York, and J. Whitaker Wright, of Philadelphia, both well known as wealthy and shrewd mining men, whether laboring on the stock boards or in the camps. The principal mines at Lake valley have been opened up, under the direction of these men, in such a manner as to expose large bodies of high-grade ore, said to aggregate fully a million in value. The stock of the various companies organized is selling rapidly in the East, and at high figures. The camp has been christened Daly, in recognition of the great service rendered the capitalists mentioned by George Daly, who effected the purchase of these mines, and who was subsequently killed by Indians. The nearest railroad station is Nutt, and the stage line from there to Daly is owned and run by Con. Cosgrove.

Over 200 manufacturing firms of Rochester have formed an Employers' Protection Association against strikers.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LAROEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

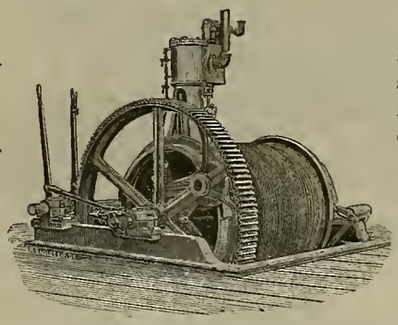
JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

Colorado Iron Works,

MANUFACTURERS OF ALL KINDS OF Mill and Mining Machinery.

Engines, Boilers, Cornish Pumps, Hoisters, Crushers, Rolls, Stamp Mills, Smelters, Furnaces, Ore Cars, Kibbles, Etc. Also, Saw Mills, Heavy Forgings, Bridgs and other Bolts.



Machine Bolts and Lag Screws, at List Prices, with Freight added, less current discount.

THE OLDEST AND LARGEST MANUFACTORY OF MACHINERY IN THE WEST.

For Circulars and Prices, Address

COLORADO IRON WORKS,

Denver, Colorado.

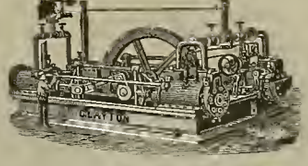
Works, 33d and Wynkoop Sts. P. O. Box 1921.

CLAYTON AIR COMPRESSORS,

—AND—

INGERSOLL ROCK DRILLS.

INGERSOLL ROCK DRILL.



CLAYTON AIR COMPRESSOR.

Having been appointed Sole Agent for this Compressor, I will keep a full stock of the different sizes in store. Prices much less than any First-class Compressor in the market. SEND FOR CATALOGUE.

GEORGE R. FOARD, 18 First Street, S. F.

Sole Agent for the Ingersoll Rock Drill and Clayton Compressor Co.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

RICHARD C. REMMEY, Agent,

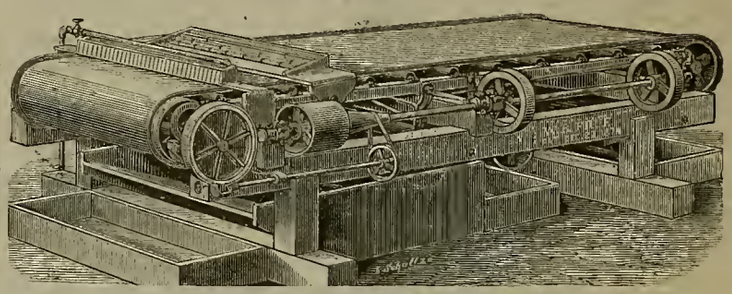
Philadelphia Chemical Stoneware Manufactory,

1100 E Cumberland St., Philadelphia, Pa.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists. Also, Chemical Bricks for Glove Towers.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

Berry & Place Machine Co.,

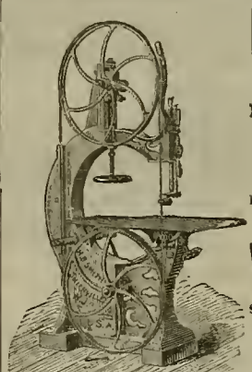
PARKE & LACY, Proprietors.

No. 323 & 325 Market St.,

San Francisco,

CAL.

Importers and Dealers in every Variety of



Wood and Iron Working Machinery,

STEAM PUMPS,

Stationary, Portable and Hoisting Engines and Boilers Sawmills, Shingle Mills. Emery Wheels and Grinders, Gardner Governors, Planer Knives, Sand Paper in Rolls, together with a general line of Mining and Mill Supplies, including Leather Belting, Rubber Belting Packing and Hose.

Catalogues furnished on Application.

ESTABLISHED 1868.

GOLD SAVED

BY USING MY

SILVER PLATED AMALGAMATING PLATES.

These Plates are used in Quartz, Gravel and Placer Mining with gratifying success. I am constantly filling orders for them, and when once used they prove themselves so superior to any other process yet discovered for saving Gold that my customers would not do without them. I have the best facilities on this coast for filling orders for these plates, and will guarantee my work.

Send for Circular.

DEWEY & CO.'S

Scientific Press

Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

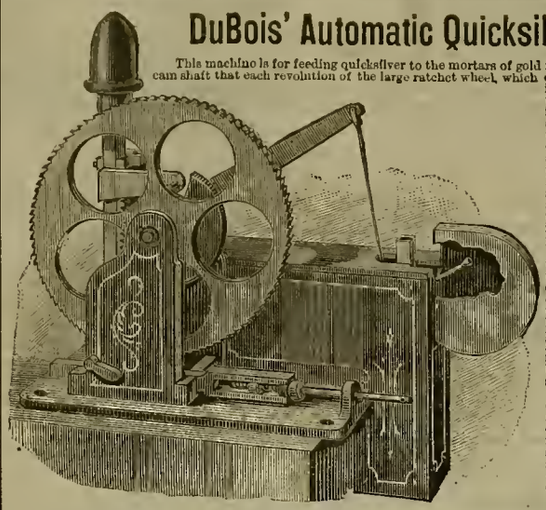
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed to mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

The Explorers' Miners' and Metallurgists' Companion.
Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,
Containing 672 Pages and 83 Engravings,
BY J. S. PHILLIPS, M. E.,
Of California, a Practical Operator for Thirty-eight Years; Explorer and Resident in the Pacific States and Territories for the past Twelve years.
PRICE—bound in cloth, $10.50; in leather, $12.
For sale at this office.

GEORGE WILSON,
MINING ENGINEER and METALLURGIST,
Parral, State of Chihuahua, Mexico,
VIA EL PASO, TEXAS.
Mines examined, reported on and superintended in any part of Mexico. Will buy or rent good mining property. FOR SALE.—Several groups of good mines in State of Durango. 1,450,000 acres ranches.
Terms Moderate

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia, and 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 527 Commercial St., S. F.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING MAY 2, 1882.

257,273—RIDING SADDLE—Joseph Bassler, San Jose, Cal.
257 213—TACK—A. J Culbertson, San Andreas, Cal.
257 306—STATION INDICATOR—Michael Farley, Portland, Oregon.
257,106—WATER AND AIR WHEEL—David B. James, S F.
257 350—POCKET—David Lubin, Sacramento, Cal.
257.351—PIN—David Lubin, Sacramento, Cal.
257 352—ENVELOPE—David Lubin, Sacramento, Cal.
257,173—OIL CUP—John S. McBride, Sacramento, Cal.
257 357 - UNDERGROUND CONDUIT FOR ELECTRIC WIRES—A. F. McGrew, S. F.
257,234—CAR COUPLING—Frank Miller, Olema, Cal.
257 380—SELF ACTING BLOW PIPE LAMP, ETC.—Thos. Poyser, S F.
257 239—UTILIZING SPENT LIMS FOR BRICK AND TILES—E. L. Ransome, S. F.
257,241—PLOW—Milton Ross, San Jose, Cal.
257 244— AR COUPLING—A. Schulenburg, S. F.
257,249—BRAKE BLOCK—Edward O. Spencer, Iowa Hill, Cal.
257 254—TWO WHEELED VEHICLE—Samuel O. Thompson, Santa Rosa, Cal.
257,320—NUT LOCK—Wm. C. Watson, Puyallup, W. T.
257 219—ENDLESS TRACK FOR SEAMING CYLINDERS FOR CANS—Joseph P. Haller, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ENDLESS TRACK FOR SEAMING CYLINDERS FOR CANS.—Joseph P. Haller. Assigns one-half to S. Wagenheim, San Francisco. No. 257,219. Dated May 2, 1882. For making the body of a can there are usually three operations: First, the material is fitted around a forming or seaming cylinder, its meeting or overlapping edges being held in place by a knife attached to the cylinder. Second, the seam is soldered; and lastly, the knife is raised and the soldered can removed from the cylinder. The work is ordinarily performed by one man, and requires his attention to three distinct operations, so that while using his hands to get the material upon the cylinder, or to remove it, his soldering tools must be laid aside. Therefore, there is loss of time. This method is open to the further objection, that it does not distinguish between work requiring skill and work calling for no skill. The second operation—that of soldering the seams—requires skilled labor, while the simple fashioning upon or removing from the cylinder may be done by boys. This brief statement of the method now employed will serve to show the object of this invention. It is an endless track for seaming cylinders for cans, the object of which is to facilitate the work of soldering or seaming cans, and to make it possible to separate skilled from unskilled labor, whereby more of the former may be utilized. The invention consists of a circular guide or track rigidly bolted upon a table upon which track the seaming cylinders slide. A boy stands at a treadle with a seaming cylinder before him. He presses down a treadle and mechanism raises the knife. He fits the material around the cylinder, and, taking his foot from the treadle, allows the retaining knife to press down and hold the edge. He slides the cylinder along the track and directs his attention to another one. The first cylinder is immediately soldered by the skilled workman, who stands beyond the boy. He slides the cylinder along to another boy, who removes it.

TACK.—Andrew J. Culbertson, San Andreas, Calaveras county. No. 257,213. Dated May 2, 1882. This tack is intended more particularly for securing layers of leather or other material together. The tack is made of copper or other malleable substance, and consists of a round and nearly straight body, with a bar head resembling the letter T, and it has a tapered and slightly flattened point, so that when driven through the leather and into contact with a piece of iron upon the reverse side, this point will be turned back and enter the leather from that side, so as to clinch or rivet it firmly. The tack is specially useful in securing the parts of harness together and in the formation of long, heavy loops, the work being done more quickly than by sewing, and it will not rip.

BRAKE BLOCK.—Edward G. Spencer, Iowa Hill, Placer county. No. 257,249. Dated May 2, 1882. This is an improvement in brake blocks for vehicles, and it consists in the improvement in the details of construction in fastening the block to the brake beam, whereby it is held securely and may be readily removed when necessary. The method of fastening would be difficult to describe without engravings, but it is done by means of clamps and nuts in such a way that it cannot get loose.

TWO-WHEELED VEHICLE—Samuel G. Thompson, Santa Rosa. No. 257,254. Dated May 2, 1882. This invention consists in a peculiar and novel arrangement of the shafts, axle, springs, body and foot-board, whereby the unpleasant motion or jogging of the horse is prevented from being communicated to the wagon. The novel arrangement first consists in hinging the shafts to the axle, thus making their movement an independent one, not communicated to the axle, and also providing for their removal for the substitution of a pole when desired. It consists, next, in providing against the too great play or movement of the seat and axle, which, by reason of not being rigidly fixed to the shafts, would naturally turn unpleasantly. This is accomplished by means of a supplementary spring connection, thus steadying the body by securing it to the shafts, and yet allowing the latter to have their independent play between limits without affecting the body. It also consists in hinging the foot-board and connecting it by a spring with the shafts or cross-bars between them.

CAR COUPLING.—Adolph Schulenberg, S. F. No. 257,244. Dated May 2, 1882. This improved mechanism for coupling or uncoupling cars consists of an arm suspended from a point near its middle beneath the end of one car, having a sort of H-shaped head pivoted to its front end. The lower end of this head is formed to drop through a slot in a bar which projects from the opposite car. A latch is pivoted to the side of this head, and the upper end of the head is connected by a chain with a rod or lever, by which it may be raised out of the slot in the opposite bar, when the latch will hold it up until the cars have been separated. When the cars come together the slotted bar passes beneath the suspended arm, first described, and raises the coupling hook open, gliding beneath it until it reaches a point where the pin will fall through the slot and couple the cars.

PLOW.—Milton Ross, San Jose. No. 257,241. Dated May 2, 1882. This relates more especially to certain improvements in those plows for vineyard and cotton-field work, or in such other places where it requires handling of the team and handles to allow the near and effective approach of the plow to the vines. It consists in such a construction as will enable one to throw the beam over to the other side, or adjust it in such position as may be required, and also to shift the handles to conform to the changed position of the beam.

CAR COUPLING.—Frank Miller, Olema, Marin county. No. 257.234. Dated May 2, 1882. This car-coupling device consists in combination with two horizontal coupling blocks adapted to meet each other and engage under an influence of springs, which impinge upon the back of each other, of peculiar sliding guards lying parallel with the horizontal hooks, which prevent said hooks from parting, and of a means of displacing said guards and throwing the coupling-hooks to one side to uncouple or release the cars.

News in Brief.

GEN. ROSECRANS has presented another petition in the House on the question of taxing imitation sparkling wines.

THE Boston Board of Aldermen have authorized the borrowing of $1,500,000 for the construction of a new system of sewerage in that city.

REAR ADMIRAL JOHN ROGERS died last week. The Admiral was 70 years of age, and for a number of years Supt. of the Naval Observatory.

NEWS of the President's action on the Chinese bill is received with jubilation by the people in the interior, and by the firing of cannon.

A COURIER from the Yellowstone country reports that the Crows are exasperated, and are ordering settlers to leave. However, they do this regularly every spring.

IT now looks as if the national debt reduction for the present fiscal year, ending with next month would amount to the magnificent sum of $150,000,000.

NAVAL officers are almost unanimous in the opinion that it is time now for the Government to stop requiring naval officers to go on expeditions to the north pole.

H. H. WARNER, of Rochester, N. Y., announces three scientific prizes—one for the discovery of comets in Great Britain and America, and two for meteoric stones seen to fall the present year.

A COAL mine has been discovered on the San Jose river, 43 miles from Albuquerque, N. M., on the Atlantic and Pacific road. It shows a vein of eight ft. or more. The mine is only one-quarter of a mile from the railroad.

THE Philadelphia *Times* voices the thoughts of a great many other people when it says: "It should be understood henceforward that people who wish to fool around in the Arctic ocean, must do so not only at their own expense, but at their own risk."

THE Louisiana House of Representatives have adopted a memorial to Congress asking the Federal Government to take charge of the levees. Resolutions of thanks to the President, Congress and Secretary of War, for assistance to the sufferers by the flood, were passed.

Back Numbers Wanted.

We will pay 10 Cents a Copy for the following numbers of the MINING AND SCIENTIFIC PRESS:

Volume, 13; Year, 1866; Number, 1.
" 18; " 1869; " 5.
" 20; " 1870; " 1 and 26.
" 22; " 1871; " 1
" 30; " 1875; " 2, 3, 4, 7, 10, 11, 12, 13 and 15.

DEWEY & CO.,
252 Market St., S. F.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
Press, Box 2361, S. F.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Laurel Glen Fruit Farm

This place is beautifully located among the hills. A pleasant drive from railroad and beach. Deer and other game abound in the vicinity. A limited number of boarders can be accommodated for the summer and hunting season. The place is especially desirable for ladies with children. Address, for further information, Isaac Dakin, Soquel, Santa Cruz county.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first-class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

A PUBLISHER WANTED.

A good printer, or a steady and able business man, with a good reputation and a little means, can purchase (at less than two-thirds its value) the whole or a part of a long and well-established and paying newspaper and job printing office, in one of the rising business centers of this State.

Principals only need apply, (and that soon) to DEWEY & CO., at the office of this paper.

P. S.—A first-class printer can secure a permanent situation by applying soon. Also, a steady country boy a situation as janitor.

MINES WANTED.

Two Gold or Silver Mines, with good reports by Mining Engineers of reputation, for customers in England.

MINES WILL BE AS GOOD AS SOLD
If first-class and report favorable.
Apply in person or by letter, to A. M. LAWYER,
45 Merchants' Exchange, S. F., Cal.

Carson and Colorado Railroad.

(NARROW-GAUGE.)

The Company announces the completion of its line March 1, 1882, to CANDELARIA, Columbus Mining District, Esmeralda Co., Nev., 138 miles from Mound House (Junction with Virginia and Truckee Railroad).

STAGE CONNECTIONS,

At Hawthorne with U. S. Stage Company's daily coaches for Aurora (26 m.); Bodie (37 m.); Lundy and Bridgeport.

At Luning (125 miles from Mound House) with Gilmer, Salisbury & Co.'s tri-weekly stages (leaving Tuesday, Thursday and Saturday mornings) for Grantsville, Belmont and Tybo.

At Belleville (150 miles from Mound House) with Belleville and Independence Stage Co.'s stages for Benton (40 m.), Bishop Creek, Big Pine and Independence.

At Candelaria, with U. S. Stage Co.'s stages for Columbus (8 m.), Silver Peak, Montezuma, Alida Valley, Gold Mountain, etc.

THROUGH TICKETS

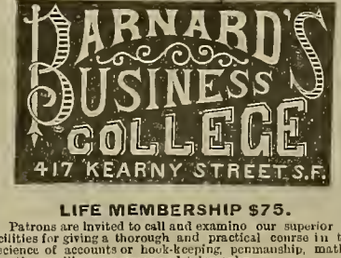
To the above points for sale at San Francisco, Sacramento Reno, Carson and Virginia R. R. Ticket offices

This is the direct and natural route for Passengers and Freight, to points in Southern Nevada, Mono and Inyo counties, California. The line, laid with steel rails and redwood ties and equipped with new and first-class rolling stock, is penetrating new and most promising Mining Districts which are now attracting deserved attention throughout the country.

For information on through freight rates apply to

H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agent, Carson, Nev.

COMPOUND OXYGEN
NEW TREATMENT BY INHALATION, for Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Debility, Rheumatism, Neuralgia, and all Chronic Nervous Disorders. Prepared by STARKEY & PALEN, Philadelphia, Pa. Package contains all directions, and is easily sent by express; ready for USE AT HOME. H. E. MATHEWS, Forwarding Agent, 606 Montgomery street, San Francisco, Cal. ☞ Send for Free Pamphlets.



LIFE MEMBERSHIP $75.

Patrons are invited to call and examine our superior facilities for giving a thorough and practical course in the science of accounts or book-keeping, penmanship, mathematics, spelling, grammar and telegraphy.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS ☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any correeponding Grade in the Market.

LOW POWDER.

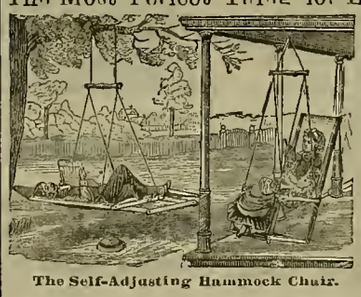
VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Loweet Rates.

CALIFORNIA VIGORIT POWDER CO., ENGLISH & WRIGHT, Agents
No 327 Pine St., San Francisco.

The Most Perfect Thing for Ease and Comfort Ever Devised.



The Self-Adjusting Hammock Chair.

THE HAMMOCK CHAIR.

Adjusts itself to any desired position, from sitting to reclining or vice versa without effort, requiring no fastenings to hold it in place The seat is of strong canvas or tapestry, which conforms to and supports the WHOLE body, thus affording entire relaxation and ease, and absolute freedom from cramped position. To the lovers of comfort or the tired professional and business man, mechanic or invalid, the enjoyment and perfect rest afforded makes this CHAIR worth more than it costs, every week They are adapted to the House, Office, Garden, Picnic and Camping Parties, or wherever solid comfort is desired. They are durable and light, weighing 11 lbs., and occupying only 4 inches in thickness when folded.

Price, $4.50, $5 and $8.

Shipped free of expense to your nearest railroad or steamboat station in the State, on receipt of price. Liberal discount to agents. Circulars on application.

O. J. LINCOLN, Sole Manufacturer, Santa Cruz, Cal

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

RANKIN, BRAYTON & CO.,
Pacific Iron Works, San Francisco.

SIEGLER SPRINGS HOTEL,

LAKE COUNTY, CALIFORNIA.

JOHN SPAULDING, - - - - Proprietor.

GOOD HUNTING AND FISHING

Right at hand for the accommodation of invalids. Baths of any desired temperature.

The SIEGLER SPRINGS STAGE will connect with the stage from CALISTOGA at LOWER LAKE on MONDAY, WEDNESDAY and FRIDAY; at GLENBROOK on TUESDAY, THURSDAY and SATURDAY. Time from San Francisco, TWELVE HOURS. These Springs have no equal in the State for speedily and permanently curing Rheumatism, Gout, Stiff Joints, Dropsy, Scrofula, Skin Diseases, Gravel, Diabetes, Female Diseases, Dyspepsia, Catarrh, Chronic Dysentery, Chills and Fever, Lead Poisoning, Painters' Colic, Constipation of the Bowels, and all diseases of the Stomach and Liver, Bright's Disease of the Kidneys and impurities of the Blood. The Hotel will be kept open summer and winter, the water proving equally efficacious the year round. Important improvements have lately been added, including new

Bath House and a Fine Swimming Bath.

Address all communications to "SIEGLER SPRINGS," Lake county, Cal. W. T. GARRATT, Manager.

No. 125 First Street, Opposite Minna.
SAN FRANCISCO, CAL.
All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.
J. H. WEED. V. KINGWELL.

California Machine Works,
WM. H. BIRCH, Prop'r.
119 Beale Street, San Francisco.
General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Agent and Manufacturer of F. A. Youse's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

STEAM ENGINES AND BOILERS
Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by
J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON. THORNTON THOMPSON.

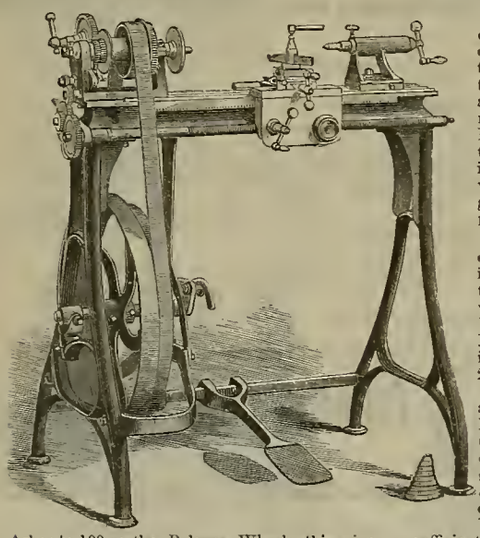
WOOD WORKING MACHINERY, MANUFACTURED BY THE H. B. SMITH MACHINE COMPANY,

And HAZARD STEEL Ropes and Cables.

SCREW CUTTING LATHE.



This cut represents a new screw cutting Foot Lathe which was put on the market abont two years ago to meet the demand for a first-class tool at a low price, which will do a great variety of work, both in metal and wood, and is the best Lathe made, considering its capacity and price. The cut gives a good idea of its appearance, and below we give dimensions of parts and general description.

Description of Lathe, 4 ft. Bed.

The Lathe occupies a floor space of 28 by 48 inches, the centers being 44 inches high from the floor; the bed is 48 inches long, 6½ inches wide, 5½ inches deep, with double Vs. for Carriage and Tail Stock. It swings 10 inches over bed and 6 inches over carriage, and will turn 26 inches long.

The Head Stock is back geared, and the Cone has three speeds for 1½ inch belt, the smaller being 3 inches diameter, the larger 6 inches diameter; this, with the back gears gives six different speeds, the fastest giving abont 1,000 revolutions of the Arbor to 100 of the Balance Wheel; and the slowest, 75 of the Arbor to 100 of the Balance Wheel; this gives a sufficient range for all kinds of work.

The Arbor in Head Stock has a ⅝ inch hole through it, which is very convenient for turning the ends of long rods, making small screws, studs, &c. The Centres are ½ inch diameter. There is an attachment in Head Stock for reversing the motion of Carriage.

The carriage has a rack and pinion for moving it by hand, and a split nut moved by a cam on the face of Carriage to throw it in gear with screw; the reversing motion is in Head Stock.

The Tool Post has a slot for tools ⅝x1¼ inches; the tool is adjusted by a wedge made on the arc of a circle and fitted to a convex washer. The leading screw runs the whole length of Lathe, and has 10 threads to the inch. A set of gears go with the lathe which will cut all common threads and a great variety of other sizes by compounding them; there is a screw stop on the Carriage for screw cutting, &c.

The Tail Stock can be set over for turning tapers, &c. The spindle of Tail Stock is 1 1-16 inches diameter, and has a motion of 3 inches. The center is fitted to a taper hole, which is the method adopted by all the best makers, and is the same size as the one in Head Stock, so that chucks and other tools fitted to one can be used in the other.

The Foot Motion, we consider the best made, the crank is adjustable and the shaft has swivel bearings; the balance wheel is 22 inches diameter and has 3 speeds to match Cone on Head Stock.

Send for Circular on Lathes.

VOLUME XLIV Number 20

Extraction of Lead from Ore.

In the various lead-smelting districts of the world, it is strange to note the variety of methods of reduction in vogue, the various classes of furnaces employed, as well as the differences in fluxes and fuel, etc., employed in each district in the common object of separating the lead from the gangue. It is found, however, that each one of the various methods pursued and furnaces employed has usually special advantages to recommend it for adoption in that particular locality; and that frequently a furnace or method which in one locality appears to work more satisfactorily and afford a better result than another working in a different locality, would, if transferred to the new district and worked under the altered conditions of ore, fuel and flux, prove an entire failure.

The considerations which then determine the method of reduction to be pursued and the furnace to be employed in the smelting of the lead ore of any locality are: First, the nature and yield of the ore to be treated; second, the character of the gangue or vein stuff; third, the nature of the available fluxes; fourth and most important, nature and abundance of fuel in the district; and fifth, means of transportation of material.

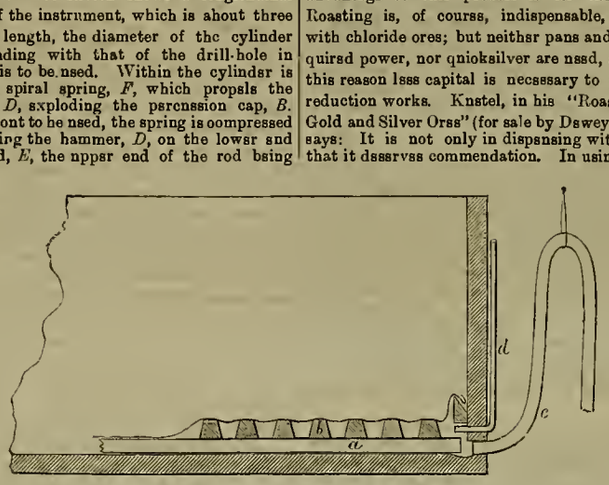
The processes employed for the smelting of lead ores may be classed according to the type of furnace employed, as, according to Greenwood, first, the methods of smelting in England, France and Carinthia; second, the methods in which cupola furnaces are employed, as practiced in the Hartz, Silesia, etc.; and third, the methods of reduction in open hearths, as in the ore furnace or Scotch hearth, and the American hearth. But Dr. Percy supersedes these classifications by grouping the various processes employed for the smelting of galena or other sulphur compounds of lead under three types, according to the agent employed to effect the decomposition of the ore and the separation of the lead, thus: First, "air reduction processes," in which atmospheric air, aided by heat, forms the reducing agent; second, the "iron reduction or precipitation process," in which iron, or an oxidized compound of iron which, under the furnace conditions yields iron, is employed for the separation of lead; third, the method of "roasting with subsequent deoxidation of the product by carbonaceous matters;" while, fourth, for the smelting of ores of lead, such as carbonates, silicates and oxides in which the metal exists wholly in the oxidized state, it is necessary to reduce the metal either by carbon or iron, or both of these agents may be employed.

Impurities in Commercial Copper.

The usual impurities occurring in the copper of commerce are iron, arsenic and silver in small quantities, almost invariably; bismuth very frequently, except in Russian and Australian specimens; tin, antimony and sulphur occasionally, and lead almost invariably in sheet or bolt copper, with nickel, cobalt and gold less frequently. The variety known to commerce as best selected is very nearly pure; while tile copper and tough cake usually contain traces of arsenic, iron, sulphur, nickel, tin, etc. The effect of iron is to render the copper harder and paler in color; sulphur and antimony likewise harden copper, make it grayer in color and impair its malleability and tenacity. Copper containing 10 ounces of antimony per ton is stated by Dr. Miller to be quite unfit for use in the preparation of brass intended for rolling. Arsenic in small quantities hardens the metal, but does not impair its malleability to the same extent as antimony; while the presence of bismuth deteriorates the toughness of the metal, and produces a "red-short" copper. Red oxide of copper renders the metal both red and "cold-short." Small quantities of lead are occasionally added to copper intended for rolling, but the addition of only small quantities (1% to 2%) of this metal renders copper unfit for the manufacture of brass plate and wire.

Automatic Exploder.

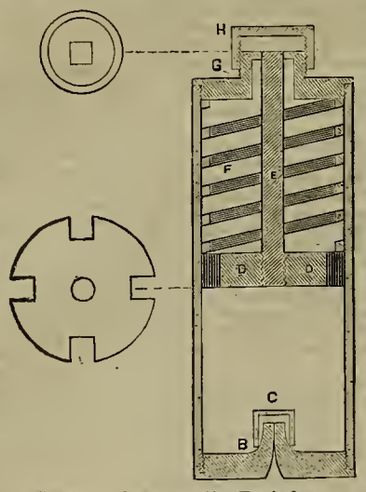
The instrument illustrated on this page is designed as an economical substitute for fuse and battery in the firing of dynamite and other explosives. The sketch shows a longitudinal section of the instrument, which is about three inches in length, the diameter of the cylinder corresponding with that of the drill-hole in which it is to be used. Within the cylinder is a strong spiral spring, *F*, which propels the hammer, *D*, exploding the percussion cap, *B*. When about to be used, the spring is compressed by screwing the hammer, *D*, on the lower end of the rod, *E*, the upper end of the rod being



BOX FOR LIXIVIATION BY AID OF SUCTION.

let into and secured to the flange, *G*, by means of solder, which is easily amalgamated with quicksilver. The cover, *H*, being removed, a drop of quicksilver is placed therein, and it is screwed on to the top of the cylinder. The instrument is then deposited in the drill-hole over the charge, the lower end being in contact with the dynamite. The action of the quicksilver on the solder releases the spring, and the hammer effects the percussion, the length of time being regulated by the depth of the soldered joint at *G*, which may be filed down so as to accomplish the explosion in 10 minutes or less, thus serving all the purposes of a "timefuse."

One of these small instruments is, of course, required for each charge. If, as is claimed by the patentee, their manufacture can be reduced to about 10 cents each, there is every probability that they will be a convenient and economical substitute for the present mode of firing by means of the ordinary fuse or the battery, more especially in submarine blasting and in situations where the presence of dangerous gases oftentimes precludes the use of a naked light, as in coal mines.



Section of Automatic Exploder.

In the efficient explosion of dynamite, much depends upon the perfection of the initial explosion of the percussion cap. By the ordinary method of applying the fuse to the cap, a portion of the effect is lost by the fusion of the fulminate, and it may be reasonably supposed that a smaller amount of fulminate, where percussion instead of fusion is employed, will have an equal effect. The experiments made by the patentee of the "Automatic Exploder" go to show that a single force percussion cap, if fired by percussion, is nearly equal in effect to a triple-force cap, if fired by fusion. Should this be the case, then additional safety would be secured in the handling of triple-force caps, which, to the miner, would be a desideratum.

THERE is a big "rush" to Wood River.

Applicability of the Lixiviation Process.

All silver ores which allow a good chlorination in the furnace, and which permit filtration, are suitable for the lixiviation process. A great advantage of this process is its cheapness. Roasting is, of course, indispensable, except with chloride ores; but neither pans and the required power, nor quicksilver are used, and for this reason less capital is necessary to put up reduction works. Kustel, in his "Roasting of Gold and Silver Ores" (for sale by Dewey & Co.), says: It is not only in dispensing with pans that it deserves commendation. In using pans there is gearing, belting and other parts exposed to breakage; the pans wear out in time, especially with base roasted ores. The cost of quicksilver itself is not great, provided it has not to be transported too far; but this process is important in localities where lime and sulphur can be got in the neighborhood, while the transportation of quicksilver is troublesome and costly. The process, although a little more complicated than the pan amalgamation, and requiring more time, is nevertheless simple and more easily learned. Ores containing much clay and lime, or talc, filter very slowly, sometimes so slowly that pan amalgamation must be preferred. The remedy in such case is found in separation of the mud or slime from the coarser sandy part. The crushing, therefore, must be changed to wet crushing, and the separation must be effected either through pointed boxes or some other arrangement, where the flow of water is swift enough to carry the fine stuff further than the sandy part. This latter, for the purpose of roasting, must be dried. Generally, it is charged wet in a roasting furnace with two or three hearths. In this case, the salt is added when the ore is in the last hearth. But then comes the inconvenience of handling the slimes. In Mexico, this part can be subjected to the patio amalgamation, provided the silver comes out by this process, and in the United States the slime, on account of its extreme fineness, may admit a direct pan amalgamation; but in either case a double manipulation is very inconvenient. The proposal to treat such ore without separation in an agitator with a filtering bottom may perhaps answer in some instances; but this point must be decided by experiments.

Ore that permits filtration, but too slowly, can be leached much quicker with hot solutions, to begin with hot water; but the hot water in the beginning dissolves more chloride of silver than cold water.

Lixiviation, with aid of suction, is a great advantage where it can be arranged. The leaching boxes must be located 10 to 12 ft. above the precipitating vats. The arrangement is represented by the engraving.

The hose, *c*, is inserted at the lowest point of the vat below the false bottom; then there is a glass pipe, *d*, reaching outside near the rim of the vat. The hose, before commencing, is likewise lifted as high as the glass tube. *a* represents the first staves on the bottom of the vat, and *b* the second row which is covered with the cloth. After the vat is filled with ore and the water admitted, the air below the false bottom escapes through both pipes; but after awhile, when the water rises and covers the mouth of the hose, the air from between the upper staves goes through the glass tube and is followed by the water. When this reaches the water-level inside the tank, the tube is shut up by a tight stopper and the hose lowered down to the precipitating vats. The lixiviation is much quicker than without suction, but if the hose should be so wide that more water escapes than can follow, there will be, of course, no suction.

Amalgamation in Kettles.

The method of amalgamation of silver in kettles is only applicable to the treatment of certain comparatively rich ores containing chloride, iodide and bromide of silver, accompanied also by native silver. It is chiefly in use in South America, but could, of course, be adopted here in such places as the ores above described are found, and where it was thought convenient. The method is sometimes called hot amalgamation. The ores are treated in kettles with copper bottoms whereby the silver is precipitated from its chloride, iodide or bromids, and subsequently amalgamated by the addition of mercury.

To carry out the process, the ores are first crushed and ground to a fine powder, concentrated, if necessary, by careful washing, and then mixed with a large proportion of water, thus forming a thin mud, which is introduced into kettles or boilers provided with copper bottoms. The contents of the kettle are now heated to boiling by a wood fire maintained beneath the kettle, when from 10% to 15% of common salt is mixed with the charge, after which a quantity of mercury is added and incorporated with the mixture by continuous stirring, the temperature of the contents of the kettle being kept up throughout the process, while samples of the amalgam are removed at intervals, and from their examination the attendant determines when the amalgamation is completed; as also whether any, and how much more mercury it is necessary to add to complete the operation, the whole treatment lasting five or six hours. The amalgam thus obtained is treated according to the method common everywhere, the silver produced requiring to be fused and refined before casting into bars, while the earthy residue left after the separation of the amalgam frequently retains enough silver to make it profitable to work it by "amalgamation in heaps." The consumption of mercury in this process is usually somewhat less than the weight of the silver extracted.

SOME time ago an attachment was issued against the Stormont mill property, at Silver Reef, and it was feared that this might have the effect to stop the production of bullion for a time. The attachment has been withdrawn, and matters have been adjusted.

THE Calumet and Hecla Copper Mining Company of Michigan paid a quarterly dividend of $5 per share, or $500,000, at Boston, on the 15th. This makes $21,350,000 in dividends to date.

THE mines at Gold Park are looking well and improving as work progresses. The 10-stamp mill is running steadily up to its fullest capacity, and everything wears a prosperous look.

THE Esmeralda *Herald* says: It is rumored that Rhodes and Wasson's salt marsh has been sold to the Carson and Colorado railroad company. Consideration, $150,000.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Nevada County Gravel Channels.

The Blind Miner's Theories.

EDITORS PRESS:—I wish to try to give you a clear and rsliable visw of the sitnation here. Now, I offsr you nothing only that which I know to be the facts without the least sxaggeration, and if you are not interested yourself, will you be clever enongh to hand it to some person that will be likely to raise a compaay to hslp ms. I intend sticking to my friends and to those who hslp me until they ars satisiied, and indifferent persons may run their guess-work till they have enongh of it, and then quit. Now, I own 2,400 ft. on the Alta channel, and all but five-twenty-fourths belongs to me, the most of which belongs to a woman that has done all she could, but is willing to do more; the rest I owe for tramping to Grass Valley 50 times. Now, this covers three positive depoeits and one negative on the Alta, and one emall deposit in the month of the Jenny Lind. Now, 2,400 ft. cannot be made to cover that much money anywhere else on the Alta, and it will be more likely to yield over $1,000,000 than under, and will be a cheap claim to work, well ventilated, well drained, and will need but little timbering—altogether one of the best situated claims in my knowing. Now, I have a tunnel in under the hed of the channel, between a second and a first-class deposit as you go down etream. It makes a good deal of difference whether you are between a second-class and a firet-class, and a firet-class and a second-class deposit as you go down stream. I was about 500 ft. either way to a positive deposit, and no lead connecting that would belp me; but had I understood in tbe first place how a first-class deposit was formed, my partners never could have driven me to have gone after it. As it was, I held out two yeare and five monthe without driving my tunnel an inch, and did all the work to hold the claim myeelf, without receiving a cent, for I knew I did not know how it was formed, and told them so; and yet I could tell that it was there, aud did not want to go after it until I had money, and my whole disaster was caused by the want of $3 in money to buy a keg of powder to start low enough. Now my tnnnels after my upper deposits are all right. I am in about 450 ft., and within about 50 or 100 ft. of the deposit, everything looking all right. Thie is my middle, positive, but I have followed the lead in a small tuuuel abont 200 ft. away from my air draft, and this deposit is not in the channel. What I want to do is to start right in the channel in gray gravel, and drive right up the channel parallel to my upper tunnel, and in about 150 ft. I will tap negative gravel. Tbis is a large body of gravel tbat will pay from $2 to one-half oz. per day; after that, it will pay its own expenses, and as soon as I reach the lead opposite the end of my upper tunnel, I will follow tbe lead up to the deposit and connect the two tunnels. This will open everything, drain everything and ventilate everything, and I will have one of the finest gravel mines that ever was near Grass Valley. The tunnel will be dry, need no timbering until we etrike the pay gravel at least, and a man can make about three ft. a day.

Now, I will give an interest that will guarantee $10,000, or I will make it up out of my share; bnt the facts are, it will yield abont $40,000 instead of $10,000, clear of all expenses. But tbat will be so mnch tbe better for me, and I will take $1,000 for this interest. This will enable me to open my claim; that's what I want it for.

I hold another claim of one mile in length, that will yield about $3,000,000 or $4,000,000. It contains four positive deposits and two negatives; it is spleuidldy situated, and will be a cheap claim to work. It will take about 500 ft. of tunnel to tap one of the largest deposits, to my knowledge, in tbese hills, and will cost about $3,000, and then this will yield money enough rapidly to open all the rest. Each deposit will need a tunnel of its own. Then this will be one of the finest mines in this county. I will give one-half of this claim to the company on any terme that will open it. We need no incorporation, only a joint stock company, for as soon as we get started, we will prodnce capital of our own as fast as we need it. We will not come in contact with either law or lawyers; this kind of cattle we want nothing to do with, for we cau and will corral all our tailings; we do not want rily water to ruu away from them. I have a good ditch right at tbe mouth of my Alta tunnel.

There are 17 deposits on this chauuel, including those I hold, besides the negatives, and I believe I could secure every one of them for less. thau $50,000, and open them all with a good tunnel without a dollar of assessments, provided I had the money to secure them at once on the sly, and I don't believe they will yield a cent less than $10,000,000.

All California lies before us full of deposits, and nothing but gness-work to work against, and no excuse at all to come in contact with that worst of scourges, with all its winks and blinks, "the United Bar Association."

Randolph Flat. H. CLENDENEN.

The Iowa Hill Mines.

EDITORS PRESS:—To rssume my account of quartz and drift mines in the Iowa Hill district: The Copper Bottom Co., on Succor flat, is opening up soms very promising ground, though its tunnel is only in soms 300 ft. This claim has not been worksd for several years, but I presume the good results obtained in the adjoining claim (the Succor Flat) has induced them to opsn up some ground, and try tbsir luck. Thsy have considerable pay dirt on the dump, which they will wash up soon. Only two men are employed there at present.

Succor Flat

Has also some quartz ledges, a little to the east, on the bank of Shirt-tail canyon. Onc known as the Providentia, formerly the Gray Eagle, was first located in 1852. It is a well-defined ledge, and though it has been claimed by many different partics, until within the last year there has not been sufficient work done to hold two years, much less 30. It has been the subject of some expensive litigation lately, the particulare of which yonr correspondent has not time to enter into in thie communication. Suffice it to say, the law of Congress hae been maintained, and the property is now in the hands of men of progress. The obstructioniste bave been pushed to the wall, and from an obscnre bunch of white rock a good paying property is likely to be developed, that will assist to pay the expenses of running our county. Some experienced parties in San Francisco, I nnderstand, have taken hold of it. The work done has developed a fine body of ore. Instructions have been received not to extract any more of it until it could be worked ae it was taken out. The ledge is between four and five feet thick.

A short distance up stream, another location was made last year, known as the Australia. Some very rich float rock was found in early daye in this vicinity. One man has been able to pound ont an ounce in a day. But diligent search failed to discover the source of the float. Last spring parties from Colfax flattered themselves they had it; cleaned out and retimbered an old tunnel, wbich, it would seem, had been run parallel with the ledge. The qnartz lay nearly horizontal. The country seems to have been much disturbed, as many of the steep sides of our canyons are. I think it will be necessary to extend the tunnel into the hill some distance, where they will find out what their mine looks like.

On the opposite eide of the canyon (Shirt-tail), the ridge which divides it from Snail canyon, there have been several locatione within the last six months. As mnch quartz gold bas been found in the latter-named canyon, I should not be surprised to hear of good ledges being opened soon after the snow goes off. Thie ridge, nnlike the others in the vicinity, is not capped with cement or gravel; it shows the quartz. Thie is all that I can give you on quartz at present, and will return to gravel.

The Rich Deposits

Found by the Succor Flat Co. caused a boom in that vicinity. Some maintained the lead ran one way and some another; old locators commenced to look up their corners; new comere questioned the right of one man to hold 320 acres of Uncle Sam's domain and not work any of it. New locations were made over the old ones, shafts sunk, cabins built, claims "proved up," lawsnits threatened, etc., but when the clerk of the weather treats us to 48 incbee of snow we are compelled to keep quiet for a while at least. Of course, every man has his idea of the "pay channel." Indeed, it is amusing to hear how each one differs.

To open this grounnd it will require a long tunnel or deep shaft. The main object at present seems to he perfect title, when, I preeume, consolidated prospecting will be the order of the day. The Attalus, on the west of the Succor Flat claim, have sunk a ehaft in Little Indian canyon 50 ft. deep, and though thie was 100 ft. lower than where the adjoining claim was being worked, they found the rock pitching off. Work wae suspended, as it was late in the fall, and it was fonnd expensive to handle the water without a pnmp. This is considered by many as a good piece of ground, containing 60 acres.

Down the Divide to the South

Is the Golden Streak Co., a last-year location. They have a ebaft 62 ft. deep, bnt discontinued work to "prove up," who, in conjunction with the Winchester Co., intend to make application for U. S. patent, the papers being now in the attorney's hands. Storm has kept the enrveyors back. These locations are on a line with the wash that many suppose fed Grizzley Flat, once very rich. The Morning Star mine must come next. This compauy commenced to run their first tunnel in '58. After extending into the hill from the eontheast side of Indian canyon, opposite the town of Iowa Hill, some 1,600 feet, they fonnd pay to the left of them, but in lower grounnd, and were consequently compelled to run another tunnel, when, to their agreeable surprise, they came onto pay gravel at 300 ft. I forgot to mention that the second tunnel was etarted eome distance to the north of the first. They concluded that this second strike mnst be continuone with the deep ground they fonnd first, on the strength of which a ten-stamp mill was put up, and for a time they rolled out considerable dust, during which time a curious freak of nature was discovered, in the shape of a crevice between 80 and 90 ft. long, ovsr 100 ft. deep, and only three ft. wids in the widest place; again the walls wonld almost touch. Strangest of all, it was full of "psy dirt." Usually, as many minsrs have found out to their sorrow, thess deep places contain anything but pay. I would like to give you the amount taken ont of this crevics, but I have not got the figures by me. Soon after passing this strange deposit, high rock and immense asbestos boulders were enconntsred, some of these from 12 to 16 ft square. The pay was scattered, and, after spending much time—and this also means money in a gold mine—tbe company got the hydraulic fever, which took sevsral Irish dividends to roducs. It was overcome, however, and soms year and half ago they started their tunnel ahead for ths low ground mentioned as found in first tunnel, since which time 1,800 ft. of the said tunnel have been excavated, at a cost varying from $8 to $12 per ft. An upraise was made some six weeks since, and the old pump shaft was tapped exactly, which reflects much credit to those in charge of the work. The tunnel was still pushed ahead; another "raise" tapped very fine pay gravel; and the old mill, which, in the meantime, had been put in good repair, will soon he heard pounding up the gravel. Tbe energy displayed by this company is very commendable, and it is the wish of many, besides the undereigned, tbat the company may find good pay to pound for years to come. This ie an incorporated company, the greater portion of the stock being owned by parties in Grass Valley, Nevada county. MINER.

Iowa Hill, Cal.

Spenceville Mines, Nevada County.

EDITORS PRESS:—Seeing in your valuable journal tbat you wonld publish any communication in regard to tbe mining industriee of tbe coast, I will try to give you a general outline of the mining being prosecuted in thie district. The San Francisc Copper mining company have worked their mine here for several years, and have recently brought it on a paying basis. It has declared its first dividend under tbe efficient management of W. E. Ellis. The ledge is becoming richer as depth is attained. Other mines in tbis distriot are looking up. The American mining company, two miles from here, are going to erect smelting works, the oppsr being of high grade—90%. It will pay better to work it this way than by leaching process. They have run about 600 ft. of tunnels and drifts in this mine; have also a ledge two ft. wide, rich in gold and eilver, which yields assays upward of $100 per ton.

The Northern Belle, another claim adjoining the American mining company, has good proepects. They have run a tunnel 300 ft. nnder Last Chance hill, and intend to resume work again at an early date. They have three ledges of cropping, from 10 to 15 ft. wide, in the line of the proposed tunnel. Rich copper has been taken out of the Last Chance mine in early days and ehipped to Swansea. The Golden Jacket Gold and Silver mining company have etruck very rich rock in their tunnel on Albion hill; it assays away up in the hundreds. The ledge is two and a half ft. wide, free milling and almost all decomposed. The company are now opening her up, and will pnt up a mill this eummer.

The Cosmopolitan, another claim adjoining the Golden Jacket, hae resumed work. They have a ledge four ft. wide on the surface, and at a depth of 20 ft. have struck rock which assays $70 per ton. In early days, at the base of Albion hill, millions of dollars have been taken ont. Here was situated a mining camp called Poker Hill, and another called Albion City. There is nothing left now but a few old standbys, who work on the old diggings in the rainy eeaeon. They still make very good wages.

The trouble is here we want capital in thie place. I have been in almost every new mining district in Nevada and Utah for the last 12 years, but never eaw a better field for a man of grit than in thie district. I only wonder, with such facilities as we have got here—wood and water plentiful, a mineral belt five miles in width—that it has scarcely been touched. Bat, as "distance lends enchantment to the view," the attention of capitalists hae been attracted towards far-off fields, and tbis part of the country hae been left behind. Not only this place, but nearly all other mining counties in California have never been prospected much for quartz ledges. T. MCCARTHY.

Spenceville, Nevada Co., Cal., April 21st.

THE CENTERVILLE MINES.—A party in from Silver canyon informs us that ex-Senator Spencer, who is now ont there, is inspecting some mines at Centerville, midway between Queen springe aud Anrum. Our informant says it is more than probable that work will soon be resumed there under the direction of Senator Spencer.—*White Pine News.*

THE Wood River exodus has been lively in Cherry Creek for the past few days. While we have lost a few good citizens, most of the emigrants from here are of the class that will not he missed, and that are not likely to add materially to the wealth of any community among wbich they may settle.

Looks Brighter.

There is no denying the fact that the mining and business intsrsts of this sscticu have for several months bsen, not only very dull, but discouraging. And this has been the condition of svery mining section of ths Stste, if we except Eureka. With the opening out of spring, however, the general gloom is being dispellsd, and our own, as well as othsr sections of the Stats, ars putting on a more lively and businsslike appearane. With us, our principal mine, the Star, is now in bstter condition to bs snccsssfully and profitably worked than at any previous time in its history. During ths past wintsr many difficulties had to be overcome in sinking the main shaft in this mine—chief among which was the insufficiency of the pumping machinery. Now a depth of 630 ft. has been reached and a new level started and run eome 30 ft. at tbis depth. About 30 ft. more will tap the vein, which on the level above was very rich. Before the 1st of June the Star will have this new level opened out, and will put beyond all doubt the true value of the mine. It is true, all this could, and should have peen done mouths ago, but the directorate at tbe bay has been lacking in enterprise and energy

The Teacup people are also prospecting their mine, with every indication of being rewarded for their outlay. When they do find it in the Teacup, it'e rich enough to gladden the heart.

The Exchange, we are reliably informed, will soon resume work under new management; anu the Egan company, though with diminished force, are still pegging away.

From Silver Canyon coms ths tidings that an important strike has been made in the Sallie L. tunnel, which will no douht result in considerable work heing done in our sister camp during tbis season.

The old minee at Centerville, midway between Queen Springs and Silver Canyon, have been re located, and ex-Senator Spencer is taking hold of the property and will develop it this summer

The chances are favorable, too, that Ruby Hill will come to tbe front this summer, with a San Francisco company with ample capital to take out and work its already developed wealth. Tbe ores of this district are very rich, and if the mines fall into proper hands, Ruby Hill will yet give a good account of itself. Altogether, the mining and business outlook in this section are a hundred-fold more encouraging than they were n month ngo.—*White Pine News.*

Mines and Mining in New York.

Joe Wasson talks a column or more in tbe Inyo *Independent*, and thus speaks of mining in New York: "Ever since that accursed extra (quinine) session of the Legislature, lese than a year ago, my health has been wretched enough, and since in this noisy, jostling place, with a climate as changeable as a modern civil service reformer, life has been almost intolerablo. An old Latin proverb says a great city is a great desert, and from what I have seen of thie one off and on for yeare past, Death valley wae a paradise alongside. There is plenty of money here for good mining property, but I see that most people succeed or fail in effecting out-and-out salee according as they have time to go and come upon. I should never think of coming to any of these Eastern citics with a mine to sell, unless it possessed a substantial development, on less than one year; and two years if a trip to London were involved. It is a curioue fact, however, tbat owners of minee, prospectors, etc., almost universally want to realize ten-fold on their property in one-tenth of tbe time that they do or would with regard to any other calling in life. There is but a emall percentage of the people bere who know or care anything about mining for the precious metals, and when you expect such people to turn from a business they know all about to one they know nothing of, just hecanse you ask them to, is the essence of human folly. And yet it is those very people who have the money of the country, and not the speculators. Tbe formsr are the game of the latter. But I did not intend to bore you with a sermon on mining or anything else.

CROSSCUTTING WIDE LEDGES.—In most places on the Pacific coast, says the Virginia *Enterprise*, a vein from 10 to 15 ft. in width ie considered big; one 30 to 100 ft. is a monster, and one 200 ft. wide is a thing hardly to be believed in—a thing in which to become lost. What then must he the allowance to be made when a mining superintendent is obliged to search through a vein over 1,000 ft. in width? On the Ophir-Mexican line, at the 2700 level, they have already cnt across the vein a distance of 800 ft. and have as yet seen no eign of an east wall. At the Union, on the 2500, 2600 and 2700 levels it is doubtlese fully as wide; indeed, has been crossed hy nearly the same distance as at the Opbir-Mexican line. In this large ore channel lie whatever ore bodies there may be, like potatoes in a hill or plums in a pudding. Thess ore bodies do not always lie lengthwise or with the stratification of the vein. They sometimes lie across it. The bonanza now being worked on the 2500 level lies almost square across the ore channel. Thus it will be seen that a crosscut may easily miss an ore body that a drift would find.

MECHANICAL PROGRESS.

Case-hardening.

By the term "case-hardening" ie meant that process by which the surface of iron is converted into steel. The art of case-hardening ie a very useful one, and should be thoroughly understood by every smith and worker in metal. By case-hardening the surface of iron may be made harder than the hardest steel, and still retain all ite malleability. One of the prime requirements in case-hardening is, that the article shall be well polished. If the iron ie not quite sound or shows ash-holee, it is hammered over and polished again. The finer the polish which is imparted to the surface, the better will be the results in case-hardening. The articles are next imbedded in coarse charcoal powder in a wrought-iron box, which should be air-tight. Sometimes, instead of a wrought-iron box, a pipe is employed. Thie is really preferable, because it can be turned, thus allowing the heat to be applied more uniformly. After the articles have thus been prepared, the box or pipe is exposed for some 24 hours to a gentle cherry-red heat. Sometimes a flue steam boiler is used for this purpose, or the heat may be obtained in any other place where a fire is maintained uniformly. By exposing the articles to the heat for the period named, a hard surface of about one-eighth of an inch in depth is obtained. If so much time cannot be given to the operation, or if deep hardening is not required, the articles may be imbedded in animal charcoal, or in a mixture of animal charcoal and wood charcoal and exposed for a much le s period of time. Four or five hours will be found sufficient to make a good surface of steel.

It is frequently necessary to case-harden a single article, which necessitates a very different operation from that which we have just been describing. The charcoal is finely pulverized and mixed into a paste with a saturated solution of salt. The tool, whatever it may be, is then well covered with this paste and dried. Over the paste is laid a coating of clay moistened with salt-water, which is also gently dried. The article thus prepared is now exposed to a gradually increasing heat, until it is brought to a bright red, but not beyond it. This heat will be found sufficient to give a fine surface to small objects. In all cases the article is plunged in cold water, when it has been heated the proper time and up to the proper degree.

A quick mode of case-hardening small objects sometimes employed is that in which prussiate of potash is employed. The iron is well polished and heated to a dark red heat. It is then rolled in a box containing powder of the yellow prussiate of potash; or, instead of being rolled, the powder may be sprinkled upon it. In either case, the powder will melt on the surface. The iron is then heated to a bright red and is plunged into cold water. The powder of the prussiate of potash to be used for this purpose is obtained by exposing the crystals to a gentle heat in an open iron box or pot, for the purpose of evaporating the water contained in them. The remainder will be a white powder.

While the operation of case-hardening, as we have described it, is very simple, it is not so easy a matter to select the qualities of iron by which the best results will be obtained. If the iron is of coarse fiber, the hardened and polished surface will be unsound; if the iron is impure, it will be brittle after being hardened. The best iron for the purpose is one of very fine and close grain. The test by which its quality may be determined is as follows:

Heat a piece a little beyond the heat by which it is to be hardened and plunge it into cold water. If it retain its fiber and malleability after this test, and is free from ash-holes, it is safe to conclude that it is entirely suitable for the purpose of case-hardening.—*Blacksmith and Wheelwright.*

A NEW METHOD OF TEMPERING.—A new method of tempering metals has recently been brought to the notice of the French Academy of Sciences by M. Clemandot. It consists in heating the metals to a cherry red, and then compressing them strongly and maintaining the pressure until they have completely cooled. Metals thus treated acquire a great hardness, and so fine a grain that, when polished, they resemble nickel. Compressed steel, like tempered steel, takes the coercive force which gives it the property of being permanently magnetized. As regards the duration of the magnetism, M. Clemandot states that the magnets of the Gower, Bell and Ader telephones, made of this new steel several months ago, have thus far preserved their force. As in ordinary tempering, M. Clemandot thinks the new process produces an amorphism in the metal, and he points out that it will now be possible to graduate a temper by graduating the pressure applied. In experimenting with different steels, he finds those of Allevard always the best for magnetic purposes. Elliptical bars of steel seemed to take the pressure in all their parts, and showed a uniform fracture throughout. M. Clemandot's highly interesting discovery will, without doubt, open an entirely new field of study to electricians and metallurgists, and will prove inestimably useful in the arts.

A New Process for Working Iron.

D. P. Kayner, M. D., of St. Charles, writing to the *Mining Review*, under date of April 13th, says: "A writer in the *Scientific American* supplement suggests that within five years puddled iron will not be manufactured; that malleable iron and steel, manufactured direct from the cast ingot, will supersede its use. The Bessemer processes will, to a great extent, accomplish the result of direct manufacture, his blast operating similarly to the labor of the puddler, but does not purify the metals from injurious mixtures and combinations. Of this process Bloxam, in his work on metals, says: 'Since, however, this treatment does not effect the removal of the sulphur and phosphorus from the metal, it is not able to produce good bar iron from any but the best qualities of pig, such as are considered too expensive for its conversion into bar.' This shows that while the prophesy of the writer may be practicable, Bessemer has not yet attained it.

"During the past winter I have been operating almost entirely upon iron, in the largest malleable iron works in the country, having exclusive charge of its laboratory, and during that time have made a great many experiments to reach this point, bringing all my practical knowledge of chemistry and metallurgy to bear upon it. In the course of those experiments I discovered a cheap process of purification for removing foreign mixtures from the iron and restoring it to the state of nature. The metal by this process can be run into hot wrought-iron molds, and while hot, placed directly under the rollers and made into bars; or it can be cast into any form and annealed with much less expense than is employed in the present process, with a saving of time, fuel and labor, furnishing an iron that can be hammered, welded and drawn without becoming brittle, and possessing superior tensile strength. And this iron can be made from the commoner kind of pig, or, without cooling after leaving the smelter until it is cast into form, can be made direct from the ores.

"I have specimens of the iron made by this process, which those interested can examine, and as soon as the proper patents can be procured, I shall be ready to make arrangements to put in works."

THE FUTURE OF IRON.—A well-known French steel maker, discussing the future of iron, recently made the following remarks, which deserve some attention, as representing the views of a practical man on this subject: "Those who are occupied in the manufacture of Bessemer steel know how difficult it is to obtain with regularity the extra soft steel employed for boilers in the French navy. Such metal appears only to be made in the Martin furnace, and even then it is necessary to employ picked material in its manufacture. But by the new Bessemer dephosphorizing (Thomas Gilchrist) process, steel of an extraordinary degree of softness can be obtained with the greatest facility, and at a price less than that of ordinary steel. By heating a pig containing from 1.5 % to 2 % of manganese we obtain, after the decarbonization and dephosphorization is finished, a non-oxidized metal, which does not contain more than a trace of carbon or manganese. If it is desired that the steel should be entirely free from any tendency to red-shortness, we may add from .25 % to .50 % of a rich ferromanganese to remove any traces of oxygenization. The only precaution to be taken to obtain a soft steel is to choose pig (if direct working be employed) which contains sufficient manganese (with 2 % as a maximum), or to make a suitable mixture of pigs, if cupolas be employed. But this will be by no means the one outlet for dephosphorized metal, for up to the present time the high price of soft steel has been the great obstacle which has prevented many people from employing it in construction. But by this process soft metal can be produced at a less price than ordinary (puddled) iron; there is, therefore, no longer any reason (apart from routine), why steel should not be employed in all cases in place of iron, to which it is so much superior in strength."

TESTING BEARING METALS.—After buying bearing metals, some machine builders go to the trouble to have a test made of their coolness of running, thinking that when they do this they are doing all that is needed to be done. This test for cool running is made by making a shell of each of the several samples to be tested, one against another, and putting this shell upon the journal, running the journal at a very high speed and under considerable pressure, until the heat of friction boils the water, or heats it to a certain observed temperature. Such a test can be of little or no use in determining the anti-friction qualities or the wearing qualities of a bearing. A bearing may run cold and yet consume a great deal of power and wear away very fast; it may wear long and yet consume power and run hot; or it may wear long and wear hot and consume power. These three elements exist in different proportions in different bearings. It is not always necessary to have all of them in a very high degree. In ordering or mixing a bearing metal, the proportions and character of the material should be determined by the diameter and length to be given to the journals, the speed they are to run at, the load they are to bear, etc.—*Am. Inventor.*

SCIENTIFIC PROGRESS.

A New Accumulator.

Since the Faure accumulator, otherwise Plante's improved secondary battery, saw the light of day, save the *Electrician*, numerous patents have been taken out by not less numerous inventors, and we may expect all the electrical firms or companies to shortly have each its own accumulator.

For some time past, indeed, periodical announcements have been made respecting some new accumulators which were said to give wonderful results and leave far behind them the now well-known Faure apparatus. These announcements, for some unknown reasons, persisting in existing on paper only—caused at last the people interested in the success of the Faure accumulator to wake from their lethargy and write in a short but well-meant letter what they thought of that kind of anonymous announcements; their theory upon the subject being of the same nature as that of the naval secretary who thus expressed himself on one occasion in Parliament: "Men," said he, "disputed, and perhaps would ever dispute, as to the best type of battle ships; but a good ship that was armed and afloat was better than an ideal ship which was still on the stocks."

But still another great improvement in electric storage or accumulation batteries was again announced about a month ago, which is said to be possessed of five times the durability and two and a quarter times the storage capacity of the Faure accumulators. The following advantages are also claimed in favor of the new apparatus: To be of such a practical construction that they can be readily renovated when necessary, without waste of material; to cost less than the Faure accumulator to manufacture; to be of great electrical capacity, each cell of about .43 of a cubic foot in size, and consisting of about 60 lbs. of metallic materials; is capable of containing about 400 amperes, and of delivering during eight hours a current of 50; each cell is said to represent over one-horse power of energy for one hour.

In this particular instance we are promised more than mere assertion, as the new accumulator has been patented in this country, and will soon be put into practical use by an electric light company.

A SECRET TELEPHONE.—The National Secret Telephone Co. recently filed articles of incorporation in Albany, N. Y.; capital $5,000,000, with power to increase it to $10,000,000. The route of the line is from New York to Albany, thence to Buffalo, with the right and privilege to extend the route to other States and Territories. The company, which has not yet been fully organized, was incorporated to manufacture and put in operation a telephone invented by Prof. J. Harris Rogers, of Washington. It is called the "secret telephone," because when two persons are talking no one else, although he may be on the same line, can listen to the conversation. The inventor claims great advantages for his instrument over the ordinary telephone. Instead of being suspended, the electrodes float in mercury, which gives distinctness in sound and enables the telephone to be operated at long distances. There are many other minor differences between the "secret" and the common telephone, but the advantages urged are the secrecy and the superiority in transmission. In an experiment in Washington, conversation in a low tone at a distance of 25 ft. from the transmitter was heard plainly two and one-half miles away.

MELTING POINT OF FATS.—The method adopted by the "Society for the Mineral Oil Industry," in Halle, is to be preferred for the safest and most accurate results above all other methods. Instead of determining the melting point they use the solidifying point as a basis for their results. The following method is recommended as giving accurate results for the direct determination of the melting point: A cylinder having thin walls is heated in a beaker containing water or oil. In the cylinder there is a thermometer whose bulb is only partly dipped into the fat. The temperature is determined at the moment when the fat begins to become transparent.

RESTORING WORN COINS.—Recently, while Dr. A. H. Beet, of Savannah, Ga., was silver-plating a small article with silver cyanide solution, he used an old Spanish silver coin as anode. The coin was worn perfectly smooth and had been hammered to twice its original size; yet in a little while after it was put in the bath every letter and figure became plainly visible. The date, 1800, though defaced so as to be beyond deciphering with a powerful glass, became plain.

VARIATIONS IN THE VELOCITY OF SOUND.—Prof. Mach, of the University of Prague, has experimented with sounds which are produced by electric sparks. The waves which are excited by two simultaneous sparks interfere, and the interferences are observed by the traces which they leave upon glass covered with lamp-black. The velocity of wave propagation is greater than that of ordinary sound waves, but it diminishes in proportion as the waves separate from the point of excitement, and tends towards the ordinary values.

The Sun's Fuel.

What keeps the majestic ball hot and bright? This has greatly engaged physicists and astronomers, and various have been their theories. If the sun shone only by mere combustion of its own materials, the calculation is that its fire would not last 5,000 years. It is very kind of Dr. Siemens to come forward with an entirely new theory, which holds out the hope that the men of science are all wrong with their dismal foreboding, and that the creation is not schemed on the poor footing of a German stove or a suburban gas company. The learned ironmaster and physicist believes that the sun may very well go on illuminating and warming our world and the family of sister planets for an indefinite, if not infinite, time. He supposes interstellar space to be filled with an extremely attenuated hydrogen, and interplanetary space with denser gas, albeit more rarefied than the atmosphere drawn round each world. The sun, he thinks, whirling on its axis, draws into its poles the thin hydrogen, hydrocarbon and oxygen of our sphere, and these, being kindled, are projected outward at his equator into space. The accepted view is that the heat and light there developed and radiated perish, as far as we are concerned, except for the small portion arrested by each solar satellite; but Dr. Siemens argues that this heat and light do their chief work in decomposing the carbonic oxide and watery vapor which were produced by the kindling at the solar poles, so that the sun itself perpetually renews its own supplies, and restores by its energy the waste matter which has fed that energy. The theory is much too technical and complicated to be here discussed, and we should offer a bad compliment to its ingenious author even to attempt such a task. Dr. Siemens, however, has had great experience with the phenomena of radiated heat, and his applications of the new view to the nature of the zodiacal light and of comets is particularly striking. Of course it is startling to hear of something in our own system which closely resembles perpetual motion; and those who maintain that everything comes to an end, and that all mechanical energy must be gradually degraded and metamorphosed, will be slow to receive the new suggestion.—*London Telegraph.*

TORNADOES AND HOW TO AVOID THEM.—The Signal Service Bureau has in press a monograph, by Sergeant Finley, containing a review of the observations of 600 tornadoes, with generalizations from the recorded facts and suggestions as to the methods which ought to be followed in the investigation of such storms. The storm studies have occurred during the past 87 years in all parts of the country. The storms occur most frequently from five to six in the afternoon, although there is no hour of the day that has been entirely free from them. The average width of the path of destruction is 1,085 ft., and the storm cloud runs with a velocity of from 12 to 60 miles. The wind within the vortex sometimes attains a velocity of 800 miles an hour, the average velocity being 392 miles. Among the most valuable suggestions of the paper are those with reference to the peculiarity of the movements of tornado clouds, containing rules for arriving at their violence. A tornado cloud always has a center, and it always moves forward from west to east. It may, however, sway from side to side in its progressive movement. Changes in motion are sometimes very sudden. In the event of a sudden change the observer, who is east or south of east of the storm, should move quickly to the south. If he is northeast he should move to the north. If within a very short distance of the cloud the observer should run east, bearing to the south.

CANALS ON THE PLANET MARS.—A curious discovery, made by Signor Schiaparelli, Director of the Royal Observatory at Milan, seems to start again that old and unanswerable question, "Are the planets inhabited?" This Italian astronomer is one of the most assiduous watchers of the planet Mars. It was he who, in 1877-78, first detected the many dusky bands which traverse and subdivide the ruddy portions of the martial orb. Again, in 1879-80, when the position of the planet was favorable, he re-identified these strange lines; but during last January and February he has been able to observe and map out, in more than 20 instances, duplications of the dark streaks "covering the equatorial region of Mars with a mysterious network, to which there is nothing remotely analogous on the earth." The Italian astronomer has styled them "canals," for they bear the appearance of long seaways, dug through the martial continents, as if a mania for short cuts had seized the inhabitants of the planet, and everybody residing there had become an active M. de Lesseps.—*London Telegraph.*

INJURIOUS ELEMENTS OF ILLUMINATING GAS.—M. Pohek, of Breslau, finds that the chief poisonous agent in illuminating gas is carbonic oxide. In some cases, when the gas traverses a stratum of ground which is not yet saturated, it deposits the hydrocarbures which give it its characteristic odor and then diffuses itself in dwellings without its presence being perceived. In such cases the danger of explosion is added to that of poisoning. Explosions are comparatively rare, because the definite proportions which are required for an explosive mixture are not present. When the gas is imperfectly burnt, as in heating apparatus, there is an excess of moisture which is injurious to health.

The Mining Share Market.

The mining share market continues dull, with limited transactions and slight fluctnations. Down at Bodie the Noonday and North Noonday joint incline is now getting down to a point where water may he enconntered at any moment, its depth being 253 ft. below the 512 level. When water shall have been reached, a crosscut east of 35 or 40 ft. will intersect the ledge, where the interest of Bodie district is now very largely centered. Those who saw the ore in the winze 200 ft. helow the 512 level are most sanguine that a rich development will he made in this lower working.

On the Comstock as yet no movement has been made toward the drainage of the flooded mines. The Yellow Jacket folks are ready at any moment to set their pumps in motion, hnt the other companies concerned do not appear to have made even the first move toward standing in with them.

At the sonth end the Alta folks now have the whole lead to themselves and are doing some excellent work in the way of exploring the conntry at the depth of 2,150 ft. Other companies in that section are standing back, waiting to see what the Alta people will find.

The *Enterprise* says: On the 2600 level of Union the northeast drift is still cutting streaks of low-grade ore. It is liahle now at any time to run into paying ore. The winze (No. 1) helow this level continnes in streaks of good ore, the largest of which are two feet in width. The hottom of this winze is liable to he wholly in ore almost any day.

At the Savage they will soen begin exploring, with drill and crosscnt, their 2400 level from points on the main north drift. On the 2200 level the main north drift is now entering very interesting ground, and has ahout reached the point where the first great flood of water hroke into the mine some years ago. As to what was to be seen at this point there was great curiosity at the time. The edge of this curiosity is somewhat dulled hy the rust of time, as regards the multitude, yet mining men are still interested in the matter, even thongh nothing of valne shall he fonnd. A careful examination of the rock formation at the point may serve to show whence come the heavy flows of water it is not desirahle to cut into. Many are of the opinion—or were at the time—that the flood ponred out of a large seam or channel between the west conntry rock and the vein material lying against it. Recent work in the north drift on the level wonld seem to indicate that there is a heavy hody of quartz, or, at least, vein matter, where the west conntry rock was snpposed to lie.

THE Morning Star mine at Leadville has been under its present management six months, and dnring that interval it has pnid seven dividends of $25,000 each, and has a snrplus of $80,000.

THERE are recorded in Summit mining district, which inolndes Butte, 4 000 locations, the entire area heing shout as large as Bodie district. There are three smelters, one concentrator (Colorado patent), two 60 stamp dry crnshing mills, and another nearing completion of like capacity, helonging to the Lexington company, owned and officered hy French and Italian capitalists, who recently purchased it from Judge Davis, Jr., for $1,000,000 and 200,000 shares of the stock.

THE nnnnal meeting of the Evening Star of Leadville was held at New York on the 1st of May. This mine has been in operation for three years. Dnring that period the expenses at New York were $7,000; at Leadville—inclnding developments, etc.—$393,000, making a total of $400,000. The product was $1,500,000, leaving a net profit of $1,100,000. Out of this snm 43 dividends of $1,075,000 have been paid.

SWEETWATER.—The Summers mill is shut down for the present, while a new hoiler and two new pans are being pnt in. It will take till Jnne 1st to complete these improvements. The mine is said to he looking hetter than ever, which report is confirmed hy tho fact that the owners are projecting,a new tunnel 300 ft. helow the old one.—*Esmeralda Herald.*

THE amount of ore for sale, represented hy sample hottles assayed hy Frank Foote yesterday, was 1,090,650 pounds. It was all from Bingham, and domonstrates that the old camp is coming to the front again as one of the greatest mining camps on the Coast —*Salt Lake Tribune*

THE Copper Qneen mine was sold as a prospect for $4,500, and subsequently for $18 000. After the mine had been developed and a smelter erected, the property sold for $1,200,000. It has since paid $300,000 in dividends. The last dividend was paid on the 1st of April.

THE Portage Lake, Mich., copper mines produced 7,364 tons of copper in the first qnarter this year—an increase of 639 tons over the same time last year.

THE rush of teams and men to the Oregon Short Line in Idaho still continues, and the Utah & Northern is taxed to carry them as fast as they arrive at Ogden.

THE first ore shipments from Wood river this spring were made hy the Minnie Moore. The ore is very rich, and there is ahont 500 tons mere on the dump awaiting transportation.

THE Nevada *Transcript* sensibly suggests a miners' convention, so that the qnestion at issue hetween the ranchers and the miners may be fairly presented to the people.

W. E. WILD, the superintendent of construction of the Princess mill, has arrived, and will at once hegin getting together the material for the fonndation.—*Candelaria True Fissure.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

ISABELLE.—*Monitor-Argus*, May 15: The Exchequer mill started up last week, after several days' stoppage, on Stella ore, and everything works like a charm about the mill and new furnaces.

ONION.—The Orion G. & S. M. Co. has erected a residence and boarding house near its claim on Stella, and work will soon he commenced in the mine.

COPPER.—Extract from a letter from J. O. Stewart, Esq., concerning copper produced from Stella ore at the Exchequer mill: "Alameda, May 1, 1882.—Your last shipment of copper did all of us credit. Holden told me today that it went 78.¾ copper, and only 3¾ moisture."

AMADOR.

GIANT.—Amador *Ledger* May 13: This quartz claim is owned by Messrs. Reaves & Way, and is located a mile south of Plymouth. There is a shaft down 40 ft, with hunches of quartz varying in widtb from 4 or 5 to 15 ft. The owners are working the property on a small scale by the arastra process, crushing about 3 tons per day. How the rock pays is not definitely known, as no tborough clean-up has been made. Enough is known, however, to warrant the belief thst it will more than pay expenses by regular mill process.

BUTTE.

HUPP'S RED GRAVEL MINING CLAIM.—Oroville *Mercury*, May 12: Among the many valuable mines of Butte county is John Hupp's red gravel hydraulic claim of 160 acres, held under patent from the United States Government. This claim was located in 1871, and purchased by the present owner in 1872, who bas worked it, when water was obtainable, ever since. A ditch having a capacity of from 600 to 700 inches has been constructed from the mine to Middle Butte creek, which supplies water for a few months each year, sufficient for hydraulicing. For a length of 80 ft an exposure bas been made along the gravel deposit showing a depth of from 80 to 125 ft of paying gravel. A good dump of a perpendicular hight of near 500 ft enables the impounding of tailings, which are carefully stored for future washings—the bottom stratum being so hard as to require exposure to air, which slakes it and frees the gold carried off in the lumps which unavoidably go off at the first time of washing. The past season but 32 days' water was had, which never exceeded in volume more than 400 inches, and the owner cleaned up from the flumes $1 700. He employed about 5 men. A large proportion of the gold yet remains in the pit, on the bedrock, that having not yet been cleaned up, while at the second washing of the impounded tailings the yield is often as much as the first. Mr. Hupp was in town the fore part of the week and exhibited to us a nugget of 2 ounces weight which he recently picked up in the claim. He has refused an offer of $64,000 for the mine.

CALAVERAS.

TAPPING OLD WORKS.—*Mountain Echo*, May 10: On Friday evening last, while two Chinamen were drifting in the McElroy mine, on Bald hill, at a depth of about 200 ft, they, by some means tapped the old works, and a heavy volume of water rushed into the drift, which was about 700 ft from the main shaft. The Chinamen ran to the shaft and were hoisted out just in time, as a minute more would have been fatal to them. The mine rapidly filled with water, but is being pumped out, and work will be resumed again.

CAVE.—While Keys & Fletcher were at work on Monday last, cleaning out an old drift in their mine, a terrible cave occurred, literally filling the mine with debris. A few minutes before the cave they had been in the drift some distance examining it, as to the probability of its being a safe place to work. Being satisfied on that point, Mr. Fletcher went to the surface and sent Geo. Lindsay down to fill tubs; George had no sooner reached the bottom than he discovered that the mine was caving. He and Keys then got in the tub and were rapidly hoisted to the top, thus luckily escaping a free burial.

LINDSAY & CO. are pushing work on their mine as fast as possible. The tunnel has been run into the hill over 20 ft and is large and roomy, being 4x6 in the clear. It will require about 300 ft of tunnel to reach the old works. More than likely, however, good pay will be found soon. This is one of the most valuable mines in the county.

A NEW vein has recently been discovered in the Black Oak mine which yields from 50 cents to $2 per pan, and bids fair to become a permanent lead.

EL DORADO.

STRIKE.—Georgetown *Gazette*, May 13: Another strike of some $3 000 has been made this week in this vicinity, but we are forbidden to give any further particulars this week. J. C. Rich, superintendent of the Pease & Blair hydraulic mines on Long canyon, was in town Thursday. He says that work started up on the 1st inst., and that an abundance of water is assured for the entire season. Mr. Bowers and party, who have been running a tunnel to tap the lode in the old Graves mine, at Volcanoville, for the past 6 months, reached the lode this week, which is highly satisfactory. Thus another 10 stamp mill will be added to that camp this summer. Corwin & Spencer continue to take out big pay from their claim east of town. Ike Tankeley has made a strike on mine near town, but the amount is not known at this writing. We learn that the Cal. W. & M. Co. are going to lay pipes from the upper ditch to furnish the town with water this summer. We have it from good authority that the owners of the Eureka mine, in this place, are negotiating with parties in this State for the placing of a large mill upon the mine.

GREENWOOD.—Our "important mining camp" can at the present furnish but few mining items. Our mines generally are in a state of repose. Our citizens have turned their attention to bucolic pursuits, and our mining town is now a cow corral. The music of the (cow) bells on the hills by day, and on the streets by day and night, is never ceasing, interspersed by the nocturnal mariars of our numerous fences, the bowls of our canines, and the bleating of calves and goats, etc. Mr. Desmarchias is working as usual in the Nagler mine, and some work is being done on the Union and Spanish mines, and I believe on the Muntz and Niagara hydraulic mines, beyond which all is quiet. Capital has been invested in our mines; the season for activity in mining is here, and I suppose in due time a commencement will be made, and probably the Middle fork of the American river will be a center of attraction this summer. Mr. J. A. Meudes, of Pilot hill, writes me that he is driving a tunnel to his quartz mine on Pilot hill for the purpose of developing. This is a move in the right direction. Mr. Mendes has, I believe, valuable mining properties, and his claim on Pilot hill will prove a rich and lasting mine, and be the means of attracting attention to the many very promising but neglected quartz lodes in that neighborhood. The want of a quartz mill has long kept that district back, but the day is coming when it will become a busy quartz mining locality.

MONO.

NOTES.—*Homer Mining Index*, May 13: New mines are being discovered daily in the Sweetwater region..... Mining will be resumed in Prescott district the present season.....Prospectors are striking out into the mountains in all directions.....Work will probably be resumed on the Gold Band mine next week.....Arrangements are now being made for bringing in the Little Emma 10-stamp mill.....A very rich strike in the Detroit company's copper mine in Jordan district is reported.....The west crosscut, 150 level of the Bay Queen, is being steadily pushed in favorable ground.....Work is still being prosecuted on the Garfield, and the rich ore vein holds its own as the cut is advanced.....The shaft of the Josephine is being substantially timbered, and sinking will be resumed early next week.

MARIPOSA.

BAD MANAGEMENT.—Mariposa *Herald*, May 12: The managers of the Bentoo Mills tunnel seem to have managed their prospecting very poorly when they drove through very rich rock somswhere in the mine and knew nothing about it, as now the richest kind of rock is found in the dump. A fair specimen, found by Thomas McElligott, can be seen at Schlageter's hotel, which shows coarse gold in large quantities. This rock would assay many hundred dollars per ton. The question naturally arises: This rock came out of the tunnel, the tunnel is yet open, why can't they prospect along on the vein and find this rich chute? But when we learn that many shafts have been sunk, crosscuts, over cuts, etc., run, the timbers have been taken out and the said works allowed to cave in, excepting the main tunnel, then we know it would be next thing to an impossibility to tell exactly where it did come from.

NEVADA.

GOLD FLAT EUREKA.—Nevada *Herald*, May 10: A *Herald* reporter visited the above mine yesterday afternoon, in company with W. G. Richards, E. M. Preston and John Bonney. The Eureka is situated on Gold flat, a few hundred yards southeast of the once-famous Sneath & Clay mine. Upon our arrival at the mine we found a gang of men at work getting everything ready to put in place the hoisting and pumping machinery recently purchased. The main building is nearly completed. It is about 50x20 ft in size. In addition to this a boiler room and blacksmith shop will be built on. The engine is 10-horse power, and a 6 inch pump will be used to handle the water encountered in sinking the shaft. The new incline is now down about 80 ft. ft will have to be sunk 50 ft further before reaching the level of the old works. It is a 2-compartment shaft, substantially timbered and has thus far been easily sunk, no blasting being required. The ledge will probably be tapped when the shaft reaches the level of the old works, if not before. It is expected that steam will be got up next Saturday. Everything about the new hoisting works is being put up in a substantial manner, and indicates that the stockholders have great faith in the future of the mine. The work is being ably superintended by Mr. John Trenberth, the efficient superintendent. A short time since a crushing of 40 tons of ore from the Eureka paid over $120 per ton. The calculation is that the money thus obtained will pay the cost of the works now being put up. We wish the stockholders success in their undertakings, and trust that before long one of the richest gold mines in Nevada county will be opened up through their enterprise and exertions.

NEW YORK HILL.—*Tidings*, May 15: Work is still being pushed ahead at the New York Hill, with the very best prospects before the miners. About the same number of men is now employed as there was last year. Late developments in the mine show a great improvement over those of two months ago.

THE Empire is looking exceedingly well, the 13 level being especially good. The mill is running night and day on good ore.

THE Ontario Co., whose works are located on the Colfax road, have their shaft down 80 ft, and are now crosscutting for the ledge. Indications are very favorable. There is scarcely any water to contend with at the Ontario. The mine is managed by Messrs. Richardson and McDriff.

THE Champion mine, near Nevada City, is looking very well. A slate formation has recently been encountered and a strong and permanent ledge, in all probability, will soon be reached.

THE Lowrie ground is being diligently prospected. A new tunnel is being run a few ft south of the old one. This new tunnel will tap a vein of gravel which was discovered in the old one, but which could not be worked from it. Tributers and contractors are constantly working on the top of the hill on ledges which this tunnel is destined to tap. The ground is known as the old Marshal property, in the south part of the town of Grass Valley.

THE Imperial Co. is driving its shaft ahead, and will continue so doing until water level is reached. This excellent little prospect has just taken out a crushing of 4 loads, which will be milled as soon as it can be hauled. On Thursday last some gold bearing quartz was taken from the Imperial.

DRIFTING is still going in at the Washington. The ledge is looking better and is widening out. There is considerable water to contend with in the mine.

THE old Morning Star gravel claim, at Iowa Hill, in Placer county, as we learn from a gentleman who knows all about it, is being diligently worked by the company and they have the very best prospects ahead. The Morning Star claim has been worked for a number of years, and good success has attended the efforts of the company. At the start it was worked by drifting, then the hydraulic process was resorted to, but the cement proved to be too hard for this mode of work, and now the company is again drifting. A tunnel has been run and an upraise made which has reached good pay gravel. A 10 stamp mill has just been completed and will soon start to work crushing the cement and gravel. John C. and Edward Coleman, of Grass Valley, and J. H. Neff, of Auburn, are the principal owners.

PLUMAS.

A PROMISING MINE.—Plumas *National*, May 12: We have been informed by several parties lately that the quartz ledge discovered near Squirrel creek, Mohawk, last year, and known as the Roberts mine, is showing some splendid prospects. ft is being opened by Gallagher & Co., who have run a tunnel to the ledge and drifted each way, besides sinking a shaft. The ledge shows good rock and is extensive, being some 4 or 5 ft wide. Some of the experienced quartz men of the Plumas-Eureka say that it is the best quartz prospect in the county. It should be thoroughly developed during the present summer.

PLUMAS-EUREKA.—This old and well known mine is keeping on in the even tenor of its way and proving a "stand-by," as usual. Mr. Keddie, who was recently at work there, informs us that everything looks very prosperous, and that good ore is being opened up in the level below the Mohawk tunnel. The Eureka tunnel, on a level with the Mohawk mill, near Johnsville, is now in a distance of 2,2 0 ft. When completed it will tap the pay ore at a much greater depth than has heretofore been reached, and the company will then have the advantage of coming down out of the deep snow.

KILLED IN THE EUREKA MINE.—On Friday of last week a sad accident occurred in the Eureka mine, resulting in the death of a young man named James Knotwell. He was at work in one of the shafts with 5 other men. Some timbers were being let down, and a large piece, 14 ft in length, got out of the skip and fell to the bottom, striking Knotwell on top of the shoulder, killing him instantly.

SIERRA.

MORRISTOWN.—*Mountain Messenger*, May 13: Work is in full blast at Morristown and Craig's flat. About 50 men are being worked and a great many more would be put on if they could be obtained.

SCALES.—J. Dibson, who is over this week, reports times lively at this old mining camp. Union Hill gravel claim, owned by Boyce, McChesney & Westall, is yielding handsome returns this season. Thus far about $14,000 has been realized. Abundance of water to last until the 1st of August. Twenty-five men are employed. The same number are employed at Fair Play, Boyce & Bro. owners. No clean-up there yet, and will not be for some time, but working on good ground. Diggings at Poverty hill in full blast, and will pay well this season.

KILLED.—A Chinaman employed in a mining claim near Scales' diggings recently got into a flume, was carried over the dump and was found dead on the bank below.

COUNCIL HILL.—The mining claims at Council Hill, owned by Boyce, Westall and others, are paying better this year than ever before. We understand that the company has already cleaned up $14,000 from a short run.

CONTRACT LET.—*Tribune*, May 12: N. H. Noble and other owners of the Rainbow mine, at Chipp's Flat, have contracted with Walter, Lind & Co., of San Francisco, for a 10-stamp mill to be erected at the mine as soon as possible. This mine has been steadily developed for the past 3 years, during which time a large amount of money has been extracted. There is now ore enough in sight to warrant the erection of a mill. The new mill will have power sufficient to permit the setting up of 10 additional stamps should it be necessary.

MINING SALE.—The Rainbow M. Co. has purchased of S. S. Crafts, of Alleghany, the Twenty-one mine, located on Kanaka creek. The amount paid for the property, we understand, was $3,000. In connection with the mine was a water right which was necessary for the company to have, in view of its building a water-power mill on the creek.

TUOLUMNE.

OUR MINES LOOKING UP.—*Independent*, May 13: A number of the Tuolumne mines are looking up. The Heslep mine at Quartz mountain has come upon fine-looking ore in the 800 level. The Little Gem, on the Mother lead, owned by W. N. Harris, is opening up splendid ore; also the Alabama, adjoining. The 40 stamps at the mill are kept busy by the miners, who quarry from the vein from the surface down, in large quantities. The Soulsby mine, at the lower level, is also extracting rich ore, and our informant says the mine has not looked better for years. Divoll is still taking out large quantities of gold in his bonanza claim at the upper end of town. The past week the men in the drifts came upon a large body of gold to the south, showing that the gold in this immense vein is not confined to one locality. Capt. Colby, on this bonanza vein, north, is again in fortune. About 100 ft on the hill above the present incline shaft some boys who were prospecting on the surface found some beautiful specimens. Mr. Colby investigated the "find," and for the past week has been doing a business that a 40-ton would be proud of. The Patterson mine, near Tuttletown, has a large force of men at work, employed by an English company. They intend to sink several hundred feet on the vein and put the properly in good shape. As the spring opens a lively interest is being taken in mining. We need new blood in this business for legitimate work, and less jobbing, as has heretofore been the case. We are in possession of many curious, interesting and crooked facts regarding our Tuolumne mines, showing that our "properties" are not faulty in many of the cases of failure.

TRINITY.

BRIGHT PROSPECTS.—Trinity *Journal*, May 13: From parties who have recently visited the mines of the Nash Deep Gravel M. Co. on Coffee creek, we learn that the prospects are excellent and that the company will make a splendid showing this season. They are said to have lately struck one of the richest gravel deposits ever found in the county. Work on the new ditch and other improvements is progressing favorably.

NEVADA.

WASHOE DISTRICT.

CHOLLAR-NORCROSS-SAVAGE SHAFT.—*Enterprise*, May 12: Sinking the shaft is being pushed ahead vigorously. During the 7 days ending yesterday at 12 M., 25 ft have been sunk and timbered, making the total depth 2,490 ft.

CALIFORNIA.—Joint Con. Virginia east drift, No. 2, on the 2700 level, has been advanced 21 ft, and are now putting in a drain. On the same level the main south lateral drift has been extended 20 ft.

UNION CON.—On the 2500 level are stoping out ore. The northeast drift on the 2600 level has been advanced 18 ft, and No. 1 winze on the same level has been sunk 13 ft. On the 2700 level east crosscut No. 1 has been advanced 50 ft. On the 2900 level the joint Sierra Nevada west crosscut has been advanced 25 ft. During the week 517 tons of ore have been extracted from the stopes on the 2500 level, and 520 tons and 1,220 lbs. have been sent to the mill.

SIERRA NEVADA.—On the 2500 level No. 2 winze has been sunk and timbered 11 ft. The main north lateral drift has been extended 30 ft. The air course with No. 2 north drift is completed.

ALTA.—During the week the flow of water on the 2150 level has greatly increased, and it requires the pump, running at 8½ strokes a minute, and one bailing tank, going constantly, to handle it. The 2150 station has been covered several times during the past few days, owing to the temporary stoppage of the pump. The west drift on the 2150 level made 45 ft last week, and is now out 1,281 ft. The crosscut near the Benton line on this level is out 11 ft. The formation in the face is encouraging.

YELLOW JACKET.—During the past week the water rose 7 ft, standing to day 413 ft above our 2300 level station. At the Winter's shaft we commenced to-day opening the old sagebrush station on the 100 level from the surface. The 400 level drift is in 50 ft, having been run 35 ft during the week. In the 640 level drift we made 26 ft, the face of the same to-day being 36 ft from the station. We have reopened the 1028 level station and repaired 40 ft of the drift.

MEXICAN.—On the 2700 level are cutting a drain in the main lateral drift; also, are cutting out for west crosscut No. 2.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, May 13: The main drift on the fifth shaft level has been extended 21 ft during the week in the same formation as reported last week. The face of it is 115 ft distant from the station. The other shaft levels present about the same appearance as last week. The adit and levels above, though showing no material change, look fully as well as at time of last report, and are yielding the usual quantity of ore. The daily output of ore is about 50 tons. Mill No. 1 has finished crushing Mount Diablo ore, and will be shut down for the present. Owing to the caving of the main line shanter shafting in mill No. 2, the same has been entirely stopped since the accident. The new piece of shafting, ordered to replace the broken one, was expected on the 10th inst., and on its being in place operations at the mill will be immediately resumed. Meanwhile there will be no bullion shipments, but as the usual amount of ore is being delivered at the mill, there will be a large surplus on hand when crushing is resumed. Besides the broken shaft, some other very much needed repairs have been made to the mill.

MOUNT DIABLO.—Winze No. 1 has reached a depth of 98 ft, making a total depth of 106 ft below this third level, and shows a ledge of low-grade quartz in the bottom that looks more favorable. The east drift from winze No. 2 is in 18 ft, and is still showing a ledge of low-grade ore. Winzes Nos. 3 and 4 show no change. The latter is now down 97 ft. The east drift on the second level has advanced 12 ft, and the north crosscut near the face of this drift is in 21 ft. The south crosscut near the center of the mine, on the same level, is in 33 ft, and has shown encouraging streaks of ore for several days. The south crosscut from the east drift on the first level is in 82 ft, and has a more favorable formation in the face. Two shipments of bullion were made since last report, one on the 6th inst., amounting to $8,437.64, and one on the 9th inst. of $10,598.65.

EUREKA DISTRICT.

EUREKA TUNNEL.—Ruby Hill *News*, May 15: We visited the Eureka tunnel Thursday, and were shown through the long bore by foreman Motte. The breast, he informs us, is directly under the northeast corner of the Silver Conner ground, and 1,972 ft from the mouth. It is expected that work will soon be resumed in the header, and the tunnel continued. The new shaft being sunk about 150 ft from the south winze is now down 12 ft, and is being steadily pushed downward. It will be sunk about 100 ft, in order to connect by drift with the winze. The object of the new shaft is to give a working shaft through which the ore can be hoisted without the necessity of double windlassing, and also to prospect the ground. It is also designed to connect the tunnel, by means of a drift near the shaft, with the shaft of the El Dorado, a distance of about 500 ft. The El Dorado shaft is now down about 130 ft, and will have to be sunk to a depth of 250 ft to strike the tunnel level. By this connection much good ground will be prospected and good ventilation secured for both mines. Work on the drift from the winze is being pushed, although the foul air sometimes interferes. Contracts have been let for driving the tunnel and drifts. Work was begun to-day.

ESMERALDA DISTRICT.

HUMBOLDT HILL MINING COMPANY.—Esmeralda *Herald*, May 13: Ore enough to keep 2 eight-horse teams constantly employed is being extracted and shipped to the mill. The mill is still running along without interruption, and a constant flow of gold and silver running out. As no clean-up will be made until the first of the month, we are unable to say how much the ore is paying, but we are told that it will yield a fair profit to the company. It looks good to see the large ore teams making regular tripe through our streets.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, May 10: The ore from the Betty O'Neal mine is still being hauled by Case's team to the Eagle mill, and the quantity on the dumps does not appear to decrease. The stopes in the mine look first rate, and there is plenty of rich ore in sight. Bullion will be shipped every other day in future. A new sinking pump has been shipped from San Francisco, and is daily expected, together with the necessary column-pipe. The pump is a 4-inch discharge, and of the latest and most improved pattern. As soon as it can be got in place deepening the shaft will be pushed ahead. The prospects of the Betty O'Neal are very flattering.

MORNING STAR.—The contractors have not yet finished the sinking of the Morgan incline on the Morning Star mine. The ore extracted is of good quality, and the ledge still retains its size.

EMMA.—The contractors on the Emma mine have cut the ledge in the lower tunnel, and some pieces of rich ore have been taken out. The ledge is large and of good looking quartz, but from appearances the tunnel is north of the ore chimney in the old shaft.

EAGLE.—The Eagle tunnel is still being pushed ahead as rapidly as possible through the country rock under the foot wall of the ledge. Crosscuts will be made through to the hanging wall, probably next week, or soon after the arrival of Manager Bothwell.

MT. COREY DISTRICT.

BIG INDIAN.—S. L. Hunk, one of the owners of the Big Indian mine, is in Virginia City. He said to a *Chronicle* reporter that the Mt. Corey district is prosperous, over 50 men being at work. Considerable prospecting is going on. The ore in the principal claims is free-milling gold, but recently some discoveries of silver ledges have been reported. The Big Indian mill is being kept going constantly. Five more stamps are soon to be added to the mill.

SANTA FE DISTRICT.

TIP TOP MINE.—Virginia *Enterprise*: The Tip Top mine, Santa Fe district, Esmeralda county, owned by B. G. Smith & Bros., and under the management of Johnny Powell, is the best developed mine in the district. There is a force of 12 men at work. Recently a very important development was made on the 250 level, an 8 ft vein of $100 ore being cut at that point. The work at present is merely prospecting and developing, no ore being extracted except where veins are cut in doing the necessary work. The Tip Top is without doubt a large and valuable property. In the Dunbarton mountains, in this district, some big copper mines have recently been discovered. They are running as high as 40%.

TUSCARORA DISTRICT.

OUTLOOK.—Elko *Independent*, May 16: The outlook at the various leading mines is more satisfactory than could reasonably have been anticipated, recent unexpected developments giving positive assurance of lively times this season, at least. The new discovery in the Central has been prospected westward 100 ft and to the east 150 ft, disclosing at a depth of 13 ft a 7-ft ledge, an average of the ore across its entire face giving an assay of $100 to the ton. Samples of the high-grade ore from the lead, shown us, would assay nearer $1,000. In the Argenta explorations are reported as being very satisfactory, and in the Navajo the ore developments are said to exceed anything heretofore uncovered in that mine.

ARIZONA.

GLOBE DISTRICT.—*Chronicle*, May 6: In the McMorris the vein has been cut on the 600 level, showing soft ledge matter, rich in silver, with superb promise. The shaft on the La Plata Richmond basin, is 40 ft below the tunnel, and about 120 ft below the surface. Indications are splendid. Next week will give approximate value of ore dump.

OLD DOMINION PROPERTIES.—The smelters of the Old Dominion copper continue turning out bullion at a rate astonishing experienced reducers of copper ores. The fact is, the ore is extraordinarily rich in not only copper, but gold and silver. The developments in the mines justify the most sanguine expectations. The Indian war has interfered seriously with transportation, but in spite of every obstacle, the energetic superintendent has kept his works going almost constantly, and has reason to be proud of his output. Whether the Old Dominion mine should be called a gold or copper mine is a matter of doubt. The present workings show up a richness of gold production which would pay were the copper thrown away; and, we might say, vice versa—throw the gold away and the copper will pay. All eyes are turned upon the properties of this company just now, with a confidence that it will be "the making" of this city and district.

COLORADO.

ENGINES.—*Register-Call*, May 5: Mr. Whitaker, of the King M. Co., Nevada district, has purchased Leidyerwood engines of the capacity of 20-horse power and 30-horse power boiler which will be placed over the working shaft of the King lode.

ORE.—The owners of the Vancouver mine, on Camp Clifford mountain, are very jubilant over the fact of having struck a good body of ore in their main shaft. The vein matter is of unusual width, and contains quite a large amount of clear mineral. The ore is assorted in 3 different qualities, the refuse or waste being piled up for concentration.

DILBERT & CO., discoverers and owners of the Yellow Jacket, north of the Vancouver, have everything in readiness to start up the workings of the vein. ft is quite likely that a plant of machinery will soon be placed over the mine.

THE CLIFFORD MINE, operated through the management of Mr. J. E. Rockwell, of the city, has a large lot of concentration ore out and piled up. The recent strike in the lower last level is largely adding to the output of the mine. Modifications in the arrangement of the manipulation of the ore treated under stamps are being made. Mr. Rockwell informs the *Register-Call* that an Embry table will be used in connection with the Bradford tables.

W. D. YOUNG & CO. are drifting east from the bottom of the main shaft of the Jenny Lind lode, situate near the head of Woodpecker gulch, north of Camp Clifford. The shaft was sunk through a lean portion of ground, but in drifting east under the mountain, in going but a short distance, they have struck a fair sized pocket of silver-bearing ore—galena intermixed with gray copper and zinc blende.

THURMOND & HAMILTON, of the Russell dry ore concentration works, have received their new and improved fan, which has been placed in the mill building. It works like a charm

IDAHO.

WEST FORK MINES.—Wood River *Times*, May 10: A prospector, who recently took a run through the West Fork mines and prospects, reports enough ore in sight and on the dumps to keep the Philadelphia Co.'s smelter running all summer. The Dutario and Star, of the Rook's group, have large bodies of ore in sight, and many tons on the dumps. The Philadelphia Co.'s mines, the Blackhawk and the Irvine group, are looking well. The latter were recently purchased by the company for $40,000 cash. There are 300 tons of good ore on the Blackhawk dump. The Nignthawk, an extension of the Blackhawk, owned by Connor, McGregor & McLeod, is also looking well. The winter's development work has shown it to be a good property. The Allen group was prospected during the winter by shafts and drifts on several ledges. One shaft is down 55 ft, the bottom in ore. The Rogers, one of the group, has been prospected by open cuts for a distance of 500 ft, showing ore at every opening. Snow is fast disappearing, and West Fork will soon be open for prospectors up as far as Little Smokey divide.

ONE MILLION IN SIGHT. Miners just down from Vienna state that there is $1,000,000 in sight in the Solace mine, at that place. The tunnel reached the vein 333 ft from the entrance, cut it 81 ft west of the discovery, at a depth of 170 ft to 200 ft below the surface. The vein is about 15 ft wide, with 2 pay streaks—one on the hanging wall, 10 inches wide, of $50 rock; the other on the foot wall, 6 to 15 inches wide, of high-grade ore.

BLOW-IN THE SMELTER.—It is reported that Col. Lewis, of Ketchum, came down to Hailey yesterday to make arrangements with Falk & Co., to work his Elkhorn ore, but that no one could be authorized to make contracts. Several parties are offering ore for sale, and making inquiries as to when the smelter will be blown-in.

BAYHORSE ITEMS.—Idaho *Messenger*, May 12: Men are at work shoveling snow and repairing the trail from Ramshorn and Skylark. Good ore has been struck in the Tenderfoot mine. We hear blasting every day on the Bullion. Captain W. A. Gill is satisfied there is a body of ore there. We hope he may strike it. There are many new arrivals here but there are more than can obtain employment at present.

WOOD RIVER ITEMS.—*Miner*, May 6: New strikes are being made now daily and we predict that before the next 60 days have passed more valuable finds will be made within 7 miles of this place than at any other point on the river. Work done at mining within a radius of a few miles, during the past winter, has been a paying operation in every instance, one of the number netting nearly $30,000 with less than half a dozen men employed. Many new prospects, within a few weeks and inside of 5 miles of town, have been found and located. The location of Dickson & Pinkham is considered equal, if not the best of any. Mr. Burgess, of San Jose, found an immense body of galena ore on Saturday last and many other prospects are reported daily now. Many of our people are making preparations for going to their mines for work. A. Himes and partners are at their East Fork claims. I. I. Lewis is preparing for extensive work on the Elkhorn, Webster and Conners for the Trail Creek canyon mines and many others on the canyon. Parties will soon be on Lake Creek; J. Miller and partners, who will arrive soon, will operate on Eagle creek; Mr. Chambers and others on North Fork; and the 47 locations on Boulder creek, mostly owned by Shultz, McMillan and Murdock Bros., will also be worked. The Warm Springs M. Co. will soon have a new superintendent at the mines who will have authority to push their mining operations to the fullest capacity. They will probably erect smelting works during the summer. Hundreds of other claims on Warm Springs creek will be fully worked the coming season. The new find of ore by Adams and Hughes excites much attention, owing to its richness and the large quantity of ore in sight. The Connors and Chambers claims near the Philadelphia Co.'s property will produce large amounts of first-class ore with very little work. The Allen and Dement claims are showing finely and will have a number of tons of ore to sell at once. Col. Miller, of Philadelphia, the new superintendent of the Philadelphia M. Co. appears to be the right man in the right place.

SQUAW CREEK.—*World*, May 10: Prospectors are beginning to turn their toes in the direction of Squaw creek. About 20 are now there, and a good many more will strike out for that district shortly.

MONTANA.

CLEAR GRIT.—*Inter-Mountain*, May 11: On the Clear Grit the west 120 ft drift on the foot-wall vein has been driven 100 ft, the ore body being remarkably regular and uniformly rich. The stopes will soon be opened. The sinking of the main incline has been vigorously prosecuted and the 260 station has been completed. A crosscut from the bottom of the shaft is being driven south to tap the hanging-wall vein which in the upper level is both rich and extensive.

THE SHAKESPEARE-PARROT is being actively developed under the supervision of Alex. Tarbot. The main shaft has attained a depth of 200 ft and crosscutting out to the ledge is now progressing. Several weeks will elapse ere the ore body will be tapped, as the distance to run is considerable. From the upper workings a little first class ore and a considerable amount of second-class ore are being extracted. The latter is shipped to the concentrator, which is running very satisfactorily.

NEW MEXICO.

GEORGETOWN ITEMS.—*New Southwest*, May 6: Some very extensive pockets have recently been struck on the second level (18 and 20 ft below the first series of pockets) on the Naiad Queen, which bid fair to produce ore in large quantities. The mine continues to turn out its quota of ore, and there is scarcely a doubt but that large pockets exist throughout the entire depth of the silurian lime, which extends down for several hundred ft on the lower side of the contact. The main shaft on the Nalad Queen is upwards of 400 ft in depth, showing good ore, in places as much as several ft in width, on the contact between the lime and the porphyry. The intention is to go through the lime. The McGregor and Commercial mines are being extensively worked, not only by the owners, but also by lessees, all of whom are doing well, judging by the amount of high-grade ore they are shipping to the mill daily. They have not the advantage of steam hoisting machinery on these mines, yet the horse whims are kept going pretty steadily extracting metal and waste.

OREGON.

NOTES.—Gregon *Sentinel*, May 10: Silas Draper, of Foot's creek, was in town Monday. He predicts a larger clean-up in that camp than there has been for many years. .....Mr. Benner, of the Centennial mine, made a very satisfactory clean-up last week. There is still a fair supply of water in the Willow Springs camp.....Work at the Sterling hydraulic is being crowded day and night with a full head and no interruptions.....Mr. Stoutsmeister, of San Francisco, is across the Siskiyou examining the Emeline quicksilver mine for San Francisco capitalists, with a view to bonding or purchasing....Good work is being done at the Squaw Lake mine and a considerable amount of dirt is being washed.....The Green Bros. are still stoping splendid rock from the Sugar Pine ledge, in Josephine county, and have a large amount of it in sight. The mine is now well opened and a handsome stake is assured to these patient miners.....The big strike in the Walt Simmons mine lately opened on Galice creek is much talked of in Josephine county. It is said to be the richest ground in that county and the clean-up will be immense.

UTAH.

EXCITEMENT.—Southern Utah *Times*, May 13: The excitement in and about Copper Gulch is unabated, and the whole country is located by excited prospectors.

SINKING THE SHAFT on the South Horn still continues as rapidly as possible. The ore which was struck in this mine some few days since still continues to improve as depth is attained. Supt. Cody is a man of large experience and one of the best miners on this coast. The prospects for his striking ore in this mine are certainly very flattering, and he will undoubtedly have a second Horn Silver mine before long.

LEVEL.—The work of drifting on the 400 level of the Lulu still continues without interruption. This drift is now in considerably over 100 ft and is expected to cut the ledge inside of the next 100 ft if it does not pinch much deeper than it does in the Horn Silver mine. The formation is the same trachite which was encountered in drifting from the working shaft of the Horn Silver to the various levels. Mr. Pat. Ryan, a man of experience and pluck, is superintendent, and he will go on with the work until he succeeds.

Ill-fated Finders—Noted Discoverers of Pacific Coast Mining Camps.

The superstitious belief is an old one with the early inhabitants of Pacific coast mining towns, that unless the discoverer of a camp meets an untimely or bloody end, the place of his creation will not descend into the future as one of the "excitements." This idea seems to be not without foundation, wherever it originated. Of 38 "booming" towns in the early days, the locators of 12 were killed by the bullet, one caved into a deep shaft, and a majority of the others adrifted with the tide of emigration into oblivion, or died and were buried in panpers' graves. "Old Virginny," who donated an everlasting name to that queen of mining camps, Virginia City, came to his death by an "over" dose from a bucking mule, near Dayton, Nev., and the no less noted Comstock died by a bullet self-administered in Montana, and like his predecessor, he died financially broke. Colonel Storey, whose name that county adopted, was killed in battle by the Pyramid Lake Indians. Billy Farrell, who "struck" Meadow Lake, died a victim to remorse in one of the leading hospitals of San Francisco, haunted by the spirits of 1,000 delnded pioneers and prospectors passing and repassing at the foot of his bed. He made no confession, His name is a household word. His grave lies side by side with that of Doughnut Bill in the Lone Mountain cemetery, where he was planted in 1868. The locator of the first find in Pioche is said to have stopped a stage-load of shotgun messengers early in the Black Hills excitement, and rumor says that he was buried alongside a boulder not far from the line of the road. Kelse Austin, whose name is attached to one of Nevada's pioneer towns, is anchored in northeastern Elko county, and is probably no nearer the goldeu goal than the legion of early settlers who surround him. Of they who first uncovered "the lead in the White Pine mines" the world knows little. A lone grave under a whitepine tree tells a chapter in the tale. Of Eureka's first inhahitant nothing also is told us, hut it is safe to surmise that few nuggets weighed down his hlankets as he walked out over the grade. Tuscarora was the work of an insane emigrant from Massachusetts. Legend locates his tombstone near the adohs shacks of the old townsite, hut those posted, infer that he atoned for his misdeed by sinking himself to the hottom of the head waters of the Owyhee, if, indeed, he did not fall into the hands of a determined vigilance committee. Anrora started a goodly-sized graveyard with her "oldest inhahitant." Bill Body slept himself "away" in a snowstorm a few miles from the present place of writing. When his memory had reached the age of 20 years, his hones were resurrected and after heing paraded at the head of a procession of tenderfeet through the town after his own name they were identified hy his comrades and buried with imposing ceremony among the "had men from Bodie." A monument was raised to his memory, and it still stands unpaid for in the stone-cutter's yard. Homer, of Homer district, followed in the suicidal tracks of Comstock, and after squandering a small fortune shot his hrains out in the streets of San Francisco. These are hut a few of many instances, but the fates that have hefallen the many who have ventured in the discovery of new lodes, and succeeded, hear the old timers out in the helief that still has existence in not a few minds.—*Bodie Free Press.*

A Mexican Mining Legend.—One of the most commonly believed Mexican tales is that one of the "Step Devil." The men tell you in some of the mines there is a dwarf. A peculiarity about him is that he has immense long arms—so long that he can take off his sandals without stooping. This dwarf, when there is any danger in the mine, such as a cave, goes up the ladders, lifting himself hy his arms, with his legs hanging free. As he passes each rung he stamps or kicks it out of the side pieces, so that the men, when they attempt to fly, find all means of climhing out of the mine is destroyed. In the very old mines, which were worked hy the Indians, there were no ladders, hnt in their place trunks of trees, in which notches had been cut, and the Indians climhed hy inserting the hig toe in the notches. When the Indians tell you of the "Step Devil," they say that he has on each big toe an enormous nail, and that as he climhs the tree trunk he uses this to gouge the notches ont hy splitting off the part on which the toe rests. The story is evidently an Indian one, although altered hy the Mexicans to suit the change in the means of going up and down the shafts.

Reduction Works.—We have it from pretty good authority that the prospect for having reduction works here in Prescott, before long, is encouraging. The agents of a certain mining company are figuring on the matter, and, though little is said hy them on the subject, we know they mean business. It may he that Prescott will he asked to help the enterprise along. If so, something will, nndouhtedly, he done hy our people. The erection of one set of works would soon be followed by another, and although Prescott may never become as great a bullion extractor as Leadville, with her 12 or 14 reduction works and furnaces, producing over $3 000,000 every month, she will surely rank pretty high.—*Prescott Courier.*

Some Sonora Mines.

The Arispe District Coming to the Front.

Mr. A. W. Miller, of Sinoquipe, Sonora, is paying Tombstone a visit, and was taken in charge hy an *Epitaph* reporter yesterday afternoon and subjected to the news pump. Mr. Miller, in company with A. C. Riordan, his business partner, went to Sonora about five years ago and located at the town of Sinoquipe, in the Sonora valley, about 150 miles from the American frontier. They purchased some mines, and with characteristic pluck began to develop them. It needed no ordinary courage to stick and prosecute the work, as the mines were far from favorable at the start. But time proved the wisdom of their enterprise, and about a year ago the reward came. The San Augustine mine, on which most of the unproductive labor of years had been expended, snddenly revealed a bonanza. A good thing is never slow in asserting itself, and the San Augustine almost immediately jumped into public notice. Eastern capital sought a slice of the honanza, and something less than a half interest was sold hy the original owners for a large sum. A ten-stamp mill has been erected on the Sonora river near Sinoquipe, and will start up soon. Abont 150 tons of rich ore are at present on the dump, and the mine is opened up sufficiently to admit of ore being treated in large quantities. Several American and native lahorers are employed, and Mr. Miller has engaged the services of Archie McDonald and Charles Bigney, experienced mill men, to accompany him to Sonora when he returns. Los Delicias, the home of the famous Santa Helena mine, is situated a few miles south of Sinoquipe. The Santa Helena company has a ten-stamp mill in operation, and a large 60-stamp mill will be put in place this summer.

Messrs. Malter & Lind have entered into a contract with the Santa Maria Mining Co. to erect a 60-stamp mill, and work upon that establishment is now progressing. The Buena Fortuna mine, owned hy A. W. Miller, Geo. Marks, Mr. Fredericks and James Shane, is situated on the San Domingo, ahout half way between Arispe and Magdalena. The mines in the Arispe district are very extensive, and yield a fine quality of high-grade ore. Nearly all the discovered mines of any consequence are owned by Americans, either individual or corporate. The mountains in that vicinity swarm with the industrious prospector, and the day is not far distant when the American people will he in a majority. Both the government and the people invite and welcome American capital and labor. There is an abundance of timber and water in the vicinity, and the Sonora railroad is only distant about 60 miles. The mining companies and Malter & Lind, the contractors, have pooled their issues and will huild a good wagon road from Sinoquipe to the railroad. Mr. Miller thinks that the entire Sonora valley is naturally tributary to Tombstone, and that an effort on the part of our merchants would control the entire trade between here and Ures.—*Tombstone Epitaph.*

No Better Mining Country.—It is a strange thing that in mining undertakings capital should be so shy of investment in the development of our home mineral resources, while it is supplied without hesitation and lavishly for operations in wild and distant regions, difficult of access, and where the expense of carrying on enterprises are necessarily heavier, owing to these very conditions. But the conditions which it would seem should operate to discourage investment appear to have the opposite effect. Douhtless remote and comparatively unknown regions are hetter suited to the speculative class of mining, hut coming down to the legitimate industry is quite another thing. That there are good mines in those remote sections, in which capital can he invested with liheral compensation, there is no douht, hut why wander off in search of that which lies right at hand? The mineral helt extending through this section of country affords as good a field for remunerative mining enterprises as can he found anywhere, with hetter facilities for carrying them on.—*Calaveras Chronicle.*

Not a Success.—Last fall the Bear River Tunnel company out a bedrock tunnel through a spur of rock around which Bear river runs in the shape of a horseshoe, the tunnel heing 250 ft. long. It was the intention to cause the flow of the river to run through the tunnel and hy means of suitable undercurrents to catch the gold that is continually heing washed down the stream with the debris. The water was turned through the tunnel early in the winter, hut owing to the incapacity of the flume to carry all the water and wash during high water (the time when the most wash takes place), it has proved a failure—that is, the plan as practically carried out. We understand only about $8 have been cleaned up. The theory, in our judgment, is correct, hut practically the plan was a failure on account of the smallness of the tunnel. The company will not work the flume until after the tunnel has been sufficiently enlarged to admit the flow of the entire river.—*Placer Herald.*

Bishop Creek *Times:* From a private letter from Lone Pine we glean the following: Keynot has struck it rich, and every day rich developments are being made in Beveridge; Lone Pine is crowded with strangers; hotels all full and everybody happy.

Too Many Claims.

To show what a newly arrived prospector and miner thinks of mining matters in Arizona, we extract as follows from a communication signed "L. C." in the Globe *Chronicle:*

For two months I have done nothing else hut investigate the mineral resources around Prescott, and I can only say this much, that although the mountains and hills contain an unlimited amount of the precious metals, it is to he regretted that but a limited amount of development is carried on throughout this region. The reason for all this is, that the majority of the ledges or claims are for sale, and are not located for the sake of developing them. You will get an idea of some of the enterprising prospectors, when I tell yon that some of these gentlemen have or own from 17 to 31 ledges or claims, and have held them from one to 16 years. These same gentlemen claim that they do the necessary work on them every year, although these poor fellows have hardly any funds to purchase provisions to live on from day to day. Would you, or do you, or anybody else, helieve that these men perform the requisite work on these claims? It is the duty of the Territorial legislature to pass an act to stop all such foolery as taking up such numberless claims.

Another discouraging feature is the witnessing the large number of idle reduction works. Go where you will, and you will see reduction works of every description lying idle and going to ruin. Should you ask the question why the works are idle, the reply will he that the works are not able to extract the gold and silver in the ore profitably. This is all a mistaken idea. The fault lies in the incompetency of the parties who had the management of them. There are no ores here which cannot hs treated. But it requirss skill, or men who have been brought up in the profession. But every tom-fool of a pretender has had no difficulty in trying his wits on the ores in this direction. Is it to he wondered at that, when capitalists come hsre for the purpose of investing in minss, they go hack again on the same road they came, disgusted with the country and deterring others from coming here to invest their surplus money in good and reliable mines? This last state of affairs exists in the Globe district, as well as here.

The Californian for May.—The May issue of the *Californian* has a most excellent portrait of Longfellow from a recent photograph. Prof. Sill has, in the body of the magazine, an article on the dead poet that is at once discerning and appreciative. A profusely illustrated series of "Studies of the California Missions," by Frances F. Victor, is hsgun in this number. So much that is romantic and fascinating in the earlier history of California is connected with the missions, that these articles will prove of unusual intsrest. Pictures are given of the missions San Gabriel, San Luis Ohispo, Carmel, San Diego, San Buenaventura and San Juan Capistrano. That of the Carmel mission is a full-page sketch by the well-known artist William Keith. A character poem hy J. Rnssell Fisher is also accompanied hy a spirited engraving, "Only a Tramp." Amelia W. Trnesdell has a poem entitled "The Lost Jeannette," and there are numerous other articles of ahility, including several stories of marked power. James O'Meara tells the story of the celebrated Mier prisoners. Altogether this is one of the best issues of the *Californian*, and it should he duly appreciated.

Appropriation for California.—The House Committee agree to the following appropriations: For continuing the improvement of Oakland harhor, of $200,000. This amount is granted without any conditions such as have proved embarrassing in the last two appropriations for Oakland harhor. For the improvement of Humholdt bay, $40,000; for Wilmington harhor $75,000; for San Joaquin river $40,000; for Sacramento and Feather rivers $250,000. This amount is granted simply for the improvement and protection of the channels of the Sacramento and Feather rivers. The debris question, it will he observed, is not mentioned in the phraseology thus employed.

The *New Northwest* says: Instantly, on the discovery of gold in paying quantities, hetween the Yellowstone and the Missouri, and as a consequence of the prospect that the working of the Clarke's Fork mines, in the Crow reservation, would he legalized hy Congress, the shipment of mining machinery and tools over the Northern Pacific road hecame a new feature of its traffic. Large already, it will soon attain to first importance in the Northern Pacific company's westward traffic.

The Grass Valley *Tidings* says that Henry Nicholas has been working a stringer of quartz near his ranch, and the other day he run into a pocket which panned out $500 in gold. Some of the specimens of quartz gold were very hautiful and valuable.

The Winnemucca *Silver State* says: L. F. Dann has invented a concentrator, one of which is now running at the Eagle mine. A machine of 30 tons daily capacity can be huilt for $50, and it is said to work well and save all the gold and sulphnrets.

It is stated that the Richmond company has fair prospects of getting an ore hody on the ninth level, in close proximity to the Eureka Con. line.

Probate Confiscation.

The complaint is general, and not wholly without cause, that the estates of deceased psrsons are to a great extent absorhed in the costs and attorney fees attending their settlement. The father or the mother owning real estate dies intestate, leaving minor children, and, not only is it necessary that the estate of the deceased be probated, hnt the estate going under the operation of the law to the children must needs he kept in court through their entire minority, and often at such cost to the estate that little remains for distrihution.

As most psrsons know that this result can to a great extent be avoided by making a will, I suppose no one who reads this and has anything to devise expects to neglect this important duty; hutas he or she is not expecting to "shuffls off this mortal coil" just yet, the matter is likely to be postponed until too late. The title to the real estate is generally in the husband, who as generally neglects the matter of making a will, and the widowed wife is for years compelled to consult the probate judge as to how she shall educate and how clothe her children, and render consecutive accounts of every item of expenditure in their behalf, and pay large fees for the inestimahle privilege.

This is not according to the desire of the deceassd, hut rather the result of a pernicions custom and gross carelsssness.

The title to real estate acquired during marriage should, as a rule, be placed in the husband and the wife jointly, and each should make a will, leaving all of his or her property to the other and dispense with the necessity of any bond. Very few husbands and fathers desire, in case of their death, the nurtnre and edncation of their children placed in the hands, substantially, of others than the mother, and yet, as above indicated, this is generally the operation of the law as applied to the custom of putting the titles to real estate in the husband's name, and failing to invest the wife and mother with the titles hy will.

The following form of a will, sufficient for the purposes suggested, is submitted as simple, plain, and concise, and in the hope that it may induce many to act, who have hitherto been content with good intentions.

The last will and testament of ———— ————.

In the name of God, Amen.

I, ————, now residing at ————, do declare this to be my last will and testament: That, after the payment of my debts, if any, and funeral expenses, all my property and estate, of whatever sort or description and wheresoever situated, shall go and belong to my beloved husband (or wife, as the case may be) ———— ————, to have and to hold unto my said husband (wife) h— heirs and assigns forever. And I appoint my said husband (wife) to be executor of this my last will and testament, and request that —— be not required to give any bond as such executor, the necessity of security being given being hereby waived.

Witness my hand and seal this —— day of ————, 188-.

{ L. S. }

The foregoing was signed and sealed by the said ———— ————, in our presence, and we, in his (her) presence, at his (her) request, and in the presence of each other, sign hereto as witnesses,

———— ————.

———— ————.

—*Inter-Ocean.*

Comments.

Believing that some of our readers might be helped to record their wishes hy the above, we submitted it to our legal adviser for an opinion as to its character. He replies:

The article contains good advice and it is applicable here. However, if there is nothing hut community property, there is no need for the wife to make a will, for "upon the death of the wife, the entire community property without administration belongs to the surviving husband."—Civil Code, Sec. 1401.

Would make a single improvement in the form for the attestation of a will. The will given in "Probate Confiscation" is good, down to the attesting clause of the witnesses. There I would put this:

"The foregoing instrument was at the date thereof by the said ————, signed and sealed in our presence, and by him published as, and declared and acknowledged to us to be ls last will and testament, and we, at his request and in his presence and in the presence of each other have subscribed our names as witnesses thereto.

———— ————.

———— ————.

[Two witnesses, with their places of residence.]

Still a West to Which to Miorate.—This year a regular fever for migrating to new and wild regions appears to have broken ont in what was formerly the Western States. There is for many something romantic about thus setting out for unexplored lands. Even the old men and old women feel it, and at setting forth are filled with a new life and fire that makes them young again, while the young kick up their heels like so many haby colts. The rush is now into the far northwest, the Custer region heing a grand central point. Gen. Brishin, in a recent letter, dated Fort Keogh, Custer, Montana, speaking of this rush, says: "The cry is, still they come. I never saw such a rush of people westward. All trains are loaded down. The Ripon colony passed here yesterday—115 families, 506 souls—hound for Clark's Fork hottom. They had an immense train, and hring all their stock, horses, wagons, milch cows, plows, harrows, household furniture, tents and six months' provisions. They had a hand of music, an editor, a doctor, etc. They will tent out till fall, and huild their houses slowly. It seems to me it must be fun to come West in this way, when one has a jolly crowd and music."—*Virginia Enterprise, 5th.*

The Engineer.

The English Channel Tunnel.

We condense the following account of the present status of the great engineering feat of constructing a tunnel under the straits of Dover, to connect England with the continent by railway, from a late issue of the London (Eng.) *Building and Engineering Times*:

The total length of the 7-foot gallery, to test the practicability of a channel tunnel, now extends to upwards of a mile. Since this heading was commenced, the progress made has been of the most satisfactory character, and continues to improve. A uniform rate of boring is maintained, and the work is materially assisted from the fact that there is an entire absence of water. The debris from the heading is at present removed in trollies connected with the machinery at the top of the shaft, but in order to expedite the work a compressed air engine is about to be introduced into the cutting. A double set of rails is laid in the heading, so that no time may be lost in the conveyance of the trollies to and from the shaft. The gray chalk through which the 7-foot gallery is being driven is a very solid substance. As it comes away from the face of the heading it is in large flakes. The possession of a piece is regarded as a great novelty, and the miners find a ready market for any they happen to have. The boring is now proceeding under the sea.

It was recently announced in the House of Commons that the government had concluded to stop work on the tunnel until further action had been taken by Parliament in the matter. In regard to this opposition, which is based upon military grounds, the *Law Journal* observes that the Government will do well to consider whether the opposition of this country is necessarily conclusive. Suppose a French company, aided, it might be, by British capital, were to take French leave, and set to work without asking the British government or Parliament? It is clear that a tunnel might be ron from the French coast to the line at which British jurisdiction begins before any difficulty of international law would arise. From the limit of British jurisdiction to the shore, excavators would come within the influence of the rule that the sea within the limit is presumed to be in the possession of the country whose coast adjoins. But the Territorial Waters Act, 1878, applies only to jurisdiction on the sea, not to the land under the sea; and the rule as to the jurisdiction of the adjacent country cannot apply to land under the sea acquired by a foreigner from seawards.

The three-miles' rule assumes possession, being calculated according to the carrying powers of a cannon; and if there is any constructive possession of the land under the three miles of sea, it must give way to actual possession by a tunnel. In fact, from the point of view of international law, it would be the last step only which would cost—namely, the rise to the surface of the tunnel under the shore and in British *terra firma*. If, however, the French company could buy their footing, there is no reason why they should not hold it, as, by the Naturalization Act, 1870, the disability of aliens to hold land is abolished. No doubt an act of Parliament might be passed annulling the purchase; but such a step is more possible than practicable. It thus seems that, if England does not meet France half way, we may have France coming across to us under the sea and actually touching British soil at Dover.

FAST OCEAN STEAMING.—An old Scotch shipbuilder said, years ago, that if he were paid money enough he would build a steamer that would cross the Atlantic without breaking the Sabbath. At the time this was thought to be an idle boast. Twelve days between Liverpool and New York was then considered a fair passage, and 10 days was held to be a fast passage. But the confidence of the shipbuilder in the possibilities of the ocean steamer is justified by what is now being done every day on the North Atlantic. Although no steamer has yet made the passage within seven days, yet it is more than possible that that time will be made in the near future. The average time of the passage has been reduced until eight and nine days is only considered good time, and the extraordinary runs of the *Alaska*, of the Guion line, is an indication of a still further reduction. The *Alaska*, on her last trip from New York, made the run between Sandy Hook and Queenstown in 7 days, 6 hours and 53 minutes actual time, and she arrived at New York from Liverpool, on April 16th, having made the run from Roche's Point to the bar in 7 days, 6 hours and 18 minutes, averaging 394.83 knots per day, or 16.45 knots per hour. To give an idea of her actual work per day, we will state that on her first day she made 380 knots; second, 383; third, 392; fourth, 417; fifth, 409; sixth, 397; and seventh, 419.

MUSIC ON BRIDGES.—Bands of music are forbidden to play on most of the large iron bridges of the world. This is due to the well-known phenomenon that a constant succession of sound waves, especially such as come from the playing of a good band, will excite the wire vibrations. At first these vibrations are very slight, but they increase as the sound waves continue to come.

Useful Information.

Workmen in an Employer's Shop.

Every man in a workshop ought to constitute himself the guardian of his employer's property, and not only should he avoid waste himself, but, as far as practicable, he should discourage it in others. If this were done, millions of dollars would be saved to the country, a much larger percentage of profits would go into the pockets of the employer, manufacturers would be enriched, and, in the end, the workmen would be proportionately benefited. Strange that these simple facts should have so little weight; but so it is. Waste by another is cruel to the man who has to pay. It does not, can not, benefit the person guilty of it, and it is a dead loss to the nation. And every scrap of material so destroyed makes the product more costly, and consequently dearer. In the interest of workmen it is important that these facts be borne in mind. Wages bear a relative proportion to cost of raw materials, and both combined determine the price of commodities; the cheapness of this latter augments their sale, increases their production, enhances the demand for labor and tends to keep up wages; the reverse is equally true. If, therefore, an obvious duty is neglected or carelessly performed, the men mainly responsible ultimately suffer, and that suffering will be in an exact ratio to that which produced it.

One great remedy for the losses incurred by waste is a closer supervision of every detail of the undertaking, whatever it may be. This, however, involves extra expense. If the men can contribute to a saving in this respect, they will indirectly reap the advantage. To overlook this fact shows a lamentable ignorance of the internal economy of a workshop and of the forces and influences always at work for the purpose of bringing about a given result. And the men who complain of strict supervision are just those who need it most, and who, without it, would render large contracts next to impossible, for the simple reason that they would not pay, and could not therefore be executed. Many a builder and contractor has been ruined by the wastefulness of his employes and negligence of his foreman. A careful man is a jewel in a workshop.—*Builder and Wood Worker.*

NEW WINE-MAKING PROCESS.—Adolph Reihlen, of Stuttgart, has invented a process of wine-making, which, says the Vienna *Free Press*, opens a new era in wine industry, because it affords a means of thoroughly utilizing the grapes. An increase in the quantity of wine produced is attained without, as in the case of Petiot's and Dr. Gall's method, affecting its quality. Riehlen operates as follows: The berries are gently pressed, the must heated to boiling, and the marc mixed with the boiling must for three or four minutes, whereby the coloring matters, tartar, aroma, and other valuable substances are extracted, and at the same time the injurious albuminous substances are rendered insoluble. The marc is, however, not quite exhausted by this process, but is capable of imparting the rest of its still valuable contents to weak wines, so-called fruit wines, and saccharine liquids generally. By this method (which has been in operation since 1880), when purple grapes are worked up for wine, a deep bluish-red must is obtained in a few minutes without fermentation, the quantity of coloring matter extracted by the boiling must being from three to seven times as much as that extracted according to the old method after three months' fermentation. Reihlen further prepares the marc of purple grapes in such a way that even after years this will impart a color to red wines which have become bleached, or revive the taste of deteriorated wines. The process can be applied to both red and white wines, and the bouquet peculiar to the Reisling and Traminer grapes admits of being imparted to the must from other kinds of grapes.

THE FUTURE VALUE OF COPPER.—Soon we will not allow telegraph wires to be strung through our streets and over our buildings, to the detriment of life and property. And, when the time comes that telegraph wires must go under the ground, it will not pay to use any other metal for making them than copper, or steel, copper-coated. Even now, between our populous towns and cities, it is a question whether it would not be cheaper, in the long run, to string our telegraph poles with copper wires, or steel wires, copper-plated, owing to their greater durability and connectivity, just as railroads have found it more economical to use steel rails rather than iron. For conducting electricity for lighting, heating, and power purposes, copper wires must be used, and of considerable weight and thickness. It is said that Edison estimates that he alone will require 2,000,000 lbs. of copper in 1882. His is but one company. There are many other similar companies at work, not only in this city and country, but all over the civilized globe. The same activity prevails wherever there are energetic and civilized nations. As no man could foresee the extraordinary demand for iron that would grow out of the invention of the steam engine, so no man living can form a correct estimate of the demand for copper, for the coming time, that will be created by this more modern invention of the dynamotor.—*Mining Gazette.*

SAFETY SHIELD FOR CIRCULAR SAWS.—A new self-acting safety shield for circular saws, designed to guard against the constant danger which threatens the workmen, is made of a plate of iron or steel about as thick as the saw, and curved to its radius, broad enough to give sufficient firmness. It is placed at a given distance from the teeth of the saw, and is furnished with movable plates and adjustment slides, and screws to suit the alterations in the diameter of the saw by wear, or the substitution of smaller for larger saws, or stuff deeper than the cutting part of the saw. The shield is attached to an arm hung upon a stud concentric with the saw mandrel, and is balanced with a counterpoise under the table. The semi-circular shield is about one and a half inches deep and the same thickness as the saw. The forward end is so formed that the piece of timber to be cut raises the shield, but the latter rests upon the timber and forms a guard which prevents the workman from bringing his hands or arms into contact with the cutting edge of the saw. As soon as the timber has passed from the saw the shield returns to its original position, entirely covering the saw, and so remains until raised by the next piece of timber.

GRAPHITE AS A PAINT FOR SMOKE-STACKS.—John Dent of Ore Knob, Ashe county, N. C., writes to the *Engineering and Mining Journal* as follows: "I notice your suggestion as to the use of graphite as a paint to protect iron smoke-stacks against the corrosive action of sulphurous acid fumes. Two years ago I painted two iron smoke stacks with a mixture of oil and graphite, and it is now nearly as good as when it was put on. The stacks stand within 400 ft. of the roasting ore piles, and are exposed to the fumes for nearly half the time."

IMPROVED MORTAR.—Sawdust is better than hair in protecting rough cast from peeling and scaling under the influence of frost and weather. The sawdust should be first dried and then thoroughly sifted, in order to remove the coarser particles. A mixture is then made of two parts sawdust, five parts sharp sand and one part cement, which should be thoroughly stirred together and then incorporated with two parts lime.

AIRING FEATHER BEDS.—Do not put your pillows or feather-beds, if so unfortunate as to have feather-beds, into the sun to air, but in a shady place, with a dry wind blowing over them. If it is cloudy—but not yet damp—and the wind strong, it is all the better. This, if practiced often, will keep well-cured feathers always sweet. Badly-cured feathers cannot be made sweet. A hot sun on the best of feathers will turn them rancid.—*Mrs. Beecher.*

Good Health.

Flesh Worms on the Face.

The black points, flesh worms, technically termed comedones, which are found in the face, and especially near the nostrils, are not at all produced by the accumulation of the particles of dirt or dust, as has generally been believed, but by pigmentary matter, which is soluble in acid. It is known, in fact, that black comedones, which accompany and often appear, not only on persons exposed to dust, or rather careless of their person, but also on chlorotic young girls who live in good circumstances. Besides, observation shows that the discoloration not only exists on the surface of old comedones, but descends always to the lower parts. Accepting this fact, Unna has used successfully acids in the treatment of comedones. He generally prescribes: Kaolin, 4 parts; glycerine, 3 parts; acetic acid, 2 parts, with or without the addition of a small quantity of some ethereal oil. With this pomade he covers the parts affected in the evening, and if need he during the day. After several days all the comedones can be easily expressed, most of them even come out by washing the parts with pumistone soap. The same results can be obtained by bandaging the parts affected for a long time with vinegar, lemon juice, or diluted hydrocloric acid. The author concludes by saying that the acids act like cosmetics, as they transform the black color into a brown and yellow shade, and destroy it gradually altogether; they produce a quicker desquamation of the horny bed which interrupts the exit of the comedones and brings to the surface the glandular openings.—*Archives de Virchow.*

OUT-DOOR AIR AND EXERCISE.—The surest of all natural prophylactics is active exercise in the open air. Air is a part of our daily food and by far the most important part. A man can live on seven meals a week, and survive the warmest summer day with seven draughts of fresh water, but his gaseous nourishment has to be renewed at least 14,000 times in 24 hours. Every breath we draw is a draught of fresh oxygen, every emission of breath is an evacuation of gaseous excrements. The purity of our blood depends chiefly on the purity of the air we breathe, for in the laboratory of the lungs the atmospheric air is brought into contact at each respiration with the fluids of the venous and arterial systems, which absorb and circulate it through the whole body; in other words, if a man breathes the vitiated atmosphere of a factory all day and a close bedroom all night, his life-blood is tainted 14,000 times in the course of the 24 hours with foul vapors, dust and noxious exhalations. We need not wonder, then, that ill-ventilated dwellings aggregate the evils of so many diseases, nor that pure air should be almost a panacea. Out-door life is both a remedy and a preventative of all known disorders of the respiratory organs; consumption, in all but the last stage of the delirium, can be conquered by transferring the battle-ground from the sick room to the wilderness of the next mountain range.

The Assimilation of Fat.

Most physiological text books teach that the fat of the body is not derived directly from the fat of the food. But from statistical analysis Hoffmann has arrived at the conclusion that the formed fat of the animal body arises not only from heterologous elements of the food, but also in part, at least, from ingested fat. Radzejewsky concludes that the special destination of this fat is the intramuscular adipose tissue. A series of investigations, undertaken by Lebedeff in the clinical department of the Pathological Laboratory at Berlin, leads him also to the conclusion that the ingested fat is deposited unchanged in the fatty tissue of the body. Two dogs were kept fasting for a month, losing in the time about 40% of their weight. Previous experiments have shown that, under these circumstances, all the fat of the body disappears. The dogs were then fed on a diet which consisted of large quantities of fat foreign to their own nature, and a small quantity of flesh. Both dogs regained their normal weight in three weeks, and were then killed. One had been fed on linseed oil, and from its tissue was obtained more than a kilogram of fatty oil, which did not become solid at the freezing point of water, and which corresponded closely in chemical characters to linseed oil. The second dog was fed on mutton suet, which had a boiling point about 50° C., and in its body, in the muscles, about the internal organs, and beneath the skin, a form of fat was found which was almost identical with suet. The organs of each dog were free from disease. Thus it would appear that ingested fat, even such as is foreign to the individual constitution, may yet become transformed directly into the fatty tissue of the animal. Other experiments of the same investigator seem to show that this is true also of milk fat.—*Lancet.*

"HARDENING" THE BODY.—A young man was an earnest advocate of a theory that the human body can accommodate itself to any temperature in which it may be placed. One winter he determined to harden himself by wearing no covering for his ears; they were badly frozen on a very cold day, and were tender for several years after. He grew wise and abandoned the hardening process. A young woman heard an eloquent lecture on the importance of fresh air in chambers at night. The lecturer said there was no danger from a window slightly opened; the body would soon harden itself so as to resist the effect of the exposure. She tried the experiment one cold night and caught a severe cold, which lasted the entire winter. She lost faith in hardening against cold. A young mother maintained that children ought not to be brought up too tenderly. Arms and legs ought to be hardened by exposure in early years, and not be made tender by warm coverings in winter. She lost her two oldest children by croup and pneumonia, induced, as the physician said, by insufficient clothing. She gave up the attempt to harden the others. The best way to harden the body is to protect it well from extremes, both of cold and heat, and build up a strong constitution by good food, good sleep and good exercise. The Scotch Highlanders, with their bare legs, are victims to rheumatism.

THE BORACIC ACID TREATMENT OF DIPHTHERIA.—Dr. T. D. Harries, of Aberystwith, reports in the *Lancet* a very successful treatment of diphtheria by the local application of boracic acid in solution. The solution is prepared and applied as follows: Boracic acid, two drams; glycerine, half an ounce; water, half an ounce; to be applied freely to the fauces every hour at first, diminishing in frequency with the disappearance of the deposit and general symptoms. The application should be continued for some days after the throat has become perfectly clean. If discontinued too abruptly, the deposit is almost certain to reform, with a return of the general symptoms; and with the view of warding off this danger, I make it a rule to continue painting up to the eighth day, after which date the patient may be considered comparatively safe. The solution seems to have no injurious effect when swallowed, as I have frequently applied an ounce during 24 hours in the cases of children of from four to five years of age.

MOSQUITOES AS DISEASE CARRIERS.—The discovery that mosquitoes carry filaria in their probosces and infect the human subject with that much-dreaded worm parasite, has attracted considerable attention among English microscopists. Particulars of various cases are given, in which it is proved that those suffering from filaria had received the contagion from mosquitoes, and the latter have themselves been found infected with filaria. The latter are very minute worm-like parasites, which, on entering the human body, breed until they increase to countless numbers. They are also said to have the power of entering and leaving the body at pleasure—usually invading the circulation in the evening, increasing till midnight, and then retiring to other parts of the system.

Passing Events.

Hundreds and hundreds of men seem to be leaving the various camps where there is no special excitement and rushing to Idaho and to Montana. The Wood River region and Butte seem to be the main objective points. Information from both these places points to the conclusion that, while the country may be good for prospecting, it is a poor place for men to go in search of employment, as there are so many men there already. Our "Mining Summary," from week to week, gives the news from there and other localities.

Nothing conclusive has been done by the mining companies towards putting up the money to pump out the flooded mines on the Comstock.

The picnic season is advancing and the hands are filling the air with stirring melody. The environs of San Francisco are almost daily invaded by hosts of armed men or men clothed in regalias and bearing banners. Every organization is having its annual outing, and its wife and children are getting a breath of rural air and a chase for wild flowers. In the country the roadways are filled with gay family carryalls and speeding teams, and the laughing loads of children make a music sweeter than the measured peals of city bands. It is a joyous season, and California enjoys it to the utmost. It is not to be wondered at that a writer for an Eastern paper dubs California the "picnic State." It is well to have hosts of these merrymakings to smooth away the lines of toil and worry, and to increase sociability and sympathy.

Detection of Nickel and Cobalt in Complex Ores.

[Written for the PRESS by C. H. AARON.]

A mixture was prepared containing nickel, cobalt, bismuth, iron, and manganese as oxides or carbonates. This was again mixed with powdered partzite, a mineral containing silver, copper, lead, and iron as oxides combined with antimonic acid. The whole was then calcined. In such a substance it is not easy, even if possible, to detect nickel or a little cobalt by simple fusion with borax or salt of phosphorous, on platinum wire or on charcoal, even with the resources afforded by the different flames, etc.

Taking advantage of the fact mentioned in a previous article, that nickel and cobalt oxides are converted into soluble chlorides by a hot solution of copper chloride, a portion of the mixture was heated with a solution of two parts of bluestone and one of salt. The clear liquid was boiled with zinc to separate silver, copper, and any lead, bismuth, or antimony which it might contain, filtered and evaporated. The residue, consisting of zinc, nickel, and cobalt chlorides, with probably manganese chloride and sodium sulphate, tested in borax on wire, gave the nickel reactions very strongly, but in a yellow flame the cobalt blue was hardly perceptible. On charcoal the first result observed was one which might have been foreseen; the borax spread over the coal instead of forming a bead. This was rectified in a measure by the addition of a little colorless glass, but it was impossible to obtain the cobalt blue, the slag being either colorless or yellow from sodium sulphide produced by reduction of the sulphate. A borax bead was then strongly colored by cobalt from another source, and some of the matter to be tested was added. On fusion in a yellow flame the bead was completely decolored. With the view of getting rid of the sodium sulphate, the remaining powder was redissolved in water, and solution of sodium carbonates added to precipitate the metals, but the zinc carbonate was so voluminous that caustic soda was added to redissolve it. This left a very small quantity of undissolved matter, which, when collected on a filter and tested, gave the reaction of cobalt, but not of nickel. The use of sodium carbonate was an error, as it dissolves the cobalt and nickel oxides; potash alone should have been employed.

A second portion of the original mixture was boiled with a strong solution of sal ammoniac (ammonium chloride), which, as is known, acts on copper oxide, forming copper chloride and evolving ammonia. The green solution was boiled with zinc, filtered and evaporated. The residue, tested on wire, did not react sensibly for either nickel or cobalt. Perhaps the treatment of the ore was not continued long enough in this case.

A third portion of the mixture was heated in a small quantity of hydrochloric acid diluted with water. The acid was not in sufficient quantity to decompose the whole of the ore, but it produced a green solution containing copper. This was boiled with zinc until all precipitable metals were thrown down, filtered and divided into two parts. The one part was evaporated and the residue tested. It reacted very well, after volatilization of the zinc, both for nickel and for cobalt, on wire or charcoal. The remaining part of the filtered solution was treated with caustic soda in sufficient quantity to redissolve the zinc oxide at first thrown down. A flocculent brown precipitate remained, which whitened on boiling, and again became brown on the filter, but was greenish-gray when dried. This substance reacted strongly for nickel and cobalt on wire before the blue flame, and for cobalt on coal in the yellow flame, notwithstanding the presence of a little iron.

The object of these experiments was to find a comparatively simple yet sure process for the detection of nickel and cobalt in very complex ores, with such simple reagents as are always accessible in the mines. The first experiment was marred apparently by the presence of sodium sulphate. The second was a failure. The third was successful, and in the second modification eminently so. I have not at present an opportunity of continuing the investigation, but believe that the results obtained will warrant me in recommending the following processes for testing mixed ores for the metals in question:

Roast the powdered ore, before the blowpipe or otherwise, to complete oxidation, adding powdered charcoal after the sulphur smell ceases until a garlic-like odor of arsenic is no longer perceptible, burning out all the charcoal at the last. Digest the powder for half an hour in a glass or porcelaine vessel, at or near the boiling point, with a small quantity of strong solution of two parts bluestone to one of salt. Stir occasionally with a glass rod or shake the vessel. Add water from time to time to replace that evaporated, or, if the liquid loses its color, add a little more of the copper solution. Allow it to settle, and pour off the clear liquid into another vessel; wash the ore with a little water, settle, and pour off again into the other vessel. In the liquid place a piece of clean zinc and heat until another piece is not stained by the liquid. Filter, and to the clear liquid add a solution of caustic potash free from carbonate, until the white precipitate at first produced is redissolved. If any solid matter remain it probably contains nickel or cobalt, or both. Filter again, and wash the substance by passing water through it. Fuse a little of the substance in borax on platinum wire beyond the point of the blue flame. If cobalt alone is present, the bead will be blue. If nickel alone, it will be reddish-brown, or violet while hot, and yellow or yellowish-brown when cold. If manganese is present, which may happen, its amethyst color will be mingled with that of the nickel; or if nickel and cobalt are both present the bead will be violet or purple both hot and cold. If the bead be now well covered with a yellow flame for a minute or two, not blowing too strongly, it will, if it contain nickel, become first gray or black and finally colorless, unless it also contains cobalt, when it will be small blue. The nickel may then be seen in the form of black specks in the bead.

Melt some borax to a bead on a piece of charcoal, add a little of the powder and melt under a strong yellow flame. If cobalt is present, the borax will be blue, the nickel being reduced to metal and the manganese becoming colorless. If, in the last-mentioned melting, a bead of pure gold be added, it will collect the nickel, and, on being cleaned by throwing it into water while still hot, and rubbing, it will be found more or less gray in color, and hard or brittle. If this gray bead be now fused on charcoal in contact with a fresh bead of borax, or, better, of microcosmic salt (salt of phosphorus) before the point of the blue flame, the slag will show the nickel color alone, unless, perhaps, a little cobalt may also have been metallized, in which case the gold bead must be again cleaned, and the test repeated until the nickel color is got. The borax bead on wire or coal may be charged several times with the powder, if necessary, to obtain distinct reactions.

For caustic potash, "concentrated lye" will answer, but it should be freshly opened, or the part which has not been affected by exposure must be used. The beads must be examined by the aid of a lens, and those on charcoal should be flattened or drawn up, while plastic, by the forceps. They should not be much, if any more than one-eighth inch in diameter, in order that they may be well covered by the yellow flame when desired.

If a solution of pure copper chloride is used, instead of bluestone and salt, the liquid filtered after boiling with zinc may be evaporated to dryness, and the residue tested as above, except that the fusion on wire should be performed in the yellow flame first, with a strong heat, to drive off the zinc chloride, after which it may be oxidized to obtain the nickel color by holding it for a minute or more beyond the blue flame. It is better, however, to use the potash, because then the nickel and cobalt oxides can only be contaminated by manganese, which does not interfere, except in the test on wire before the blue flame, or by earths which give no color to borax.

Hydrochloric acid may be used in treating the ore, but there is the objection that it is liable to dissolve too much iron, which would interfere with the observations. Iron may, however, be removed by digesting the liquid with copper oxide, or ore containing it. This must be done before the treatment with zinc. If the ore treated contains no copper, it is best to add a little oxide of that metal when acid is used. It is only necessary to take so much acid as will suffice to keep some copper dissolved during the digestion.

It may be that the solution of copper chloride, or of bluestone and salt, would act on the sulphides, arsenides, antimonides, and arseniates of nickel and cobalt. This has not yet been tried, but should it prove so, roasting would be unnecessary. The experiment is commended to those who may meet with the ores.

For the method of making a quantitative assay of nickel and cobalt by the blowpipe, the reader is referred to Richter's edition of Plattner's work on blowpipe analysis, where will also be found the usual blowpipe tests applicable to the various minerals and alloys.

Note.—In the course of some further experiments, a curious effect was noticed. When solution of cobalt acetate was heated with a piece of zinc, a black substance, insoluble in ammonia, was produced. It surprised me by being strongly magnetic, but this was accounted for by the detection of iron, probably from the zinc. It contained also zinc and cobalt. This experiment was repeated with the same result. It seemed, however, that the cobalt was not all precipitated, as the solution obstinately retained a pink color, which became strong purple when heated to boiling, and faint pink, again, on cooling. Another experiment proved, what I had long suspected, that manganese protoxide is converted into soluble chloride by the action of a hot solution of copper chloride.

OVERDONE.—A correspondent of the Bodie *Free Press*, writing from Butte, Montana, says: Locally, house building is flourishing in the city, but competition is so great that carpenters find it almost impossible to get anything to do, and as a consequence the wages have been cut down from $5 to $4, and plenty of men are working in Butte to-day for $2 50 per day. In fact, every other business is overdone to a like extent. The only consolation for the many people coming here is that the country is large enough to hold them all, and strike out for pastures fresh and green, inwardly wishing, no doubt, that Butte was in hell, or some other place. Butte is evidently getting a good send-off in the East, whence nearly all these people came, and who never before saw a mining camp, and are consequently as green as grass; hence the term "tenderfoot."

Mining Classes.

In Europe the questions concerning technical education are being practically tested in many places. Technical schools, institutes, classes and other means of educating boys and young men to fit them practically for the work of life, are established in every direction. On the continent they recognize that much of their progress in mechanical industry is due to the attention they pay to this technical education. In Great Britain they also recognize this, and though they are not so well organized as on the continent, yet the classes and schools are by no means neglected.

Naturally, in England great attention is paid to the mining industry, and young men who are desirous of obtaining information on subjects connected with it have plenty of sources to draw from. There are museums, collections, exhibitions, lectures, schools, classes, institutes, and all sorts of places to look to, and there are plenty of mines and metallurgical establishments to visit and see in practical operation. And such opportunities are not confined to any metropolis alone. The small towns vie with each other in offering advantages for persons to obtain scientific knowledge concerning the business in which they are employed.

As an illustration of the scope of the work of some of the classes, we append some of the questions put at preliminary examinations of Heworth colliery science classes, held in the National school-room adjoining the colliery. The mining papers contained 16 questions, and the students were expected to show how much they had been benefited by attendance at the lecture. The following are the questions:

1. What gases are met with in coal mining? In what seams of coal are they most dangerous, and why? Show how to find their specific gravities. 2. Name the several compounds used in blasting. What are their advantages one over the other, and what especial methods are required to develop these advantages, and what are the special dangers to be guarded against in their use? 3. Enumerate the different classes of rock found favorable in various regions, as country of the lodes. 4. Explain the construction and action of a drawing lift and plunging lift. 5. Describe a method of deep boring, and show how the detritus may be discharged continuously. 6. Define the terms, seam, vein, measures, bade, dip, underlie, dyke, slip, cross-course, slide, shode, costsan, underhand, overhand. 7. Point out the advantages of "splitting the air" in ventilation. What is the object and mode of placing the "dumb drift" in mines ventilated by furnaces? 8. Describe thoroughly a mode of putting down a shaft from surface through quicksand, and explain the operations followed in sinking through ordinary coal measure ground. 9. How is the ore-bearing character of lodes affected by variations in the nature of the rocks forming the walls? 10. Illustrate with figures the question, how far and in what direction hore-holes should be driven in advance, against water. 11. Describe a long-wall method of working coal. 12. Give sketches illustrating the pillar-and-stall method of working coal. Show how creep can be avoided. 13. Name the respective width of lodes. Give six examples. State the methods adopted in working metalliferous mines. 14. Explain the construction and action of man engines. 15. What methods may be adopted for counter-balancing the weight of the rope in deep mines? How would you avoid the "jerk" on the rope at the lift of the load? Describe the construction of Stephenson's, Clanny's, Williamson's and Mueseler's.

WINDING GEAR FOR MINES.—Some improvements, intended to prevent the great wear in the ropes by one coil chafing against the other, and obviating the necessity for coiling the ropes round the drums usually employed, have been patented by Mr. J. Craven, of Wakefield. He employs a single winding rope, an upper set of grooved head gear pulleys, and a lower set of grooved winding pulleys, each consisting of two pulleys and an intermediate grooved pulley between the two sets. The rope is attached at one end to one of the cages, passes over one of the head gear pulleys, under one of the winding pulleys (to which motive the power is applied), and back over the intermediate pulley, and then under the other winding pulley, and thence over the other head gear to the other cage, to which the end of the rope is attached. By this arrangement not only is greater durability of the rope insured, but all tendency to slipping off the rope is entirely obviated, as in proportion as the weight of the load is increased the adhesion of the rope is augmented. The bearings of the intermediate pulley may be carried in a movable frame, either inclined or otherwise, so as to admit of the pulley being adjusted as required in order to maintain the rope taut.

BUTTE.—A correspondent of the Bodie *Free Press*, speaking of Butte, Montana, says: With the inexhaustible bodies of ore they claim to have, all of the mines, mills and smelters cannot, nor do they, ship as much bullion as does the old reliable of Bodie, the Standard. These are facts beyond dispute. The total number of men employed in and around the mines does not exceed 700. The wages for all men working under ground is $3.50 per day; all above, $3.

Shaft Timbering.

In shafts in ground too unsettled to allow of sinking to any considerable depth without support, the work of timhering is necessarily done from above downward, as the sinking progresses. The method of putting the timbers in place is about as follows: When suffioient ground bas been excavated below the last set of timbers for conveniently putting in another lower set, the long horizontal timhers, or sill-pieces, forming the sides of the set, already framed for receiving the ends, and having gains cut for the posts and cross-pieces, or ties, are lowered down and put appropriately in place, boing hung by chains to the last set already fixed above. The sill-pieces are usually in two parts, eaob about 13 ft. long, hutted together at the middle, without splice or framing. The ends, cross-pieces and posts are then fitted as nearly as possible into their proper places.

This heing done, several long round iron bolts, each made in two parts with a tightening screw in the middle, are passed through the new set and the one, or somotimes two or more, above. Everything heing approximately in its place, the new set is adjnsted exactly to its proper position, hy means of the tightening screw on the holts by which it now hangs to the set ahove. The lagging is then put in hehind the timbers, and botween the plaok and the gronnd are inserted pieces of spiling and wedge timbers which are driven into place or are forced in hy jackscrews as firmly as possihle. Ooce fixed in this manner, everything is hcld hy lateral pressure; the bolts hy which the set was at first suspended are allowed to remain for a time and then withdrawn for use in placing succeeding sets.

The shafts on the Comstock timhered in this manner generally stand very well, and are maintained in good condition. When movements of the ground force any part of the work out of line, the disturbed sets may be taken out and replaced hy new, or readjusted without difficulty; and unless the ground is very had, with a tendency to move in large masses, the perpendicular line of the shaft may he well preserved.

When it hecomes necessary to retimher a shaft or any considerahle part of it, the work is usnally carried on in one compartment, while operations are carried on through the other compartments.

All the deep shafts of the Comstock mines have required more or less retimhering. This has been specially necessary in the deeper portions near the vein, where the ground passed through is sometimes very heavy, consisting of massive clay, whioh exerts a tremendous pressure upon the timbers. To withstand this latter, it is sometimes necessary to resort to methods still more snbstantial than that described. Where uncommonly heavy ground is passed tbrough douhle sets are used, an outer set inclosing the ordinary single set, giving additional strength to the frame. The deep shafts of most of the hig mines have encountered very had ground, involving large expense for the maintenance of the work.

Water Balance for Hoisting.

In many of the open works on the northern side of the great coal hasin of South Wales, water-halance machines are largely used for winding purposes, and for mines of not more than 100 fathoms deep; in a district affording a good supply of water and free drainage hy means of adits, they may he highly recommended. Sometimes they are nsed when there is no drainage, the water being pumped up from the hottom hy an engine, but this is not to be recommended. In some cases the machines are placed at different levels, so that the same water is used five or six times, over as many snccessive lifts. The tram, containing from 12 to 20 cwt., is placed in a cage over an empty water-hucket, and the empty tram on a similar hncket at the top. Water is then made to flow into the upper hucket until its weight is great enongh to canse it to descend, so raising the filled tram. On the arrival of the full hucket at the hottom of its fall, a self-acting valve opens and the water is discharged, so allowing the process to he repeated. The hnokets are made of one-half-inch hoiler plate, oircular in form, and some hold more than 2 tons of water. The landing chain is halanced hy a chain which hangs helow esch hucket, and gnide chains are nsed to keep the huckets from striking each other when the shafts are not divided. A speed of 300 to 400 feet per minute is easily attained hy this machine, and the total cost of raising stuff is ahont 1½d. per ton per 50 fathoms. For great depths the weight of the necessary machinery hecomes so great that the economy is reduced or disappears. Somewhat similar machines are in use in some of the iron mines of Cumherland and elsewhere.

JAMES ROWE, the miner who lost both arms and the sight of hoth his eyes in the terrihle hlasting acoident at the Forman shaft several weeks ago, on the Comstock, has gone home to his family in England. As it is through their sympathy and aid that he is enahled to realize the dearest wish of his heart and return to his wife and children, who will be eyes and hands to him, he will through life continne to cherish the most grateful feelings toward all the people of the Comstock lode. As a sum of over $2,000 has been raised for Mr. Rowe, he will not return penniless to his people,

Production of the Precious Metals.—No. 9.

(An abstract of the Census Monograph on the Bullion output of the country.)

NEW MEXICO.

Although during the census year the mines of New Mexico were attracting much attention, their practical development was awaiting the completion of the railroads which were about to interseot it. Its mining districts were, many during the census year and not accounted for below is not of very great amonnt.

The double-column table in these columns give the production of the deep mines by counties.

Placer Mines.—Considerable rich placer ground is known to exist in New Mexico, hut as yet hut little gold has been obtained from it, owing to want of water. No record could he ohtained of any product from such workings during the census year.

of them, difficult and even dangerous of access, and it was almost impossihle to ascertain in advance whether they had actually producing mines. The collection of statietios under these circumstances was peculiarly difficult, and the completeness of the material ohtained was seriously impaired hy the assassination of Col. Charles Potter, the expert in charge of this Territory. The data presented below do not necessarily give a fair idea of the capahilities of the Territory as a mineral producer. It is believed, however, that the quantity of ore produced

WYOMING.

Wyoming is surrounded on three sides hy important mining regions, hut has as yet developed but few mines within its horders. During the census year, as far as could he ascertained, the actual production of gold and silver has heen confined to Sweetwater county, of which the production is given in the douhle column table.

Statietice of the Eastern Divieion.

The following tables, which are grouped together without comment, are compiled from schedule data furnished hy Prof. Raphael Pumpelly, together with such information as could he gathered from other sources than the direct census investigation. Some unavoidable gaps occur in the tables, arising chiefly from the nncertainty regarding assay values to be expected where mining is conducted on a small scale. The estimates for Michigan and for Tennessee are not included in this exhibit, as they are derived exclusively from material other than that collected directly hy the experts.

Mining Law Amendment.

A few weeks since we published some comments on a pending bill in Congress, under the title of "Oaths hy Proxy," taking the ground that it was a dangerous precedent to establish, to allow agents to make oath to adverse claims or anything else connected with the mining laws. People in New York can locate claims in California, and if people in New York can take oaths on adverse claims which can keep actual miners on the ground from working their mines for a year or so until the adverse claim is adjnsted at the Land Office, it is, to say the lesst, rough on the miners. The men who go into a mining region, rough it, prospect, and start work on a claim, ought not to he liahle to he ousted hy people who never took any such chances, or who never saw the mines. The new law is very good for the rich man or the corporation. It does not follow that injustice will he done, hut it gives an opening for it, as we explained in the previous article, above alluded to.

The hill, which was introduced hy Senator Hill, has passed the Senate, and is as follows:

Be it enacted hy the Senate and House of Representatives of United States of America in Congress assemhled, That the adverse claim required by section 2326 of the Revised Statutes may he verified hy the oath of any duly authorized agent or attorney-in-fact of the adverse claimant, if residing or at the time heing heyond the limits of the district wherein the claim is situated, may make oath to the adverse claim before the clerk of any court of record of the United States or of the State or Territory where the adverse claimant may then he, or hefore any notary public of such State or Territory.

Sec. 2. That applicants for mineral patents, if residing beyond the limits of the district wherein the claim is situated, may make an oath or affidavit reqnired for proof of citizenship before the clerk of any court of record or hefore any notary public of any State or Territory.

THE 10 stamp mill at Marysvale is now running on ore from the Deer-trail mine, of which there is an ahundant supply. Since the mill dropped its stamps the canyon has presented a lively appearance, and mining matters over there appear more promising than they have done heretofore.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x30 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

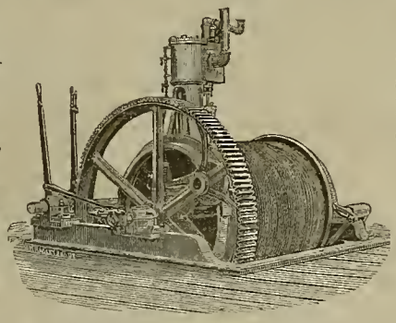
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

Colorado Iron Works,

MANUFACTURERS OF ALL KINDS OF Mill and Mining Machinery. Engines, Boilers, Cornish Pumps, Hoisters, Crushers, Rolls, Stamp Mills, Smelters, Furnaces, Ore Cars, Kibbles, Etc. Also, Saw Mills, Heavy Forgings, Bridge and other Bolts.



Machine Bolts and Lag Screws, at List Prices, with Freight added, less current discount.

THE OLDEST AND LARGEST MANUFACTORY OF MACHINERY IN THE WEST.

For Circulars and Prices, Address

COLORADO IRON WORKS,

Denver, Colorado.

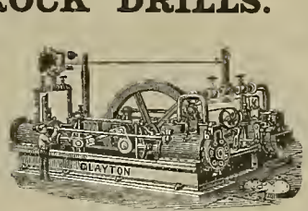
Works, 33d and Wynkoop Sts. P. O. Box 1921.

CLAYTON AIR COMPRESSORS,

—AND—

INGERSOLL ROCK DRILLS.

INGERSOLL ROCK DRILL.



CLAYTON AIR COMPRESSOR.

Having been appointed Sole Agent for this Compressor, I will keep a full stock of the different sizes in store. Prices much less than any First-class Compressor in the market. ☞SEND FOR CATALOGUE.☜

GEORGE R. FOARD, 18 First Street, S. F.

Sole Agent for the Ingersoll Rock Drill and Clayton Compressor Co.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

BY TELEPHONE.—Subscribers, advertisers and other persons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

RICHARD C. REMMEY, Agent,

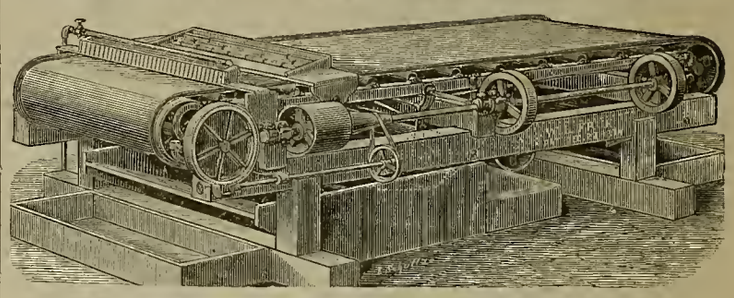
Philadelphia Chemical Stoneware Manufactory,

1100 E Cumberland St., Philadelphia, Pa.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists. Also, Chemical Bricks for Glove Towers.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

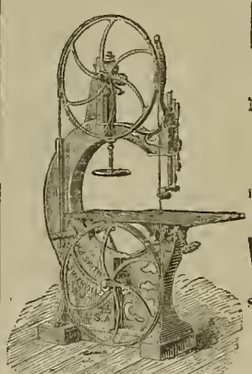
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

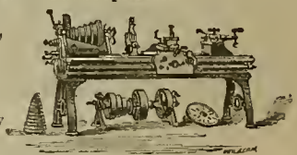
ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.



Berry & Place Machine Co.,

PARKE & LACY, Proprietors.

No. 323 & 325 Market St., San Francisco, CAL.



Importers and Dealers in every Variety of

Wood and Iron Working Machinery,

STEAM PUMPS,

Stationary, Portable and Hoisting Engines and Boilers Sawmills, Shingle Mills, Emery Wheels and Grinders, Gardner Governors, Planer Knives, Sand Paper in Rolls, together with a general line of Mining and Mill Supplies, including Leather Belting, Rubber Belting Packing and Hose.

☞Catalogues furnished on Application.☜

ESTABLISHED 1868.

GOLD SAVED

BY USING MY

SILVER PLATED AMALGAMATING PLATES.

These Plates are used in Quartz, Gravel and Placer Mining with gratifying success. I am constantly filling orders for them, and when once used they prove themselves so superior to any other process yet discovered for saving Gold that my customers would not do without them. I have the best facilities on this coast for filling orders for these plates, and will guarantee my work.

Send for Circular.

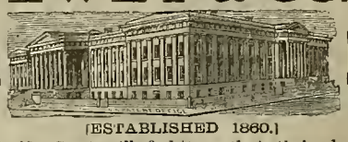
DEWEY & CO.'S

Scientific Press



Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

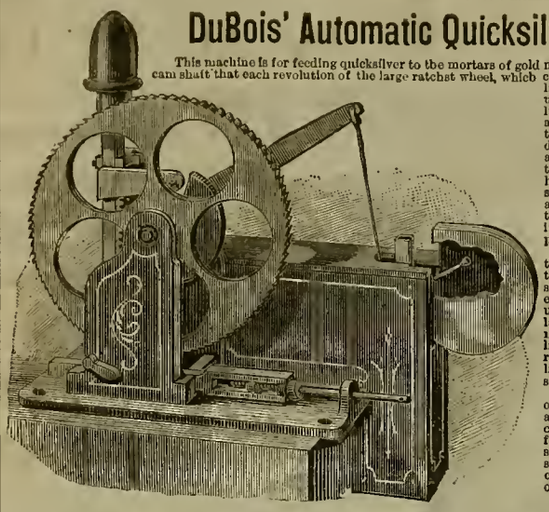
SHEET IRON PIPE.

FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING MAY 9, 1882.

257,311—PHOTOGRAPH COLORING—H. Austin and L. J. Kimball, S. F.

257,360—APPARATUS FOR UTILIZING SOLAR HEAT—Geo. W. Deitzler, S. F.

257,674—CABLE RAILWAY—Terrence Duffy, S. F.

257,488—NEW GOVERNOR FOR ENGINES—Myron G. Foote, Gold Hill, Nevada.

257,702—UNDERSHOR—Frederick W. Hesse, Santa Rosa, Cal.

257,726—WATCHMAKER'S COMBINATION TOOL—Wm. H. Lamb, S. F.

257,521—STENCIL PRINTING MACHINE—Albert G. Shannon, Santa Rosa, Cal.

257,536—DEVICE FOR COOLING TIRES—Isaac L. Umstead, Ione, Cal.

257,739—HARROW ROCK DRILL—Eugene Morcan, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

CAMERA ATTACHMENT.—Wilfred L. Brown, Mare Island, Cal. No. 256,966. Dated April 25, 1882. The attachment in this invention consists in a novel removable holder for any number of prepared sensitized plates. This is placed in suitable guides upon top of the camera, and is provided with a sliding false bottom, adapted by its movement to expose a slot in the top of the camera, through which any of the plates may be lowered for exposure by means of a vertically moving "plate elevator," and may be returned to the holder by the same means. The arrangement of shutters in the eye-piece, and the means for adjusting the removable plate-holder, closing the entrance aperture, and for raising and lowering the plate elevator are details of construction included in the invention, and necessary to its perfect operation. The object of the invention is to provide a convenient and effective plate-holder, to be used in connection with a camera when carried from place to place, or in field work, where the facilities for developing are wanting.

CABLE RAILWAY.—Terrence Duffy, S. F. No. 257,674. Dated May 9, 1882. This consists in a device for keeping the slot in the street closed, which will protect the tube from foreign substances, yet not interfere with the passage of the grip; and it consists, also, in cleaning attachments upon the dummy adapted to run within the slot and upon the road to keep them clear, so that the accumulations will not fall within the underlying tube while the dummy is passing and the slot temporarily opened. The object of the invention is to provide a means for keeping closed the grip-slot, so that dirt and especially snow, ice, etc., which in cold countries are liable to render impracticable the operation of a cable railway, may not fall down into the tube. An accumulation of material is liable to clog the mechanism, and for this reason a cable tunnel with an open grip-slot has been considered impracticable in places where there is snow and ice.

WATCHMAKERS' COMBINATION TOOL.—Wm. H. Lamb, S. F. No. 257,726. Dated May 4, 1882. This watchmakers' tool consists of a frame having two spring arms passing through it longitudinally, and so formed that their sides may be made to approach or separate. These arms serve as a poising tool for the balance, and also as truing callipers. Upon one side of the frame is a plate pivoted at one end to the frame and having the opposite end movable and capable of being fixed so that one side will make an angle with the side of the frame. Between these sides the roller of the staff may be clamped to be removed. The free end of this pivoted plate is provided with a holding device for the second hands while they are being broached out or fitted, the whole being intended as a handy tool for different classes of work.

APPARATUS FOR UTILIZING SOLAR HEAT.—Geo. W. Deitzler, S. F. No. 257,760. Dated May 9, 1882. This invention relates to an improvement in apparatus for the collection, concentration and utilization of the sun's heat for industrial purposes; and it consists essentially in the use of a cylindrical reflector, in combination with a cylindrical heat receiver of novel construction, and an arrangement whereby the reflector and receiver can be set in the proper position and made to follow the direction of the sun's apparent movement automatically or otherwise. We described the apparatus in detail a few weeks since.

THE temperature of the water flowing from the Sutro tunnel is 110°.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1869; number, 5. C. W. Patten's Patent Concentrator.

The machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.
The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

Manufactured by
F. A. HUNTINGTON,
220 Fremont Street, SAN FRANCISCO, CAL.
Where a machine can be seen in operation. Also, manufacturer of all descriptions of Quartz Mill Machinery. Send for Circulars.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Guadalupe Silver Mining Company—Location of principal place of business, San Francisco, California. Location of Works, Urique, State of Chihuahua, Mexico.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of April, 1882, an assessment (No. 28) of Fifty dollars ($50) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 109 California street, Room No. 13, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifth day of June, 1882, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the third (3d) day of July, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. WM. BLACKWOOD, Secretary.
Office—No. 109 California street, Room No. 13, San Francisco, Cal.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

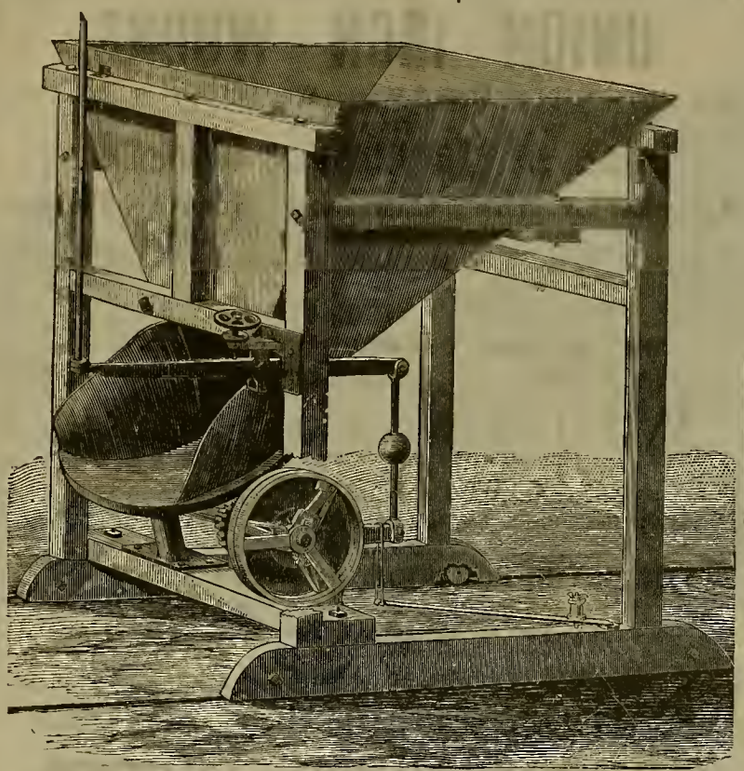
The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.



JOSHUA HENDY, Agent,

Machine Works, 49 and 51 Fremont Street, San Francisco.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.
They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:
Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.
If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.
Send for Pamphlet showing methods of testing the different qualities of all Powders.
The Company manufactures:

DETONITE.
This is an explosive involving new principles and recently ratented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.
This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." t is suitable for hard rock.

VIGORIT, No. 1.
For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.
Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.
This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONG R THAN BLACK POWDER, having from twice to ten timca the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

VOLUME XLIV Number 21

Tell-tale for Mining Fans.

Among the different apparatus for the safe working of mines is a fan-recorder or tell-tale, invented by Mr. H. Hall, an English inspector of mines. It is a simple and effective means of recording constantly the work of the ventilating machinery, the knowledge of which must necessarily act as a check upon any neglect of those in whose charge the working of the ventilation is placed. This is of great importance, especially in coal mines, where a temporary sticking off of ventilation may lead to fearful disaster. It can be applied to Guibal fans, such as are used on the Comstock and elsewhere.

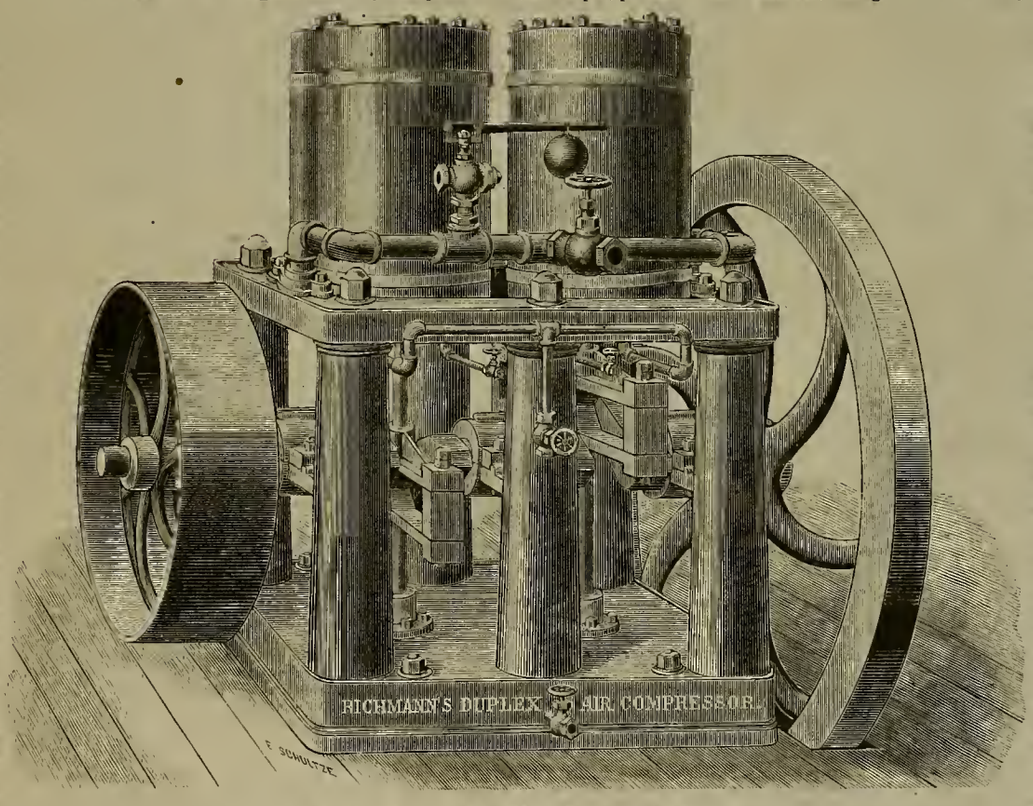
Briefly described, the apparatus consists of a specially designed water-gauge glass, which is fixed in the manager's office or room, and leading from this to the fan-engine house is a range of three-fourth-inch pipes, the open end of which is placed within the fan drift. A short branch of similar pipe is then joined to these, and the open end placed in the fan-engine house, where it is so fixed as to be within reach of some moving part of the engine that drives the fan. To this pipe end is next attached a small lever, with a movement up and down, so as to open and close the outlet of the pipe, and the motion of the spindle plays against this, so that, at each stroke of the fan-engine, the pipe end is opened for an instant, and a variation of the pressure of atmospheric air in the long branch of pipes takes place, causing the fluid in the gauge-glass in the manager's office to fall to zero; but immediately the pipe end is again closed by the falling lever, the water-gauge glass shows the drag, or water-gauge of the mine, and the result is a perfectly correct and constant indication of the drag of the mine, and also of the number of revolutions the fan is making. This taking place in the manager's office, it can be recorded at will, and is entirely out of the reach of the person responsible for the speed of the fan.

As the fluid in the gauge-glass falls to zero at each stroke, it is only necessary to count these movements in the glass to determine the speed of the ventilating machine, and the height of one leg of the fluid over the other between the strokes is the measure, or water-gauge, of the mine. When the fan travels at a great speed, each fifth stroke only is dealt with, and this is effected by the introduction of two small wheels working at five to one, and deriving their motion from the drag-crank of the engine. The cost of this apparatus, Mr. Hall states, does not exceed three or four pounds, unless the distance between the manager's office and the fan is very great; but, so far as the efficiency of the appliance is concerned, distance is immaterial, as it has been tested up to 800 yards. For those who were anxious that the indications should be permanently registered, an eight-day clock could be added, fitted with a revolving brass cylinder carrying a diagram paper, upon which a spiral line was drawn by a pencil, indicating the number of revolutions made by the fan and the water-gauge during every and any hour of the day and night.

In Tombstone, Arizona, is a Chinese washman who has issued cards on which is printed: "Patronize home industry. The American laundry. Un Wo, proprietor."

Richmann Duplex Air Compressor.

We have before described the piece of California mining machinery represented by the Richmann air compressor, and now show a new form—the duplex belt compressor. The Richmann belt air compressor is constructed on the same principle as the steam power compressor, excepting that it is driven by a belt connected with a pulley attached to the crank shaft, which is made long enough to allow an additional loose pulley if required. It occupies no more space than the steam power compressor, and from its lightness is easily transported. No



RICHMANN'S DUPLEX BELT AIR COMPRESSOR.

air receiver is required to these compressors. They are simple in construction, compact, and the various parts so nicely balanced that there is no undue strain upon any one part.

In case water power can be had for driving compressors, great economy is assured, as by an attachment to a water-wheel the compressor can be run without the expense of fuel.

The water-jacket around the air cylinder is arranged to keep a constant circulation of cold water, maintaining a uniform degree of temperature around the valves and the entire length of the cylinder. The air is thus forced into the supporting columns (*i. e.*, the receiver) in a perfectly cool state; and, as no water enters the cylinder, the air is delivered into the receiver free from moisture.

The valves open with the least pressure of the atmosphere, allowing the cylinder to fill up to its full capacity, and instantly close on the return of the piston.

The principle of this machine is the same as all of them. The cranks are set at quarters, however, which is different from the machine we before described. It is double-acting, and requires less power. One of these of this form, with two 18-inch cylinders, has been running for eight months at the Hite mine, in Calaveras county.

This machine is very light and portable. It is unnecessary for us to go into details of construction and operation of the compressor, as we described its points in speaking of the other style. These machines are made by the Richmann Drill Air Compressor Co., Nos. 25 and 27 Stevenson St., in this city.

Smelting in the Spanish Slag Furnace.

The furnace known as the Spanish slag hearth, or Castilian furnace, is a small blast furnace of from three ft. to four ft. six inches in internal diameter, and about eight ft. six inches in hight. It is circular in section, except at the hearth, where it is prolonged forward by a cast-iron hearth-pan, provided with a cinder-bed, through which the reduced metal filters and escapes from time to time, by a tap-hole, into a kettle in which the lead is kept melted for casting into ingots. The shaft of the furnace is surmounted by a rectangular head of masonry, supported on four cast-iron columns, and which contains the door at which the materials of the charge are introduced, as also the aperture by which the gaseous products escape to the fluss and fume-condensing apparatus. The furnace is provided with three horizontal tuyeres, one at the back and one at each side of the hearth, and coke forms the fuel employed. This furnace has a very limited application.

The reduction in this furnace is exceedingly imperfect, the slag produced being black and vitreous, while frequently containing considerable proportions of lead.

The large bullion output of Utah is surprising mining men all over the country, and as they are aware the surface has only been scratched, they wonder what the product will be when the mines are thoroughly opened. As good prospects can now be purchased for a mere song, capitalists cannot find a better country in which to invest than Utah.

Moses Taylor, a prominent New York merchant, is dead.

Mercury and Iron in Amalgamation.

Mercury, when perfectly pure, does not apparently possess, to so great an extent, the power of taking up other metals, or of decomposing mineral combinations, as when it holds a minute quantity of some foreign metal in solution. The experience among amalgamators in Mexico is that the yield of gold is increased by the presence of silver; also, that the latter metal is extracted with greater facility if a considerable proportion of the amalgam is already present. This opinion is held by many mill men in the silver regions of this coast.

It is stated by some writers upon the question that silver is absorbed with increased activity when copper is employed, and as the former is amalgamated the latter will be expelled. Both iron and copper cause the formation of copper amalgam. On the other hand, sulphate of copper exhibits a tendency to drive out lead.

Karsten mentions the property of this salt to purify the mercury from both zinc and antimony. Anyone who has witnessed the intensity which sodium amalgam exerts, cannot fail to have been impressed with the rapidity with which it attacks gold, silver and silver compounds: yet its application on the Comstock in practical operations did not give such results as would warrant its general introduction in the process used there.

Although the presence of a small quantity of several metallic bodies enhances the amalgamating energy of the mercury, yet a slight excess "sickens" it—that is, loses its fluidity and becomes dull and inactive. The peculiar phenomena attending the mercury by which both electro-positive and electro-negative metals are absorbed, and the effects which they produce in increasing or neutralizing its action, are very little understood.

In discussing the chemistry of the Washoe process, Mr. Arnold Hague considers that mercury and iron, under the proper conditions, are the principal agents in the extraction of the precious metals by the Washoe method. The results depend, he maintains, in a great measure upon the mechanical treatments employed to reduce the ore to an exceedingly fine division, and to maintain, with the proper degree of consistency, a constant agitation of the entire mass; the essential conditions of the amalgamation being that the mercury shall be thoroughly incorporated in the pulp and every particle of reducible minerals brought in direct contact and triturated with the metal, in the manner so well accomplished by the friction and grinding action of the pan.

The mercury should also at all times retain a bright, clear surface, free from any film of metallic salts, such as sub-chloride of mercury or sulphate of lead, or any coating of oil or grease. The slightest tarnish appears to retard very greatly the activity of the metals. The iron seems to act as an electro-chemical agent; the immediate contact of the two metals, aided by heat and friction, causes a local electric current, which renders the amalgamating energy of the mercury much more intense.

Mr. George W. Arnold, mining engineer, recently in the employ of the Horn Silver Co., of Frisco, Utah, resigned his position with that company to accept a responsible place in the management of the Christy company.

A New System of Ventilating Mines.

Of late several proposals bave been made for ventilating mines, not only to make them bealthy for men to work in, but to carry off the gases that are evolved from the mineral worked. Some of them would no doubt effect all that could be desired, such, for instance, as the making of large bore-holes from the surface, or really increasing the number of shafts, and as some mines have an air current extending for miles, it need scarcely be said that either system would he most costly, and such as very few owners could afford under the most favorable circnmstances of trade. The use of pipes for tbe escape of the gas has been frequently urged, hut most of the plans are either too costly to be carried out, or are found to be imprscticahle hy mining engineers. The latest addition to the many schemes brought forward is one hy Mr. W. H. Jenkins, of Pontypridd, which we are told was bronght under the notice of mine owners some time since, bnt evidently witbout effect, and now it ie open to those who may he desirous of trying it. The proposal is that hesides the ventilation obtained by means of the furnace or the fan, a powerful air pump should be placed on the surface snd connected with a series of ges pipes, which should he laid throughout the whole of the mine, terminating in esch working plsce, and at various points in the headings, the pipes for the latter being larger than the other. Then the months of each of the pipes are to be connected with a valve attaohed to a thin india-rubber hag made in the form of a cylindrical ring, the hsg heing capahle of cont ining 2,998 cubic inches of hydrogen gas, which in pure air has an upward tendency of 835 graine. Such being the case, the pressure of the valve on the mouth of the pipe in pure air, it is stated, would he equal to 189 grains, and the downward pressure to set the valve at rest in an air-tight receptaole made to receive it, when surrounded by light carbureted hydrogen gas, would he eqnal to 188 grains, that heing the difference between the weight of the bag and valve and the like cubic contents of gas so dieplaced, and so leaving the pipe open to the action of the pump. On carrying ont this system, it appears that if it is considered desirable to extract the gas with a larger admixture of air than one-half, all that is required to be done is to add to the weight of the valve, and should the upward pressure he merely a few grains, the suction of the pump during the up stroke would be sufficient to keep pure air out of the stall and heading pipes, whilst during the down stroke the valve would have sufficient time to drop if the air got mixed with gas.

But we should say that it would not be necessary to bring out a mixture contsiuing more than one-half of air, for even where there is one-third gas and two-thirds air there is an insufficiency of oxygen to keep light hurning, wbilst the less air that is extracted from the workings, so much better for the workmen and the ventilatiou of the mine. Tbe gas and the air, of course, would readily mix together, for it is found that several aeriform fluids of different densities are contained in the same vessel, or by vessels which communicate by simple and very narrow openings; the gases in the first instance have a tendency to arrange themselves hy order of density, but at the end of a longer or shorter time they form, without a single exception, a mixture perfectly uniform. So it follows that when several gases occupying equal volnmes under different pressures sre united in a space equal to the volume of esch one taken separately, the pressure of the mixture is equal to the amount of tbe pressure of the mingled gases. Returning, bowever, to Mr. Jenkins and his system, he states that the principal pipes could he constructed in the form of a whistle without any impediment to their acting as escapements, for when tbe pipes were open, which would be the case only where gas existed, the suction would produce a shrill sound, which would announce the presence of danger to the men working near. As to the hags and valves getting out of order, they would be prevented by having a light metal cap somewhat in the form of an inverted saucer fixed as closely as possihle over each hag, snd the inner diameter of every hag filled in with a very thin sheet of India rubber, so that the whole of the upper surface would he thoroughly protected from auy accumulation likely to affect their weigbt. With respect to the goafs or open spaces where the gas generally accumulates, and in large quantities, Mr. Jenkins suggests that air-tight partitions should be formed between them and the workings, with a six-inch pipe inserted in the higher end of each goaf, all being connected with a separate goaf-pipe leading to the surface of the ground, and at the lower end of each goaf, an opening should be left near the floor, so that should any fall take place therein, the gas, instead of being forced out into the workings, as it is under the existing system, would he forced at once to the surface of the ground, and the vacuum so formed would he replaced with air from the opening at the lower end of the goaf. As the flow of gas in all likelihood would not be sufficient to keep open a nnmher of valves equal to maintaiuing the pump in full draft, safety valves could be placed as far from the bottom of the shaft as possible, and so constructed that they would not be open unless the euction applied for that purpose wae equal to 30% of the breaking strength of the pipes. Where there was a probability of the main pipes being damaged by pressure from any cause, it is suggested that the pipes should be made of guttapercha, lined with a spiral wire, which would naturally give very much before it was damaged.

Such is the proposal of Mr. Jenkins, who candidly admits the possibility of its being improved npon, and so adapted to the saving of life in mines. One part of the system, that relating to pipes, is by no means new, bnt the ventilating bag or valve is certainly a novelty. But we must suppose that an extra shaft or large hore-hole would be necessary for carrying out the system. The running of a series of pipes, too, in all directions throughout a mine would be no easy matter, whilst it could not fail to interfere with the ordinary operations of the workmen, and in the passage to and fro of the trsms. Then the taking of a nine-inch pipe from the goaf to the surface would be a rather serious matter in many ways, for some of the roads and working places are not so laid out or made as to admit of large and small pipes. But even admitting the practicability of this scheme, then comes the question of cost to be tsken into consideration. The mine owner could not he expected to go to the expense of carrying out an entirely new system for the drawing off of the gas, and the lessor of the minerals would say it was no business of his. Then there is the government, and we need scarcely say that no hope would lie in that quarter for making a grant of money for the working of mines, for the safe working of which the owners are now liable. Bnt there is one omission in the scheme of Mr. Jenkins which we should like to see defined, for on it depends the whole of the position, assuming that it could be carried out, and that is the cost. Take, for instance, a mine 400 yards from the surface, with air courses eight or nine miles long, what would be the probsble expense of the system? Furnished with this, one might be ahle to come to a conolusion as to whether it is likely any mine owner would be found willing to undertake the cost in the event of his believing that the scheme would be successful.—*London Mining Journal.*

Working Dry Gold Placers by Centrifugal Force.

The following extract from the *Mining Record* describes a devise for obtaining the precious metal by centrifugal force, without the agency of water, from sands containing gold :

At an iron foundry on West Twenty-seventh street, a machine was exhibited yesterday, which, it is claimed, will, at a cheap rate, separate gold dust from sand witbout the agency of water. The device is intended to meet the requirements of the placer region of the West, Mexico and Central America, where vast tracts of gold-hearing sand are found miles distant from any source of water supply. To illustrate the working of the new invention, the exhibitor scattered an ounce or so of gold in a granular state through a hushel of coarse sand, wbich was placed in a vessel, shaped like the hopper of a mill. From the taper end of this it was theu allowed to pour between two curved copper plates, situated horizontally and revolved at a speed of from 65 to 80 revolutions a minute. Passing betweeu these two plates the sand is driven by centrifugal force against a "wall" of mercury, which is also maintained through the action of centrifugal force. Surrounding the copper plates is an iron ossting like an iron stew pan with the greater part of the bottom cut out, so that its half section resembles a letter L. This is connected with an axis by four hollow arms, each of whicb is made to contain about 50 lbs. of mercnry. The whole arrangement is revolved in a direction contrary to that of the plates, and by a rotary force the mercury runs from the arms through grooves provided, and climbs along the upright surface, corresponding with the upright stroke of the L, thns forming a perfect wall. Every particle of gold, as it is thrown, instantly amalgamates with it, while the sand is partly thrown off by its own rebound and partly blown away by a series of pipes attached to a blower used in connection witb the machine.

When whatever quantity of sand tbe operator chooses is passed through, the machine is stopped, the mercury is withdrawn by a trap from the arms, into which it falls the instant the rotation ceases. It is then strained through ticking, in the way well known to all miners, and the gold is finally cleared of it, througb the agency of heat in the common way. The experiment resulted in the recovery of the gold originally mixed with the sand, without sensible diminntion, and the advantages claimed by the plan are: First, that it extracts every particle of gold from the matter passed through it; and, second, that it does so without any serious loss of mercury. It is claimed that it will open up vast stores of the precious metal not at present available, and will even render it possihle to work over again with profit the "tailings" of mines operated under old systems. The ontside diameter of the machine shown was five ft., and it was claimed that with it ore or sand could be worked at the rate of a ton in less than 20 minutes. Among those who witnessed the trial were several representatives of Western and Southern America mining interests.

For a long time past tbe utilization of dry gold placere has been a desideratum, but as yet no instance is known in wbich any rational attempt commanding the proper kind of technical advice, as well as the financial means required, has been made in this direction. The San Pedro and Canyon del Agna company, of Boston, preferred to nneuccessfully apply in New Mexico, where there is no water, the methods of California, wbere there is water, at an expense of $250,000, rather than to spend a few thousand dollars in an investigation as to the possibility of working their placers without water.

Very erroneously it has been assumed that the successful working of dry gold placers depends on the invention of a machine for the separation of the gold from the sand. Such preparations can be perfected in several well-known ways with the aid of several good apparatuses, either patented or free for use by all, and there is certainly no difficulty in effecting such separation.

In other words, the difficulty is not solely a technical one, and the technical part, as far as the separtion of gold and sand is concerned, has been solved practically in an absolutely satisfactory way, hut what remains to do is the successful handling of large amounts of material without the aid of water for so low expense as will not materially surpass the expense of handling the material with the help of water, say at not more than five or 10 cents per ton of 2,000 lb.

It is important to know that 99 tons in 100 may he handled and all the gold may he collected in one without the use of any special separator, on account of the difference in size of gold from the size of the land and gravel occurring in the same bed with the gold.

The success of working dry placers is, therefore, dependent on general engineering skill in moving at low cost dry gravel, and on special skill in treating ores so as to retain the gold within a small part of the total mass, and nltimately on treating the retained small part for separation proper. It is in this sense only that the foregoing deserves attention.

The Mines of Venezuela.

The eastern division of Venezuela comprises the valley of the Orinoco, containing gold fields and other mineral riches, of which the value is now estimated as exceeding that of any gold district at present explored, the magnificent water-way of the Orinoco and its tributaries stretching away into the Republic of Columbia, with Cumana and Carupano, on tbe coast, and Cindad Bolivar, on the Orinoco, as ports for sea-going vessels. It is to be regretted, writes Colonel Mansfield, that more exsot and copious information is not forthcoming respecting the mines in Venezuela, which are yearly becoming more productive, and, as regards gold, will certainly, in the course of time, be recognized as some of the most important gold fields in the world. The mining companies of El Callao, Nueva Hansa, Mocupia and New York, Potosi, Caratali Nueva Quebrsda Limitada, and the Revilla Con. mines, respectively in the States Gnayana, Yaryacuy and Cumuna, during the year 1880 imported, free of duty, 1,303,737 kilos. of machinery and goods for mining purposes. It appears that since 1866 there has been exported from Ciudad Bolivar 840,045¼ onzas of gold. No information has been published respecting the gold exported from other ports, or of the produce of the copper mines at Tucacas. The lattsr are worked hy an English company, and the number of British subjects employed is very considerable; while in the gold districts of tbe Orinoco there are whole villages of British subjects from Trinidad and Jamaica, amounting to upwards of 6 000 persons. Of industries, properly so called, Venezuela posses none, as, owing to the high price of labor and manufacturing inaptitude of the population, it is cheaper, notwithstanding the high tariff, to import from abroad. There is little douht that the value of British produce imported into the Republic amounts annually to a sum much in excess of £1,000,000. The consumption of British goods is clearly on the increase, and inasmuch as the number of vessels plying to the United States has not increased, there is no reason to suppose that American goods are, up to this time, supplanting British manufacturers to any very serious extent.

A Modification of the Daniell Cell.—Among recent introductions of electrical appliances is a cell without acid—the copper plate being surrounded hy a solution of sulphate of copper, and the zinc hy a solution of caustic soda. The porous diaphragm consists of parchment paper folded into the required shape, two or three thicknesses heing used, according to the resistance required. The zinc and copper plates are provided with two longitudinal slits, being two-thirds their length, and are hent so as to form three sidea of a parallelopiped; the parts between the two slits are turned hack and upward, and, reaching above the liquid, form the connections of the cell. In this way all waste in cutting out the plates, as well as soldered connections, are avoided. The electromotive force of the cell varies from 1.47 to 1 35 Volt., the latter value being reached after the cell has been for a considerahle time on short circuit, and its internal resistance for a cell 20 cm.—7.87 inches—high and 3 liters—2.64 quarts—capacity, is about .075

Men at Candelaria.—A correspondent, speaking of Candelaria, Columbus district, Nevada, says: The mines are doing considerahle work. At preeent the only hullion producers are the Northern Belle and Mount Diahlo. There are in the neighborhood of 400 miners and prospectore at work in the district. Pending the arrival of W. J. Sutherland and other New York parties, who expect to make things lively, there is a surplus of working men there at present.

Use Your Own Judgments.

While there can be no period assigned to the work of prospecting along Wood river, and far along from peak to peak in the mountains of Idaho, nevertheless, the time has come when the planting, at proper points, of machinery and furnaces and cupels for reducing and refining is demanded, for the utilization of veins already well opened and plethoric with ores fruitful with metals of commercial value. Experts and practical mining men have been and will be sent into the country this season, hy and in the interest of capitalists, to invest in properties and to establish and erect the necessary works for converting the orude ores into hullion. These agents will be, generally, men of proper technical qualifications, capable, when they have examined a prospect or ledge, to form an estimate of its probable value, and competent enough to take in all the surroundings and select a site for any proposed works, having due regard to the tributary material for carrying on productive operations. Where they really possess experience, and are left wholly to their own unbiased judgments, they will he governed in their choice by a careful consideration of such facts as the accessibility of fluxes, charcoal, and other essentials to the business. But there will be some who will listen to town claquers and runners for "wild-cat" mines, who will be drawn in and stuffed with all sorts of bogus honanzas and holes in the gronud, attracted more by the numher of locations in the 'group" than by any tangible evidences of ledges or ledge matter.

Mining, perhaps, opens wider the doors to tbe sinister play of designing men that any other legitimate industry; hecause on the flanks of the real prospector there always hang a species of parasite, who hope as middle-men and promoters to get their fingers in, and make thrift of the labors of men of industry. It is the interest of the substantial men of Wood river to prevent rather than to promote mistakes hy the men who come as the representatives of capital. A few hlunders, either in the purchase of mining properties or in fixing the location of smelters, and it will require, perhaps, a year or two of time wasted to correct the impressions oreated by disaster, whicb might readily have heen avoided hy proper vigilsuce and good judgment. In other words, let us have no "hlack eyes" given to the oountry, when the way to prosperity is olean-cut and olear to men of good will, who will use, and not abuse, the solid resources of this region.—*Wood River Times.*

Northern Gold Fields.—A new mining district of unprecedented richness has just heen discovered in northern Montana. It comprises both placer and quartz diggings. The placers produce ahout $40 a day to the man, and the quartz assays in high-grade silver from $3,000 to $12 000 per ton, and is free milling. The gold quartz has not opened very extensively yet, but enough to know its true value. The hest developed mines are the Chollar and Montana, both of which now have over $100,000 on the dump waiting machinery. The prinoipal town is Maiden, situated at the head of Wsrm creek, about four miles from Fort Maginnis, and town lots have advanced in value from $50 to $1,500 within the past two or three weeks. There is now in the place about 100 business houses and enongh saloons and other things usually found on the frontier for a city of 20,000 in the East. They have one good hotel over 100 feet long, and this and all others are crowded. Carpenters get $5 per day, miners $5 and $6, and common laborers $4.

The Auburn Mill.—G. R. Walker, who has been out to the Auhurn mill, informs us that the mill is running splendidly and is crushing 40 tons of ore every 24 hours. The tramway is capahle of carrying 100 tons of ore a day from the mine to the mill, and it is working as well as oould he expected or desired. Mr. Walker has seen many mills, and helped make machinery for several, snd he says he never saw machinery work smoother or better than that in the Auburn. The mill has been running a few days, and if tbe ore pays as well as that worked at the first trial, the Auhurn company's property will be among the most valuable properties in the State.—*Silver State.*

Preparing for Work.—The Blue Light copper mining compsny is preparing for active work on the smelter at Soda springs. Surveys will be made for the smelter and for a railroad side-track thereto. Ditches or pipe lines from the springs back in the meadow will he viewed and the general preliminary work and plans required hy such an undertaking will all he perfected in a short time. Messrs. Williams & Bisbee, the principal owners, are thorough copper miners and will have things in proper shape for the rapid reduction of ore from the mine.—*Candelaria True Fissure.*

The Sulphur Business.—Supt. Rhodes, of the Humholdt sulphur mines, was in town yesterday. He says that in conseqnence of the high water in the river tbey have not heen hauling any sulphur to the railroad this spring. They are getting everything in order for a good summer's run at the minee, and have about 500 tons of crude sulphur on hand that yielde ahout 55% of pure hrimstone. The refining worke will he started up eoon and run steadily duriug the summer.—*Silver State.*

Nearly 7,000 immigrants landed on Monday at New York.

MECHANICAL PROGRESS.

Steel vs. Iron for Steam Boilers.

A late number of *Wood and Iron* contains quite a lengthy article designed to show that steel, and especially American steel, as now regularly made by well-established and responsible houses, is a far better material for steam boilers than any iron that has ever been made. In proof of which the journal quotes the following

English Authorities on the Subject:

"In 1856-57, Shortridge, Howell & Jessop, of Sheffield, brought their homogeneous metal prominently under the notice of boiler-makers and ship-builders, and induced the admiralty to give it a trial. The results were highly satisfactory, but we do not find that it was adopted to any considerable extent for boiler purposes, probably from its high price more than any other cause." (Jeans on Steel, p. 748.)

"Several boilers were made of this homogeneous metal between 1857 and 1859, by D. Adamson, of Manchester." (Jeans, p. 750.)

"Adamson's steel boilers are now used extensively, both for stationary and locomotive purposes. Upward of 1,400 steel boilers of all kinds have been made at Adamson's works." (Jeans, p. 75.)

As to the results obtained by the use of the steel boilers, Beesemer himself stated, in 1869, that "they have found also an economy of fuel, since the thinner boiler transmits the heat more readily than the thicker ones previously in use; and probably from an another circumstance, viz., that the metal is not in that laminated condition in which ordinary iron is; the heat passes through a purely homogeneous body from the outside to the inside, and there is therefore no interruption of heat. There is another point which is most interesting, inasmuch as a blister never occurs. We cannot have a blister upon the cast-steel plate, simply because there are no two surfaces imperfectly united." * * *

"The wear of a steel plate is only a simple case of oxidation, and that is a very slow process in comparison to the blistering of ordinary iron." (Jeans, p. 752.)

"Mr. John Hicks, Member of Parliament for Bolton, bore early testimony to the advantages of steel over iron, maintaining that although a steel boiler costs more per cwt., say 50% yet, an entire boiler of the same length and diameter costs only 20% more in steel, while 11 ft. of heating surface in a steel boiler was as effective as 14 ft. in an iron boiler, thus indicating that the cost of the effective horse power in the former was not more than in the latter." (Jeans, p. 753.)

Lloyd's surveyors say that steel "at first sight recommends itself by its tensile strength, malleability and ductility, and also by its freedom from laminations and blisters, as eminently suited for the construction, not only of the shells and stays, but also of the furnaces and combustion chambers of marine boilers." (Jeans, p. 760.)

"In the spring of 1878 there were 27 boilers made of mild steel, under the inspection of the engineer surveyors of Lloyd's Register, with reductions in the weights of the shells and stays of about 25%. In the first few sets of these boilers it was deemed advisable to submit the material to some severe tests. * * * The mean of the results of over 80 tests gave a tensile strength of 27.5 tons per square inch, while the extreme variations of strength in the different plates manufactured by different companies and by different processes, was not more than four tons per square inch. * * * In order to prove that the material does not suffer from the effects of repeated heating and cooling, two pieces of plate were made hot and quenched in water repeatedly—one 50 times and the second 100 times—but without any apparent injurious effect upon the temper of the material. * * * The satisfactory nature of these tests and the information gained thereby, enabled Lloyd's surveyors to dispense with many of them in subsequent cases, the actual tests now required being much less stringent." (Jeans, p. 760.)

Mr. Barnaby, chief constructor of the British navy, in 1878 said: "In the royal dockyards we are coming to this position, that the admiralty, instead of using iron of the quality they had been obliged to use previously, proposed for the future to use only steel, and he believed they would not only gain in strength, but in point of money also."

In 1881 fully 25% of all the tonnage built in Great Britain was of steel, and the amount of steel used would have been greater if that article could have been obtained.

Similar experience and practice are recorded for Germany and Belgium.

American Steel.

Since about 1863 the Pennsylvania Railroad company has used nothing but American cast steel, low in carbon, in its locomotive boilers.

In the early manufacture of American cast steel, there was much complaint of its lack of uniformity; the trouble was found to be the presence of phosphorus. That has long since been obviated, and Mr Cramp, the well-known Philadelphia shipbuilder, has recently said: "So far as my experience is concerned, the steel of this country is better than the steel of England. * * * Yes, I would always insist on the use of steel in the construction of boilers."

Mr. James Park, Jr., during an examination before experts in Boston, said: "The United States is the prime mover, the originator of that manufacture, and has succeeded in making the best cast steel for steam boilers and for the construction of naval or other vessels that is produced anywhere in the world. The quality of steel plate has not yet been brought up in any country to the standard of ours today."

Mr. Sherman, on the same occasion, said: "That is perfectly true. * * * Yes, I had eight years' experience in Europe, in England, Austria and France, in the manufacture of steel, and since my return I have been in constant communication with gentlemen there, and know what is going on in this line, and I know that we are now producing an article very superior to anything they are making in either of those countries."

THE FATHER OF WOOD WORKING MACHINES.—The machines and appliances for working wood that were invented and practically applied by Mr. Samuel Bentham, previous to the year 1800, may be enumerated as follows: Machine for planing and forming moldings; improved planing and molding machine (rotary); wedging guard for circular saws; segmental circular saws; conical cutters for dove-tail grooves; undulating carriage to form wave moldings; compound cutter heads to work two or more sides at once; the slide rest; tubular boring implements (core boring); crown saws (or cylinder saws); reciprocating mortise machine; rotary mortising machine; radius arm, for sawing segments; tracer guide, for sawing irregular forms, bevel and curve sawing; machine for grinding saw blades; taper gauge for sawing; grooving table; vertical adjustment of saws in benches; rebating machine; sectional cutters; pivoted table for mortise machines; forked or double mortise chisel; gauge lathe, with slide rest; rotary cutters, for forming screw threads on wooden screws; double grooving saws; rack feed, for planing machines, with many other things. The slide rest is very fully and clearly described in Bentham's patent of 1793, and it ranks with the greatest as an invention in engineering implements. It gave us the machine lathe, without which our modern practice in machine fitting could not be carried out. The facts adduced will be sufficient to show that Sir Samuel Bentham is entitled to the distinction of being called the father of wood-working machines in England, at a date that precludes any probability of his inventions having been anticipated in other countries.

A MONSTER MACHINE.—"We hear," says the *Manufacturers' Gazette*, "of a Newark (N. J.) firm, Watts, Campbell & Co., having just completed for a Pittsburg (Pa.) foundry, the largest machine ever made in the United States, and probably the largest in the world. It is a boring and turning machine, which is so large that a special building had to be erected to put it up in. It weighs 110 tons, is 25 ft. high and occupies a space 30 ft. square. It will turn, bore and cut a keyway in wheels of any size up to 16 ft. in diameter by 11 ft. wide on the face. This ponderous machine is most delicately and accurately adjusted in all its parts, and can be regulated to any desired speed. A belting from the engine runs around a cone pulley connecting with a gearing under a revolving face-plate, the gearing being adapted to various rates of speed so that it can be made to go fast enough to bore a six-inch hole, or slowly enough to turn a wheel 30 ft. in diameter. Two massive iron stanchions support a heavy cross-head, with two "saddles" for tools, these being adjustable at any desired angle for boring. These stanchions are movable, so that the cross-head can be brought directly over the face-plate or moved away from it."

THE VALUE of iron beams and posts in the construction of large buildings is becoming seriously questioned. Gen. Meigs, of the War Department, who has given some attention to the matter, states the superior advantages of thick wooden pillars. He says: "The safest story post—*i. e.*, a post supporting a floor at reasonable cost—is one of some hard and not resinous timber. Posts of oak, of 14 inches square, will stand safely through almost any fire, until the powerful force and means of our city fire departments are unable to quench the fire. If wrapped with wire netting, covered afterwards with plaster, they will suffer still less; but the naked wooden poste will remain cool and strong in its center for hours, and the fire will not for a long time char it to a depth sufficient to much injure its strength." It is believed that if round pillars instead of square ones were used as above, there would be fewer available points for fire attack.

A TREE OF IRON.—There is a curious work of art on the grounds of the State House at Columbia, S. C. It is an iron casting commemorating the South Carolina soldiers who died in the war, whose names are inscribed on brass tablets at the base. A correspondent says: "The success of this casting consists in its perfect imitation of the living palmetto—the favorite tree of South Carolina. We had heard of this statue in other places, but had never been able to believe the stories of the flexible leaves bending in the breeze, supposing this phenomenon an optical delusion, but such is really the case. The long, thin leaves of iron, lifelike, even to the hair-like fibers of the twigs and branches, wave tremulously in every zephyr, and the whole tree, painted artistically, has so close a resemblance to the real tree as to deceive the acutest observer at the distance of five rods."

SCIENTIFIC PROGRESS.

The Propagation of Magnetic Waves in Soft Iron.

Mr. Harold Whiting has been making a series of experiments relating to the propagation of magnetic waves in soft iron, from the results of which he draws the following conclusions:

1. The magnetic waves induced in a bar of soft iron by an alternating current differ in form, phase and magnitude from the values assigned to them by any theory of instantaneous propagation.

2. They differ in form, inasmuch as the rise and fall of the magnetic wave is in no case abrupt, but it presents, even for a moderate number of reversals to the second, a perfectly rounded crest and trough, especially at considerable distances from the primary.

3. The magnitude of the wave is constant up to five or six reversals per second, after which it is much lessened; at from 20 to 30 revolutions it diminishes nearly with the number of reversals (the deflections of the galvanometer remaining constant). At from 50 to 100 it falls off rapidly, especially for moderate distances along the bar, being there reduced so as to give one-thirtieth of its former deflection.

4. The phase within the primary is retarded more and more as the rapidity of alternation of the current increases—to a maximum of 90°, and for a distance not too remote is invariably later than it is within the primary.

5. The apparent retardation of the phase depends upon the period (length) of the wave, the arbitrary distance from the primary, the material dimensions and special condition of the bar, and even, in extreme cases, upon the strength and distribution of the magnetic field.

6. The retardation increases for a certain distance (about 30 diameters) to a maximum of from 127° to 130°, or from 37° to 40° later than that of the primary, falling again gradually, at great distances, to 90°, that is, to the original value within the primary itself.

7. The apparent velocity of propagation, accordingly, increases from a moderate value, in parts of the bar not too remote, to infinity somewhere in its central portion, and then descends, with change of sign, for a still further advance in distance, to a minimum, and finally becomes infinite again; so that the most distant portions of the wave reaching their maximum light simultaneously with the nearest, the wave appears to flow backward over the most distant part of the bar.

8. The apparent velocity of propagation over the first 14 diameters is from 25 ft. per second, corresponding to four reversals per second up to 90 ft. for 23 reversals, after which it rises nearly in proportion to the number of reversals, until, for 140 reversals, it measured about 300 ft. per second.

9. The magnetic conductivity of the bar increased (in one case from two to three-fold) under the continued influence of the alternating current sent by a high electro-motive force, whose use in these determinations must generally be avoided.

10. The retardation of phase is less for small rods than for large ones, but in most respects the effects are similar for distances proportional to the relative diameters of the bars.

11. The retardation is less for steel than for iron. With steel, a high electro-motive force may be advantageously employed to overcome the tendency of the magnetic displacements to become permanent.

12. The phase of the magnetic wave may be treated as the resultant of that two sets of waves, one due to the direct (and instantaneous) action of the primary itself, and proportional accordingly to the time and to the inverse cube of the distance; the other depending upon the secondary effect of magnetism already induced in the bar, and hence proportional, more or less, to the square or higher powers of the time, and to the distance as the exponent of a constant factor less than unity. In the same way that each law of magnetic induction has a parallel in the conduction of electricity, it is probable that the law of change in the one is similar to the law of change in the other.

OCEAN METEOROLOGY.—The study of ocean meteorology, which was first successfully undertaken by Lieut. Maury, has been greatly extended in France by M. Brault. His investigations were begun in 1869, upon the basis of exclusively French documents, and they were so successful that, in 1878, he received a prize from the French exposition. His charts of the North Atlantic appeared in 1875 and were presented to the French Academy on the 6th of September. They contain 230,000 observations, both of the direction and of the intensity of the wind. The charts of the South Atlantic appeared in 1876, and those of the Indian and Pacific oceans in 1880. They contain 1,820,000 observations. One of these charts is especially noticeable, that of the summer isanemones or curves of equal wind velocity. They are almost identical with the curve of mean isobars or mean atmospheric pressure. They introduce, for the first time, considerations of the force of the wind at the surface of the ocean, and throw light upon such points as the succession of winds, the ocean currents, the rainfall, the state of the sky and sea, the proportion of tempests and all the principal elements of nautical meteorology.—*Les Mondes*.

The Resemblance of Sound, Heat and Light.

Prof. Tyndall recently gave a course of three lectures on the resemblance of sound, heat and light, in one of which he recurred to the researches of Dr. Thomas Young, as illustrative of the connection which existed between the phenomena of sound and light, the studies of that philosopher on the nature of sound having led up to his parallel studies on the nature of light. The heats in music afforded the most familiar illustration of the interference to which the sound waves are subject. Such a wave consisted of pulsations of rarefaction. If two waves coincide in such a manner that condensation answered to condensation and rarefaction to rarefaction, the sound became stronger, but if the pulse of condensation in the one coincided with the pulse of rarefaction in the other, the sound was neutralized so far, and silence was the result. Experimental proof was given of this periodic reinforcement and extinction of the sound-wave's motion.

It was then also shown by experiment that the phenomenon known as Newton's rings establishes a like periodicity as regards light. Newton's main objection to the undulatory theory of light was that it made the shadows impossible. Newton appealed to the fact of the divergence of the waves in water after passing through an aperture, and Prof. Tyndall thought a like divergence ought to occur in the case of light. It really did occur, as Prof. Tyndall showed by experiment, but the diverging waves obliterated each other according to the demonstrated law of interference.

It was further shown that even in water something of the kind took place. In 1808 an observation of Malus ushered in the darkest days of the undulatory theory. Young himself at first felt that it presented an insuperable difficulty, but he wrestled manfully with it, and waited for more light. As yet the notion was current everywhere that the vibrations of the ether were spread longitudinally, like those of sound. At length the idea of transverse vibrations occurred to Young, and he patiently worked it out, undeterred by its involving the paradox of attributing to the ether the properties of a solid. The same fruitful thought long afterward struck Fresnel, who was then working with Arago. The latter shrank from indorsing so daring an opinion, and that portion of their joint *memoire* was signed by Fresnel alone. In concluding, Prof. Tyndall conducted some interesting experiments, showing that polarization was a phenomenon common to both light and heat.

ACCURACY IN TIME.—The question of accuracy in the matter of time has lately been presented by the American Society of Civil Engineers, in a series of papers embodied in a pamphlet entitled "Standard Time for the United States of America, Canada and Mexico." The plan most favored is that of a series of time meridians, four in number, thus constituting four standards of time on the North American continent. All places less than half way between two of the meridians will take the time of the nearest. It is advised that the first embrace the territory from Nova Scotia on the east to Ohio on the west, and all States lying directly north or south of these. The next would have Indiana and Iowa for its east and west limits. The third would commence with Nebraska and go west to Colorado and Wyoming, while the fourth would include from Utah to the Pacific ocean. These four meridians would form part of a series of 24 extending around the globe, so that this principle could be extended to other countries. The question is also raised whether the day shall not be numbered by hours from midnight to midnight, instead of commencing again at noon. Mr. John Bogart, Secretary of the society, whose office is at 127 East Twenty-third street, New York, will be glad to hear from all who are—from business motives or otherwise—interested in the question of accurate time.

DISCHARGE OF ELECTRICITY BY HEATED BODIES.—It is stated, in *Engineering*, that a burning match or a gas flame acts as a discharger of electricity, this fact having been applied by Sir William Thomson to his portable electrometer in observing the potential of the atmosphere at any point. Recent experiments by Prof. Guthrie have shown that an incandescent platinum wire also acts as a discharger of electricity, displaying a preference for discharging a negative rather than a positive charge. If a platinum wire, made incandescent by an electric current, is placed between two gold-leaf electroscopes, one charged with positive and the other with negative electricity, it will be found that the negative charge is rapidly drawn off, while the positive charge remains almost unaffected. The wire in this experiment was at a dull-red heat, and it is probable that a higher temperature would also have affected the discharge of the positive electricity. Prof. Guthrie likewise shows that a red-hot metal ball at certain high temperatures will not accept a charge of positive or negative electricity from the conductors of a glass electrical machine, while at certain lower temperatures it will accept a negative charge, but not a positive one, and at still lower temperatures it will take both a positive and negative charge.

The Mining Share Market.

There is not much to say concerning mining shares. The market is still quite dnll.

The speed of the Union pnmp has been increased hnt one stroke since the water came in at the end of the main north drift on the 2500 level of the Sierra Nevada mine. It is snpposed that the report of there having occurred a second flood evening before last had no other fonndation than that some one observed a hailing tank being used at the Union shaft. This tank was merely pnt on temporarily while a pnmp clack was being changed.

The flow of water in the drift is of an intermittent character. At times it is very small, and again it is almost as great as at first. This is snpposed to be owing to the fact that the crevices throngh which it flows at times become clogged with sediment, which finally gives way nnder an increased pressnre.

A hnlkhead has been placed across the drift, which prevents this sediment from flowing down to the shaft and into tbe sump. The water interferes with no work in the north end mines, except at the face of this particnlar drift. As it is water that wonld nndonhtedly have been tapped further along, the sooner it is ont the hetter.

The *Enterprise* says: On reflection dealers in stocks will find that there is nothing to cause any alarm. The worst featnre on the Comstock to-day is one that conrage might remedy in a very short time. This is the allowing of so many of the mines at the sonth end of the lode to lie idle and water-logged. This is a sort of standing damper on the whole Comstock.

Why it shonld effect the north end mines, nearly a mile away, it is hard to see. Yet, it evidently does, and also there appears to he in the minds of many a sort of prejudice against the leading north end mines, or a suspicion that there is some kind of trickery ahont the developments made and making in Union, Mexican and Sierra Nevada. We venture to say that had the eight-foot streak of rich ore cut on the 2,600 level of the Union Consolidated—and which was hardly looked at there—heen cut on the 2,400 level of the Savage, the stock of that mine would have bonnded np to $20 or $25 per share. Why this rich streak of ore is not as good for Union as it wonld have been for Savage we oannot see.

At the Union they have now commenced hreasting ont and pntting up sqnare sets 50 ft. helow the 2,500 level, and the ore is opening np splendidly. They now see hefore them in that one spot ore enough to insure the present weekly yield for two months to come. Meantime it will be strange if they do not open up deposits at other points. The rich streak on the 2,600 level has not yet heen touched. There is a 10-ft. streak (containing mnch good ore) on the 2,500 level, ahont 200 ft. sontheast of the present stopes, which has not heen touched. On the 2,800 level they are raising for the deposit ont throngh hy the joint Union and Sierra Nevada winze some months agu, and are already finding streaks of ore from 6 to 12 inches wide. There are excellent indications of ore in the northeast drift on the 2,600 level, and this will probably be fonnd when least expected.

TUSTIN'S PULVERIZER.—W. I. Tustin's ore pnlverizer, which we not long since illnstrated and described in detail, has heen in nse for some 15 months, and is as nearly mechanically perfect as possihle. He has sent one recently to Nevada City, to be used at Maltman's reduction works, and is now hnilding another to order. The Hoffman Bros., who are nsing it in this city, say: "Dnring the 15 months which we have had yonr pnlverizer in our establishment, we have snbjected it to many fair and thorongh trials, and in each and every instance it worked to onr entire satisfaction, and far exceeded any machine we have ever used in pulverizing ores. As we receive ores from all parts of the conntry, we have every and ample opportnnity to test it on all kinds—hard and soft—and always fonnd it meeting our expectations. Even on manganese ore, the terror to all pulverizes, stamps and Bnhr mills, it worked with a No. 40 mesh screen at the rate nf 7 tons in 24 honrs. Another feature of great merit in your machine is the fact that on all rich ores which contain more or less native or virgin metal it acts as a perfect dry concentrator, as it discharges all the fine ore and small pieces of metal throngh the screens and retains the pure bnllion, which can easily he extracted hy removing one nf the small plates and allowing the machine to make a few revolntions. The small amount of power it reqnires to work it is one of its main points, as ahout one and one-half horse power was fnund to he more than sufficient on the very hardest ore to which it was snbjected."

WATER WHEELS.—A correspondent of the Amador *Ledger*, writing from Sntter Creek under date of May 17th, says: There has been mnch talk ahont the relative merits of rival water-wheels, bnt there is nothing that tal s so potently and effectively as actnal test. This test has lately heen made at the Keystone mill, and has proved the superiority of the famous Knight's wheel heyond the possihility of cavil. The fnll particnlars of this interesting trial of strength yon will no donht publish hereafter, as a matter of general importance to the mining community. I may here state, however, that several weeks ago Knight's wheel, which had been nnnning the mill for years, and had given entire satisfaction, was taken ont in order to try a wheel invented by I. Lepley. This wheel proved a failnre, and was discarded. Next Donnelly's wheel, for which a patent was secnred recently, was pnshed to the fore. This, it was londly claimed, conld heat the Knight wheel. So a trial was made of it, resulting in its being proved far inferior to the Knight patent. Every device was resorted to in the hope of coaxing the thing to do the required amount, bnt to no purpose. Saturday morning the attempt was ahandoned as a failnre. The Knight wheel was pnt back, and has been nnning the works as smoothly and economically as heretofore. The chances are slim indeed of its being taken from its post of dnty again in order to experiment with untried machinery.

FRUE CONCENTRATORS.—E. L. Montgomery, Snperintendent of the Amador Pacific G. M. Co., Plymonth, Amador connty, says that the 16 Frne concentrators in that mill, which have been running since February, give entire satisfaction. He says: They are the hest concentrators for snlphurets in nse. Wonld not want to do without them in any gold mine.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

CALAVERAS.

CLEAN-UP.—*Mountain Echo*, May 17: Findlay & Co. cleaned up $400 the other day, the yield of 18 tons of ore taken from a 7-ft vein in the Dock Hill mine.

MISCELLANEOUS.—The Big mine, nwned and worked by Potter & Co., never looked better than at present. The lead continues from 12 to 15 ft wide and yields about $16 a ton....J. T. Curtis recently sold his quartz mins in Salt Spring valley to an Eastern company for the sum of $3,000. The lumber and machinery for erecting a new mill are now on the ground, and the company intend to have the mill in operation the first of June....Leeper, Keyes & Co., intend to commence sinking a shaft on the Invincible mine in a few days. It is their intention to sink at least 150 ft deep. Their success will depend mainly upon their own efforts, as this mine is known to be ons of the richest on our great mineral belt....Lindsay & Co. are making rapid strides in the way of developing their mine. Within a few weeks they bave driven the tunnel over 40 ft ahead, and bavs already discovered some good ore. It will require several months to reach the main works, but when once reached they have the most positive assurance of a goldon harvest.

GOLD CLIFF.—Everything is in splendid working order at the Gold Cliff mine. A new track has been laid from the mins to the mill, which will naturally curtail the expense of conveying the ors to the works. Heretofore it has been necessary to convey the ors a part of the way in wheelbarrows, but the new track will obviate this useless expenditure. The mill has been repaired and everything is in readiness to rs nme operations.

LETTER FRBM MURPHY'S.—We are on tbs eve of another exciting quartz boom of hugs proportions. An incsntive has been given prospectors by the recent strikes that revives the latent spark of hope that had almost become extinct in the old stand-by's, and inspired them to renswed exertion for their prospective pile. Since my last, I have to report anotber very rich strike in the Mayflower, a mine recently opened by Sublett & Dodge, and supposed to be an extension of the O. K. The vein is small but very rich; $50 per day has been pounded ont of it for the last three days of last week, in a hand mortar, besides accumulating several tons of high-grade ore on the dump. This vein is located on Buckhorn Ridge, and is nno of the group mentioned in my last letter. There was a run maas of 30 tons of rock from the O. K., one of the group also, in Moss & Stone's mill last week, and the snug sum of $500 taken out. This is over $16 per ton without the sulphurets. The next crushing from this group will be 50 tons from the Banner, owned by Sentar, Sublett & Co. Good returns are expected from this rock.

EL DORADO.

THE BENFELDT MINE.—*Mountain Democrat*, May 19: Fred Benfeldt is still putting in big licks at his gravel mins near Smith's Flat. He is still breasting, and is now in 86 ft, and still no sins of the rim, thus showing that the width of the channel far exceeds his expectations. He is working 10 men now, and his clean-up last week realized something over $3,000. Some of the cement that he is taking out is literally filled with coarse gold, presenting a most bewildering pepper-and-salt appearance.

THE STRIKE.—Georgetown *Gazette*, May 20: The strike we spoke of last week was made by T. Z Armstrong and A. Baldwin on the Rich gulch seam mine south of town. They took out nearly $3,000 last week, and it is still yielding good returns. The mine has yielded fully $8,000 since the 1st of last month.

A STRIKE of considerable importance has been made this week on a quartz mine 2½ miles southwest of Georgetown, owned by Sam Collins and two other gentlemen whose names we have not learned. They have been sluicing with good prospects, and came upon a vein of quartz 12 to 18 inches in width, which is well filled with gold. They have taken out a goodly lot of handsome specimens, and work on the veiu so far shows no signs of the gold giving out.

INYO.

THE O. L. M. & M. CO. MILL.—Inyo *Independent*, May 20: Since the loss of the Bessie Brady, Supt. Wheeler has hnd: up the stamps of the Hawley mill until a supply of wood can be got down from Cerro Gordo, which he has contracted for. The mill had worked 136 tons of Palma ore, but what results we are not informed. Supt. Keeler has his men engaged repairing and increasing the capacity of the old barge, with which will he tried the experiment of getting the wood supplies across the lake.

MARIPOSA.

HORNITOS.—Cor. Mariposa *Gazette*, May 20: Times are looking mors prosperous in the way of mining matters than they have been for years in this section of country. A great many had predicted a failure in the mines in this section after the old Washington mine was closed; and, indeed, it was a sad blow to a great many. But Mr. Hullings has come to the rescue, and is making the mining interest look up. The Yosemite, or No. 9, has been increasing her yields every clean-up, showing that she only needed to he in the proper hands to be one of the first veins of the State. Work has just been commenced on the Pool mine, which Mr. Huling has just purchased at a large price. So far as developed it looks well, and bids fair to be one of the best mines in the State. The rock looks and prospects well, and shows considerable free gold in the hard rock. Steam hoisting works will be put up just as soon as they can be had from below. The Mount Ophirs mine, after having sunk a perpendicular shaft of over 90 ft through blue granite—the hardest rock in the country—was stopped for a few weeks, all work was suspended except the pumping, which has been going on in order to drain the old works. Work will be resumed in a few days, and pushed forward with all possible speed.

MONO.

CROWDED.—*Homer Mining Index*, May 20: Lundy is crowded with strangers and returning old timers to such an extent that the present capacity of our lodging-houses is inadequate for their accommodation. A new mining district has been organized at Death valley, with Judge Calif, formerly of this place, as Recorder. Some of the ledges are reported as being 60 ft or 70 ft wide. Six Burleigh drill miners went over to Tioga, on Thursday, to go to work for the Great Sierra Co.—3 of them heing from Butte City, 2 from the Comstock and 1 from Eureka. All the old timers are coming back to Lundy in anticipation of the boom, which will strike here as the summer wears on. The shaft of the Josephine has been substantially timbered sinking has been resumed and the vein matter is improving in aspect.

NEVADA.

EMPIRE.—*Tidings*, May 19: The Empire mine is looking exceedingly well, the ledge improving as depth is attained. The 13, 11 and 10 levels are looking well, each containing a good ledge, while the 9, 8 and 5 levels are not looking bad. The Empire Co. will soon open up the old Rush & Laton ground, and the machinery from the Rich Hill ground will be placed upon the new ground as soon as possible.

REPAIRS.—Repairs on the O'Connor are going steadily forward. The hoisting works will be ready in a day or two. The tributers are industriously working, taking ont quartz to be crushed as soon as the mill is completed, which will be but a short time. Mr. Clark informs us that it will probably be some time before the Menlo Co. resumes operations. The affairs of the company, however, will be straigbtened very shortly.

IDAHO.—It will be about 5 months before the 14 level in the Idaho is opened up. There is a splendid ledge in the 12 and 13 levels, which gives the Messrs. Coleman en-

encouragement to keep going down. The yield this month will be a large one.

NEW YORK HILL MINE is looking up. The directors of this mine feel greatly encouraged at the present appearance of the mine. Sinking and taking out rock on tribute, is being done at the mine. There has been no news received here for some time regarding the Scotia. The probabilities are that a number of mines on Massachusetts hill and surrounding country will start up during the coming summer.

THE bonanza of the Ford & Mullen is looking as well as ever. Good rock is now coming out of the mine. The last rock crushed paid considerably over $200 to the ton.

THE IMPERIAL CO are still sinking on their ledge, and the best kind of indications for a valuable mine are in sight. Rock recently taken out is now being hauled to a custom mill, and will be crushed some time during the coming week. The Imperial has put on an extra shift of miners, and is now working day and night.

THE WASHINGTON is looking very favorable, the ledge improving in character as it is opened up. The present indications are that a large ledge will be reached in due time. There is a large stream of water coming from the ledge.

WORK has been suspended for a short time on the Cold Point. The probabilities are that a 20-stamp mill will soon be erected upon this property. The ledge is large and of good quality.

THE MENLO.—Grass Valley *Union*, May 13: Mr. Atherton Clark, who has been connected with the Menlo Mining Co., of this place, and who has been conducting the affairs of the company here, left yesterday evening for the East. Mr. Clark says that his company by no means intends to abandon work here, and it is quite liable that work on the company's mines here will be started up again during the summer. The company has great faith in the mines under its control, and it is certainly to be hoped that work will again be started up on the Homeward Bound and Pennsylvania claims.

A GOLD-BOUND BOWLDER.—Nevada *Herald*: There was found in the China diggings at Moore's Flat, on Saturday, a quartz bowlder, weighing 85 lbs., which our informant says is quite a curiosity. The rock is egg-shaped and extending nearly around the center of it is a band of leaf gold. The band is not regular in size, in some places being nearly an inch wide, and in others reduced almost to a thread. The bowlder looks as though it had been rolled over a large streak of gold and some of the precious metal had adhered to it. Whether the gold extends through the rock is not known, as it has not yet been broken open. Several who have viewed the specimen estimate that there are 10 lbs. of gold in it, but this is mere guess-work. The rock is on exhibition at Hegarty's store, Moore's Flat.

CONNECTION MADE.—Nevada *Herald*, May 20: The work of running a tunnel from the Wyoming mine to connect with the incline of the Nevada City mine, for the purpose of furnishing the latter with an outlet through which to drain has been completed. The connection was made a few days ago. The tunnel was driven from both mines and taps the Nevada City at the 350 level, to which point the water will be pumped and then flow through the drain tunnel, which is over 3,000 ft in length. The grade of the tunnel will have to be changed a little, near where the connection was made, when it will be ready for service. By this arrangement less power will be required to keep the mine free from water, and as soon as the pipe is finished and put in place, the hoisting works, pumps and quartz mill will be run by water power instead of steam. The running expenses of the mine will thereby be reduced considerably.

PLACER.

CRAVEL.—*Placer Argus*, May 17: The Morning Star gravel claim, at Iowa Hill, is being diligently worked by the company, and they have the very best prospects ahead. At the start it was worked by drifting, then the hydraulic process was resorted to, but the cement proved to be too hard for this mode of work, and now the company are drifting again. A tunnel has been run and an upraise made which has reached good pay gravel. A 10-stamp mill has just been completed and will soon start to work crushing the cement and gravel. John C. and Edward Coleman, of Grass Valley, and J. H. Neff, of Colfax, are the principal owners.

AN IMPORTANT STRIKE.—Placer *Herald*, May 20: Robt. Lewis, of Damascus, and one of the standbys of that section of the county, after working against more or less adversities for some 2 years in driving a tunnel into the side of the mountain, has at last struck the channel, we are informed, and has every prospect of a permanent and rich drift mine. Mr. Lewis was confident all the time that there was a channel ahead, and his hard work has demonstrated the correctness of his theory. There is no more deserving man anywhere than Mr. Lewis, and we share in the joy he undoubtedly realizes in his success.

PLUMAS.

BUTTE BAR ROCK.—*National*, May 13: Mr. Masten, one of the gentlemen who owns and works the Butte Bar ledge, sent us a couple of specimens from his mine this week, which will compare well with anything we have seen. Assays from this rock go as high as $9,500 in gold and silver. The ledge is a large one and will undoubtedly prove very valuable, when fairly opened and worked. It is one of the most inaccessible places in the county, on the Middle Fork, and about south of Buck's ranch, but a wagon road can easily be built to it, and before the season is over we hope to record the fact that a mill is at work there. It is certainly a valuable mine, and the owners should develop it as soon as possible.

MOHAWK ITEMS.—Our correspondent tells us that the King and Nesemen boys are taking out big pay in their mine near the valley, and report says they have cleaned up over $4,000 so far this season..... Mr. Culver started for San Francisco a few days ago, for medical treatment..... Hapgood, Bisbop & Co. are fitting up their gravel claims..... Burge & Goegle have their claims in good shape, and will start up in a few days.

MONTE CRISTO.—Mr. D. J. Mahoney, of the Monte Cristo mine, was in town on Wednesday, and reports everything moving along in good shape. The gravel improves as the tunnel progresses, and a full force of men are driving the work ahead as rapidly as possible. The snow still shows up on Spanish Peak, and the spring season is late up here.

ANOTHER GOOD MINE.—We are informed that a mine recently opened by Tom Davis, of Crescent, and T. F. Emmons, of Greenville, and located near and above the Green Mountain mine, is showing some very fine rock and paying handsomely. They have four stamps at work, and the chances are good that a very valuable property will yet be developed by their operations.

ROADS OPEN.—Greenville *Bulletin*, May 13: The road to the Plumas National mine is now open, and that to Gold Stripe was open a week ago. It is certain that crews of men will soon be at work on both these mines.

GOLD STRIPE MINE.—The Gold Stripe mine and mills are now ready for work. The ground has dried out and become solid enough for hauling. Some repairs must first be made on the roads where they have been washed out. The mills will be started up on the first of June.

DIXIE CANYON MILL.—The Dixie Canyon mill is now running on ore belonging to Messrs. Emmons & Davis. The mine is known as the Altona. At present the ledge is from 3 to 4 ft wide, and improves in width and richness as depth is gained. One hundred tons of ore will be crushed during the present run.

OREGON MOUNTAIN MINE.—Since the mills of the Green Mountain mines have resumed work the reports of the New York Mining Stock Board show an increase in the value of the stock. This confidence in the value of the mine is well founded. During the past month the mills have been running steadily and the shipment of bullion has been heavy. Beyond question the mine will soon be paying dividends as usual.

SHASTA.

FRENCH GULCH.—Shasta *Courier*, May 20: We understand that Johnny Coyle, at the Center, is going to rush things in his claim this summer, and will employ a force of 20 men. Wm. Murray was down from Flat Creek, Friday, and tells us that they have struck it rich again in the Dent, Young & Murray claim.

SIERRA.

A BIG LANDSLIDE EXPECTED.—Sierra Co. *Tribune*, May 18: The Boston Hydraulic Mining Co., of Moore's Flat, discharged the men last week that were recently put to work in its claim. This was done from the fact that there were indications of a large landslide occurring—such as the one that filled up the claim last year. It is said that the company will suspend operations altogether. If this is true, it will prove a terrible blow to Moore's Flat.

VIRGINIA GRAVEL CLAIM.—D. Cross, who has the Virginia mine, at Howland Flat, leased, is working the claim on an extensive scale. He is employing 50 men, and under his supervision the mine is yielding profitable returns.

LARGE DIVIDENDS.—It is said that the Marguerita quartz mine at Sierra City is paying $10,000 per month above all expenses of working it. This is only one of Sierra county's rich mines.

A NEW ROAD.—The Rainbow Mining Co. will commence grading a wagon road in a few days from Alleghany to Kanaka creek, where the quartz mill is to be erected.

THE OUTLOOK OF SIERRA COUNTY.—As spring opens there is beginning to be very hopeful inquiry continued by would-be investors from the East for legitimate mines. Among them perhaps none are coming to more prominence than the location lying east of this place, known as the Wallis Con. property. It is generally understood that an ample working capital will be shortly forthcoming to develop it. As the matter involves no sale or speculations other than bona fide investment and development, with liberal terms to those who put up the money, together with the high esteem in which the property is generally held, there seems no reason why the scheme should not be a success. As a test of the ridge to the east, ranging some 14 miles in distance, it will be invaluable to other locations and properties; and should it result in a success, as we doubt not it will, a new impetus will be given to our mining industries, at once warrantlug the best hopes, and in every way satisfactory.

AN EXTENSIVE ENTERPRISE.—The owners of the Marguerita mine, at Sierra City, are engaged in making a survey for a tunnel to be run in the ridge for the purpose of tapping the Keystone ledge. There are also in the same course 5 well-defined ledges, all of which prospect well in the croppings. The Keystone was a big paying mine a few years ago. It was worked as deep as possible by tunnels, when a shaft was sunk to quite a depth from the face of the lower tunnel, the mine yielding largely at that time. But owing to the difficulty of securing pure air so far under ground and the large amount of water that was necessary to contend with, the owners, who had already made their fortunes, suspended operations. The proposed tunnel will tap the ledge of this mine (at a rough estimate) in about 4,000 ft. This is a big undertaking, and if it is pushed ahead to completion, Sierra county will surprise the outside world as to her wonderful mineral resources.

THE BONANZA DRIFT CO.—The Bonanza Co., at Howland Flat, is still pushing operations in its claim. Fifteen men are employed at present in running gangways and tunnels. The main channel was lost soon after the company had purchased the mine, but the outlook is very encouraging for again striking the lead at an early date.

OPERATIONS TO BE RESUMED.—The Martine quartz mine, located near the Keystone and owned by residents of Sierra City, will soon be in full blast. Supplies are being shipped to the claim, and work will be pushed this season. Enough ore has been extracted to satisfy the owners that they have a good mine.

NOTES.—*Mountain Messenger*, May 20: We learn that the One Thousand and One gravel mine, above Sierra City, has gravel that prospects 25 cents to the pan. The company is now trying to follow the pay gravel that was found several years ago..... Red Dog gravel claim, between Monte Cristo and Downieville, S. Baker, Gen. Davis and A. Cregnon, owners, yielded last week 17 ounces of heavy lead gold. Abundance of pay gravel ahead. ..... Supt. Deidesheimmer, of the Marguerita quartz mine, left for Virginia, Nevada, last Tuesday. This property now bids fair to become a permanent and remunerative investment for its lucky owners.

RUBY.—The Ruby Co have not yet found the lead, and we understand that it has been decided to come back 1,200 ft in the tunnel and raise up, with the expectation of striking the Bald Mountain lead.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—*Enterprise*, May 20: On the 2500 level No. 2 winze has been sunk and timbered 9 ft. The main north drift has been extended 15 ft and work suspended for the present, on account of a considerable flow of water appearing. This water is now steadily decreasing in volume and does not interfere with other workings in the mine.

ALTA.—We are now hulkheading the east drift, which I find necessary to guard against flooding, as our pumps and tank are doing all they possibly can do, consistent with safety. Rock hoisted, 420 cars, wood consumed, 110 cords; strokes made by pump, 18,982.

UNION CON.—On the 2500 level are stoping out ore. On the 2600 level the northeast drift has been extended 32 ft. A north drift has also been started on this level. During the week 562 tons of ore have have been extracted from the 2500 level, and 413 tons and 1,380 lbs of ore have been sent to the mill. During the week bullion to the value of $24,600 32 has been shipped.

YELLOW JACKET.—The work of reopening the old levels from the Winters shaft continues. This work is necessary now, as we find the stations and drifts caved full, it requiring nearly as much labor as to run new drifts.

CALIFORNIA.—The south lateral drift on 2700 level has been advanced 34 ft. Joint consolidated east drift No. 2, on the same level, has been extended 18 ft.

BELMONT DISTRICT.

OVERHAULING.—Belmont *Courier*, May 18: The work of overhauling the Monitor-Belmont mill is going on at a lively rate; many improvements have been made since it shut down, and when completed it will undoubtedly be one of the best reduction works in this part of the State. The two new furnaces are now on the way from Lyning, and immediately after their arrival here they will be put in place. It is thought that the mill will be ready to start up early next month. ..Mr. Emerson's mill started up on Wednesday. The machinery works like a charm, but the steam supply proved to be inadequate. The engineers are now engaged in making some improvements, and when these are completed the mill will again be started on ore from Mr. Emerson's mine.....As we will soon have two mills running in Belmont, mine owners and chloriders should go to work and extract a few tons of ore from Mother Earth.

BRISTOL DISTRICT.

TAILINGS.—Pioche *Record*, May 13: The mill of the Bristol S. M. Co., which started up a week ago on tailings, closed down again on Wednesday, owing to the tailings not paying. The roaster is now being repaired, and after it is repaired the mill will be put to working ore again.

DAY CO.—At the furnace 4 men are engaged in completing the repairing that has been going on. In the Day mine prospecting is being vigorously pushed, and some of the greatest work ever done in a mine on this coast has been done by the company during the past 4 months. At the Meadha the same vigorous prospecting is being carried on as at the Day.

CHERRY CREEK DISTRICT.

ON THE LOWER LEVELS.—White Pine *News*, May 20: The Star folks reached the north vein on their new level Wednesday afternoon. We hear, but from no authentic authority, that good ore, giving assays of over $100 to the ton, has been met with. It will, however, probably take several days to determine the real bulk and value of the ore on the new level.

COLUMBUS DISTRICT.

MOUNT DIABLO.—*True Fissure*, May 20: Winze No. 1 on the third level has been sunk 14 ft since last report, and has followed a bunch of quartz which gives $300 assays. It is looking very promising. A shipment of bullion, amounting to $13 515.24, was the result of a final clean-up of the last crushing.

NORTHERN BELLE.—The daily yield of ore from this mine is about 62 tons. Mill No. 2 started crushing again on the 14th instant, all the repairs being fully completed and the mill put in excellent order. A shipment of bullion, amounting to $6,295 66, was made on the 18th instant.

JEFFERSON DISTRICT.

ST CHARLES.—Belmont *Courier*: The St. Charles mine at Jefferson is looking better and better as work progresses. The ledge is wide and well defined and carries very high-grade ore. Persons who have recently inspected this property pronounce it one of the best in this part of the State.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, May 17: The usual amount of ore is being extracted from the Betty O'Neal mine. The stopes are looking well and plenty of ore in sight. The sinking pump and column pipe have arrived and will be placed in position as soon as possible. Eight hour shifts will be put on and the shaft sunk as rapidly as possible. New levels will be run and stopes opened up. It is the intention of this company to push the work and open their mine up in good shape. Bullion will be shipped twice a week. Judging from the bullion output, the company will have a large working capital in their treasury, the proceeds of their mine, which will be much more satisfactory to the stockholders than having to pay Irish dividends.

MORNING STAR.—The connection on the 228 level was made on Monday evening between the Morgan and Mayo inclines in the Morning Star mine, opening up a block of stoping ground, 228 ft in depth by 200 ft in width. The last assays of car samples from the lower levels was $95. There is about 600 tons of ore on the dump and at the forks of the canyon ready for milling, and the intention is to work a large quantity in the Eagle mill as soon as arrangements can be made for the Betty O'Neal Co. to let their ore lay over a while.

NEW PITTSBURGH.—Great excitement has been caused by the locating of a mill-site and town site in Crum's canyon. The new town we hear is to be called Pittsburgh, and will no doubt rival its famous namesake in a year or so.

STARR-CROVE.—Reports from reliable sources are to the effect that the Starr-Crove mine will be started up in a short time. It will take a week or so to settle up the affairs of the company, but there seems to be no doubt that the matter will be satisfactorily arranged and operations resumed at an early date.

PIOCHE DISTRICT.

"THE FLAG IS STILL THERE."—Pioche *Record*, May 13: During the week preparations have been going on for the purpose of starting in retimbering the shaft of the American Flag mine. It will be timbered for a distance of 700 ft, down to the body of base ore. This ore body has been thoroughly tested by assays. The ore, sorted, goes $150 per ton, but unassorted, it averages $80 per ton. Now that there are furnaces for working base ore in our immediate vicinity, it has been determined to extract this ore. It will take about 5 months to retimber this shaft.

REVEILLE DISTRICT.

FAVORABLE.—Belmont *Courier*, May 20: Favorable reports continue to come from Reveille district. The ore encountered in the mines is of a high grade, and good quantities of it are being extracted. Bullion amounting to about $20,000 has been shipped from the Cila mill this spring.

SPRING VALLEY DISTRICT.

THE VANDEWATER MINE.—*Silver State*, May 20: The Vandewater mine, generally known as the Eagle, situated in Spring Valley, is now being worked by a New York company, of which the late Cornelius J. Vanderbilt was president. The superintendent, E. D. Luxton, formerly Vanderbilt's private secretary, and one of the executors of his will, was in town yesterday, on business connected with the estate. He informed a *Silver State* reporter that the Vandewater mill is now at work on refuse ore from the old dumps, which assays from $7 to $26 per ton in gold. The mill reduces about 30 tons of ore daily, and it is worked exclusively for gold. A new shaft has been started on the mine, and is now 42 ft deep. This shaft is located near the west end of the original Eagle ledge, where the ground was abandoned as worthless by the old company. The shaft is now in ore that assays from $20 to $40—three-fourths of which is gold—to the ton. Mr. Luxton says the present Vandewater G. & S. M. Co. bought the property, believing it to be valuable, and they will prospect it to a depth of 500 or 600 ft if they do not find paying ore in paying quantity nearer the surface.

TYBO DISTRICT.

THE MILL.—Cor. Belmont *Courier*, May 18: Since Mr. N. S. Trowbridge's return from California he has been very busy in reconstructing the Tybo mill. New improvements have been added, old machinery being replaced with new, in fact, the mill is in better shape today than ever before, for he was preparing for a long run, there being at least 1,500 tons of ore on the dumps and ore chutes to be crushed. The boilers were to be hired on the 10th, but, unfortunately, Tybo is again under a cloud. A message reached here summoning N. S. Trowbridge to San Francisco, and the time for starting the mill had to be postponed until Mr. Trowbridge's return, which we all trust may be very soon. The nature of the war cloud I could not penetrate further than that it did not look disastrous, and we all hope that it may prove so and reveal a bright future for Tybo.

ITEMS.—Messrs. Page & Donnel are developing a fine body of ore on their Red Rock mine, it being the extension of the 2 O mine.....The Mountain View Co.'s new mill is going up as fast as money and labor can accomplish it. Their mine looks well.

ARIZONA.

GROOM CREEK.—Prescott *Courier*, May 16: Gentlemen who went out to Groom creek Saturday and returned Sunday last are very well pleased with the way mines and miners are looking and yielding. Geo E. Berry and others have a 50-ft shaft on the Adel. They had saved about 40 tons of ore and are steadily adding to the pile. Mr. Merrington, superintendent of the mill, recently made careful samples of George's rock, and it gave gold per ton, $97; silver, $50. The ore body was of good size when our informant saw it. Mr. Merrington has men taking ore from the Chicago mine. The mill was not running, but will be in a very short time. We think it would be well if owners of rich Groom creek mines would go to work and take out more ore.

BLACK HILLS.—M.A. Ruffner, just from Black Hills district, says that when he left camp there were on the Hermit mine dump 40 tons of extra good copper ore. The ledge was opened to a depth of 50 ft below the surface. Having recently conversed with miners from Walker & Hassayampa mining districts, our impression is that Dr. Farnsworth, who is operating for a New York company, is developing several fine ledges, notably the Bodie, in Hassayampa district, the Mifflin, Wadleigh and Kishacoquilles in Walker district. Men are drifting and sinking. We believe it is the intention of the company to very soon erect a furnace near the Bodie mine. Mr. Callen and a party of gentlemen from the east are looking at mines, etc., in Walnut Grove district.

MUSIC MOUNTAINS.—Pioche *Record*, May 13: These mountains are located in the northwestern portion of Arizona, but, owing to no known water or springs, the prospectors feared venturing among them. We learn from George Latimer, who recently returned from that Territory, that the prospectors have at last gotten into the Music mountains and uncovered several gold ledges. The Haulpai Indians have been in the habit of going into these mountains to hunt, but were careful in not permitting white men to follow them, or disclose where water was located. A prospector, 4 months ago, trailed the Indians to water, and, after a few days' search, discovered the location of several springs. As yet, there are but half a dozen men prospecting in the above-named mountains, and some of the ledges discovered are reported promising.

COLORADO.

THE FLETCHER MINE.—Georgetown *Courier*, May 20: The Matilda Fletcher mine, on Democrat, continues to pay largely. Last week Warren Young had between 7 and 8 tons milled, which was taken out by drifting 15 ft and raising 20 ft, that netted nearly $3,000, the first-class returning 445 ounces of silver to the ton, and the second-class 304 ounces. This month he is continuing his drift, and will probably commence stoping, the ore vein still being very large. Good ore has also been struck in a raise over the second level, which is leased to W. M. Fletcher & Co., who have a vein of smelting ore 6 inches thick, a sample run of which returned 210 ounces to the ton. The lowest level is being driven ahead by Bart Hopkins & Co., who have 6 inches of quartz that carries a small amount of ore.

IDAHO.

AN IMPORTANT CONTRACT AWARDED.—Wood River *Times*, May 17: The Moore brothers have been awarded a contract to haul all the ore which the Bullion, Mayflower, Jay Gould and Eureka mines will yield this summer, down to Hailey, where it will be loaded for the railroad. At Hailey the ore will be received by a joint representative of the owners of the mines named, and forwarded. If the railroad is completed to Hailey before the close of the shipping season, the contractors will deliver it at the depot without extra charge. The price agreed upon for hauling from Bullion to Hailey is $2 per ton. The Moore brothers will make two trips a day. Their teams have a capacity of 50,000 lbs at a load.

VIENNA MINING DISTRICT.—A new mining district has just been created, as follows: Beginning at a point on Sandy Gulch creek, 14 miles north of the town of Vienna; thence west 5 miles to a point; thence south 10 miles to a point on South Boise river; thence east 10 miles to a point on Big Smokey; thence north 10 miles to a point on the divide between the head waters of Wood and Salmon rivers; thence west 5 miles to the place of beginning, embracing an area 10 miles square, as provided by the Territorial statute. David M. Snyder has been appointed Deputy Recorder for the new district. His office will be in the town of Vienna.

MONTANA.

THE LIQUIDATOR.—*Inter-Mountain*, May 18: With the recent developments on this valuable copper property the readers of the *Inter-Mountain* are already familiar. The property has opened up wonderfully well and is already regarded as one of the most promising copper mines in the district. Within the past few days $2,000 worth of ore has been sold to the Montana Copper Co. by the owners of the Liquidator, who shipped it to the smelter without concentration or sorting. Besides what has been sold, McDermott & Co. have on hand 50 tons of ore assaying 28%, 40 tons of ore assaying 25.5%, and 20 tons assaying 40%, and the dump is rapidly increasing in size.

JEFFERSON NOTES.—Cor. Helena *Independent*, May 20: The Wickes reduction works, a few miles from here, have been a great benefit to this place. The number of men employed by the Alta Montana Co., directly and indirectly, will, I believe, number about 300. The Alta mine, one of the principal mines of the company, is looking well, showing large bodies of rich ore. The doors of this mine are not closed, and the genial foreman, Lyman Rowley, will be pleased to show anyone through the mine. A force of about 50 men is kept constantly employed. The Custer mine is being operated by this same company, a force of 12 or 15 men being employed. The Cornet mine is soon to be started up. Favorable results may be looked for. Still, for all the disadvantages of location, Wickes is a pretty place. It has been the firm determination not to have a saloon in the place, and, in that end, the company has been successful. The works are running nicely in all the various departments. The Gregory Con. Co. has spared neither pains nor expense to build works that will return dividends. The Gregory mine, I am informed, is looking better than ever before. This company employs about 200 men, directly and indirectly.

NEW MEXICO.

NOTES.—*New Southwest*, May 13: Bremen's mill is still running day and night, on high grade ore....Some valuable mining property in the Hanover district was sold this week....It is rumored that there are some heavy sales being negotiated in the Hanover district.... Half interest in the Sherman mine was sold yesterday by Messrs. J. and B. Williams, to the Income company.... The Silver City Co.'s mill has been shut down during the past week for want of cord-wood. Arrangements have now been made for a constant supply, and the mill will start up on Monday next.....At the Sherman mine good progress has been made at all points during the week. A fine body of high-grade ore has been found just above the tunnel level. This is by far the largest body uncovered in this mine. At several other points good ore has been found. The drift connecting the 100 level with the main shaft is nearly through. A good shaft house over the main shaft is being erected. The Silver City Co's mill will start up about Monday on Sherman ore.

OREGON.

NOTES.—Jacksonville *Times*, May 20: A large quantity of gold-dust will be taken out this season, after all..... A. Bowman is running the English Co.'s hydraulic at Galice creek.....Ingram & Beck, of Willow Springs precinct, are now cleaning up and doing well.....Jack Layton, of Applegate, still has a large head of water, and is doing better work than ever.....J. Klippel & Co., of Foorman's creek, are cleaning up, and propose to do considerable drifting during the summer.....Gin Liu made another good clean-up a few days since. He is taking out considerable gold at Uniontown, and also on Palmer creek.....The Sterling Co. has a full head of water and expects to continue piping night and day until the latter part of August. A heavy clean-up is expected then..... G. F. Topping, who was in town Tuesday, informs us that Alex Watts, of Williamsburg, has about cleaned up, with favorable results. $1,500 have already been taken out..... C. H Barkdell informs us that some California prospectors are in the vicinity of Blackwell, and that more prospecting for quartz will be done this season than for some years past. He proposes doing some substantial work himself soon.

UTAH.

LULU.—Southern Utah *Times*, May 20: Work on the Lulu still continues without much change, which is not looked for until the ledge is struck, which will be for some time yet.

THE HORN SILVER continues its regular shipments of ore to Frisco and Francklyn. The north shaft is still being sunk, and they are drifting north on the 5th level.

THE CACTUS is now down 50 ft and looks very favorable. The ore continues about the same as last reported, yielding about half a ton to the foot in depth of the shaft.

WORK on the St. Marys continues as usual. This mine has a large body of ore in sight and has had for a year.

THE COMET is still working and looks big. It has several tons of 150-ounce ore on the dump and plenty more in sight.

THE MAMMOTH tunnel is still working and is now very near to the ledge.

THE shaft on the South Horn is still going down. The ore continues mixed through the rock and spar, and they will probably have to drift to catch the ore body.

MR. O. T. CLARK is working his mine, the Monitor, in Star district. He has a fine showing of ore, which is increasing in quantity as depth is attained.

THE Wood River ore shipments will begin to arrive in Salt Lake about the last of the present month.

Extracting Copper and Other Metals from Their Ores.

For smelting the sulphides or other ores of copper, Mr. W. W. Hughes, of Bayswater, proposes first to use a cupola or reverberatory furnace, and to mix all necessary fluxes with the charges. The slag is run or drawn from either of these furnaces in the usual way, and the regulus is run off into sand-beds, or he runs the molten regulus into a ladle and pours it into the desulphurating furnace, places the regulus obtained from the sand-bed into a large melting reverberatory or other furnace, where he brings it into a thoroughly molten state, and after drawing off any slag that may have risen upon it, he runs it into or carries it in a ladle and pours it into the desulphurating furnace, which is heated up ready to receive it. He uses a desulphurating furnace, the main bed of which is longer than it is wide —say, about 9½ ft. long and 6½ ft. broad, internal measurement. The depth of the furnace from the level of the skimming plate to the bed is about 12 inches, but these dimensions may be considerably varied, and the furnace may be made larger or smaller as desired. The two ends of the main bottom of the furnace are semi-circular. At one end is a skimming door, and in front of this door the bed is stepped up, say about six inches, forming a platform and hay measuring two feet long along the center of the furnace. Into this hay the slag accumulates before it is drawn or run off. At this end of the furnace is also a flue leading to the culvert or chimney stack, whilst the fireplace is at the opposite end of the furnace, as in an ordinary reverberatory furnace. The flue leading to the culvert or stack he makes larger than the flue of an ordinary copper smelting furnace, otherwise the fumes of the sulphur would for want of vent be driven out at every opening in the furnace.

The fire is required for creating a draft when the furnace is not working on a stack with other furnaces, and is at all times required for keeping it hot between the charges and for heating it up after repairs. He places a small door in each side of the furnace, one door near one end of the furnace and the other door near the other end of the furnace, and opposite to these doors he sets tuyeres in the walls of the furnace. He uses one or two tiers of tuyeres, according to the depth of metal to be blown upon, the lower tuyeres a little above the bottom, the upper tuyeres a little higher in the side of the furnace. By placing the tuyeres in the opposite sides and ends of the furnace, the blast keeps the molten contents in rapid circulation and supplies itself with a constantly renewed surface to blow upon. The blast enters through the sides of the wall. He uses large tuyeres with a moderate pressure, rather than small tuyeres with a high pressure, as he finds in practice that it is not heat so much as air that is required to drive off sulphur. He uses either clay or iron tuyeres.

When he commences each operation with the desulphurating furnace, as soon as the molten regulus begins to run, or as it is poured into it, he puts on the blast and increases it to the required strength. As the contents rise to a level with the skimming plate, it is always kept at a level by running or pouring in molten regulus as the slag is drawn or run off. When the contents of the furnace are brought up to 85% or 90% of metallic copper, he runs it off either into sand beds or into iron molds, and begins another operation.

Silent Smelters.

Why is it that there are so many smelters and stamp mills lying idle, if not utterly abandoned, in Colorado? In traveling through the mining regions, a by no means infrequent sight is a building in which it was originally intended to treat ore by one process or another, and which has cost a large sum of money, standing idle and valueless, when it should be the seen of unceasing activity and a source of great revenue.

This strange sight may be explained in several ways. In some cases mills are erected by over-confident individuals in localities where the output of ore does not warrant any such display of enterprise. The mill man, however, anxious to be first on the ground, and, possibly, with more money than good judgment, accepts as true the rose-colored statements of prospectors concerning their claims, and hastily puts up his machinery, only to find, after a large outlay of cash and time, that there is not enough of paying mineral in all the country around to keep a mill busy one month in a year. Again, the would-be mill owner inspects neighboring properities himself, and decides that he can derive from them a plentiful supply of ore for the successful prosecution of his business. The mill is speedily built. Then its unfortunate proprietor discovers that he knew very little about determining the true character of ore and its suitableness for treatment in his peculiar kind of mill; or the ore may change in character; or mine owners may fail through any one of many causes to produce a quantity corresponding with their original estimates. Then the mill, the birthplace of so many bright hopes, is abandoned, sadly, but of necessity, and remains a monument to the folly of too hasty action.

Among those who go down to the mines to smelt ore, the case is of a like nature. Smelting is a process more intricate and difficult than milling, and shutting down a smelter is less practicable than shutting down a stamp mill. The smelter must have a large and continuous supply of ore to treat, and, above all, must have a manager of experience and full of resources, who can overcome the refractory nature of ore by some other process when the ordinary course of treatment fails. Merely theoretical men cannot manage a smelter. Practice alone, as much as in any other business in the world, makes perfect. Many an establishment intended for reduction works stands idle today, after involving its owners in extraordinary expense, because of the incompetence of its so-called managers. Fledgeling "experts," fresh from college, and ambitious persons filled with visionary and impracticable ideas and plans, are not the ones to manage smelters and mills, and it is due to the employment of such as these that many thousands of dollars have been lost in mining communities.—*Leadville Herald.*

Sex in Mineral Veins.

A few weeks since we gave an article on the above subject from the London *Mining Journal.* We now append a letter from Mr. James Williams on the same subject, referring to the previous article:

I am very pleased at seeing in the *Mining Journal* an article on "Sex in Mineral Veins." The subject is not by any means a new one, as it is an idea that has occupied my attention for the last 30 years, and I am fully satisfied, and have been for many years past, that we cannot apply the word sex to mineral veins, as on close inspection I have found that the north and south vein (and which Mr. J. Van Cleve Phillips, New York, would term a male, and non-productive) by a secondary influence has become the bearing or productive vein.

A short account of my investigation of mineral veins and what led to it may not be out of place. Standing on an old mine barrow and elevated, on looking southeast and northwest, I was somewhat surprised at beholding a number of mines in that direction, as our Cornish mines, with but few exceptions, are east and west, and the above was a few degress south of east and north of west. Where I stood I could take in a distance of from four to five miles, and the number of mines (about six), and on visiting the mines separately, I found that each had been made productive on the east and west vein, except the last. All the former veins had been made productive by the cannter running in the direction named above, and non-productive until forming a junction with the east and west vein, but the last to the south of east was in the direction of and with the Nine-o'clock vein, and up to this point might be termed the male or non-bearing vein. But at this point it changed its character, and became the female or bearing vein, in consequence of being disturbed by an elvan conrse as a secondary element, and was very productive for a short distance, and was called Wheal Chance in South Crenver, where thousands of pounds were recklessly wasted looking over a second Wheal Chance, but not finding a secondary element or elvan conrse, their money was spent in vain.

The next we shall hear of this caunter carrying its head, and pursuing its conrse, so to speak, east and by south, will be in Poloreho mine, to the east and south of South Crenver, now commenced to be worked by Mr. Battye, Secretary, Great Winchester street, London, which I have considered for years to be a valuable piece of ground, second to none. As I prefer giving a reason for the faith that is in me, please permit me to do so in this instance, as it is of the utmost importance.

This caunter or Nine-o'clock vein, after being traced a few miles through highly mineralized ground, with varied but beneficial results, we now have in Polcreho mine to the west and north it will intersect a northeast and west vein, then three veins east and west, parallel to each other, and underlying to form a junction in depth, and which is about the center of the sett. It passes on, and in the south part of the sett it will again form a junction with three other east and west parallel lodes, about 30 ft. apart at surface, and coming together in depth. One of those (the south one) was made productive by a cross course as a secondary element. When this vein was first discovered close to the cross-course, and only 28 fms. from surface, it was in September, 1872, worth more than £84 per fm. The best work made 7 cwts. 13 qrs. of tin to 20 cwts. of the vein (tin hook now before me—amount, £209 10s. 6d.); yet this sett was condemned by all the old-fashioned miners. It is quite time a new state of things should take place, so that we could with a greater amount of certainty find our mineral deposits. I have used every effort to form an Inductive Scientific Mineralogical Institution, visited London in 1879, was three times to Marlborough House to endeavor to see the Prince of Wales and Duke of Cornwall, being extensively interested in mining property in the county, and, as I then stated, I now again affirm that the Prince of Wales' income may be increased by 50%; also all the mineral land proprietors in proportion.

It is only three-years since I made the attempt to see and interest the Prince of Wales with my theory. However, I am not out of heart or discouraged, as I read that Mr. Samuel Morse, the inventor of the electric telegraph, presented himself at the White House Congress in America in 1837, where he was laughed at and jeered by those who should have assisted him, and did assist him after wasting six years of precious and valuable time. I suppose I must hope to be more fortunate than was Mr. Morse with his valuable invention.

"Old Coloma."

The name of Coloma always brings to mind Suttor's old mill and that first nugget of gold picked up in the tail-race thereof by Marshall; but of late years the old camp has been better known for the great quantities of excellent fruit grown there than for its yield of gold. For many years Coloma has been a very quiet place, but now it appears likely to awake from its long sleep amid its great circling hills.

Rich discoveries in the way of both gold quartz and gravel are now being made in that vicinity, and men who have not thought of prospecting in the last 20 years are taking to the hills.

Dr. M. Holmes, for years in the early days a resident of Coloma, day before yesterday returned from a visit of some days' duration to that section, and he is quite enthusiastic in regard to the present prospects of the old camp. He says a few days since two young men, who for some purpose broke a road for a considerable distance into a region of chaparral, unexpectedly came upon a quartz vein showing free gold above the ground. They took out over $600 in one day with pick, mortar and pan. All that section is filled with quartz veins, and there are thousands of acres of hills and flats, covered with greasewood, which have never been trodden by the foot of man. The discovery mentioned above was made in White Oak township, on the Sacramento road, about eight miles from Coloma. Several other veins of quartz showing well in gold have been found in the same vicinity.

Cement mines are also being looked after. Interest in cement has been excited by the rich strikes recently made at Prospect flat, some two miles above Placerville, also in the Cedar Springs mine, just in the edge of the town. In Prospect flat, the gold is in fine scales, and so much is there of it, that it forms yellow streaks across many lumps of the material. The cement from Cedar Springs is heavy, and is in the shape of cucumber seeds. Some pieces weigh from half an ounce to over an ounce. Cement is being taken from both these mines that will pay $20 to the pound. It is literally filled and sparkling with gold. At Grizzly flat, east of Placerville, some rich strikes have this spring been made in quartz.

All these strikes have set the people of Coloma to thinking that there is no reason why all their surrounding mountains may not contain rich quartz and cement. As in many other places in California, the old settlers have not thought about going out prospecting in many years, and there are all about the town places that have not been looked at since the days of "forty-nine."—*Virginia Enterprise.*

Silver King.

Great activity exists at the Silver King mine. The new superintendent is pushing things with great vigor in all departments at the mine. They have erected a sawmill, and a new carpenter and blacksmith shop. In the new double-compartment shaft they have now two cages, dispensing with the bucket. They have overhauled the hoisting works, supplied them with a new steel boiler, of 70-horse power, which gives them ample power to reach a depth of 1,500 ft. The capacity of the old boiler was only 12 horse power. It will be used as an auxillary to the new engine. They will continue sinking in the shaft with increased facilities, make very rapid progress and strike out on new levels at suitable points. On the 700 level, they are excavating all around the drift, in ore everywhere. It appears to be without a limit. This drift is now 132 ft. toward the northwest, from the main shaft. The excavation has reached 105 ft. in width. They are now cutting mainly on the northeast side of the drift. The mill is running to its full capacity, all the roasters, concentration tables, lixiviation apparatus, stamps and smelting furnace working at full speed. Several important changes have been made in the working forces, the most important of which is the retirement of Ottokar Hofmann, who gives way to Charles H. Aaron, as metallurgist and chemist. Messrs. Kurth and Fischer of his force retire with him. James Duffy, the engineer, and several others also give way to new hands. All these gentlemen have long discharged their duties in the King reduction works with marked ability and punctuality. The ore teams are as busy as they can be supplying the mill with ore from the mine. The immense supply of cord-wood on hand covers nearly the entire mill-site, and all the King now wants is an additional mill with 100 stamps and everything else in proportion. Then it can run out more bullion than all the rest of Arizona together, and he the King, indeed, quadrupling its monthly dividends.—*Pinal Drill.*

THE WOOD RIVER SITUATION.—The Wood River *News* says: "Stay away. We hear of thousands on the road to Wood river, packing their blankets and begging their way. Better keep out. You won't have wind enough to cuss the country with by fall. All Wood river wants is men with coin to buy mines and develop them, or certainly enough to prospect with. A disturbance occurred at the corner of Main and Elm streets yesterday, and in a minute 500 men were counted in the crowd. Lots of loafers here now, and when we say loafers we mean men who have no visible means of support."

The Gravel Miners.

We have just had a talk with one of the 1,000 miners who are employed in the gravel mines on what is known as the Ridge, in this county. We learn from him that miners in that section are thoroughly organized in a Miners' Union, which has for its object taking care of miners who have been injured in their work, or who may be sick and in distress, and for purposes of general protection.

This organization, we understand, is determined that no injunctions from any valley county judge shall deprive its members of their daily bread, and that it will be very dangerous work for any lawyer from the valley to attempt process serving on the Ridge. A great number of these 1,000 miners own their own houses, with small vegetable and fruit ranches about them. Their surplus earnings have been devoted to improving their little homes, and should the mines be closed, and they be compelled to seek their subsistence elsewhere, they realize that they would be giving up the work of the best part of their lives.

It is an unfortunate condition of affairs which has brought about such a determination of our laboring classes to resist to the bitter end any mandate of the valley judges. The miners, neglecting the nice formalities of the law, cannot see what right the judge of Sutter county has, by one stroke of his pen, to arbitrarily deprive them of their only means of subsistence, and to annihilate their frugal savings.

The valley newspapers talk an infinite deal about the destruction of happy valley homes by slickens. For one home destroyed in the valley we will guarantee to point out 20 more comfortable homes which will be destroyed in the mountains should gravel mining be prohibited.

It was agreed, we understand, that no legal attacks should be made against the miners until the decision of Judge Temple has been given on the Gold Run case. The lawyers of the valley people, however, have, as usual, broken faith in the matter, and have lately been trying to close the mines at Dutch Flat, by their favorite tactics of injunctions. The miners there treated the process server to a dose of cold water, and he was glad to get away with such mild treatment.

Everybody recognizes Judge Temple as both able and impartial, and it seems as though the valley people are unwilling to abide by his decision, which will doubtless be given in a few weeks, and are determined to do all in their power to increase the ill feeling which now so unfortunately exists between the valley and the mountains.—*Nevada Transcript.*

Jordan District.

Jordan mining district, adjoining Homer on the east, was organized on the 22d of April, 1879, but its boundaries were not clearly defined until the 20th of June, 1881, when the annual meeting of the miners adopted the following: "That the boundary lines of Jordan mining district shall be as follows: Starting at the mouth of Lee Vining creek and running west to the east line of Homer district, and then north along that line by the foot of Lundy lake to Virginia creek; thence down that creek to where the old Bridgeport trail crosses Virginia creek; thence east to the Lonis Lockhurn cabin at the mouth of Mono gulch, and then south to the mouth of Mill creek, and then across Mono lake to the place of beginning." Jordan district embraces many rich auriferous, argentiferous and cupriferous quartz ledges, as well as extensive deposits of auriferous gravel, the latter lying chiefly along the tracks of the Mill Creek glaciers and under the adjacent moraines. At present the Detroit Copper mining company is engaged in opening some of the copper mines, which are among the richest known in the history of that metal; the Mono Lake Hydraulic mining company is operating on an extensive scale on lower Mill creek, and others are engaged in opening what promise to be valuable gold and silver bearing quartz ledges. G. Adolph Lippert is the present Recorder of the district, and the annual election will take place on the 20th inst.—*Homer Mining Index.*

SEAMLESS BOILERS.—The *Blacksmith and Wheelwright* says that a seamless boiler, or one made with welded joints, is a great novelty in this country, and doubts very much if many of its readers have ever seen such a construction. Their use in England, however, for many purposes is the rule rather than the exception; and they are there employed not only on account of their quality, but also on account of their relative cheapness, comparing them with other forms. We do not know of a single establishment in the United States that is prepared to do work of this kind. We do know several which are experimenting in this direction, and hope ultimately to be able to compete with our English cousins in a field which they occupy alone at present. These statements serve to show the relative positions of the two countries in some kinds of smith work.

THE Hudson River tunnel has now reached a distance beneath the river of 239 ft. in the North tunnel, and in the South tunnel 700 ft. The work is progressing at the rate of 4½ ft. per day.

Overcoming Summer Heat.

The time is approaching when the thermometer will do its best work in the hot valleye of oar State, and aids to withstand the heats may be valaahle. It is generally known that the lofty marks to which the mercary sometimes ascends are aot true measures of heat effects upon men and animals, bccaare, through the dryness of the air, there is none of the prostration which accompanies great heat in countries with a moist summer. Nevertheless, there are times when it is qnite valuable to be ahle to reduce the temperature a few degrees. The best way to do this is hy using the coolness which proceeds from the evaporation of water. Perhaps a lesson can he learned from East India contrivances. Acoordiag to *Chamber's Journal* they use in India what is called a "tattie," a large curved or sloping screen, whioh accurately fits into eaoh door or window facing the west, and is made of the roots of the khuskhus grass (*Andropogon muricatus*), which siagalarly combines strength and porosity with the most delicious and refreshing fragrance. These screens are ahout an inoh in thickness, and, during the hot and dry west wiud, are saturated from outside with water, whioh immediately commencee evaporating uader the fierceness of the blast; and as evaporation always implies cold, the wind which, in the veranda, would raise the thermometer to 120° Fahr., passes into the house at 75° to 80°, laden with adelioioas fragraace. While tatties are in working order all other cooling appliances are unnecessary.

In the neighborhood of Gwalior and Jhansi there is another form of tattie. A small, creeping, thorny variety of the her (*Zizyphus jujuba*) is largely found in the juagles; this is collected and dried, and at the proper time the whole west veranda is inolosed with thorny walls nine to ten inches thick, and these being saturated from the outside, all doors are thrown open, and a delightful temperature is secured. Tatties are of no nse during the easterly wind, whiob nshers in and accompanies the rains. Laden with moistnre it is a damp wind, and therefore retards evaporation. The creeping thorny plant, *Zizyphus jujuba*, is growing in different parts of this State, and is known as the jajube, and could be had for tatties, if the growere wished to sacrifice the fruit which they are growing it for. But it is not at all necessary that we should take the time required to weave the thorny jujube into hrush-cloth. All that is needed is to get some material which will hold the water in contact with the air as it passes through. No douht onr tules wonld make good tatties, and the evaporation of water thrown on the leaves of vines thickly covering the sides of the veranda would produce as mnch coolness as a hedge of hrambles. There is great chance for ingenuity in choioe of materials and methods of usiag them, but the principle is oonstant, to wit, the evaporation of water before admitting the hot wind to the domicile. A good hot summer norther will certainly furnish the wind power to dry out miles of tatties.

High gr Low-grade Ores.—A six-ft. ledge of $30 or $40 ore, even should it be free milling, is too small a thiug for most prospectors. What they are after is a big ledge of $1,000 rook. They have not time to look at the small things. Experience teaches them nothing. If they have a prospect on which they have sunk a half dozen feet, that shows ore of a high grade, tbey will not look at less than $100,000 or so for it. Hundreds of hursted prospectors can be found who own locations from which rock that will assay $1,000, or more, oan be obtained, hnt these rich streaks are soarce. Capitalists have disoovered that large ledges of low-grade ore in the end prove the most profitable and permanent, and it is into these that they are putting their coin, on general business prinoiples. It would he hetter for a prospector to spend his time on a mine that he thinks something of than to fool around 20. People who have too many irons in the fire generally come out at the little end of the horn, and this is true in prospecting as in everything else.—*Grantsville Bonanza.*

The Dog Town Placer Diggings.—John C. McTarnahan is preparing to resume hydraulic mining in the old Dog Town diggings, six miles north of Lundy. Last season he prospeoted the ground thoronghly and found it to be rich in gold worth $18 per ounce, and will now commence operations witb a force of 20 men, working night and day. He has a long flume already construoted, and an unlimited supply of water in Green creek ready to turn on. There will be no tronble about slickens, as the alkaline land below will be benefitted by the debris from the washing. As there are thousands of acres of gravel adjacent to the tract owned by Mr. McTarnahan that appear to be equally rich in gold, it is to be hoped that he will meet with great success, and thereby stimulate others to oommence similar operations in the same vicinity.—*Homer Mining Index.*

The Utah and Nevada Railway is nearly oompleted, and will be of immense benefit to the mines of Tintio.

The prodnct of the Utah mines for the first quarter of 1882 is one third greater than for the same time in 1881.

Useful Information.

On the Drying of Oils.

All oils tend to chaage in the air; those lese pure changing more rapidly. Butter whioh has aot heea properly freed from buttormilk is a good example.

This chango is, first, the nnlinking of the oil-acid and the glyoerine, setting the oil-acid free. Still exposed to the air the oil may give a sharp, unpleasant odor and taste, due to further changes; it has hecone rancid. Rancid hutter may be sweetened, however, by washing it with some snbstance which will form a soap with these rancid acids and remove them. Lime water is sometimes used for this purpose; and the olearing up of a fatty linseed oil hy litharge is an action of the same nature. In this case a lead soap is formed by the acid and the litharge.

The drying part of the linseed oil—*i. e.*, the linolein (linsecd oil acid and glycerine ether) does not become rancid. The same is true of the drying portion of poppy oil and of other dryiag oils. The drying parts of these oils thioken and change into stioky, elastic, or into leather-like snbstances, all of which are waterproof, and upon all of which water has only a small influence.

The Changes in Oils.

The ohemical changes in oils which hecome rancid and in oils which "dry" are of the same nature; the results are different hsoause the oils are different.

The science of chemistry is founded upon weight. If a snbstance changes and weighs heavier than before tbe chemist is sure it has gained something. If a snbstance chaages and weighs less, he is sure that it has lost something. He then proceeds to discover what it is that has heen gained or lost, and in this his scales are again useful in weighing other snbstances with which this one has heen in contaot, in order to discover which of them has taken the lost something, or has given up the something gained.

Linseed oil in dryiag gains from 8% to 10% in weight. A French chemist exposed some dryiag oil to the air. It weighed ahout 155 grains; after 18 months, ahout 166 grains. It had gained ahout 11 grains, or more than 7% of its weight. In speaking of the drying of linseed oil, therefore, we mean merely a change from a flnid to a solid condition. There is a loss of something, as we shall see, hnt tbere is a gain which not only makes up in weight for the loss hut usually leaves the same quantity of linseed oil 10% heavier than hefore it heoame "dry."

Influence of Heat in Drying Oils.

Heat also has a very important effect in drying oil. In a recent experiment, two panels were painted, one of which was subjected to a natural heat of from 60° to 68°, and the other to an artificial steam heat of 176° F. The panel which was heated was exposed to the extreme heat bnt two hours the first day and four hours the second day. The heated panel gained .211; the panel not heated gained .004. In other words, excessive heating dried the panel about 50 times as fast as when exposed to an ordiaary summer atmosphere. Experience has shown that moist heat must be used, and that any beat much over 176° is iajurious.

The Gain in the Weight of Drying Oil.

We have seen that oil in darkness hardly increases at all in weight. In the light, and especially if heated, drying oil becomes from 8% to 10% heavier. Doss it get this weight from the rays of light? Science has shown that these rays have no weight—that hoth light and heat are merely waves of motion, like the waves whicb spread over the surface of smooth water when we throw a stone into it. The water is no heavier for the motion, it is ouly heavier hecause of the stone. Air, bowever, has weight as a stone has—100 cubic inohes weigh 31 grains. Air, however, is not a simple substsnce; it is composed of at least three gases, nitrogea, oxygen and carhonic acid.

Chevrereil, a celebrated French chemist, made a series of experiments hy snhjecting painted panels in air-tight glass hoxes—No. 1 containiag carhonic acid, No. 2 containing nitrogen, No. 3, oxygen, and No. 4, common air. The result sbowed a gain of 11 parts of oxygen in 22. In other words, the quantity of oxygen gained was just equal to the original amount in the undried oil.—*Condensed from Railroad Gazette.*

A new and desirable papier mache process for covering floors is described as follows: "The floor is thoroughly cleaned. The holes and oraoks are then filled with paper putty, made by soaking newspaper in a paste made of wheat flour, water and ground alum, as follows: To one lb. of flour add three quarts of water and a tablespoonful of ground alum, and mix thoroughly. The floor is then coated with this paste, and then a thiokness of manila or hardware paper is put on. If two layers are desired, a second oovering of paste is put on the first layer of maaila paper, and then the second thickaess of manila paper is pnt on. This is allowed to dry thoronghly. The manila paper is tbon covered with paste, and a layer of wall paper of any style or design desired is pnt on. After allowing thia to thoronghly dry, it is covered with two or more ooats of siziag, made by dissolving one-half lb. of white glne in two quarts of hot water. After allowing this to dry, the surface is given oae coat of 'hard oil-finish varnish,' whioh comes and is hought already prepared. This is allowed to dry thoroaghly, when the floor is ready for use." The process is represeated to be durable and cheap, and besides takiag the place of mattiag, carpet, oil-oloths or other like coveriags, makes the floor air-tight, and can he washed or scrubbed.

The Influence of Light and Darkness and Colored Lights on Drying Oils.

A Dutoh ohemist who has made a oareful study of the drying of oils has arrived at the conolusiou that linseed oil inoreases in weight in almost exact proportion to its becomiag dry. Comparison of the inorease by weight of the drying oil under the several glasses gives the order of drying as follows: Most rapid under the uncolored glass, then follow blue, yellow, green and red, hut this order is of no oonsequence, nor trustworthy as a constant fact.

After 150 days, on the contrary, the gain in weight is greatest in the following order, under green, yellow, red, hlue and nncolored glass.

In darkness there is no drying, or it proceeds so slowly that it may be said not to go on at all. *Light is the first natural drier of oil.*

The powerful influenoe of light upon the drying oil indicates that a paintiag or varnishing shop should have many windows, and a great ahundance of uacolored light—no sort of driers in a shop are more valuable than windows.

These tahles also show that oil loses as well as gains something in drying, and that the least loss or greatest gain after many days is in slowly drying oil.

Japanese Hand-saws.—The Japanese hand-saws cut on the pull-stroke; so no matter how hard the wood or dull the sap, they will not hend or huckle. It is rather more difficult to saw to line with such saws than with ours; hut they have their advantages. Take one of our key-hole or compass saws, cntting on the pnsh or shove-stroke—what an aggravating, limber thing it is. Now point tbe teeth the other way, and you have a tool that will keep stiff no matter how maay knots it encounters or how dull it gets. In other words, the pull-stroke of 3,000 years ago is the best for such thin, narrow hlades.

Good Health.

Diet in Corpulence.

Joseph Harrass gives some interesting hints on his personal experience in treating corpulence, which may he heneficial to others suffering as he did. He was corpulent, had irregular and feeble action of heart, tendency to fainting, difficnlty of breathing, and many disagreeable sensations in the head indicative of nervous exhaustion. Hight, five ft. six inches; normal weight, 150 lbs.; age, 59; weight at heginning of treatment, 200 lbs. Began treatment Ootober 8th. Treatment as follows:

Breakfast—Vegetables, brown hread (toasted), water, with lemon juice, and ocoasionally oatmeal.

Dinner—Vegetables, brown bread, water and plain pudding.

Supper—Brown hread (toasted), stewed fruit and water.

No tea, coffee, cocoa, or milk, except skimmed, and only a trifle of butter.

Result:

End of October weighed	187	lbs.
" November weighed	182	"
" December weighed	177	"
" January weighed	174	"
" February weighed	173	"
" March weighed	170	"
" April weighed	168	"
" May weighed	166	"
" June weighed	166	"
Present weight	150	"

All the distressing symptoms have been relieved, and the patient is so well he can again carry on his business. His physical and mental atrength have heen greatly increased.

Mr. Harrass says be has suffered no serious discomfort from his diet, exoept when away from home, and he feels as if be had learned an important lesson as to how to reduce his corpulence—which has heen such a source of discomfort—and once more enjoy life.—*Herald of Health.*

Digestion of Fats.—A querist asks, in the *Dietetic Reformer*, if fats, being rather hard of digestion, cannot be dispensed with as food, and sugar and starch used in their stead. To this the *Herald of Health* replies that fats are no more difficult to digest than starch; that they contain about twice as much force-giving qnalities to the pound, and that there being a special arrangement in the digestive apparatus for preparing them for absorption, it would seem ahsurd to dispense with them altogether. So, too, the milk furnished by the mother abounds in fats and sugar, whereas there is no starch in it, and this is evidence of its use in the animal ecoaomy. The prejndice against fats is not justifiable. It works barm rather than good. It is time there was a better nnderstanding on the snhject. The vegetarians need not abstain from fat becanse they eat no animal oils. Vegetable oils ahonnd, and are even more digeatible than the former, and purer and more wholesome.

Living on One Meal a Day.

We are oftea asked the qnestion, "How many meals a day should he eaten for health?" With few exceptions, we aaswer the qnestion thus: "Two meals a day are all that are required for the maintenance of health, and more and better work can he done on two meals a day thaa with more." We have heen trying the experiment for some sixteen years, and are so well satisfied with the results that we could not he induced to return to the old plan of eating three or more meals a day. The ancient plan of eating was twice a day. In fact, among the ancient Greeks, the custom was one meal a day natil three or four centuries hsfore the present era.

When hard pressed with exhaustiag labor, we have, for several years, adopted the plan of eating hut once a day until the period of excessive taxation was over, and have invariably found benefit by so doing, heiag ahle to accomplish more work and with less inconvenience, either at the time or afterward, than when taking two meals a day. We oandidly believe that the world would have hsen much hetter off to have adhered to the original plan of eating hut once a day.

There are many arguments offered against the one-meal or the two-meal plan, hut we have never heard one presented which was not easily answered hy experiance; aad the best way to silence all objectors is to induce them to make the trial for a few months. We have never known an instance in which a person has made a faithful and intelligent trial of the two-meal system without heing pleased with the results.

The Boston *Journal of Chemistry* recently published an article from a Dr. Page, who has been trying the one-meal-a-day plan, and claims to have realized great benefits; among others, a considerable increase of flesh. We quote a portion of the article, as follows:

"S. N. S., 28 years old, resolved to adopt the one-meal system, and did so, leaving off meat and all condiments, as salt and pepper, and eating ohiefly wheat-meal bread and fruit, tho bread made from unsifted meal and mixed with water only, no salt nor bread-raising devices—unleavened bread. Within seven months his weight increased from 145 lbs. to 170 lbs., and his strength of both body and mind had increased in proportion. His labor had heen severe; he is a machinist and an inventor, working 10 hours every day, and doing a good deal of practical and profitable thinking at the same time. It is now a full ysar since he came to one meal, and the weight gained has been maintained, and his health is perfect."—*Good Health.*

The Position and Movements of the Stomach.

According to Dr. Lesbaft, the Professor of Anatomy at St. Petershurg, the statemsnts current in anatomical text-books regarding the normal position of the stomach are erroneous. He has made careful observations on the point in more than 1,200 hodies, and has arrived at the followiag conclusions: The stomach doss not, as is usually asserted, lie horizontally in the abdominal cavity, hut vertically, so that the fundus touches the diaphragm; the smaller curvature and pylorus are to the right, and the larger curvature is to the left. Its position is in the left hypochoudrium, and the situation of the pylorns is in the vertical line formed hy a continuation of the right margin of the sternum. If the stomach is enlarged, no one part can he alone displaced, hut all parts are equally moved hy tho distention. The arrangement of the muscular fihers of the stomach is such that food enteriag it is moved toward the pylorus, where it can he most thoroughly mixed with the gastric juices, and it then passss haok along the center of the cavity to the fundus, where the resistance is least. This movement of the food along the wall to the pylorns, and hack again along the center, is rendered possible by the form of the organ, and it is probahle that it is to this movement that the peculiar shape of the fundus is due. As is well known, the fundus is absent in newly-born children. Thus the shape of the stomach determines the long retention of food in the organ for the purposes of digestion, and its slow passage through the pylorus. If the transverse colon is distended with gas, it may rise to the left of the stomach, as high as the fourth intercostal space, and even as high as the fourth rih. If the coils of the small intestine are similarly distended, the lower part of the stomach may be pressed forward, and the stomaoh may assume a more oblique position. Even a large stomach, accustomed to dietetic repletion, maintains a vertical position, but the pylorus is moved a little upward and to the right.—*The Lancet.*

Influence of Ale, Beer, etc., on Mothers' Milk.—Dr. Thomas Dolan has made a careful study of mothers' milk, and the various agencies which affect it, in a lying-in hospital, and published his conclusions. He states that there can be no greater mistake than to imagine fermenting liquors are necessary to the mother who is nursing a child. The milk may bo increased in quantity, but is injured in quality—renders the child irritable; exhausts the mother prematurely, and adds only a fictitious support. He has had a very large experience, and found good results by forbiddiag its nse, and giving inatead a pint of fresh, new milk.—*Herald of Health.*

SAN FRANCISCO:

Saturday Morning, May 27, 1882

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Tell-Tale for Mining Fans; Richmann's Duplex Air Compressor; Mercury and Iron in Amalgamation; Smelting in the Spanish, 337. Passing Events; The Mine or the Superintendent; The Denver Mining Exposition; Underground Temperature, 344. Production of the Precious Metals —No. 10, 345.

ILLUSTRATIONS.—Richmann's Duplex Belt Air Compressor, 337.

MECHANICAL PROGRESS.—Steel vs. Iron for Boilers; The Father of Wood Working Machines; A Monster Machine; The value of Iron Beams, 339.

SCIENTIFIC PROGRESS.—The Propagation of Magneric Waves in Soft Iron; Ocean Meteorology; The Resemblance of Sound, Heat and Light; Accuracy in Time; Discharge of Electricity by Heated Bodies, 339.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 340.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, New Mexico, Idaho, Colorado, Oregon, Idaho, and Utah, 340-1.

USEFUL INFORMATION.—On the Drying of Oils; A New Process for Making Papier Mache; The Influence of Light and Darkness and Colored Lights on Drying Oils, 343.

GOOD HEALTH.—Diet in Corpulence; Digestion of Fats; Living on One Meal a Day; The Position and Movements of the Stomach, 343.

MISCELLANEOUS.—A New System of Ventilating Mines; Working Dry Gold Placers by Centrifugal Force; The Mines of Venezuela; Use Your Own Judgment, 338. Extracting Copper and Other Metals from Their Ores; Silent Smelters; Sex in Mineral Veins; "Old Coloma;" Silver King; The Gravel Miners; Jordan District, 342. Overcoming Summer Heat, 343.

Business Announcements.

Assessment Notice, Gould & Curry S. M. Co.
Lane's Mineral Springs, Calaveras Co., Cal.
Wire Rope—S. V. Mooney, Manager, S. F.

Passing Events.

There is very little to note concerning mining matters other than what is printed in our "Mining Summary" for the week. By reference to that it will be seen that nearly everywhere renewed exertions are being made this spring by miners in opening their mines and working them.

In prospecting, the Wood River region of Idaho and the Butte region of Montana are attracting the most attention. Men are leaving Utah, Nevada and this State for these new camps, and many are going who will before long wish themselves back again, as we see by the local papers that there is plenty of room for prospectors who have some means to keep them going, but men who want work are too plenty already. The season is fairly open in these regions now, and the hills are covered with prospectors. Before long we will no doubt hear of numerous strikes.

GOLD AND SILVER PRODUCTION.—A statistical abstract just issued by the Treasury Department contains statistics of the annual production of gold and silver in the United States from 1857 to 1881 inclusive. The figures show that the production of gold has declined from $55,000,000 in 1857, to $36,500,000 in 1881, and the production of silver has increased from nothing in 1857 to $42,000,000 in 1881. The total production of gold and silver in 1881 was $78,600,000, an increase of $3,000,000 over the year previous. The largest production recorded in any one year was in 1878, when over $96,000,000 were produced. The statistics of the production of gold and silver in California for 1881 are, gold, $19 000,00; silver, $870,000. In Nevada, gold, $2,700,000; silver, $8,860,000. Colorado, gold, $3,400,000; silver, $15,000,000. Oregon, gold, $1,000,000; silver, $80,000.

The Mine or the Superintendent.

There have been more failures in supsrintendents than in mines on this coast; there is no doubt about that whatever. In fact, when you come to think of it, a mine cannot be a failure; it is man's method of working it, or his inability to treat the ors economically, that constitutes the failure when such occurs.

We all of us can remember numbers of instances where mines have proved unprofitable under one superintendent, but which, when worked by a conscientious man who understood his business, have yielded good returns. This is no uncommon circumstance by any means. It was the man who failed, not the mine; yet such mishaps are laid to the mine every time.

In truth, many a good mine has been brought to ruin by a poor superintendent, and many a poor mine been brought to profit by a good supsrintendent. When both are thoroughly bad it is a hard case, but under such circumstances there is the stock market to fall back upon, and the mine itself need not be worked necessarily.

The ability, integrity and economy of the superintendent is as much a factor in the matter of profits as is the character of the ore. We have in mind an instance of a mine which was paying dividends at the time the supsrintendent was changed under a new management. The ore was just the same exactly, but in two months dividends stopped, and for a year the mine only just held its own, with the mill running all the time. Then there was another change for a more practical man, and in three months the mine began paying dividends again, and is doing so to-day.

If stockholders would insist that perfectly competent men only should be chosen to manage their properties, and that favorites of the principal directors should not be considered for the position, unless perfectly qualified, we would have fewer failures in every direction. Taking men out of offices and stores in cities to send them to mining camps where they must manage a lot of men, look after endless detail, judge in matters requiring technical knowledge, decide disputes, purchase supplies, and attend to the multifarious duties of a frontier mining superintendent, is only tempting ill-fortune and disaster.

This is often done under the mistaken idea that, as long as you have a lot of good miners, the mine will run all right. The superintendent is sent to look after the business or stock interests of the principal shareholders rather than to manage the mine, as a mine. Of course, all this is understood by those who have had experience in the business; but new men are constantly coming to the front, not many of whom commit new blunders, for there are few to invent, but nearly all make the old mistakes, of which the lack of care in choice of superintendents is the commonest and widest spread in its results.

POSTMASTER GENERAL HOWE in his letter to Congress recommending the abolition of postage upon newspapers and magazines says: "It may well be doubted if the whole people get as much information of public affairs from volumes gratuitously thrown at them by the Government, as they do from the newspapers and magazines which they purchase and pay for." The Postmaster-General recites other considerations which lead him to the conclusion that Congress may at the present time safely abrogate all discrimination between subscribers to newspapers and magazines, and send the same through the mails without charge, whether such subscribers live within the county of publication or out of it.

IT is expected that the furnace of the Clipper Gap Iron Co. will start up by the 1st of June, by which time enough charcoal will be on hand to insure a long run. To supply the necessary amount of charcoal, 30,000 cords of wood have to be cut, which is being done by a force of 125 woodchoppers, and the wood they cut is on land owned by the company in Placer and Nevada counties. This land lies on both sides of Bear river, chiefly on the Nevada county side, and comprises 8,000 or 10,000 acres. About 15,000 cords of wood have already been cut, and much of it hauled to the kilns.

THE agreement entered into by the manufacturers of cotton goods, cotton and jeans, and other low-grade textile fabrics, looking to a reduction of the quality produced in Philadelphia and vicinity, has gone into effect, and many mills shut down. The movement is to curtail the production of lower grades 50% and manufacture the finest class of materials of 22,000 looms. In Philadelphia nearly 10,000, or the greater number of those engaged in making the goods mentioned, have entered into a compact, and a large number outside of Philadelphia, have agreed to join the movement.

PREPARATIONS for the commencement of work on the seventy-mile gap of the Northern California and Oregon railroad are being completed, and the work will be begun immediately. The contract for the mason work on bridges and culverts was let to James Scoble, on Wednesday last. The work to be accomplished will take about two and a half years time to finish. The railroad is one of the branches of the Central Pacific railroad.

The Denver Mining Exposition.

We have before mentioned the mining and industrial exhibition which is to come off at Denver, Colorado, opening on August 1st, and closing September 30, 1882. A very large building is now being erected. Bonds to the amount of $200,000 will be issued, bearing 8%, and from the proceeds a fund will be available to defray all preliminary expenses.

The principal cause which gave birth to the idea of holding a "National Mining and Industrial exposition" in the great West was, according to the circular, the prevailing ignorance everywhere concerning the wonderful natural resources of that portion of this nation lying west of the 100th meridian.

It was felt that the necessity existed for removing the many erroneous impressions prevalent, and showing in the most convincing manner that this part of the United States, instead of being in one portion a barren desert, and in another a mass of snow-clad mountains, really contains a soil encouraging to the agriculturist, and a marvelous diversity of native minerals, only awaiting the introduction of manufacturing facilities to find an active market.

In mining, inventors will be stimulated by the demand for new processes that will make low-grade ores more profitable; in manufactures, capitalists and skilled labor will find every inducement for the establishment of new industries. The remoteness from Eastern sources of supply acts as a protective tariff to the producer here, where crude material exists in profusion, and is comparatively neglected.

To bring capital face to face with these opportunities for investment, and with skilled labor, to more rapidly develop the country, is an aim and purpose of the exposition, and the display now in preparation is designed especially to hasten the establishment of extensive and flourishing industrial communities.

Copper Rammers in Mines.

The English mining act, while it forbids the use of iron and steel rammers in blasting in coal mines, says nothing about copper ones. Recently a miner at Wigan, while ramming a shot, started an explosion which killed him and injured his companions. From the evidence it appeared the deceased was using a copper rammer, having discarded a wooden one owing to the hardness of the rock and the drill hole being smaller. Mr. Hall, inspector of mines for the district, stated that the law did not forbid the use of a copper rammer, the act only prohibiting iron and steel rammers. Mr. Ralph Betley, public analyst, Wigan, said the rammer used by the deceased contained 89.5% of copper, 8.2% of zinc, and 2.3% of antimony. The metal itself was somewhat harder than copper, but there was very little in its constitution which would lead to the belief that it would give results in working very much different from those given by a pure copper rammer. He had tested the rammer at a rapidly-revolving grindstone, and there was no difficulty in procuring sparks. A piece of copper rod held against the same grindstone produced sparks with almost, if not quite, as little difficulty. It would appear from these experiments that it was readily possible to produce sparks by the friction of particles of sandstone against the rammer, as also against a copper bar, and that it was therefore probable that sparks might be produced by the friction of the rammer against similar material in the shot hole. In reply to Mr. Hall, witness said the rammer used was not anything approaching an iron or steel rammer. In his summing up, the coroner said doubtless Mr. Hall would make a report to the Home Secretary on the matter, and the question would probably be raised whether copper rammers should be allowed to be used in stemming. The law enacted that neither steel nor iron prickers should be employed, but nothing was said with regard to copper. The general impression in the past was that copper would not give off sparks, but now that impression has proved a fallacy.

PLUMBAGO.—Six million pounds of plumbago are annually imported into the United States, and it is estimated that the home production in New York, Pennsylvania, Canada and elsewhere equals this amount. This valuable material is used principally in the manufacture of lead-pencils, stove polish and crucibles. Its market price varies, according to quality, from $25 to $75 per ton. There are great quantities of this mineral in this State, but no one pays any attention to it. On the Opir grade, between this city and Washoe valley, there is a large deposit that can be had by anyone who cares to locate and explore it. All that has ever been done with it was some surface shoveling in the early days by parties who tried to make fire-proof brick out of it by mixing with it a certain proportion of clay, and then burning.—*Enterprise.*

So many miners are leaving Utah for Wood River, that the *Tribune* thinks it looks as though there would be a scarcity there when the districts all open up this summer.

GOLD was discovered in Trinity county as early as 1849; mining has been successfully prosecuted as the leading industry ever since, and yet the county is not half prospected.

Underground Temperature.

The subject of temperatures in mines is one of very great economical importance. When we remember that in very deep mines the lower levels and drifts get so hot that the men cannot do half as much work as they can a few hundred ft. above, it will be seen how great a factor the temperature is in a question of profit. We gave, a few weeks ago, a table showing the relative increase of temperature with depth in the Forman shaft on the Comstock. The showing there made was that the increase was gradual but sure. Of course, the temperature in drifts and levels and in all underground workings depends, to a great extent, on the facilities of ventilation and the means employed for obtaining a good supply of air. The normal temperature of the works at certain depths is the important feature, and it was this that the record we published of the Forman shaft gave.

This subject has been considered worthy of careful investigation by the British Association, and a committee consisting of the following eminent men has had the subject in hand: Prof. Evarett, Prof. Sir Wm. Thomson, Mr. G. J. Symons, Prof. Ramsay, Prof. Geikie, Mr. J. Glaisher, Mr. Pengelly, Prof. Edward Hull, Dr. Clement Le Neve Foster, Prof. A. S. Herschel, Prof. G. A. Lebour, Mr. A. B. Wynne, Mr. Galloway, Mr. Joseph Dickinson, Mr. G. F. Deacon, Mr. E. Wethered and Mr. A. Strahan.

The 14th report of this committee contains some facts of interest in giving the observations of Mr. E. Garside, M. E., on East Manchester coal field: In Ashton Moss colliery the temperature was observed on June 27th at the depth of 930 yards, and found to be 85.3°, the thermometer being inserted in a hole two inches in diameter and three and one-half ft. deep, drilled for the purpose in hard blue shale which lies below the Great mine coal seam, being newly-opened ground, dry and free from cracks. The hole was allowed to stand 10 or 15 minutes that the heat of drilling might partially escape, and one of the committee's slow action thermometers was then inserted with proper plugging, and left in for six hours. It was not considered advisable to leave it longer as, "owing to the great crush and unsettled state of the ground," there might have been difficulty in extracting it. Up to the time at which the thermometer was withdrawn no disturbance of the solidity of the ground had occurred. The tunnel, and especially this part of it, was free from the action of any strong air-current. Assuming 49° as the surface temperature, we have here an increase of 36.3° in 2,790 ft., which is at the rate of 1° in 76.9 ft. Earlier observations were taken at the depths of 871 yards and 897 yards, by the colliery engineer; but Mr. Garside reports that the thermometer with which they were taken was an ordinary cheap one with wood scale, and that on examination the tube was found to be a little loose in the scale. It seems best, therefore, to neglect them as unreliable. In reference to an apprehension which was expressed, that the heat of drilling had not had sufficient time to escape, Mr. Garside writes that he has, on several occasions, made a second observation in the same hole in places where he knew that the strata would stand and not crack, and he has always found the temperature unchanged; but that it is impossible to repeat the observation at such great depths as that of Ashton Moss, as in a few hours the holes became crooked. Mr. Garside's next observation was at Bredbury colliery (in the county of Cheshire), and at the depth of 340 yards. A hole was drilled, as before, in dry warren earth (an argillaceous rock) free from cracks or water, in New Mine south level; and the temperature, observed as before, was 62°. Assuming (as above) 49° as the surface temperature, we have here an increase of 13° in 1,020 ft., which is at the rate of 1° in 78.5 ft. The distance from Ashton Moss colliery is three or four miles, and the two shafts are sunk through the same coal measures, one being near the outcrop, and the other more on the deep. Making no assumption as to the surface temperature, but comparing the two observations with each other, we have an increase of 23.3° in 1,770 ft., which is at the rate of 1° in 76.0 ft. The consistency of these results is eminently satisfactory. On a subsequent date, Mr. Garside took the temperature at Nook pit, belonging to the Broadoak Colliery company, at the depth of 350 yards, in the floor of the Royley mine. It is in newly-opened ground, free from cracks or other visible irregularities, at the far end of the newly-opened north level. The depth of the hole, which was in hard warren earth, and the other conditions of observation, were the same as before, and the temperature observed was 62½° Fahr. Taking the surface temperature as 49°, this gives an increase of 13½ in 1,050 ft., or of 1° for 79 ft. All these stations, as well as Dukinfield, where Mr. Garside last year obtained results in good agreement with those now presented, are within a few miles of each other and close to the river Tame, which is here the boundary between Lancashire and Cheshire. Mr. Garside calls attention to the great quantity of water which is found in some parts of the rock overlying the coal measures in this district, a source which is largely drawn upon for water supply, and suggests, with much show of reason, that its presence may account for the slowness of the rate of increase shown by all these observations.

Silver Contained in Placer Gold.

No account is taken by the miners of the silver alloyed with placer gold, unless in the exceptional cases where the value of the former is allowed for in the sale of the product, as in direct sales to the mints or United States assay offices. In the aggregate this silver forms a considerable item, which should be included in the total product, but which has usually been disregarded by statisticians.

The schedules of the experts contain data for a close estimate as to the average tenor of the placer product. A statement of the fineness in gold of samples from various localities is appended:

From the same aources the following condensed abstract has been prepared, showing the average fineness in gold and silver of the placer yield of several States and Territories, with the number of specimen examples from which these averages are derived. The amount of base metal contained in the crude bullion varies from nothing to 0.020.

Average Tenor of Placer Gold.

State or Territory.	Examples. Number of	Average fineness. Gold.	Silver.
California	80	0.8831	0.1124
Colorado	3	0.8205	0.1755
Dakota	7	0.9235	0.0725
Georgia	10	0.9228	0.0732
Idaho	413	0.7806	0.2134
Montana	14	0.8851	0.1009
Oregon	77	0 8727	0.1233
Total	600		

From 80 examples of California placer dust and bullion an average fineness of .8836 is derived, a proportion slightly in excess of that stated in Dana's "Mineralogy," where the fineness is quoted at .875 to .885, or an average of .880. It is possible that the census average is a trifle too high, owing to the natural tendency of producers to overestimate the fineness of their gold; but the slight difference between it and the figures given by Dana would not materially affect the general result.

The average for Idaho is 413 lots of placer gold from Boise basin, a district producing three-fourths of the total for the Territory. This gold is of less fineness than that obtained in several other localities in Idaho, but the average stated will hold as a close approximation for the total.

There are three methods of obtaining from these data an average for the United States—neither of which is quite free from defects.

If the sum of the figures representing the average gold fineness for the several States and Territories be divided by seven, the number of the States and Territories from which reliable data as to fineness are obtainable, the quotient is .871257, which may be described as an average of geographical distribution. This, however, does not represent the average fineness of the whole actual amount produced, for by this method each State and Territory is taken as an equal member in the calculation, without regard to the large difference in their several products. Thus, Georgia, with a product of $66,863, has as much weight in influencing the general average as California with a placer yield of $8,580,989, or 128 times as large.

Another mode is to give each individual example equal weight, disregarding territorial limits. Dividing the sum of fineness in gold of 610 specimen examples, 495,887, by 610, an average of .8129 is obtained. This gives a true average for the number of cases in which the fineness is definitely given in the schedules, but represents neither the average according to geographical distribution nor that of the whole product. In this way California, with a placer product nine and three-fourths times greater than that of Idaho, is largely overweighted by the latter, owing to the preponderance of examples furnished by Idaho in the census returns. The result is evidently too low.

The third and preferable method is to multiply the average fineness for each State and Territory by the coefficient of the several yields, and then divide the sum of the products so obtained by the sum of the coefficients. This gives each not an equal but a just weight. The result is the average fineness of the total product without reference to the producing source. This principle is thus applied:

State or Territory.	Average fineness in gold.		Yield of placer gold in millions of dollars		Resultants.
California	0.8836	×	8 681	=	7 5821716
Colorado	0.8205	×	0.102	=	0.0838910
Dakota	0.9235	×	0 051	=	0 0470985
Georgia	0.9228	×	0.007	=	0 0018276
Idaho	0.7806	×	0.880	=	0 6869280
Montana	0.8851	×	1 103	=	1.0410013
Oregon	0.8727	×	0 926	=	0 8081202
			11 770	=	10 3108382

$$\text{Total average gold fineness} = \frac{10\ 3108382}{11.770} = 0.87602$$

The proportionate contents in silver and in base metal are similarly ascertained. By using the figures representing the average tenor of the placer gold for each of the States and Territories for which reliable data are obtainable, and assuming the general average deduced from them for the cases in which the returns are defective, the probable total silver contents may readily be calculated. It is found that the 580,766.6 ounces of fine gold were associated with 80,177.3 ounces of fine silver and 2,753.2 ounces of base metal, making the total weight of the ornde placer gold 663,697.1 ounces. In mint value the silver contents were worth only $103,661 as against $12,005,524 for the gold. Thus while the ratio of silver to gold products was 1 : 7.2437 in weight, it was only 1 : 115.8153 in assay value. At the market rates the value of this placer silver, if any account were taken of it, would be considerably less, or a ratio of about 1 : 131. The loss to the miners in the price paid for the actual gold contents of the placer dust, when sold in small quantities to local dealers, is so much greater than the whole value of the silver contents, that the latter does not appear to them a matter of any consequence. The amount of silver alloyed with the placer gold of the several States and Territories is shown in the accompanying table:

Contents and Mint Value of Crude Placer Gold.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetsfeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x30. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

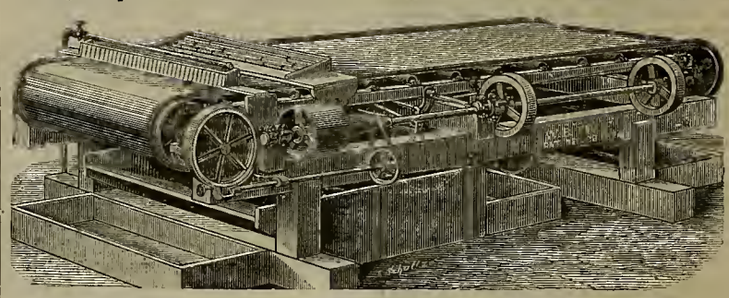
PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

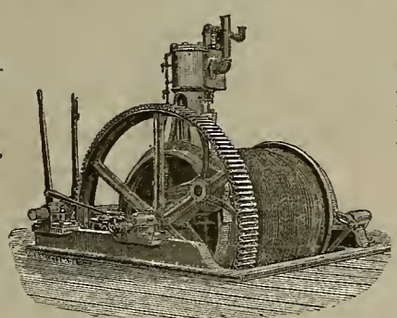
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

Colorado Iron Works,

MANUFACTURERS OF ALL KINDS OF Mill and Mining Machinery. Engines, Boilers, Cornish Pumps, Hoisters, Crushers, Rolls, Stamp Mills, Smelters, Furnaces, Ore Cars, Kibbles, Etc. Also, Saw Mills, Heavy Forgings, Bridge and other Bolts.



Machine Bolts and Lag Screws, at List Prices, with Freight added, less current discount.

THE OLDEST AND LARGEST MANUFACTORY OF MACHINERY IN THE **WEST.**

For Circulars and Prices, Address

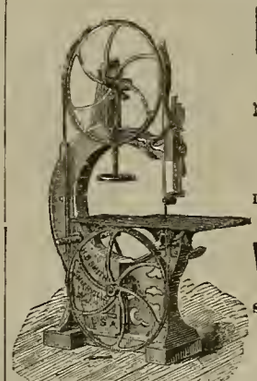
COLORADO IRON WORKS,

Denver, Colorado.

Works, 33d and Wynkoop Sts. P. O. Box 1921.

Berry & Place Machine Co.,

PARKE & LACY, Proprietors.



No. 323 & 325 Market St., San Francisco, CAL.

Importers and Dealers in every Variety of

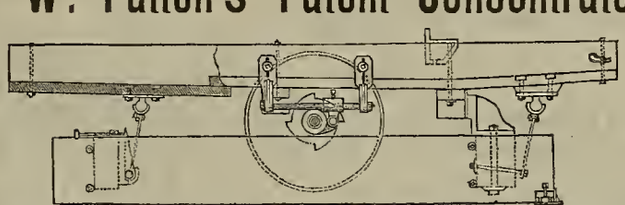
Wood and Iron Working Machinery,

STEAM PUMPS,

Stationary, Portable and Hoisting Engines and Boilers Sawmills, Shingle Mills, Emery Wheels and Grinders, Gardner Governors, Planer Knives, Sand Paper in Rolls, together with a general line of Mining and Mill Supplies, including Leather Belting, Rubber Belting Packing and Hose.

☞ Catalogues furnished on Application. ☜

C. W. Patten's Patent Concentrator.



The machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

Manufactured by

F. A. HUNTINGTON,

220 Fremont Street, SAN FRANCISCO, CAL.

Where a machine can be seen in operation. Also, manufacturer of all descriptions of Quartz Mill Machinery. Send for Circulars.

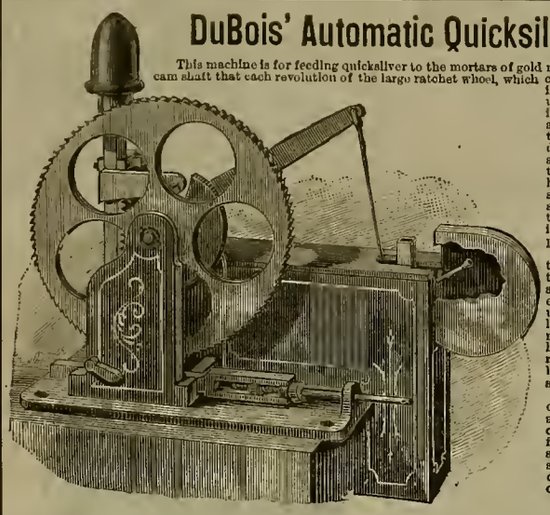
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.



This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, similarly to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.

For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

257,975—GOVERNOR FOR PUMPING ENGINES—Geo. C. Phillips, Silver City, Nevada.
257,976—DIRECT ACTING ENGINE—George C. Phillips, Silver City, Nevada.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

The Lane Mineral Springs.

The Lane Mineral Springs, owned and managed by Mr. James Hutchins, are located in the northeast corner of Calaveras county, six miles northwesterly from Knight's Ferry, Stanislaus county, the present post office address. The springs can be reached by Lane's Springs stage, starting from Commercial hotel, Stockton, on Tuesday and Saturday mornings. Mr. Hutchins meets passengers with his own conveyance at Knight's Ferry, during the season, on Tuesdays, Thursdays and Saturdays. Guests can arrive any day (except Sundays) from Milton, the terminus of the Stockton and Copperopolis railroad, by biring a private conveyance, some 13 miles to the springs. Copperopolis, famous in early copper mining days, is situated within seven miles north of the springs. Telegraph City is four miles, the once famous Napoleon copper mine, 2½ miles distant. They were discovered by Major Thos. Lane over 20 years ago, and have been visited as a place of resort ever since. Their altitude is 1,000 ft. The climate being favorable, guests are accommodated during all seasons of the year. They are heat known hy the people of Calaveras and adjoining counties, with whom they are in high favor by those who have tested their qualities and observed their remarkable and salntary effects. The water is cool and refreshing, and to most tastes quite palatable. From the reputation it hears, the water may be rated as second to none in its beneficial and curative qualities for pnlmonary complaints. It is also considered superior in cases of catarrh, rhenmatism, asthma, paralysis, and dyspepsia, liver, kidney and nervous diseases.

The climate is markedly dry during comparatively a large portion of the season, without being excessively warm. This arises, perhaps, from the fact that it is situated, as it were, on a point of rolling foothills, hounded on different sides by the vast plains of the San Joaquin valley. Fogs are infrequent visitors, and only in the wet season. The sea air, sweeping across the broad valley, seems to be favorably acted upon by the golden rays of a California sun, nntil it possesses rare desiccating and health-restoring qualities. Upon reaching the hase of the Sierras, it evidently heoomes tempered witb mountain atmosphere sufficient to make it more agreeable and consequently kindly in effect upon the human system.

Gnests can comfortably visit these springs considerably earlier and later in the season than most other resorts in the central and northern portions of the State.

THE PACIFIC WATER JACKET SMELTERS.—The vast mineral deposits of smelting ore now being developed in all parts of Arizona have created a large demand for the most approved means of redncticn. The water-jacket smelters, for both galena and copper ores, made by the Pacific Iron Works, Rankin, Brayton & Co., of San Francisco, seem to have met all requirements in this way, and have so far been nniversally successfnl in working every class of ores found in this Territory. All our most enterprising companies are using them in preference to any other make, and, so far as we can learn, with the most satisfactory results. We recall nó instances in which anything like a failure has been made with these smelters, while many others have wrecked the fortnnes of those who bave put their trnst in them. Theas smelters nnquestionably embrace the most perfect mechanical appliances now known for the treatment of all classes of smelting ores, and their general adoption has greatly stimulated mining development, and contributed mnch to tbe material advancement of this interest in all the mining States and Territories.—*Arizona Citizen.*

GUITEAU has been finally denicd a new trial. He is not despondent, however.

Back Numbere Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1869; number, 5. Press, Box 2361, S. F.

Promptness Dieplayed, Etc.

MESSRS. DEWEY & Co., Patent Agents:—The Canadian patent obtained through you is at hand. This makes three patents received within a month. The ability, energy and promptness displayed by your firm must certainly be gratifying to your numerous patrons—as it assuredly is to

Yours respectfully,
THORPE & BELLOLL.

Attend to Thie.

Our subscribers will find the dste they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Laurel Glen Fruit Farm

This place is beautifully located among the hills. A pleasant drive from railroad and beach. Deer snd other game sbound in the vicinity. A limited number of boarders can be accommodated for the summer and hunting season. The place is especially desirable for ladies with children. Address, for further information, Isaac Dakin, Soquel, Santa Cruz county.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and gather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central systemin San Francisco.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If ic comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first-class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Lane's Mineral Springs,

CALAVERAS COUNTY, CAL

Pine and Hemlock Chemicel-Vapor and Electro-Thermel Baths.

Connected with these Springs are Hot and Cold Baths. The Water of these Springs is Cold, Clear and Palatable, having been used 20 years for Medical purposes.

These Fountains of Health are located 35 miles east of Stockton, in the foothills of the Sierras; at an altitude of 3,000 feet above the level of the sea. Always ready, Winter and Summer, for the reception of patients, on account of the even temperature of this most genial climate.

The accomodations consist of a Hotel, Cottages, Camp Grounds and Stables.

Stage leaves Commercial Hotel, Stockton, at 7 A. M., Tuesdays and Saturdays.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the Strongest Powder ever placed on the Market, in this country or abroad. It is the Safest Strong Powder ever made. For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is Stronger than the Highest Grades of Hercules or Giant. It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for Rank Blasting, Log Splitting or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is Superior to Judson Powder, in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

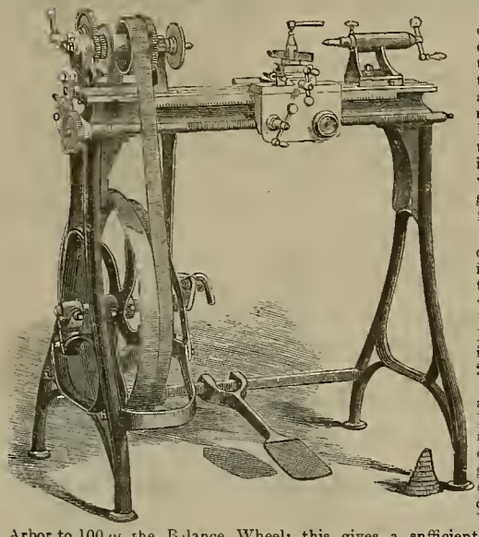
WOOD WORKING MACHINERY, MANUFACTURED BY THE H. B. SMITH MACHINE COMPANY,

And HAZARD STEEL Ropes and Cables.

SCREW CUTTING LATHE.



This cut represents a new screw cutting Foot Lathe which was put on the market about two years ago to meet the demand for a first-class tool at a low price, which will do a great variety of work, both in metal and wood, and is the best Lathe made, considering its capacity and price. The cut gives a good idea of its appearance, and below we give dimensions of parts and general description.

Description of Lathe, 4 ft. Bed.

The Lathe occupies a floor space of 28 by 48 inches, the centers being 44 inches high from the floor; the bed is 48 inches long, 6½ inches wide, 5½ inches deep, with double Vs. for Carriage and Tail Stock. It swings 10 inches over bed and 6 inches over carriage, and will turn 26 inches long.

The Head Stock is back geared, and the Cone has three speeds for 1¾ inch belt, the smaller being 3 inches diameter, the larger 6 inches diameter; this, with the back gears gives six different speeds, the fastest giving about 1,000 revolutions of the Arbor to 100 of the Balance Wheel; and the slowest, 75 of the Arbor to 100 of the Balance Wheel; this gives a sufficient range for all kinds of work.

The Arbor in Head Stock has a ⅝ inch hole through it, which is very convenient for turning the ends of long rods, making small screws, studs, &c. The Centres are ½ inch diameter. There is an attachment in Head Stock for reversing the motion of Carriage.

The carriage has a rack and pinion for moving it by hand, and a split nut moved by a cam on the face of Carriage to throw it in gear with screw; the reversing motion is in Head Stock.

The Tool Post has a slot for tools ⅜x1⅛ inches; the tool is adjusted by a wedge made on the arc of a circle and fitted to a convex washer. The leading screw runs the whole length of Lathe, and has 10 threads to the inch. A set of gears go with the lathe which will cut all common threads and a great variety of other sizes by compounding them; there is a screw stop on the Carriage for screw cutting, &c.

The Tail Stock can be set over for turning tapers, &c. The spindle of Tail Stock is 1 1-16 inches diameter, and has a motion of 3 inches. The center is fitted to a taper hole, which is the method adopted by all the best makers, and is the same size as the one in Head Stock, so that chucks and other tools fitted to one can be used in the other.

The Foot Motion, we consider the best made, the crank is adjustable and the shaft has swivel bearings; the balance wheel is 22 inches diameter and has 3 speeds to match Cone on Head Stock.

Send for Circular on Lathes.

VOLUME XLIV Number 22

Consolidated Claims.

By the act of July 9th, 1870, it was declared that no location of a placer claim should exceed 160 acres, whatever might be the number of locators associated together, or whatever the local regulations of the district.

In November of the same year the Commissioner of the General Land Office rendered a decision, that where several placer claims had been surveyed for an individual or company holding the possessory right thereto under the local laws, there was nothing to prevent the patenting of the several tracts or parcels of mineral lands thus surveyed as a single entry. This was not intended to be understood as authorizing the joint entry of parcels or claims situated at wide distances from each other in different land or mining districts, but simply to enable individuals or companies holding several placer claims in the same neighborhood, though not contiguous, to effect their entries and have their rights adjudicated with as little expense as possible. It was also decided at the same time, with regard to the matter of newspaper publication in such cases, that one notice might include a description of all the tracts or parcels desired to be entered by an individual or company holding the same. It was only required that the notice should give a sufficiently accurate description of each tract applied for as would enable other parties in the neighborhood to tell readily what mineral grounds were sought to be patented.

It was also decided, in 1875, by the Commissioner of the Land Office, that an unincorporated association of citizens owning separate and distinct interests in a placer mine might unite their means, and expend the $500 required by the mining laws at one point, and thereafter secure patent from the United States.

These decisions or rulings have always been considered as good law until recently. Having been held, as stated, that different interests could be consolidated in applying for patent, it has been held, too, that different locations consolidated in one claim under one ownership or interest, that claim could be patented in one piece without proving up, or all the different locations incorporated in the one claim.

The important mining decision rendered by Justice Miller, in the Circuit Court for Colorado, was recently referred to as having reached the point of final review by the United States Supreme Court, is to the effect that no mineral land patent can be legally issued for more than 160 acres, and that if a number of original locations have been consolidated into one claim, each of the locations must be treated as a distinct claim and advertised and proved up, with proof and separate work upon it. This decision, if sustained by the Supreme Court, would, it is said, destroy two-thirds of the patents heretofore issued for mining claims, and make the securing patents for most of the old claims impossible, because of the impracticability of making proof of old locations, and because, in most instances, separate work has not been done on the old locations which have been consolidated into larger claims. Thus a shaft sunk into a consolidated claim has been held for work done in every part of it, but the Circuit Court judgment overthrows that principle. The appealed case has been twice argued in the Supreme Court, and its forthcoming decision is awaited with great interest.

A GOOD OUTLOOK.—The mining districts in the vicinity of this city, Silver Glance, Mountain House and Sweetwater, are showing some excellent properties, which are sure, before the close of the year, to attract the attention of capitalists. Many of the mines in those districts are now being uncovered by their owners, and at a depth of only a few feet show astounding richness.

MR. WM. P. PENRY, editor and publisher of the Amador *Dispatch*, called on us on Monday. He represents mining prospects as being good in various parts of the *Dispatch's* local jurisdiction.

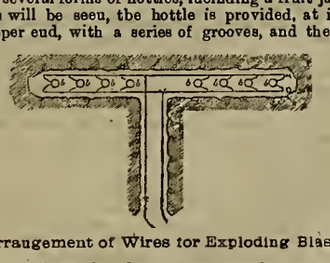
Cushion Protector for Bottles.

An ordinary bottle protector is a rubber band or cord resting in a groove encircling the bottle. In this class of protectors, like bottles have been made with the groove for containing the rubber cushion in the same relative position. By this construction, when the bottles are packed, the packing rings of contiguous bottles abut against each other, and the two bottles would be separated by the projecting portions of two packing rings, thus occupying much more space than is necessary.

Mr. James M. Thorpe, of San Jose, has recently patented, through the MINING AND SCIENTIFIC PRESS patent agency, a cushion protector for bottles, which overcomes the objections heretofore held against this class of articles. It consists in a bottle provided with a series of grooves or holding devices near its upper end, and of adjustable packing rings, which admits of the packing rings being readily placed on contiguous bottles, at varying elevations, so that they will not abut against each other.

THORPE'S CUSHION PROTECTOR FOR BOTTLES.

The engravings show the invention as applied to several forms of bottles, including a fruit jar. As will be seen, the bottle is provided, at its upper end, with a series of grooves, and there



Arrangement of Wires for Exploding Blast.

is a similar series of grooves at the lower end. A cylindrical rubber ring is passed over the bottle and sprung into one of the upper grooves, and a like rubber or other elastic ring placed in one of the lower grooves. The series of grooves admits of the elastic rings being readily changed on contiguous bottles at different elevations, and this prevents them from abutting against each other, and much economy of space in packing is the result.

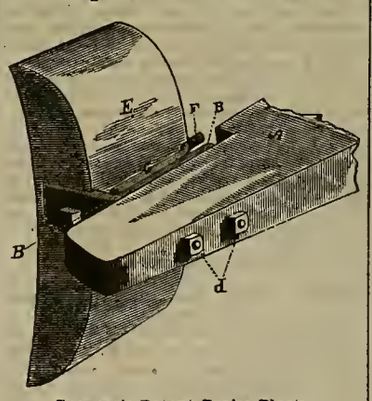
This method of protecting bottles requires no experience or skill. The bottles are, of course, packed in very much less space than in the old-fashioned way. This system is much cleaner, as it does away with the usual litter and confusion always attending the packing or unpacking in the old method, which for packing establishments is quite an advantage, lessening the risk they run in fires, thereby being quite a gain from an insurance point of view.

This cushion protector in no way interferes with or hides the labels, and the same device is ready for use over and over again. In shelving or storing in bulk there is no danger of breakage from careless handling; and in case of breakage of bottles from fermentation of contents the moisture is not absorbed and retained as in the case where straw protectors are used. Importers and exporters and dealers in wines, liquors, bitters, ales, porter, patent medicines, liniments, chemicals, fruits, candies, etc., will readily see the advantages this new system has over the old method in vogue. Joseph A. Belloli owns an interest in the patent with Mr. Thorpe, and parties desirous of further information, or of purchasing State rights, can address Thorpe & Belloli, San Jose, Santa Clara county, California.

Bank Blasting.

The following method of bank blasting has been found to give excellent results with banks from 50 to 125 ft. high, such as are generally encountered in hydraulic mining, and likewise in cement gravel of ordinary tenacity.

The main drift should be run in a distance two-thirds the hight of the bank to be blasted. The cross-drifts from the end of the main drift should be driven parallel with the face of the bank, and their lengths determined by the extent of the ground which is to be blasted. A single T is all that is necessary. The amount of powder required for charging the drift is from one-half to two-thirds of a keg of powder, minimum quantity, per 1,000 cubic ft. of ground covered by the drifts—*i. e.*, hight of bank × length of cross-drifts × length of main drift = cubic contents. The quantity of powder used must depend on and vary with the position of the bank and character of the gravel.



Spencer's Patent Brake-Block.

In charging these drifts the amount of powder used should be sufficient to blow out the bottom ground (the line of least resistance), the bank then falling by its own weight. The firing of all blasts is best done by electricity, and where the dynamite exploders with platinum wires are used, the compound circuit is most desirable.

The powder in boxes or kegs is piled up in rows in the drift. Two wires extend along the middle row, the tops of the boxes on which the wires rest being removed. The exploders, *b b b*, are inserted in powder cartridges and placed on top of the paper covering the powder. The wires are then connected with the wires which extend to the battery.

New Brake-Block.

The accompanying engraving represents an improvement on brake-blocks recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, by Edward G. Spencer, of Iowa Hill, Placer county. The patent covers an improved method of fastening the block to the brake-beam, whereby it it held securely, and may be readily removed when necessary.

A represents an end of an ordinary brake-beam used upon vehicles. Its inner edge is preferably notched out as shown, and against it lies a clamp or jaw, *B*, having its end turned at right angles. Upon the clamp, *B*, is another clamp, *C*, having its opposite end turned. The inner clamp, *B*, is provided with elongated slots, and the outer clamp has holes in it. Bolts pass from the inside through holes and slots in both clamps and through the beam, *A*, as shown, being secured by nuts on their ends.

The heads of the bolts are flattened and counter sunk, in order to preserve a flat surface upon the clamp, *C*. This arrangement allows the clamp, *B*, to slide within limits while holding the clamp, *C*, rigidly.

E represents the brake-block. Its head is provided with a transverse groove, and its sides are notched out to allow the clamps to fit therein. The block is fitted between the clamps, its back lying closely against the clamp, *C*. A bolt, *F*, is passed loosely through the outwardly turned end of the clamp, *C*, through the groove in the block and through the turned end of the clamp, *C*, on which screw-threads are provided for the screw end of the bolt.

The fastening of the brake-block is accomplished as follows: The bolts through the beam are first loosened, and the adjustable or sliding clamp, *B*, draws out, to allow space enough between the ends of the clamps to insert the brake-block. This is fitted between the clamps, their ends lying in the notched sides of the block.

The bolt, *F*, is then screwed up, forcing the sliding clamp inward until both clamps hold the block as tightly as desirable. The nuts on the bolts through the beam are then screwed up and the bolts tightened to hold the clamps in place.

When the brake-block requires to be removed, it is easily accomplished by loosening the bolts through the beam and unscrewing the bolt, *F*, when it can be knocked out. The notched sides of the block, held tight by the clamps, prevent it from working out.

Roasting Ores in Mexico.

In Mexico only the richer varieties of silver ores are smelted, the greater proportion, of course, being worked by the patio process, while in some few of the mining districts, barrel amalgamation is extensively resorted to. The ores which are to be smelted are, in some places, roasted in heaps, which is done by surrounding the mineral, broken into large lumps, with a layer of charcoal, retained in its place by an open wall of rough stone built in a circular form. The openings in this wall admit of the passage of the necessary amount of air, and the operation is completed in the course of 24 hours, with an expenditure of charcoal amounting to one-half the weight of ores operated on.

At Nieves the ores are roasted in circular kilns four feet six inches in diameter, and of about the same hight. These are formed of a bottom wall of adobe or sun-dried bricks, and are without a roof, the walls being so constructed that the area of the openings is nearly equal to that of the brickwork between them. Into each of these kilns are charged 2,000 lbs. of roughly broken ore intermixed with one-half its weight of dry wood. The operation requires a week for its completion, but this method of roasting can only be employed during the dry season.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Another Raid on the Congressional Mining Act.

A Voice from the Churchyard.

EDITORS PRESS:—Some 27 months ago a determined effort was made to legislate mining prospectors out of existence. Clarence King, who was then Director of the Government Geological Survey, was the main agent in that attempt, and having the Public Land Commission at his back, it looked at one time as if he might carry his point. But the conductors of the MINING AND SCIENTIFIC PRESS and its correspondents made such a vigorous resistance to the objectionable measure, and so many petitions against it were forwarded to Congressmen, that it was speedily abandoned.

Since then, peace and mining progress have been the order of the day. A much smaller man than Clarence King is now in the field to renew the fight which ended then, and openly declares, over his signature, that one of the results of his scheme will be a complete reversal of the prospectors' occupation.

In the *Engineering and Mining Journal* of May 13th, there appears a letter from Mr. John A. Church, Superintendent of the Tombstone Mill and Mining Co., headed, "Improvement in the Mining Law." It is accompanied by another letter on the same subject, from Elbert C. Van Blarcom, also dated at Tombstone. The two gentlemen staggering forward under such ponderous names are probably bold enough to think they are about to secure an easy victory. Mr. Van Blarcom, it may be, is only a sort of advance agent for his coadjutor. Perhaps Mr. Church requires his presence in the same way that a small boy having to go through a sighing pine grove at night likes to have a playmate, long to scare ghosts away by whistling.

That Mr. Church means business and has been looking up agents to help him, will be seen from the following editorial remarks, quoted from the *Engineering and Mining Journal* of last week:

"We print elsewhere two letters which deserve close study, because they take up a subject which must, at an early date, engage the full and earnest attention of the entire mining community. With a view to getting a full presentation of this subject in all its bearings, we invite our readers to discuss the points brought up. Mr. Van Blarcom's suggestions, we understand, have been submitted to men who have much weight in the councils of those who influence such legislation, and we believe have met with favorable consideration in some quarters. Prof. Church's remarks are the first of what we trust will be a series of communications on the subject. We shall spare no efforts to bring them to the notice of those who we believe have no other means of hearing the voice of many who have been instrumental in developing our mining industries. We purpose, should the interest in the matter warrant it, to gather these letters in pamphlet form, for greater convenience of distribution by those who have contributed to the series."

That the editorials and letters printed in the *Journal* will be all one-sided is to be inferred from the fact that two years ago its editors put every letter which opposed the Public Land Commission mining bill into the waste basket.

The points which Mr. Van Blarcom desires to see incorporated in a new Congressional mining law are the following: 1. Each mining district to have a Government mineral agent—if possible a mining engineer, but of necessity a surveyor. 2. This agent to go on the ground when a location is made, and decide on its validity, put up monuments, make a survey and charge the discoverer $15 as a fee; perhaps to take the claim as his own if the fee is not paid. 3. The mineral agent to certify as to assessment work done, and allure $7.50 from the prospector's pocket into his own. 4. Mr. Van Blarcom is willing to give the prospector five years, within which he must patent his ground; but "Professor-Doctor" Church is more drastic, and, crying out against the present law, declares that one year is a better probationary limit than five years. 5. No person is to be permitted to relocate his own claim, and the records of the mineral agent (whether he be honest or not) are to determine the point, if a given lode—not previously captured by himself for a song—is subject to relocation.

Such are the principal measures our poorly-informed Tombstone agitators proposed to place upon the national statute books. In future letters, Mr. Church will, no doubt, spread himself over a wider mining expanse than he has been able to cover in one effort; but he has gone far enough to show that if his and Mr. Van Blarcom's counsels are to be followed by our lawmakers, prospectors and miners of small means will have to leave the country, as Mr. Church, with a huge monopoly at his heels, struts forward to take possession of mines, out of which they have been deliberately robbed.

As a specimen of reasoning knowingly from a false hypothesis, few statements could be more "cheeky" than the opening sentence in Mr. Church's letter. Hear this Truthful James: "The propriety of replacing our present mining law by an enactment more exact and comprehensive seems to be generally acknowledged. Miners talk of it, papers discuss it, and Congress has invited suggestions from the knowing. The tendency of this opinion is, that some system should be found which would not be less liberal in giving than the present law, but more stringent in what is required from the beneficiary."

Toward the end of his effusion he says: "Probably the real opposition to a change would come from the complete reversal which a restrictive law would make in the prospector's business. But it is a question whether the time has not come for making such a change. Our liberal law has been a great help to prospecting; but its very liberality has developed evils which prevent the prospector from reaping the results of success with the certainty he would have if his title were more secure. The criticism of the present law comes largely from prospectors, and it is quite probable that they would be among the advocates for renewed legislation."

Mr. Church practically admits that the existences of the mineral States and Territories west of the Rocky mountains is due to the explorations of prospectors and pioneer miners, but as the country is pretty well run over now, and the class he so thoroughly detests seem determined to hold onto their mining claims until they can realize something for their time, toil and risk, it is necessary, in his estimation, to kick them out of the way, so that capital may come in and "gobble up" every lode of promise and, getting a patent on it, let it lie untouched for 20 years, until metallurgical processes are cheapened and miners are willing to work for two dollars per day. This is simply the plain English of Mr. Church's argument, there being no other logical outcome to it, when it is subjected to a reasoning process.

But what is it that has started Mr. Church on his windmill raid? It is not because he is a patriot and wishes to see our country prosper under good mineral laws. By no means. It is revenge he is seeking; he is in a rage because the Tombstone mining company, which gives him his bread and butter, has been defeated in a law suit with the Way Up mining company. The latter had a cross vertical ledge which ran into the Tombstone company's ground, and Mr. Church was extracting fine ore beyond his company's side line, on the assumption that he was following the lode on its dip.

These end lines, under our present law, are fatal to many well-laid schemes. Any miner or mining company desiring to do what is right will never object to that, or, indeed, almost any of its requirements, but to a trespassing, wealthy company, end lines are unmitigated evils. In the great contest between the Eureka Consolidated and Richmond mining companies, it was an end line that spoiled the high game of the latter. Then it was that Clarence King, who was the Richmond company's expert, dashed ahead, just as Mr. Church is doing now, to have the objectionable law modified. He failed in his efforts, as Church is certain to fail, simply because it is well understood that if any change in the existing law is attempted, more harm may be done in one direction than good in another.

I am sorry that this agitation has been forced upon the mining community. It is plain, however, from the above presentation of the case, that if no attempt is made to thwart the plans of Messrs. Church and Van Blarcom, the prospecting business will be quickly brought to an end. Mr. Church will do well to confine himself to his legitimate duties. With his knowledge, the Tombstone company has been paying large dividends while it owed $350,000. If this is the kind of morality which is satisfactory to Mr. Church, many people will be inclined to think he is a very unsafe adviser, either as to mining or any other kind of law.

I trust that our Pacific Coast Congressional Representatives will, by the pressure brought to bear on them from our widely extended mining camps, use such means as will soon put an end to the Church and Van Blarcom monopolizing speculations, and leave us our safe and nearly perfect mining law untampered with by wily hands. A PROSPECTOR.

Cochise County, Arizona, May 20, 1882.

Ancient Gravel Channels and Ridges.

EDITORS PRESS:—In the PRESS of May 13, 1882, page 306, by request of H. Clendennen, of Raudolph flat, Nevada county, you want to know "why ancient river channels follow ridges, and if the ridge is wide, there is none in the middle? And he challenges any man in the State to answer the question publicly in a few words." So we will be brief, and say that where the channel followed the ridge it was down grade at the time, so the water by gravitation ran that way and formed the channel. 2. That some wide ridges have channels in the middle, because streams once ran there. Mr. Clendennen appears to assume that the channels do run under and follow the line of ridges down; I will say this hypothesis is untenable and is not supported by facts, as regards the Pliocene river channels in this State. Because through all the principal ridges between middle Yuba and South fork of American river, nine tenths of the channels run across or diagonally under the lava cape, on an altitude of 2,500 to 4,000 ft. He says "if this were understood, it would be science to some purpose, and save millions of dollars." In answer, permit me to state that I have no control over people who have millions of dollars to spend foolishly. A. LARSON.

Dutch Flat, Placer Co. Cal., May 18, 1882.

Mariposa County Mines.

EDITORS PRESS:—Believing that you and your readers are interested in the mining developments of California, permit me, through your columns, to say a few words in reference to Mariposa county. Less than two years ago, Mr. M. Hulings, of Oil City, Pa., purchased the mines formerly known as the No. 9, but which Mr. Hulings named the Yosemite gold mines. At the time of purchase there was a 30-stamp mill just, or nearly, completed, with railroad from the mine, and other necessary arrangements to make a fair experiment of handling the low-grade ores, running from $5 to $40 per ton, which abound in this neighborhood. Mr. P. C. Dubois was placed in charge of the property, but failed to make a success of the enterprise. Mr. Hulings being heavily engaged in business in the East, could not give his personal attention; but after five months he returned here, to find that under Mr. Dubois' management the enterprise was a failure. Under the advice and assurances of Col. J. F. Thorn, a well-known gentleman of Mariposa county, the mill was started up with Mr. Thorn as superintendent; but, chiefly owing to the breakage of shoes and dies, the experiment was nearly a failure. Mr. Hulings, wishing to cast his lot in with the people of California in the enterprise, felt it the right thing to do to purchase his supplies in San Francisco, and of course his shoes and dies. The result has been, owing chiefly to the deficient character of the castings, being of a very brittle quality of cast iron, so much so that it often happened that a new set just put in at a cost, probably, of $400 or $500, would have to be taken out within 24 hours owing to breakage, so that to remedy the fault and difficulty, it became necessary to order steel from Pittsburg, which has been done with marked success. For three months the mill has been running with steel shoes and dies without a stop or break, yielding a nice profit. It is estimated that the loss Mr. Hulings has suffered from deficient castings has not been less, in the last nine months, than $20,000. Would it not be well for the manufacturers of such castings to give this matter a careful looking up? If the experience of others in this line has been in any way similar to Mr. Hulings', it surely would. Last fall Mr. Hulings, under the advice of his superintendent, purchased the Mt. Gains mine, in the near neighborhood. He placed machinery on the mine and entered on the work of development. The shaft has not yet been completed, but will be in the course of two months. These mines are known to be rich. The ore will mill from $10 to $40 per ton by free-milling process. Some weeks ago, Mr. Hulings purchased the Pool mines, a rich group lying one-half-mile south-west of his mill. These mines are yielding ores that mill $33 per ton. The whole group assure ores to supply a 30 stamp mill for half a century at least, and Mr. Hulings may now congratulate himself in the belief, well founded, that he has solved the problem of making a success of quartz mining in Mariposa county. He has been fortunate in securing the services of Col. J. F. Thorn as Superintendent, whose energy and intelligent care have largely contributed to the success of the enterprise.

The success of this enterprise is of vast importance, not only to this county, but to California, demonstrating the value of well-directed and intelligent energy in making our abundant quartz veins valuable, thus opening a wide field for capital, well directed, in mining in California. Messrs. M. Hulings & Sons are the sole owners of this immense property, and if they pursue the same liberal policy that has characterized the management under Mr. Thorn as heretofore, it will redound greatly to the benefit of this county and advantage to the people of this neighborhood. And it may here be remarked that the enterprise has the hearty support and good wishes of Mariposa county.

Hornitos, May 24th. C. C.

LEGITIMATE mining is just as honorable an industry as any other, but unfortunately scores of unscrupulous operators go into the business with no idea of ever digging anything out of the ground, but rely solely upon the dupes they can catch. When the press in the mining districts refuses to aid in bolstering up any enterprise that they know to be rotten, we may look for a change in the feeling in regard to mining matters in general. The $5 or $10 that the paper receives for bolstering up such skin games is poor pay for the loss of confidence that follows.

ALMOST PURE BULLION.—"Say, is that what you folks call ore?" asked a new arrival, the other day, of a prospector who was showing a specimen of a new find. "Yes," some one replied; "that is the way our ore runs here. It carries an average of 65 % galena, and over 100 ounces silver to the ton." "I shouldn't think you would call that kind of stuff ore." "What would you call it?" "Base bullion." And the stranger was right. Our galena ores are almost pure bullion.—*Wood River Times.*

Chloridizing and Oxidizing Processes of Copper Refining.

Two somewhat similar processes for refining impure commercial copper, such as Spanish or the Cobar copper of New South Wales—the one an oxidizing and the other a chloridizing process—have been patented by Mr. Claude Vautin, of North Fitzroy, Victoria. The oxidizing process now recognized as the ordinary method of removing these impurities, leaves a large percentage of them behind; but Mr. Vautin claims that his improved method either wholly removes them or reduces their percentage to a minimum. The ordinary method of oxidizing the impurities in commercial copper is to melt the latter, and then by stirring or rabbling it, to bring as much of it as possible into contact with the oxygen of the atmosphere. This, however, has proved to be a very imperfect process, and open to many objections. Mr. Vautin's process is either to force oxygen alone, or in combination with other gases (and preferably in the form of atmospheric air), throughout the whole mass, so as to oxidize the whole, or very nearly the whole, of the impurities at once, which impurities then rise to the surface and are skimmed off. As an alternative to the use of oxygen in a gaseous form, he substitutes oxygen-producing solids, and mixes them thoroughly with the mass of melted metal to be purified. Metallic oxides that yield up a portion or a whole of their oxygen under heat, will, when mixed with a suitable flux or re-agent, form such oxygen-producing solids. By way of example, he mentions that one part each of binoxide of manganese, of oxide of copper (copper scale), and of sesquioxide of iron (hematite iron ore) may be mixed with two or three parts of slacked lime or soda ash. Each oxide and its flux must first be ground and thoroughly mixed, and then the mixture should be thrown on the surface of the impure melted copper and thoroughly rabbled into or mixed with it, after which the heat should be raised in order to reduce the slag to as fluid a state as possible. When the slag is in a fit state it must be carefully removed, and the ordinary operations of poling and casting conducted as usual. Of these solid oxygen-producing materials, he prefers the mixture of oxide of copper and slack lime, and in the proportion of from two per cent. to three per cent. of the weight of the copper under treatment, and he prefers the use of the solid oxygen-producing materials to the gaseous.

The alternative, or chloridizing process, is of especial value where the copper to be treated contains bismuth. It consists essentially of such a use of chlorine as will bring it into contact with all the particles of the impure metal to be treated, with the object of taking up all the impurities and carrying them away in the form of volatilized chlorides. He accomplishes this in two different ways—either by forcing a current of chlorine or hydrochloric acid gas through, or into immediate contact with every particle of the impure melted copper, or by intimately mixing therewith a chlorine-producing composition, consisting of a chloride and its re-agent. The best example of such a composition is found to be produced by mixing one part of common salt (chloride of sodium), with from three to three and a half parts of slacked lime. Whatever may be the chlorides and re-agents constituting the composition, he first grinds and then thoroughly mixes the component parts, and thus uses the mixture; after the slag has been thoroughly skimmed off the copper under treatment, he introduces the mixture into the furnace, in the proportion of from two per cent. to three per cent. of the weight of the melted copper, and thoroughly rabbles or stirs it in, with the object of making it permeate the whole mass. He prefers to throw in this composition by degrees, so as to prevent the waste of the chlorine, and if this is done effectually, all, or very nearly all, of the impurities will be expelled in the form of volatilized chlorides. During this portion of the process the damper should be closed, so as to prevent any unnecessary waste of chlorine by the draught of the flue. When a current of chlorine or hydrochloric acid gas is used, it must be forced through or into intimate contact with the molten copper, and for this purpose almost any shaped vessel may be used, such as a crucible or a Bessemer converter. With respect to the second improvement, he prefers to apply the chlorine in the form of chlorine-producing compositions, of which a mixture of salt and slacked lime appears the best.—*London Mining Journal.*

COPPER SPINNING.—A comparatively new industry, that of copper spinning, has been introduced in Lawrence, Mass. A circular piece of sheet copper of ordinary thickness is placed on a lathe, and in a twinkling, without the use of hammers, sheare, rivets, or soldering iron, is spun into the shape of a kettle, without a break or weakening of a single fiber of the material. Ladies' and other utensils in copper and zinc, cuspadoree, etc., are formed in the same manner.

THE SAN FRANCISCO MINING AND SCIENTIFIC PRESS is one of the best, most interesting and instructive journals of its class published in the United States, and every mechanic, mine owner, miner and prospector should subscribe for it, as the cost is but $4 a year.—*Homer Mining Index.*

UTAH marble is now taking the place of Vermont for tombstones in Salt Lake. As the quarries open to depth, the quality improves.

MECHANICAL PROGRESS.

Cause of Variations in the Strength of Cast Iron.

Mr. James C. Stock, an extensive iron worker of 30 years' experience, thinks that the great difference in the strength of iron castings is mainly due to the form of the furnace and quality of fuel used in melting. He has furnished the following leaf from his experience, which we copy, substantially, from *Wood and Iron:*

I have found that the fuel used in melting is highly important. We are supposed to use nothing but the best brands of charcoal pig iron for making car wheels; we melt this iron with tiger anthracite, which takes away at least one-half the strength from the casting. This I know from practical experience. One case, among others, I will cite: Some years ago Capt. Norman Wiard started to make the best gun in the world. His plan, in time, will be adopted. I formed an acquaintance with the party who had charge of working the metal for the gun. The first thing in order was the strength of the iron; in experimenting for this we built a furnace after my plans. We then melted 500 lbs. of the Sallie Ann charcoal pig iron (using soft or bituminous coal for fuel) to the temperature required. This we called No. 1. Then we melted the same quantity of the same brand of pig iron, using anthracite coal for fuel, up to the same temper as No. 1; this we called No. 2. The samples were the same in shape, temper and weight. No. 1 stood a test of 32,000 lbs. to the square inch; No. 2 only stood a test of 16,000 lbs. to the square inch.

This will show that for all castings where strength is required, pig iron, melted and refined with the right kind of fuel, in a furnace like the one used in the testing for the Wiard gun, will give double the strength. I can give many other proofs, but this is one of the best I have personal knowlege of. I feel confident that other fuels can be used that will give even better tests. Iron is the king of metals, therefore it should be studied more than any other.

I have made a statement that the Wiard gun is the best. Then why did it fail? The cause was in the furnace. After the furnace was built and the charge of metal put in, I offered to make a present to the manager (as I never bet) first, that iron could not be refined, because he could not melt all the pig put in the charge for the gun; second, the gun would burst at the second or third test. I did not have to give either present.

How can you refine iron in a furnace where the metal, when in a melted state, lies often more than one foot deep? How can the carbon pass off? I have run a furnace from three to four hours, when the work could have been done in 40 or 50 minutes better, because the iron would be more fluid in the short time. You cannot get a true test of temper from the upper stratum of iron when in a melted state, as the carbon always sinks to the bottom. Now we know to a certain degree the quality of steel or wrought iron. Why cannot we trust castings the same way? One piece of casting should be the sample for thousands. I have known large shafting to break; we look for flaws or some other defect; then, if none be found, we make the casting larger; this often fails.

Castings should be made right in size, and light, yet strong. This could always be accomplished by using the right kind of iron, fuel and furnace. What I mean by the right kind of iron is that which is made from the best ores. We have the greatest variety and the best ores in the world; England must import almost all her ores for making steel; you cannot weld English cast malleable iron; therefore we could supply the world with shears and other work. We use Norway iron to make the wire rope; this should not be. In talking with the late John Roebling, of Trenton, N. J., he said we could make iron for his works in this country, as we have the necessary material.

SMOKE CONSUMPTION.—So complete have experiments proven the possibility and economy of consuming the smoke of furnaces that the city council of Montreal, one of the most conservative cities on the western continent, has passed an ordinance making it a misdemeanor, to be punished by fine or imprisonment, for any person to suffer or maintain upon his premises any fireplace or chimney, except the chimney of a private dwelling house, so constructed as not to consume the smoke arising from the fuel burnt therein; and every proprietor, owner or tenant of any engine, steam boiler, factory, chemical works, or other manufacturing establishment is to be compelled, upon notice from the inspector of boilers, to provide his furnaces with apparatus which will effectually consume the smoke escaping therefrom. Another regulation is added which is quite new, to the effect that the proprietor of any house or building hereafter erected, the chimney of which shall not be more than 12 ft. horizontally distant from any other chimney having a higher elevation, shall be bound at his own expense to carry his chimney at least six feet above the apex or roof of the building possessing the high chimney; and the proprietor of a high building erected beside a lower one already standing, shall carry up at his own expense all the chimneys of the lower house which are less than 12 ft. away from his to the same hight with his own.

Steel as a Structural Material.

At a recent meeting of the Institution of Civil Engineers, England, Mr. Ewing Matheson read a paper on "Steel for Structures," in which the present position occupied by steel, as compared with iron, as a material of construction, was dwelt upon at some length, considerable attention being, moreover, given to the question why, while steel was rapidly superseding iron for ships and boilers, it was so seldom used in bridge construction. Steel possesses the important advantage of a strength one and one-half to thrice that of iron, besides being much more elastic and ductile, and, owing to the method of manufacture, plates and bars of the usual kind can be made of steel in much larger pieces than is possible with iron, thus avoiding the numerous joints which smaller pieces involve. It was stated that the special treatment necessary for steel could soon be learned by workmen accustomed to iron, and present tools and machinery could be used for either metal. In regard to wasting by rust, sufficient time had hardly elapsed to prove positively the durability of steel as compared with iron, but at present it appeared as if the difference, if any, was in favor of steel.

Because of its greater strength, structures equal to iron could be made of less weight in steel; and in regard to ships, this saving allowed a corresponding increase in cargo-carrying capacity, or a reduced immersion. In boilers, plates, whether of steel or of iron, could not conveniently be of more than a certain thickness, and the working pressure was limited accordingly; but the superior strength of steel permitted a working pressure of steam one-third greater than in boilers of iron, thus allowing a saving in the space occupied for a given power, and greater economy in fuel.

There are several means by which the use of steel might be extended. The proper treatment of steel has now been thoroughly investigated, and the circumstances under which the metal is damaged, by punching holes and other manipulation, are well understood. But there we also need some ready means of verifying quality, this being far more necessary in steel than in iron, because in the latter, the range within which strength might vary is only one-sixth, whereas steel has a much wider range. Again, the mere fact that iron had been rolled into shape insured a certain minimum of quality, while if steel chanced to be bad, it might be one-half weaker than was wanted.

STORED ELECTRICITY.—The agents of the Light and Force company, of New York, an organization for the introduction of the Faure storage battery, arrived in New York May 12th, in the French steamship *Labrador*. They bring with them 80 large accumulators, or storage batteries, weighing 125 lbs. each and capable, when charged, of giving out power at the rate of one horse-power for one hour, or at any slower rate that may be required—one-tenth of a horse-power for 10 hours, for instance. They also bring 65 smaller accumulators, weighing 40 lbs., and capable of giving out one-third of a horse-power for one hour. All of these batteries were charged in Paris 10 days before the *Labrador* left Havre, and have not been recharged since. To illustrate the working of the invention on shipboard, and the effect on the machines by importation, the *Labrador* was supplied with the electric light on her way across, which continued until her arrival in this city. There were eight lights kept continually lighted, six of eight candle-power, one of six and one of 50 candle-light. Only one-sixth of the electric charge was found to be exhausted on the arrival of the steamer. Negotiations have already been made with Stephenson, the car-builder, for a number of tramway cars, which are to be run with the stored electricity, and before another year it is assured by M. Faure's representative that a locomotive will be in operation that can speed at the rate of 200 miles an hour, if desired.

MANGANESE BRONZE FOR PROPELLERS.—The twin screws of the new English iron-clad *Colossus* are of manganese bronze. This metal was adopted in place of gun metal, as first ordered, after a series of comparative tests which fully demonstrated its superiority. Under a steady pressure the gun metal broke with a strain of 28 cwt., while the manganese bronze bars required 54 cwt. to break them. Tested by impact, the gun metal bars broke with from seven to eight blows of a 50 lb weight; the manganese bronze broke only after 13 to 17 blows. The superior strength and toughness of the bronze permits a considerable saving in the weight of machinery, and also the use of a much thinner blade, offering less resistance to the water.

DURABLE MORTAR.—The London *Builder* attributes the marvelous durability of mortar in Italy to the fact that the lime remains in a pit covered with water for two years before it is used, whereas in England lime is slaked and used the same day. Most building specifications even require newly slaked lime.

AMERICAN LOCOMOTIVES FOR MEXICO.—The bark *Addie E. Sleeper* has been chartered to carry a full cargo of locomotives and freight cars and other railroad material from Philadelphia to Vera Cruz, Mexico. American locomotives are now used in almost every civilized country on the globe.

SCIENTIFIC PROGRESS.

Science of Value to All Men.

M. Quartrefages, in an address before the French Association for the Advancement of Science, at Bordeaux, thus emphasizes the value of scientific knowledge, not only for those who make it a specialty, but for all practical and intelligent men:

All men cannot be expected to enlist under the banner of professional science. But all may and must acquire scientific notions, sufficient at least to understand the utility of the intervention of special men, and to be able to judge when that intervention becomes necessary. Science is nowadays omnipresent, and tends more and more to become the sovereign of the world. What industry is there that does not want the help of the engineers, and would remain content with the progress already accomplished? What branch of manufacturers would decline the help of chemistry? What medical practitioner, worthy of that name, would consent to forsake physiology, that complex science, the offspring of chemistry, and would do without natural philosophy any more than anatomy? What intelligent agriculturist does not understand that the problems of culture and production are essentially questions belonging to zoology, botany, geology, and chemistry? And in this great city, one of the queens of universal commerce, what merchant would deny the importance of geography?

Science is as indispensable to the military man as it is to the manufacturer, the medical practitioner, and the agriculturist. I am not going to undervalue the share that, in war, falls to inspiration and gallantry. But inspiration must be enlightened by study, and courage must be aided by weapons equal in efficiency and power to those of the enemy. No more than the agriculturist or the manufacturer can the officer master all the sciences, the help of which is necessary to his profession. He cannot be expected to solve by himself all the problems raised by his single art. It is essential that he should first ascertain these problems, and confidentially appeal to scientific men, pointing out to them the application he wants. Let us, therefore, stir up the intellect of all men. Surely, we may hope to bring to light many treasures which, for want of the opportunities which it will be our object to create, might remain buried in the darkness of ignorance.

Our task will be fulfilled only when every man exercising any influence on his neighbor, or having any amount of leisure on his hands, shall have become an enlightened friend of science; when the least among laborers shall know what principles regulate the processes and the practice of his handicraft. Look at the results obtained in England by our eldest sister, the British Association. It is owing to its action that part of the population of England has undergone a transformation. The sons of fox-hunting squires are now geologists, philosophers, botanists, archæologists, etc. It is a banker who presides over the Anthopological Institute, and a brewer who is at the head of the Astronomical Society. The British Association reckons its members by thousands, and all the principal towns dispute the honor of its visits. Let us, then, begin our work with confidence; let us spare no efforts, for none shall be in vain. We know now that in the physical world there is no loss of matter. It is so, and even to a more absolute degree, in the moral world. Will is also a power that increases and multiplies by transforming the minds of men, like a ferment. We have the will for good; let us resolutely apply it, and we shall develop the intellects and raise the hearts of men by the diffusion of scientific knowledge.

A NEW TELEPHONE.—It is reported that a French gentlemen, M. Bottelier, has made a new telephone, which consists of a cylindrical copper box, about five inches in diameter and two inches high, in which the different parts are placed, and covered with a lid having a hole in the center. A mouth-piece is fixed near this opening, and the emitted sounds strike a vibrating plate screwed to the lid. The vibrations act on a magnet suspended to the sides of a box by three steel wires, the tension of which can be regulated at will. Owing to the elasticity of the wires the magnet may oscillate slightly in the same direction as the vibrations of the plate by which it is attracted, and as the magnetic action increases proportionally to the square of the distance, the amplitude of the oscillation increases until the tension of the wires, on the one hand, and the elasticity of the plate, on the other, equilibrate the attraction.

DANGER FROM SODIUM.—When, says the *Engineer*, an alloy of lead, tin or other metal is made with sodium in a melting pot, great care must be used in subsequently freeing that melting pot of every trace of sodium before using it for melting tin in, with a view to tinning copper or bronze articles; otherwise these articles, when placed in the melted tin, will be rapidly eaten away. This has been recently proved by accident, but it might have been expected from known facts concerning sodium alloys, which were long ago pointed out by Mr. Mallet, who showed, among other things, that if a strip of iron be coated with sodium amalgam and dipped into a pot of, say, molten tin, the iron will disappear faster than it can be put to the bottom of the pot.

More Scientific Prizes.

Mr. H. H. Warner, of the Rochester, N. Y., Astronomical Society, announces that, in consequence of the extra research resulting in valuable discoveries which attended his offer of prizes for astronomical discoveries last year, he makes a similar offer for the present year, as follows:

Prize First—The sum of $200 for each discovery of a new comet made in the United States, Canada, Great Britain or Ireland. The conditions are: First, it may be discovered either by telescope or the naked eye, but must be unexpected, except as to the comet of 1812, which may reappear during the year. Second, the announcement of the discovery must be made confidentially and exclusively (by telegraph) to Dr. Lewis Swift, director of the Warner Observatory, Rochester, N. Y., and to him alone, and he will cause the same to be immediately telegraphed, together with the name of the discoverer, to all parts of the world. Third, the telegram must give the time of discovery, the position, and direction of motion, if possible, sufficiently exact to enable at least one other observer to find it. Three disinterested astronomers will be selected by Dr. Swift to decide all disputed questions.

Prize Second—The sum of $200 for any meteoric stone found in any of the above countries during 1882, which Profs. Henry A. Ward, of Rochester, N. Y., Principal Dawson, of Montreal, Canada, and J. Lawrence Smith, of Louisville, Ky., shall unanimously decide contains fossil remains of animal or vegetable life, thus proving the inhabitability of other planets.

Prize Third—The sum of $50 for a specimen of any meteoric stone (whether it contain organic remains or not), seen to fall in the United States during 1882. Condition, a specimen (which shall become the property of the Warner Observatory) of not less than two ounces in weight, must be sent by mail to Dr. Swift, accompanied by a descriptive letter written in English, giving the time of its fall, depth of penetration in the soil, weight of the entire stone, direction of flight, and such other facts regarding it as will be of value to science.

As the result of the offer of last year, the discoverers of four of the comets of 1881 were each awarded the comet prize of $200, and Prof. Lewis Boss was also awarded $200 for the best essay on comets.

A PHOTOGRAPHIC GUN.—Muybridge must look out for his laurels. His instantaneous pictures of the movements of the horse have now been fully equaled by the efforts of M. Marrey, a French naturalist, in taking a photograph of birds on their flight. The difficulty in this effort was to keep the object in the field of the camera. To remove this difficulty this gentleman has devised what may be called a photographic gun. The barrel is a telescope—that is to say, it contains the lenses of a camera. There are 16 apertures which take the place of the chambers. The photographer puts in a sensitized plate behind these apertures, and performing an operation analogous to cocking the weapon, he is ready for the field. On seeing a flying bird he takes aim and pulls the trigger, the chamber revolves once, and in one second he obtains 16 little pictures of the bird in various positions. Hitherto, M. Marrey has made use of his photographic gun for the purpose investigating the flight of birds. In these cases, clearness of definition is of little consequence, so long as a dark image or silhouette the shape of the bird is obtained, so that it matters little whether the object aimed at be focused or not; but it is obvious that in a multitude of other cases the image can be obtained perfectly in focus. Indeed, it will be seen that the system of thus carrying a small camera to be steadied against the shoulder admits of extension, and may prove of the utmost service to the photographer.

SUN-SPOT PERIODICITY.—An important new fact regarding the sun-spots has been lately established by M. Spoerer from his own observations, together with those of Heis and Carrington. It is known that spots hardly ever appear on the equatorial zone of the sun, and they are never observed beyond a latitude of 51° in either hemisphere. It is between 6° and 35° that the sun-spot is chiefly concentrated. Now the fact referred to is a periodicity or oscillation of the following nature: The activity advances towards the equator, rising first to a *maximum* at 18°, then diminishing, as years pass on, till at 5° or 6° it seems to be exhausted, and disappears. Thereupon some cause brings out spots in the higher latitudes again, and the same advance towards the equator is repeated, with a *maximum* about 18°. M. Spoerer also finds a preponderance in production of spots to occur alternately in the two hemispheres; but this phenomenon is less pronounced than the other. The effects are apparently not explicable at present.

TRACINGS ON GLASS FOR THE LANTERN.—The following method, by George Smith, appears to be satisfactory. A piece of finely ground glass is rubbed over with a trace of glycerine, in order to make it as transparent as possible. It is now easy to write or draw on the prepared surface with a hard and finely pointed black lead-pencil, and the glass is so transparent that the finest details of any engraving, over which it can be placed, can be seen quite distinctly. The drawing having been finished, the plate is washed with water, in order to remove the glycerine, and dried. A thin coat of Canada balsam or of negative varnish now serves to render the slide permanently transparent and ready for the lantern.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Silver King, May 23, $15,000; Northern Belle, 22, $7,548; Christy, 25, $2,218; Eureka Con., 21, $9,881; Star, 22, $2,098; Bodie, 29, $10,802; Northern Belle, 25, $19,861; Bodie Tunnel, 30, $3 688; Contention, 27, $28,443.85; Christy, 30, $5,695; Eureka Con., 23 and 24, $9,138.08; Germania, 25, $4,000; Hananer, 25, $1,770; Horn Silver, 24, $25 000; Bullionville, 25, $1,958; Horn Silver, 27, $12,500; Frisco, 27, $4,179; Bullionville. 27, $1,813; Germania, 27, $2,000; Hanauer, 27, $1,750; Stormont, 27, $3,600.

SHIPPING ANTIMONY.—Supt. McCullangh, of the McCullongh Antimony and Copper Mining Co., has made arrangements to ship about 90,000 lbs. of antimony ore to San Francisco for reduction. The first carload will be shipped in a few days, and good returns are expected. The mines are situated in Cottonwood canyon, about eight miles southwest of Battle Mountain, and are prodncing excellent ore, about 60 tons now being on the dumps. The company is working eight men, and a good showing will be made in that vicinity this summer.—*Lander Fre. Press.*

The Mining Share Market.

Our mining share tables show the fluctnation of the market for the past week, and show that they have not been very marked. The mining dividends paid in May include the following: Bulwer Con. mining company, 10 cents per share, $10,000; Contention Con. mining company, 25 cents per share, $62,500; Deadwood-Terra mining company, 15 cents per share, $30,000; Enreka Con. mining company, 50 cents per share, $25,000; Father de Smet mining company, 20 cents per share, $20,000; Homestake mining company, 40 cents per share, $40,000; Idaho mining company, $7.50 per share, $23,250; Indian Queen mining company, 5 cents per share, $6,250; Napa Con. Quicksilver mining company, 10 cents per share, $10,000; Ontario mining company, 50 cents per share, $75,000; San Francisco Copper mining company, 5 cents per share, $2,500; Silver King mining company, 25 cents per share, $25,000; Standard Con. mining company, 75 cents per share, $75,000.

On and after Monday next the San Francisco Stock and Exchange Board will hold only one session in the afternoon, beginning at 2:30 o'clock, at which the fnll list of ontside stocks will be called and afterwards the Comstocks.

In the north end mines there have been no changes of importance. The Union Con. ore stopes are looking and yielding as usual. The yield of ore for the week will be between 500 and 600 tons. No work has yet been done below the sill-floor of the lower stopes.

After rnnning the northeast drift on the 2600 level out to a point near the Sierra Nevada line (no survey has yet been made) it was discontinued, and a north drift is now being pushed forward from No. 1 winze. Cross-cuts will he rnn east from this to connect with the northeast drift, and to explore and ventilate the intervening ground. Between the two drifts lies the eight-foot streak of ore cnt near the winze some three or fonr weeks ago. The face of the north drift is in very favorable grornd, with streaks of very good ore rnnning through it.

At the 2900 station of the joint Union Con. and Sierra Nevada east winze, the diamond drill was sent out to the west and south. No water to interfere with drifting was found. The ground in both directions is very soft—so soft that it was washed considerahly hy the water sent through the stem of the drill. A drift will he started west and another south next week. This grornd is very promising, hut will require close timbering.

All is going on ahont as neual at the old honanza mines. At the C. & C, shaft they yesterday stopped the pump to pack some plnnger poles, running the tanks for a few houre meanwhile.

At the middle mines the Savage folks are making some explorations on their 2200 and 2400 levels, and some prospecting is heing done on the 2500 of the Hale & Norcross. Not much will he done in the Chollar and Potosi nntil after the Chollar-Noroross-Savage shaft has reached the 2600 level and a west drift has drawn off the water.

Phosphorescence of Minerals.

Many minerals, after heing heated, exposed to light, ruhhed, or electrified, seem to glow or shine in a pecnliar manner if taken into a dark place. This property is called phosphorescence. Thns, if a piece of finor-spar, especially of the massive qnality called chlorophane, he placed on a fire shovel and heated over a spirit lamp, it will, when taken into a dark place, he seen to shine with a hright green light. If an electric shock be passed through a piece of chlorophane, a similar phosphorescence will be produced. It has long heen observed of diamonds that, if taken into a dark room after exposure to the light of the sun, they will shine.

Minerals which become phosphorescent from heat are sometimes called pyro-phosphoric, from friction, frictio-phosphoric, from electricity, electro-phosphoric, and from exposure to the light of the snn, helio-phosphoric. These latter are said to he insolarized, as is the case with some varieties of calcite.

Sometimes a pyro-phosphoric snhstance, hy repeated heating, loses its property of acquiring phosphorescence. This may he occasionally restored hy passing a few electric shocks through the snhstance.

Among pyro-phosphoric minerals, some, as certain varieties of fluor and diamond, hegin to shine in the dark at a temperatnre helow that of hoiling water. A good many minerals shine at a temperature mnch helow a red heat.

Among minerals which hecome phosphorescent hy friction may he mentioned a certain kind of hlende, mentioned hy Collins as from Kapnick, which shines when scratched or ruhbed. Two pieces of quartz will shine if ruhhed together in tho dark, either in the air or under water, and some varieties of dolomite and oalcite emit light when struck hy a hammer.

In grinding eilicious minerals so as to make their sections for microscopic purposes, phosphorescent light is very frequently prodnced.

REPRESENTATIVES of the Miners' Unions at Moore's Flat, North Bloomfield and French Corral have visited the Blue Tent hydranlic mine and asked the management its intentions as to longer employing Chinese lahor. They were told that the force of Mongolians had recently heen redoced to 20, and there were 30 white men on the pay-roll. Also, that the rest of the Chinamen wonld he discharged as soon as the company can raise the money due them for work done hefore the mine had reached the prodncing point. It is not helieved that any trouhle will ensne, althongh some of the Union men are hitter. The Blue Tent, heing a limited oompany, oannot levy assessments to defray expenses, hnt has to rely on the retnrns from the mine, which the snperintendent asserts have not heen snfficient for some time past to pay all the running expenses.

THE grand total in value of preoious metals received hy the hanks in Salt Lake dnring the week ending May 26th amounted to $98,400 52. This does not inclnde shipments of hullion from the Ontario, which sends out eaoh week fine hullion to the value of about $50,000.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

ORION.—Mouitor *Argus*, May 23: Mr. Peter Curtz, Supt. of the Orion G. & S. M. Co., composed of Stockton capitalists, has just completed a boarding-house at the mine for the employees, and is putting things in shape for the erection of hoisting works. The property joins the Stella on the west. The Alpine Hydraulic M. Co. are nearing on to completion their new water ditch, only about 100 rods to be made, and the ditch will be completed to their claim. On last Saturday the company turned about 80 miners inches of water into their ditch, which came down proving that the ditch carries water successfully. We expect within a short time to hear of this company making a big clean-up of "the rock of all evil."

STELLA MINE.—Superior Judge Arnot, Justice Thornburg and County Clerk Harvey visited the Stella mine on Thursday last, and have given us a glowing account of what they saw in the mine. The recent discovery of the new ore body, at a point west of the tunnel and about 60 ft above the tunnel floor has created a sensation among mining men. The former owners of this mine seemed to have failed, simply because their efforts were directed in the wrong direction, they seeking the ore body east of the tunnel—Comstock fashion—while it has now been demonstrated that the ore body is west of the tunnel, though beyond a doubt ore may yet be found east, by sinking to a greater depth than yet done. But about the new find. The chamber disclosing the new body of ore is 16 ft from north to south, 13 ft from east to west and 13 ft high. The roof, face and ends of this chamber are in beautiful ore of great richness, its assay value ranging as high as $500 per ton in glod, silver and copper, about 80 per cent. of this being silver. The scene in this chamber, lit up by the candles in excited hands, is beautiful beyond description, and we only regret our space will not permit of a more extended description at this time. Two miners only were engaged in breaking down the ore, who are able to keep the mill running at its present capacity. From 40 to 60 tons of rich ore were piled on the assorting floor at the tunnel's mouth. The above-named gentlemen tell us that they have never before seen such a wonderful display of rich ore as is now exposed in this mine, and all they say is supported by the fact that more and finer bullion is now being shipped weekly to the company's banks at San Francisco.

AMADOR.

JACKSON.—*Ledger*, May 27: This quartz claim is situated within the town site of Jackson, is owned by Ginocchio Brothers, and is more generally known as the Kearsing mine. This week it was bonded for a period of one year from June 1st, to Grove Adams, M. H. Peck and E. W. Roberts, of San Francisco, for the sum of $7,500. The parties will commence work right away, by means of a patent whim for hoisting purposes. Taking out ore for crushing will be in order just as soon as the tunnels can be got at. The prospects are good for the development of a good mine.

NEVADA.—This quartz claim is located near the Bunker Hill mill on the south side of Rancharia creek, and is owned by Hayward & Hobart. Under the superintendency of Humphry Reese, work was commenced last Monday. A ledge 5 ft in thickness crops out on the surface. A shaft is to be sunk on this ledge, to what depth will of course depend upon the result of the prospecting operations. Nothing is definitely known touching the paying quality of the rock.

MISCELLANEOUS.—Alvinza Hayward has been in the county recently, and gave it as his candid opinion, based on a good deal of mining experience, that Amador is as good a field for prospecting as any place he knew of. Coming from a capitalist like Mr. Hayward, this expression of opinion is deserving of special attention. He has invested extensively in mining in various localities, and comes to the conclusion that Amador, the county that gave him the first start in the road to wealth, stands today the peer of any mining region as an available field for investment. As good results have been achieved in this county, considering the amount of capital invested, as any county in the State. Acting on this judgment, Mr. Hayward is branching out into prospecting operations on an extensive scale.

FROM DRIFTOWN.—Amador *Dispatch*, May 27: The Potosi M. Co. have taken out their pumps and ceased working the property for an indefinite length of time. The Seaton and Maryland Co.'s are still prospecting. The Grover Co. are slowly gaining on the water but will not clear the mine of water before July.

BUTTE.

GOLD MINING CLAIM.—Oroville *Mercury*, May 27: The Cole claim on Big Butte creek is now working 16 to 17 men with excellent prospects. They are now breasting out in a tunnel 2,400 ft in the hill, and have raised an air shaft 300 ft to the surface for ventilation. The mine is owned by Messrs. Starr, Hnbm & Pershaker Mr. Hubm is superintendent, and W. Powers foreman.

CALAVERAS.

CHICAGO & ROCK ISLAND MINE.—Calaveras *Chronicle*, May 27: This mine is owned by a Chicago company, and about 2 months since Mr. August Hoefer, one of the company, and a Mr. Yondorf, passed through here on their way to the mine, which is located near Railroad flat, to prospect the mine to that extent to justify the company, in the event of satisfactory developments, to invest capital in the erection of suitable machinery to work the mine. This has been done, and with results far exceeding expectation. The parties above named, passed through this place one day this week on their return to Chicago to make their report and perfect arrangements for the future management of the mine. Between 50 and 60 tons of rock were taken from the mine, 40 tons of which were milled and the remainder subjected to the arastra process. By the mills the rock yielded $35 per ton, and by arastra $48 per ton. It is a settled thing that the company will erect hoisting works, construct a mill and proceed to work the mine. We are informed that W. V. Clark, of Railroad flat, has taken the contract to supply the necessary lumber for building purposes, and that the parties expect to return in the course of 5 or 6 weeks, when the work will be started and pushed to completion.

EL DORADO.

PLEASANT VALLEY MINE.—*Mountain Democrat*: The new 10-stamp mill recently erected by Dan Wickham, at the Pleasant Valley mine will be started up next Monday. Experienced miners and competent judges pronounce it the most perfect 10-stamp mill they ever saw; the most commodious, complete in all of its appliances, and the most convenient in all its arrangements. The building is large enough to accommodate 10 more stamps, and the power is sufficient to run them. They are prepared to run the mill either by steam or water-power. For the latter they have a 44 ft Knight wheel and a water pressure of 108 ft. The mine is in fine condition. Nineteen hands are kept busy taking out ore from all parts of the mine, much of which is of extra fine quality. There are about 2,000 tons on the dump, and it is the intention to crush at least 600 tons a month henceforward.

THE SAILOR JACK MINE.—At this mine, in which Bogust, Gray and Houx recently made a rich strike, a shaft has been sunk 25 ft and a drift started on the ledge. On Wednesday of last week—the 17th instant—they took out of 100 pounds of rock, crushed with a hand mortar and pestle, about $300. From the ore extracted from their shaft and drift they have pounded out upwards of $3,000, and the dump is full of ore in which there is a fine showing of free gold visible. The boys are jubilant.

A LIVELY MINING CAMP.—The season is opening with manifestations of extraordinary activity at Grizzly flat. Everybody is busy and the prospects are brilliant. Ben. Bullard commenced operations a week ago last Monday at the Sacramento mine and mill, and is taking out a large amount of good milling ore. The Melton brothers have commenced operations in their mine and have started up their mill, with highly satisfactory results. At the old and reliable Treat mine, Frank Teagne and partners have taken a contract to sink the shaft 25 ft deeper, then to drift to the ledge, and then to drift along the ledge a distance of 60 ft. A horse power whim is being put up on this claim. An Eastern company, for whom Ben. Parlow of this city, is superintendent, are working a northern extension of the Driesbach claim, putting up a whim and sinking 2 shafts. J. E. Lyon is doing a large amount of work on the Driesbach claim. He has put up a whim on the new shaft, which has been sunk 100 ft within the past month, having passed through the old ground, and being now in fine ore. The tunnel has been completed and well timbered through 450 ft of old ground and 50 ft of new ground, making 500 ft in all. S. P. Hoskins has purchased the opposition sawmill from Olmstead & Co., and is now fitting up both in anticipation of a lively season.

INYO.

MINING SALE. *Independent*, May 27: According to a deed placed upon the county records last Thursday, Theodore Wibbelt, of this county, has sold to Edward Reilly, the noted copper mining capitalist of New York, the following mines, situated in Sherman mining district, which is about 25 miles northeast of Darwin: The Bonanza King, North Star, South Point, Natolia and Star mines. Also, several water rights and some land adjacent. The consideration named is $12,000 cash, which from reports we have heard from the mines is next to getting them for nothing. These properties were examined by Mr. Reilly's expert, Wm. R. Chadsey, and were sold to John H. Ely, who had theu under bond. We believe that Reub. Spear went to Los Angeles to receive the money.

DARWIN NOTES.—Messrs. Reddy & Gorman are getting in supplies preparatory to making another successful run of furnaces which they intend to commence in the early part of June. Frank Fitzgerald, "the hero of Modock," started the furnace yesterday, having 500 tons of excellent ore at the furnace and a good supply of coal, etc., and more coming in. J. C. Eddy, who is operating at Snow's canyon, evidently means business, from the fact of his having 20 men employed at that camp, besides a pack train and 2 teams packing ore and hauling wood, etc. Supt. Pheby is making things lively at Panamint just now, running the 20-stamp mill on high-grade ore from the famous Wyoming and Hemlock mines. He also has a fine lot of high-grade ore from the Ida mine, which is said to excel all the mines in Panamint for quantity and quality of rich ore, Judge Russell's mine excepted.

MONO.

NOTES.—Homer *Mining Index*, May 10: Work is being pushed in the Gorilla mine with an increased force of men. Prospectors are still branching out into the mountains, notwithstanding the recent cold snap. Work is being actively prosecuted in the tunnel of the Grizzly mine, and the vein is working well. Some very rich free gold rock is being taken from the lower cut in the Garfield mine on Mount Oilcrest. Some fair assays in silver have been obtained from a 6-ft vein to the west of Lake Ada, near the head of Lake Canyon. The May Lundy tramway is being repaired, and the indications are that that mine will shortly be started up with a large force. Work is being steadily prosecuted in the shaft of the Josephine claim near the head of Mill Creek canyon, and the vein is improving in appearance as depth is attained.

NEVADA.

THE CHICAGO QUARTZ MINE.—A company has recently been incorporated to work this mine, which is located on Gold flat, about a quarter of a mile east of the Pittsburg and about the same distance south of the Gold Flat, Eureka. By some it is thought to be the same ledge as the Eureka, or a continuation of it. The mine was first worked some 16 or 18 years ago, but it is now about 6 years since any rock was taken out of the ledge. There is an old tunnel 800 ft long and this, after being driven 70 ft further, will be used to drain the incline, which is down 300 ft. When the tunnel is completed hoisting works will be erected and the shaft sunk to the level of the old works. It is expected that everything will be ready to put up machinery in the course of 30 days.

IMPERIAL MINE CLEAN-UP.—*Tidings*, May 29: The Imperial crushing, of 3 loads of rock taken from the ledge as it was cut through at a depth of 80 ft, yielded $16 75 per load of free gold, and 400 pounds of sulphurets which have not yet been worked. The ledge is a solid 5-footer, and rock takea from it is about the average.

THE POCKET CLAIM. Grass Valley *Union*, May 28: The pocket ledge lately found by Mr. H. B. Nichols on his ranch, a short distance from town, still holds out nicely. The stringers from which the rich rock is taken were found while ground-sluicing, and they are several in number, all pitching toward each other, so that it is quite probable that at a depth of 100 ft or less they will come together and form a ledge. From the first pocket about $500 was taken; the second pocket about $140; and now work is being done on another pocket found a few days ago. The last find seems to be more extensive than any of the others. Mr. Nichols has leased the ground, or rather tributers are working it for 50 per cent. of the proceeds. A shaft is now being sunk on the claim, which will be put down as rapidly as the men can sink it, and it is very probable that at no great depth the ledge will get larger and better defined.

MOUNT DIABLO.—*True Fissure*, May 27: Winze No. 1 has been sunk 15 ft during the past week and shows low grade quartz in the bottom. Winzes Nos. 3 and 4, from the third level, have been connected by a drift from which crosscutting has been commenced. The east drift on the second level has advanced 14 ft. An upraise is now being made to the north and east of the shaft, and is now in ore which assays from $37 to $45 per ton. The showing at this point is very favorable. The south crosscut from the east drift on the first level is in 132 ft and shows small streaks and spots of ore that give good assays.

NORTHERN BELLE.—The main drift from the fifth shaft level has been extended 26 ft during the week, the face of the drift being 163 ft distant from the station. It is now showing a large formation. About 66 tons of ore are being extracted daily and sent to the mill, which is running steadily and doing its usual good work. Shipments of bullion amounted to $27,409.73 for the week ending May 25th; and aggregate $33,705 30 on May account to the same date.

PLUMAS.

SPRING HILL.—Plumas *National*, May 27: There is some reason to think that this magnificent body of gravel, which is located some 3 miles south of Meadow valley, will attract the attention of capital this year, and that the work of developing it will commence in good earnest. No work has ever been done, as yet, which begins to show what is concealed in the walls of the channel, but enough indications are in sight to prove it good, and some day a rich harvest will be reaped by the company owning it. Bone & Co., the owners of the Spring Hill mine, have put in a tunnel some distance, and the bank of gravel which it develops is equal to any we have ever seen. The wash is beautiful, smooth, solid and blue, and carrying good prospects in gold. The ravines which have broken from this immense ledge have been notable for their richness, and why the channel has escaped the eye of mining men who have the means to open it is a mystery. If it had been situated in Sierra or Nevada county it would have been riddled with tunnels years ago; but there it is, with no sign of a prospector's work, except the short tunnel spoken of, run by men who have little or no capital, and only their muscle to depend on. When that ridge is thoroughly prospected and opened, as it should be, there will be work for 1,000 miners, and a season of prosperity for the district which will remind the old Californian of the days of '49.

A BIG MINE.—The Plumas Mining & Water Co. now has its pipes in full blast in the Metcalf and Haycock claims at Gopher Hill, and are sending down the sluicings in a lively manner. The main bank is about 180 ft high, with from 15 to 20 ft of gravel on the bedrock. Against this two monitors, one throwing an 8-inch stream, are directed, and the dirt and gravel fairly melts away from them. A large body of pipe-clay is found above the gravel, and it has to be blasted, employing some 7 or 8 men. About 30 men are on the pay roll of the company. We learn that the mine is paying well, and averages about $400 per day. They have a full head of water at present, and the supply will probably hold good for some time yet, as the cool weather is favorable.

CRESCENT HILL.—Frank Vere & Co., the owners of Crescent Hill, near Claremont hill, and on Bachelder creek, have again commenced operations on their tunnel, and will push it through as rapidly as possible. The tunnel is in a short distance—about 75 ft—and they only have about 150 ft to run to strike the gravel. They have a very extensive claim, and are certainly on the blue lead. The boys are hard-working men, and we hope they will be richly rewarded for their outlay. The tunnel has already tapped a fine stream of water from the channel, and the indications are first-rate for a good paying mine.

SIERRA.

RICH QUARTZ.—*Sierra Tribune*, May 25: "Doc." Stewart showed a reporter of the *Tribune* some very rich quartz at the county seat last week. The rock was taken from a ledge on Kanacka creek which Mr. Stewart and another Downieville gentleman recently located. It was literally alive with gold, and would probably assay way up in the thousands et dollars.

THE BALD MOUNTAIN EXTENSION MINE.—The Bald Mountain Extension Co. is driving its tunnel through bed-rock north 30° east. On raising up 61 ft fine-looking washed gravel was encountered. It is expected to strike the pay channel at a distance of 200 ft further ahead. This mine gives promise of becoming one of the richest and most extensive gravel mines on the coast, and the plucky owners are deserving the success which they are almost certain of meeting with.

A BIG FORCE.—The American Hydraulic M. Co. at Merristown is working 35 men, and 40 more will be added to the force very soon. This is very encouraging for that section.

A NICE PROSPECT.—Frank Hauber was over from Alleghany last Sunday, and informed us that he had made a big strike in the ledge on Kanacka creek that he is developing. He commenced work on the ledge some 15 years ago, and has been prospecting it at intervals ever since. The tunnel which he is engaged in running at present is in a distance of 50 ft. The ledge at this point is about 2 ft in width, is composed of fine-looking ribbon quartz, and shows free gold quite plentifully. The owner will at once proceed to extract a quantity of ore and have it milled, which, judging by its appearance, will yield sufficient returns to permit of his operating on an extensive scale. The tunnel furnishes 300 ft of stoping ground, and tunnels can be run to give a still greater depth on the ledge. This is only one of the many private enterprises that are being carried on in a quiet way in this county, and we are always glad to chronicle the success of such. It is evident that the attention of prospectors is being drawn very rapidly towards the quartz interests of the county, and the rich deposits that are being revealed daily go to infuse interest in that class of mining, and illustrates that steps are being taken in the right direction.

TUOLUMNE.

ACTIVE WORK.—Tuolumne *Independent*, May 27: The Montezuma tunnel, in Table mountain, is being repaired for active work. Mr. McNamara, of Candelaria, Nev., who is a thorough miner, proposes to work the old channel, and is satisfied, from the large amount of gravel and the excellent prospects, that the diggings will pay handsomely. On the 18th inst. they took out a quartz bowlder not weighing much over 50 lbs, and, on breaking it up, pounded out at least $40. The stone was round, well-washed gravel. Under this bowlder, in the smaller gravel, was panned out $10 more in coarse, washed gold. Another channel, several hundred ft further in the mountain, which was tapped by miners several years ago, just prior to a heavy cave, prospected largely, and for this point they are now clearing way. T. J. Evans last summer discovered a rich vein of quartz about a mile from his residence in the mountains, and sunk a shaft, from which he took out considerable gold. He purchased a large engine and boiler from the Eames' mine and placed it near the shaft, when the heavy snows and rain set in, caving the shaft and precipitating the machinery. Notwithstanding this misfortune, Mr. Evans, with his characteristic energy, went to work this spring, now has the mine in good working order, and we are pleased to say he has struck the gold in larger quantities than ever. Con. Kearney, in his gravel claim at Brown's Flat, is taking out rich gravel. Several rich strikes in quartz are reported the past week. Some of them need confirmation.

TRINITY.

NEW MINING COMPANY.—Trinity *Journal*, May 27: Parties residing in Weaverville, Lewiston and French Gulch have advanced $3,000 as working capital and taken stock therefor in the Brunswick Mining & Milling Co., the preliminary steps for incorporating which have already been taken. The property of the new corporation consists of two quartz mines, water right, etc., in French Gulch district, near the summit of Trinity mountain. A shaft of 65 ft on the New Brunswick shows a ledge 3½ ft in which will go $30 to $40 per ton on the average. The capital stock of the company has been put at $100,000, divided into 20,000 shares.

NEVADA.

WASHOE DISTRICT.

OPHIR.—*Enterprise*, May 28: On the 2900 level are timbering up the main south lateral drift and cutting a drain in the same.

COMBINATION SHAFT.—During the past week the Chollar-Norcross-Savage shaft has been sunk 27 ft, making the total depth 2,548 ft.

CON. VIRGINIA.—The south drift on the 2700 level has been extended 6 ft. Joint California east drift No. 2 has been advanced 17 ft.

MEXICAN.—On the 2700 level west crosscut No. 2 has been advanced 27 ft, and winze No. 1 has been started.

UTAH.—On the 2500 level the main south drift has been extended 20 ft. Have finished repairing and retimbering the incline near the 1350 level.

CALIFORNIA.—The main south lateral drift on the 2700 level has been extended 6 ft. Joint Con. Virginia east drift No. 2 has been extended 17 ft. The west drift, 2700 level, has been extended 26 ft.

SIERRA NEVADA.—No. 2 winze on the 2500 level has been sunk and timbered 10 ft. On the 2700 level main north lateral drift No. 1 has been extended 29 ft, and north drift No. 3 has been extended 40 ft.

ALTA.—During the past week the west drift was extended 38 ft; total length, 1,368 ft. We completed the bulkhead in the main east drift at noon to-day, and the water is now shut off. The water in the incline has been gradually rising the past 15 days. It stands to-day 15 ft above the 1750 station.

UNION CON.—On the 2500 level are stoping out ore. On the 2000 level the north drift has been extended 41 ft. On the 2700 level south drift No. 2 has been advanced 40 ft. On the 2800 level the upraise has been extended 37 ft. During the week 561 tons and 1,200 lbs. of ore have been extracted from the 2500 stopes, and 426 tons and 790 lbs. have been sent to the mill. Amount of bullion in office, $12,511.76.

YELLOW JACKET.—On the 1028 level we have got in some 400 ft north of the shaft. We find the old drifts and stopes in fair condition, but the air very warm and bad, owing to the closing of air connections in the north part of the mine.

BATTLE MOUNTAIN DISTRICT.

SOME PROMISING CLAIMS.—Lander *Free Press*, May 27: Messrs. Kinney & Bradshaw have a number of very promising claims in Old Battle Mountain district, which they are now engaged in working. Among the number may be named the Silver Thread, St. Charles, Lost Boy, North America and Pacific. These 5 claims are in close proximity to the famous Little Giant mine, which turned out somewhere in the neighborhood of $500,000 in bullion a few years ago. The owners have out at the present time over 200 tons of excellent ore, which is sacked and ready for shipment, but they have concluded not to ship, and are now making arrangements to put up a furnace in which to reduce it. Over 400 ft of tunnels and drifts have been run, and the ledges are improving all the time. Several years ago this camp was quite lively and a good-sized town sprung up, but the Little Giant "petered" and the mill was moved away. There are undoubtedly a number of good mines in the district, and they are sure to come to the front shortly. We understand that Messrs. Bradshaw & Kinney could have had $30,000 for their mines a couple of weeks ago but wanted several thousand more. If these gentlemen succeed in their efforts to erect a furnace, Old Battle Mountain will have a boom in less than 6 months.

ESMERALDA DISTRICT.

BULLION SHIPMENT.—*Herald*, May 25: The Humboldt Hill M. Co. this week shipped a small bar of bullion weighing 151½ ounces. The mill will make a clean-up on the 4th or 5th prox. Gov. Blasdel reports the mill working splendidly and all work moving along satisfactorily.

PARADISE DISTRICT.

MILL.—*Silver State*, May 27: A small 4-stamp mill for the Credit Mobilier mine, in Paradise district, owned by A. M. Sadorus, has arrived at Golconda, and will be taken at once to the mine. Paradise district is situated about 12 miles from Golconda, in the range of mountains between the Humboldt river and Paradise valley; and the Credit Mobilier mine, the first found in the district, has produced considerable rich gold-bearing quartz.

SAFFORD DISTRICT.

THE CLAIMS.—Cor. Eureka *Sentinel*, May 27: On the Contention the shaft has been sunk about 12 ft, all in rich vein matter. The air being bad at the bottom, air pipes are being made here to improve the ventilation. Jonathan Walker, in digging a cellar on the side of the mountain back of his house for the purpose of storing his goods, struck the ledge on his claim at a distance of 15 ft from the surface.....Work has been resumed on the Key West. This claim was located last year, and is one of the most promising claims in the district. They have a shaft down 50 ft, with ledge of 20 inches of carbonate of lead ore assaying $175, and have about 10 tons on the dump.....The Lucky Jim claim was located last year, and is 1½ miles south of the Onondaga. It is the property of Jim Mattock and others, and will be worked this season for all it is worth.....The Delaware is located northwest of the Mohawk and directly on the great ore belt. It is convenient to the river, and, with small expense, could be made a paying property. It belongs to Messrs. Fletcher, McLellan, Canavan & Cheney.....The Neb Hill claim is on the south side of the canyon, and belongs to Jack Patch, the founder of the town of Safford. During the winter a tunnel was driven into the mountain 75 ft, cutting several seams of rich ore. Unfortunately, the labor thus expended is of little use, except to demonstrate the fact that the great lode crosses the canyon. The C. & C., the property of Molinelli, Smith & Co., lies to the east and north of the Onondaga. A shaft is being sunk on it. There is a ledge 12 inches wide in it, carrying ore of low grade.....The road to the mines has been reconstructed, and the approach to the mines is all that can be desired.

MONTANA.

MARYSVILLE.—Cor. Helena *Independent*, May 24: The Belmont mine and mill are running in full blast, having secured a needed supply of fuel and mining timbers..... The Pony mill at Bald Butte is doing excellent work, and has a dump of thousands of tons of rich ore to work on.... The Closter mine and mills are perfect beehives of industry, turning out the yellow dust by the shovelful.... Mr. N. S. Vestel, the man to whom this section is indebted for its start in a prosperous life, has recently returned from the East, and already the power of an energetic, rustling man of tried experience is being felt. Messrs. Vestel and Muth are having a test of some 20 tons of ore made from the Empire lode, which is now going through the Cruse mill....Your correspondent fondly hopes to soon chronicle the fact that a mill will be erected on the Empire the present season....I learn that the Drum Lummon mine and mill will run steadily from this on.... Mr. Cruse has struck a body of very fine ore on the North Star, about 1,500 ft east from his tunnel on the Drum Lummon. Truly, Cruse hill appears, as developments go on, to be a vast mountain of treasure....Warren De Camp has been taking out some fine rock from the Wine Cour the past winter, and will crush it in Vestel's arastra.

THE MOULTON.—*Inter-Mountain*, May 22: From Supt. J. K. Clark, of the Moulton, it is learned this morning that the mine and mill are in satisfactory operation. Two weeks ago a shaft 500 ft west of the main workings was started, and will be sunk as rapidly as possible to a connection with the lower levels for ventilating purposes. In the bottom it shows a well-defined vein of ore 2½ ft wide, which samples from 65 to 600 ounces, and averages 100 ounces. In the mine the various workings are looking as well as usual, and the productiveness of the property is slowly but surely increasing. During the past month the mill has been constantly running, with the exception of one day, during which time it has treated 40 tons every 24 hours. Despite this heavy and regular consumption, however, the ore has steadily accumulated, and now fully 500 tons are on hand available for reduction. Mr. Clark states that the condition of the property throughout is very gratifying. The Cornish pump and the other extensive machinery is running smoothly. About 100 men are employed. Battery samples run between $35 and $40, which is high enough to insure good profit.

IDAHO.

VIENNA CAMP.—Wood River *Miner*, May 20: The showing made by mines and prospects about Vienna Camp last season, and the rich strikes made during the past winter have resulted in attracting the attention of a large number of miners, prospectors and business men toward it. Buildings have been going up rapidly during the past few weeks, which are to be occupied as general merchandise stores, hotels, restaurants, saloons, etc. The first stock of provisions, of any amount, to reach Vienna this season, arrived there by pack train last Sunday. Meat, flour, etc., have been as high as 75 cents per pound during the season of snow. From 75 to 100 men are employed in the mines about Vienna at present, but this number will probably be doubled or trebled during the next 60 days, as a number of prospect owners have decided to begin developing their properties immediately upon the disappearance of snow. The 40-stamp mill for the Vienna M. & M. Co. is already en route from Blackfoot for Vienna. The outfit weighs nearly 300,000 lbs, and is being brought in by extra long trains of mules and freight wagons. The mill is expected to be up and dropping stamps some time during the fall. There is already an embargo on the dumps of neighboring mines to keep it pounding away until next season. There are a number of very fine properties already developed, to a considerable extent, in the vicinage of Vienna, for many of which applications for patents have been applied for. The builders of the new town have big hopes for the future of Vienna Camp.

THE ROADS, ETC.—*Wood River Miner*, May 24: The roads up the various gulches, canyons and valleys have opened up pretty well during the past week. Light teams can now get into Calena and all the canyons below. The grade across the range is still closed to teams. To the west the road to the Smokies is scarcely open yet, but will doubtless be in a few days. The stages generally come in on time, from all directions....Many mining men who went out to spend the winter in milder climes have returned, but many are still out, scattered throughout the United States, or in Europe....Mining men who are not actually interested in our mines, but are willing to be, if they can get hold of property at reasonable figures, are arriving daily, but they hardly seem to be looking for mines yet, as they evidently prefer prospects, and at prospect figures. An exception to the above is Mr. Farwell, of Chicago, and his party, who came in last Sunday, and seem willing to pay liberally, though not extravagantly, for any claim they wish to buy. They are said to be figuring on the Bullion, Ophir, Eureka, Wolf Tone, and other claims, with the intention of erecting a smelter if they conclude to invest....At and around Bellevue some life has been instilled by the arrival of E. A. Martin, of the smelter, who says that he has bought out Jos. H. Douglass, and proposes to run it alone this summer. Mr. Martin will doubtless make a success of his enterprise. The Minnie Moore people are awaiting the result of their trial shipment to San Francisco. Other claims are being worked as usual.

OREGON.

CHICKEN CREEK.—Bismarck *Democrat*, May 24: From a gentleman from the above place, we learn that the mining season has opened with plenty of water, and the miners are jubilant at the prospect of a remunerative season. Some of the best prospects ever obtained in the county have been found on Chicken creek this spring. Weatherby & Osbourn, are working two claims; Colman Campbell & Co. are working one claim; the Cooper Bros. are utilizing every moment; Dundrover & Croaker are busy, and Roland Parker improves each shining hour. A company of Chinamen are also at work on the creek.

ARIZONA.

WINCHESTER DISTRICT.—Tombstone *Epitaph*, May 23: Winchester district is about 12 miles from Willcox and not more than 9 miles from the railroad. There are about 130 claims recorded in the district, and more than half of them are being actively worked. The principal mines of the district are the Winchester Con., which comprises the Grand View, Antelope, Dexter and Great Western, the Parnell, Longfellow and Philadelphia, which has 7½ ft of good pay ore a short distance below the surface. A shaft has been sunk on the Winchester Con. at the junction of the Grand View and Antelope, and at a depth of 70 ft has been crosscut, striking at a short distance a vein of ore 2½ ft wide, that rapidly expands as the work of development is prosecuted.

GLOBE DISTRICT NEWS.—*Silver Belt*, May 24: The Centennial Co. are reported as intending to start their mill this morning, having a quantity of good ore on hand. A fair return is expected. The Monarch, a valuable copper property, belonging to T. C. Stallo and D. H. Smyth, is situated 6 miles from the mouth of Mineral creek, having a well-defined vein and 18-inch gouge on hanging wall. The shaft is already 80 ft deep. In the irene, from the tunnel level, the winze is down 90 ft, showing an improvement in quality of ore, and work still progressing under contract of $15 per ft. The Old Dominion furnace is in blast. Eleven thousand pounds of copper were shipped Thursday. More coke for smelting purposes arrived yesterday. The Old Globe Copper mine is being vigorously worked, and from present developments is regarded as second to none in the district. The Hoosier copper company are showing large quantities of ore. The Buffalo company are hauling ore to the furnace. Arizona, and particularly Gila county, is not half prospected. The prospector to-day is as liable to find paying ledges as when the pick first entered a vein. Some spots have, it is supposed, been thoroughly examined, but they are few in comparison with the mineral-bearing territory within the boundaries of the county.

THE COPPER BELL MINES are located about 2 miles north of the Gila river and about 20 miles above Florence. There are 15 locations, all showing large bodies of first-class copper ore. The Copper Bell group is in a complete basin and consists of 4 parallel claims located across the ledge, which is from 400 to 600 ft wide. Tests made by competent assayers show the ore to be fully equal to the best mines that have yet been discovered on this coast. The ledge does not crop above the surface, but is a flat body, all good ore the length and width of the ledge. The millsites are located on the river 2 miles from the mines, and there is a gradual slope from the mines to the river, and a good road can be built at a trifling cost. The road from where the smelters will be erected to Florence will run along the bank of the river, giving a natural wagon way, with not a hill to go up between the two places.

NEW MEXICO.

NOTES.—*New Southwest*, May 20: The Black Hawk mine, at Ballard's Peak, is producing some very rich ore. .....Messrs. Higby & Crawford will soon begin work on their mines in Ballard's Peak district.....Thirty-five thousand dollars was paid yesterday through the bank of Porter & Crawford for mining property in southern New Mexico.....The Silver City Co.'s mill started up on Tuesday morning on Sherman ore, and has been running steadily ever since. There are over 100 tons of Lone Mountain ore in the bins awaiting treatment.....Work on the Sherman mine progresses satisfactorily. The 100 level has changed somewhat, and is much more mineralized, particularly in the south drift. Low assays have been made during the week from this drift. The stopes above the tunnel level have been producing about 8 tons of good ore per day, and are looking well at present. The shaft house is now completed. The Silver City Co.'s mill is now crushing 100 tons of ore as an experiment. The result will be known in a few days.

GRANT CO. COAL BEDS.—About one year ago Louis Anderson and Wm. H. Fickles discovered coal in the Little Burros, about 9 miles southwest from Silver City. The lowest outcropping vein at the bottom of a large gulch is about 20 inches. There is another vein 6 ft above the first, about 12 inches in width, and a third outcropping about one mile from the first discovery is about 8 inches wide. A coal basin with outcroppings of horizontal layers of sandstone can be seen for about 8 miles southwest by northwest, and two miles wide, when it disappears under the mesa. The discoverers have located one section of this coal land.

UTAH.

COPPER.—Utah *Times*, May 7: The O. K. copper mine in Beaver Lake district is still working. There are two shafts down to the depth of 75 ft, 20 ft apart and are connected by a drift at the bottom; thence a drift is run 80 ft across the ledge to strike the hanging wall which, we believe, was never struck. They then started to sink the old shaft, which was about 16 ft deep, and now have it down over 100 ft. Some very rich carbonate ore has been found, which looks very favorable for a silver-lead mine.

NOTES.—The old Hickory mine in North Star is still working, it having been leased by A. F. Thomas, who is taking out some good ore.....The South Horn is down 200 ft. It is looking very favorable in the bottom, and it is expected that a few feet more will strike ore.....The St. Marys is working with very gratifying success. This mine has a fine showing of ore—the biggest to be seen in the county.....Work on the 400 level continues without much change, except that the formation is softer than usual, which is certainly very encouraging.....The Cactus is down over 50 ft. The ore still continues as usual. The water increases a little but so slow as not to interfere with the workings of the mine.....A contract has been let to sink a shaft on the Comet mine. The tunnel will continue to be run just the same until the hanging wall is struck. The ore contioues the same as usual.....The contract let by Messrs. Ferrell & Sparks was finished during the week. The mine is much improved, and it is to be hoped the owners will not let it remain idle long..... The Mammoth tunnel is progressing, and is very near the ledge.....There is quite an excitement over the discovery of a 20-ft ledge about 5 miles north of Copper Ouich, near the Young America mine. The lucky owners are working away for all there is in it, and if the reports from there are true, we may soon expect to see a new bonanza opened up. We wish the boys success.

THE Commissioner of the Land Office has refused to deliver certain land patents, having ordered an investigation into alleged frauds in the entries on which they are based.

The Unsuccessful Prospector.

For six long years I've tracked the trail
Behind that faithful burro's tail;
For six long years I've sought to find
A trace of treasure of some kind.
I've climbed almost from pole to pole,
And dug full many a prospect hole.
Alas, my fortune must be bound
In rocks that are not to be found.
How often have I watched yon sun
When a day's search was nearly done,
Tarry above the lofty crest
Of the gray mountain's rocky breast,
And spread it's sheets of brightest gold
In beauty wondrous to behold;
I've watched it till the twilight's gleam
Dispelled the vision like a dream;
Its red gold lingered on my mind
Like incense on a summer wind.
Oh, could I find such brilliant ore,
I'd dig the earth from core to core!
But no. My fate seems buried deep
In failure's dark chaotic heap.
I cannot strike the longed-for lode,
Or find the dark occult abode
Of veins and leads that assay high,
That capital dare risk to buy.
No, burro, we'll give up the chase
And settle in some quiet place;
To copper stains we'll bid farewell,
A last adieu we'll fondly tell
To calcite drops and heavy spar,
To iron caps and red sand bar;
All will be, as a legend old,
Etched upon silver leaves and gold.
This well-worn pick I'll cast aside,
This shovel plant on yonder slide,
A monument to wealth unfound,
Neath porphyrish and quartz ground.
Come, burro, let us hie away
And search but for another day.

—*Socorro Sun.*

Annatto.

We give on this page an engraving of the foliage and seed capsules of ashrub which has a peculiar agricultural interest in this country, in that the interest lies rather in its use than in its growth. It is the plant which yields the yellow coloring matter used for imparting a golden hue to butter and cheese, whenever the dairy man finds that his market value is improved thereby. It is a plant of many names, and may be called annatto, or annotto, or annotta, or arnatto, or arnotto. Or, if none of these suit, it may be called rocou, or orlean, or achiote. The botanist, however, escapes from this maze of synonyms and names it *Bixa orellana*. Botanically, the genus *Bixa* belongs to the order *Flacourteaceæ*—a natural order of exogenous plants, allied to the passion flower, consisting of shrubs and small trees, almost exclusively confined to the warmest parts of the globe. The genus *Bixa* is distinguished by complete flowers with simple stigma, a bispid calyx of five sepals, and a two-valved capsule, as may be seen in the engraving. The shrub annatto is a native of tropical America, but has been introduced in other warm countries, and is now grown for its commercial product in Africa, the East and West Indies and South America, but is chiefly cultivated in Guadaloupe, Cayenne and Martinique, and sparingly in Mexico and Brazil. In the three French colonies named they have about 6,000 acres of land in cultivation, and produce annually about 3,000,000 lbs. of the commercial annatto.

The coloring matter in the plant lies in the pulp which invests the seeds. It is of a reddish color, and the yellow tint in butter and cheese is secured by great dilution—a little excess would give the material a deep red color. The natives in the countries where the shrub is grown, employ various methods to separate the coloring matter from the seeds and reduce it to a merchantable form.

1. The pulp and seeds are treated with hot water, left to macerate in the presence of an anticeptic, and separated by pounding with a wooden pestle; the seeds are strained off, the pulp is left to settle, the water is decanted, and the coloring matter, in a pasty condition, is exposed in shallow vessels to dry gradually in the shade. When sufficiently consistent, it is made into rolls or balls of two to three ounces, and dried in an airy place. 2. The entire ripe fruit is coarsely crushed, treated with hot water, and soaked for several days; the seeds are then strained off, and the pulp is left to ferment for about a week; the water is poured off, and the dye-stuff is dried in the shade till it can be made up in cakes of three to twenty pounds, and covered with banana leaves. This is known as "flag annatto;" it is inferior, owing to the fermentation. The fresh article contains about 5½% of coloring matter and over 70% of water. 3. The Indians adopt a laborious process. They rub the fruit with oiled hands till the pulp is separated and reduced to a clear paste; this is scraped off the bands and laid on leaves to dry in the shade. The product is very superior.

The Indians rub the coloring matter into the skin of their whole bodies, thus intending both to adorn themselves and to obtain protection against the bites of mosquitos. Annatto is used in medicine for coloring plasters, ointments, etc. and in dyeing it was formerly largely employed to impart an orange tint to simple yellows, but it does not impart a permanent color and other materials have been substituted for it. It is also used in some varnishes. In South America, it is very extensively mixed with chocolate, both for color and improving the flavor. The seeds are said to be cordial, febrifugal and astringent. The roots are used in broth and have the properties of the seeds, but in an inferior degree.

The Age of Gold in Chile.

From the time of the Incas the enormous auriferous resources of Chile have been generally recognized, and almost every historian of and traveler in South America has given prominent notice to the region, yet those resources are still but partially developed, and for generations the mass of the inhabitants have been in absolute poverty. This is no doubt attributable in a great measure to the fact of Catholicism being the prevailing religion, for it is observable that wherever that system is practiced, ignorance and misery rule supreme. Industrial prosperity can scarcely exist under it, and it is precisely in those countries where it has least influence that social progress is greatest. Spain has long since sunk into nothingness, and her former South American colonies are in no better position. Ireland has grown worse and worse in proportion as influence has been given to a servile and half-educated priesthood; and Italy, after having been sunk into the greatest depths of crime and misery under similar influence, is recovering in proportion as the control of Catholicism is being broken down. The display of greater tolerance in Chile will have an equally favorable effect on the community, and it may be hoped that industries which have long been neglected may be revived. Chilean gold mining should be among the earliest revivals, for Rosales, in his "History of Chile," has described it as "*una de las provincias mas opulentas de oro que se an descubierto en la America.*" And this is confirmed by the French traveler, Frezier, who, writing in 1716, remarks that it may be said generally that the whole country is very rich, though the inhabitants are very poor in money, because instead of working their mines they content themselves with the business they do in hides, tallow, dried meat, hemp and corn.

FOLIAGE AND FRUIT OF THE ANNATTO PLANT—Bixa orellana.

There now seems to be a disposition to offer greater encouragement to miners, a circumstance which adds much to the interest of Mr. Mackenna's work on the "Age of Gold in Chile." "*La Edad del Oro en Chile o sea una demostracion historica de la maravillosa abundancia de oro que ha existido en el pais, con una reserna de los grandes descubrimientos argentiferos que lo han enriquecido, principalmante en el presente siglo, i algunas recientes escursiones, a las rejiones auriferas de Cataxilco i quedradas de Alvarado i Malcara. Por B. Vicuna Mackenna. Santiago: Cervantes. Valpariasiso: J. Purves, Calle Esmeralda,*" which forms a large volume of about 500 pages. It appears that Mr. Mackenna's object in writing the book has been to call the attention of his countrymen to the necessity of an alteration in the mining laws—assimilating them to those of Australia and of California, in order that the auriferous wealth of the country, which unquestionably exists, may be explored, and produce the same grand results that have followed the gold discoveries in the countries mentioned.

Mr. Mackenna explains that the title of his book is more historical than statistical, more demonstrative than industrial, more elegant than economic and speculative, sufficiently explains his object, while the variation of his one Spanish letter explains the nature of his discourse and his argument. He does not say "*la edad de oro en Chile,*" but "*del oro*"—not the golden age in Chile, but the age of gold. He maintains that the colonial age was certainly not the "*edad de oro*" which the poets have sung about and the historians imagined concerning this distant country. Quite the contrary; that was the age of dejection, of ignorance, of catastrophe, of shame, and of weeping. But at the same time it was undoubtedly the "*edad del oro,*" for, as the conqueror, Pedro de Valdivia, said, the entire country was nothing but "a mine of gold," although every grain of it cost his subjects, by the inclemency of the weather, the war, and the conquest "*cien gotas de sangre i el doble de sudor*"—100 drops of blood and 200 of sweat. Gold was very abundant in these ages of gold; in fact, the soil appeared to be impregnated with the precious metal, and in Mr. Mackenna's opinion it really was so, but, as in the present day, it was disseminated in molecules so small and difficult of amalgamation and recovery that it was only by a total change in the processes, individually and collectively, that great results, especially in the virgin soil of Arancania, could be looked for. But it is indeed not drops of sweat, much less drops of blood, which are required for the working of the gold on a large or on a small scale in these days of liberty and of moral and mechanical progress, but drops of engineering condensed into steam, or hydraulic power, applied to colossal winding machinery, destined to replace the weak and dejected slave of the Encomiendas and the slow and fatiguing mill which grinds the auriferous quartz during the rains only, and at the rate of but three or four ounces of powdery gold per day.

Commencing with an account of gold in Chili in the time of the Incas, Mr. Mackenna maintains that the primitive Chilenos were unacquainted with the use, the value and the working, the art of working it being learned from the Peruanos, and that even these employed it solely for ornamentation, and not as a medium of exchange. He refers to the imponderable accumulation of gold by the Incas, from the production of the mines of Peru and Chili, to the hawser of Huascar and the chain of the Jesuits of Santiago, and to the riches of the Temple of the Sun, and of the mines of Carabaya, mentioning numerous subsequently ascertained facts by way of verification. With regard to gold in Chili in the time of Don Pedro de Valdivia, the author refers to Marga-Marga, Quilacoya, La Imperial, Osorno and Nillareca, and he devotes an entire chapter to the gold crisis in the 17th century, dealing with the gold resurrection in the 18th century in the following chapter. After noting the favorable auspices under which the new century commenced for the gold miners of Chili, he explains that the general poverty produced by the catastrophee of the 17th century led to active work, and consequently to discoveries; and he refers in turn, and among other things, to the gold mine of Tiltil, in 1713, to the important gold discoveries in Copiapo in 1706, to the travels of Frezeir in Copiapo and La Serena, mentioning that the scientific opinions of Frezier as to the formation of gold correspond with the modern theories, to the antiquity of the Cangalla, to the mines of Lampagui and the reason of their abandonment, to the relative poverty of quartz mines as compared with gold placers in Chili and in other parts of the world, to the discovery of the mines of Potoria and Ligua, and to the abundance of gold in the neighborhood of Santiago, inducing an application for the establishment of a mint there in 1730, and Mr. Mackenna considers that the Santiago mint would not have been brought into existence either for silver, copper, or the *equivoccacion del rei*, had there not been the gold. Much interesting information is given concerning this mint, and it appears that the maximum production was reached in 1800 and 1810, and that during the century more than 2,000 quintals (100 tons) of gold was coined —"*la enorme suma de 2250 quintales, o sea una verdadera montana de oro accumulada durante un siglo.*" There are chapters on gold in the north of Chili (Atacama and Coquimbo) in the 18th century, and on gold in the central region (Del Bronco al Chivato) during the same period, whilst the succeeding chapter treats of Chili considered as the first gold-producing country of America and of the world, before the discovery of California. The two succeeding chapters are of great practical interest, since they deal with the questions of the waste and loss of gold in reduction in Chili, and of the decay of the age of gold in that country. California and Chili are then compared, and there are excellent accounts of the auriferous gravels of Catapilco, first prospected by Dr. Burnes, and of the quebradas of Malcara and Alvarado, in the province of Valparaiso.

But the matter referred to in Mr. Mackenna's volume which is the most likely to have a beneficial influence on the future of the gold-mining the industry of the country is that reserved for last chapter, which treats of Chilean gold legislation, and the necessity for its reform. Mr. Mackenna fully recognizes the excellency of the Mining Code of 1875, but very properly contends that it has many defects, the principal of which he has carefully pointed out, and the amendments which naturally suggest themselves are likely to be speedily carried out, for Mr. Vicuna is a Senator of the republic, and his motion for a reform of the mining laws was carried unanimously in July last, and was when the book left Chili (December last) in committee, so that it may be hoped that ere long Chili will have a mining code of so complete and liberal a character that her mines will be fully and profitably developed, and thus benefit the entire community.—*London Mining Journal.*

Oro Blanco and Arivaca Districts.

The Wareaw mill, in Oro Blanco, continues to do custom work on ore furnished by the neighboring mines, some of which are reported to be quite rich, especially the Golden Star, owned by Mr. A. S. Searle, the second-grade ore working at the mill over $90 per ton. Another valuable discovery has been made by Pickett & Co., just inside the Sonora line, known as the San Jose mine. Some of the richest ore seen in that section of the country is said to have come from it. The vein is large and has thus far shown improvement with corresponding depth. The Arivaca mill is crushing ore from Mr. Blanc's mine, which promises well to be the bullion king of that district. The Arivaca mill is under contract to crush 300 tons of the ore, none of which is said to work less than $60 to the ton. There is every possibility of the mine having a mill of its own. If the 300 tons now being worked give a satisfactory result, the mill will be at once put up. Reports vary as to its size, some say 20 and others that 60 stamps will be put in operation. The ledge is about 40 ft. in width and for fully 1,500 ft. comes out of the ground from 10 ft. to 20 ft. in hight. It had been located a half dozen times before coming into the hands of Mr. Blanc, its present owner, but as the surface of the rock was of no value, none of its previous owners had enterprise enough to break through the barren crust and into the free gold and chloride silver-bearing rock within. The formation of the quartz is a black hematite mixed with free gold and silver chlorides. The oxide of iron being exposed to climatic influences, decomposed, and partially dropping off hid the true nature of the ledge. A short distance down the hill from the ledge croppings, the earth was found to be pretty thoroughly impregnated with fine particles of gold, but as the surface appearance of the ledge indicated that it was barren, no further attention was given it until Mr. Blanc broke through the crust and revealed its true nature. Two men only are at work on it, but the rock is so soft that they can more than keep three teams constantly hauling to the mill ten miles distant. No sinking is being done at present; the men are simply drifting and taking out the ledge that crops above ground. Several wealthy Frenchmen in San Francisco have interested themselves, and as soon as the necessary arrangements can be made the mine will be developed for all it is worth.—*Arizona Citizen.*

THE POCKET MINES in and around Sonora continue to make the prospectors happy. Indirect reports are heard frequently of this or that one taking out a handsome sum. An old miner is said to have come upon $7,000 last week. Gold is being all the time found, but the lucky ones don't care for the world to know it, to be questioned to death and have themselves surrounded with others to interfere with their work.—*Tuolumne Democrat.*

The Engineer.

The Term "Engineer."

The extensive use of the term "engineer" in the sense of a man of education and scientific attainments, who designs work and directs the efforts of others, has raised the question in the minds of some members of the profession whether some other word than this cannot be devised for designating those men who tend engines. The English term "engine driver," has been suggested for this class of men, leaving the term "engineer" to be applied exclusively to the man of education. While this distinction may seem very desirable in the minds of some, we doubt if such a change is necessary. We think it hardly possible that any great confusion can ever arise. It certainly would be difficult to effect a change as radical as this in habits of writing and speaking that are already formed. Should the engineers who manage engines ever become ashamed of their brothers who design engines, it will be a proper thing for them to take some steps to originate a term by which they can be designated without fear of mistake. Seriously speaking, if any distinction in terms is to be made, or if a new name is to be introduced, it should belong to the educated members of the engineering profession. The usage of centuries is not easily changed by arbitrary distinctions. From time immemorial the term "engineer" has been applied to those in charge of engines—not necessarily steam engines, for the term is older than the invention of the steam engine, but to those who managed engines of war and mechanical devices of various kinds. The attempt at the present time, upon the part of the educated gentlemen of the profession, to restrict the use of the term "engineer" to themselves, to the exclusion of those who perhaps know as much, but who make less pretentions to academic honors, may be only another instance of an engineer hoist with his own petard.—*Iron Age.*

The New Revolution in Passenger Steamships.—When the artisans of Great Britain substituted the screw for the side paddle-wheels, and the compound engine for the old-fashioned low-pressure condensing engine, these improvements insured a revolution in the commerce of the world. There have probably been 500 modifications of the screw, all tending to make it a more perfect instrument of propulsion. A vast number of experiments have been made for the purpose of obtaining a composition which would stand the greatest wear and tear. Cast iron, steel, gun metal, composition, and brass, have all been used. The number of blades, the pitch and the revolution have all been made matters of scientific study. The compound engine, involving a double use of steam, secured a great increase of power with an immense reduction in the consumption of fuel. It is possible now to drive a large steamer 20 miles an hour with less fuel than was formerly used to obtain a speed of 12 miles an hour. The average time of the fastest steamers between New York and Liverpool is now about three hours less than 10 days. Notices from time to time have appeared in Eastern journals of a new steamship company which proposed to establish a line between the east end of Long island, at Fort Pond, and Milford Haven, in Wales. The programme of the company is to make the average time in seven days and five and one-half hours, at an average speed of 18 miles an hour. But at a speed of 20 miles an hour, for which the ships will be designed, the time would be six days and thirteen and one-half hours.

An Underground Railway at Naples.—The Naples correspondent of the London *Daily News* writes: The Naples Town Council has approved the project of Mr. Lamont Young for a subterranean railway uniting the different parts of the city, under the name of the Metropolitan Railway, and charged two assessors with the task of studying the technical and legal points of the plan. Part of the railway will be in the open air and part in tunnels under the hills that lie west and north of the city, and under some of the principal streets. Instead of steam, compressed air will be used, and the tunnels and carriages lighted with gas. One of the novelties of this railway is that from an underground station in the body of a mountain, called Vomero, it will be connected by means of a subterranean lift with an open air railway immediately above, running through the villages on the top of said mountain. From the underground station this lift will ascend more than 500 feet to reach the upper station on the top of the Vomero.

De Lesseps's New Project.—The French Cabinet Council has approved the scheme of M. de Lesseps's for cutting a canal through the neck of land dividing the Gulf of Gabes from the salt marshes and low-lying parts of the desert of Sahara to the south of Tunis. It is expected that the sea will, in virtue of this cutting, once more fill up a considerable portion of the Sahara. The political advantage to be obtained by the scheme, if it succeeds, will be the insulation of Tunis and Algeria by creating a water barrier between them and Tripoli. The cost of the canal, it is estimated, will be 65,000,000 francs.

Patents in Germany.—Last year there were 7,177 applications for patents in Germany; 4,339 were granted. This is the largest number granted in any year save one, 1879, when the number of patents issued was 4,410.

Useful Information.

South American Woods.—As the supply of hard woods for mechanical arts and for decorative purposes declines in this country, it is well to know where to look for the means of replacing it. Brazil seems to offer an inexhaustible supply of hard and decorative timber. Within an area of half a square mile, Agassiz counted 117 different kinds of wood, many of them admirably fitted by their hardness, tints and beautiful grains for the finest cabinet work. The *muirapinima*, or tortoise-shell wood, undoubtedly the most precious wood in the world, is found in large quantities on the tributaries of the upper Amazon, where the water can be easily used as a motive power. Many varieties of beautiful woods, easy rivals of the finest black walnut, are wasted yearly on the Amazon in amounts sufficient to veneer all the palaces of Europe. Maurice Morris, the explorer, believes that with the facilities which the Brazilian government is ready to impart to enterprising industry, the export of these commodities would yield enormous profits in a short time, while the amount of capital engaged need not be great. It is only necessary that these woods be introduced into the market to obtain a decided preference over those now most sought after in the two hemispheres.

A Whitewash that Will Stick and Wash.—We find in a German paper a formula for a wash which can be applied to lime walls and afterward become waterproof so as to bear washing. Rssenschek, of Munich, mixes together the powder from three parts silicious rock (quartz), three parts broken marble and sandstone, also two parts of burned porcelain clay, with two parts freshly slaked lime, still warm. In this way a wash is made which forms a silicate if often wetted, and becomes after a time almost like stone. The four constituents mixed together give the ground color to which any pigment that can be used with lime is added. It is applied quite thickly to the wall or other surface, let dry one day, and the next day frequently covered with water, which makes it waterproof. This wash can be cleansed with water without losing any of its color; on the contrary, each time it gets harder, so that it can even be brushed, while its porosity makes it look soft. The wash or calcimine can be used for ordinary purposes as well as for the finest painting. A so-called fresco surface can be prepared with it in the dry way.—*Scientific American.*

Smell of Paint.—To get rid of this most objectionable odor in a chamber or a living-room, slice a few onions and put them in a pail of water in the center of the room; close the doors, leave the window open a little, and in a few hours the disagreeable smell will have almost gone. Another method is to plunge a handful of hay into a pailful of water, and let it stand in the newly-painted room over a night; this plan is also effectual. The foregoing have the important advantage of being simple remedies, as the necessary materials are always easily obtainable. Yet another plan, but it is rather more complicated. Place a grate of lighted charcoal on a piece of flag or slate in the center of the room, and throw on it a handful or two of juniper berries; shut out all ventilation from the room for 24 hours. The doors and windows can then be opened, when it will be found that the nasty sickly smell of paint has entirely gone. The furniture may be left in the room during the process, and none of it will be injured. But the best way to avoid the smell of paint is by not having the painters in the house.

Black walnut can now be manufactured very cheaply. One part of walnut peel extract is mixed with six parts of water, and the wood is coated with the solution. When the material is about half dry a solution of bi-chromate of potash with water is rubbed on it, and then your walnut is ready. Furniture dealers have been known to make excellent walnut from very poor pine, but the difference was slightly perceptible; however, this method is said to defy detection.

Preventing Forest Fires.—The idea that the best way to prevent forest fires is to burn all trash and small undergrowth annually, seems to gain popularity. One who is well posted in forestry matters says: "If the undergrowth is kept down and dead matter not allowed to accumulate, there will be no fire to hurt the live trees. We know a piece of woods that is burned under every year by sparks from the Reading railroad locomotives, but the standing timber has never been injured. It will not cost a thousandth part as much to clear out all the brushwood in the United States as we lose in one year by the forest fires, and the true way to preserve our forests must start from just here. At any rate, this idea removes the great objection to forest planting—that it may get burned. If rank vegetation is kept down for a few years during the growth of the forest, it will, by its own shade, keep down the growth thereafter."

The Gutta Percha Supply.—Reports from Brazil show that the supply of gutta percha, which is used in insulating underground wires, is fast giving out, and will be exhausted in 30 years. It is said that this prospect of a scarcity in insulating material is one of the chief reasons for the strong opposition by interested parties to underground telegraphy.

When to Cut Timber.—July and August are esteemed the best months in which to cut timber, especially for fuel, in so far as durability goes. The growth of the year is then nearly over, and if the trees are allowed to lie until the green foliage dries upon them, the greater portion of the sap is thereby withdrawn from the wood, and the seasoning is rapid and perfect. When cut in midsummer, insects are less liable to attack the wood, and this is an important point with some kinds of timber.

Machinery vs. Cheap Labor.—It is one of the most striking illustrations of the power of machinery that cotton can be brought from the far interior of India, on the backs of bullocks to the sea, shipped around the Cape of Good Hope to England, manufactured, shipped back by the same route, paying repeated commissions and profits, and undersell the native manufacturer on the spot where the raw product is grown, and where labor is considered well paid at 15 cents a day.—*Senator Bayard.*

Cleaning Lime choked Pipes.—Feed, water and other pipes frequently become choked with lime incrustation, causing great annoyance. The following plan has been suggested as a remedy: After plugging one end up securely, pour the pipe full of coal oil, letting it stand over night, when the whole mass will probably slide out. Pipes have been cleared of incrusted matter in this manner which before were regarded as useless.

An experienced cabinet maker says that the best preparation for cleaning picture frames and restoring furniture, especially that somewhat marred and scratched, is a mixture of three parts of linseed oil and one part spirits of turpentine. It not only covers the disfigured surface, but restores wood to its original color, leaving a luster upon the surface. Apply with a woolen cloth, and when dry, rub with woolen.

The spruce gum industry of Maine is represented to be in a highly flourishing condition. Men who range the woods collecting the gum make good wages, selling the article for 40 cents a pound. Altogether, residents of the State obtain $40,000 yearly by the sale of the article.

Rust may often be removed from steel tools by immersing them in kerosene oil for a few days. This loosens the rust so that it may be rubbed off. Where the rust is not very deep-seated, emery paper will do; but if of long standing, the tools must be refinished.

Good Health.

Is Cold Weather Healthful?

The notion that cold weather is healthful has doubtless sufficient foundation in fact to prevent it being classed among "popular fallacies," but, like the Constitution of the United States, it may, perhaps, suffer amendment to advantage. Of course, by cold weather is not meant that which the thin-blooded, the effeminate and the invalid consider such. Anything approximating the freezing point is sufficient to set them quaking and complaining. We demand for cold weather a temperature that any healthy, vigorous individual will concede to be such—zero is about right. Yes, it is cold when the snow crackles, when the very best varnish will occasionally crack on the sleigh, and when the cheeks and ears of the sleigh's occupants wear a hectic color; while their noses and fingers, and presumably their toes, are of a frigid blue. We take it that all but those of exceptional robustness are vulnerable at these points to a zero temperature. These tingling fingers and aching toes are trifling matters, to be sure, but it will not be claimed that they are the indication of a sudden influx of health. May they not be warnings? The effect of extremely cold air upon the lungs or on a rheumatic shoulder is often unmistakably bad. It seems to us that right here is indicated where the line should be drawn between a healthy and unhealthy degree of cold. Let the test be comfort—fingers and toes included. Down to this point where the brisk air continues to produce a pleasurable exhilaration, it is probably healthful, but when the extremities, though well protected by wraps without and a good circulation within, grow cold, this should be regarded as a warning that the healthful limit has been passed. We beg to suggest caution in drinking these drafts of health proffered by old Boreas, as, like some other iced beverages, they might be more wholesome without the ice.—*Metal Worker.*

Dead Drunk.—M. Grehaut made an interesting communication to the Biological Society of Paris at a recent meeting, on the subject of fatal doses of alcohol. In order to determine what quantity of alcohol is present in blood when death ensues from drinking it in large quantities, he made a series of experiments, all of which gave the same results. By means of an œsophageal syringe, he injected into the stomach of a dog 30 grams of alcohol every half hour until the dog died. He then collected some of the blood of the animal, scrupulously taking the same precautions as when an analysis of the gases present in the blood is made. He then distilled it *in vacuo*, using for the purpose, with the necessary modifications, a mercury pump, such as is employed for analyzing the gases of the blood. M. Grehaut's experiments convince him that death happens when the blood of the animal presents the proportion of one part of absolute alcohol to 100 of blood; that this substance acts directly on the constituent elements of the blood; that the condition known as "dead drunk" exists when drunkards continue drinking, but when the alcohol imbibed ceases to be absorbed and the blood presents the proportion of one part of alcohol to 195 of blood; that is to say, almost the half of the quantity present in the blood when death is caused by drinking. M. Grehaut believes that, if death from drunkenness is less frequent than might be expected, it is because drunkards generally stop drinking when this proportion exists (one in 195).

A Rich, Unprospected Region.

The finest field for profitable prospecting there is on this coast, or on the continent perhaps, is that embraced within lines drawn westerly from the Dog Town placer diggings to the summit of the Sierra, north of the head of Green creek, thence southerly along the summit to Tioga Hill, thence south-westerly and west of the summit (for the precious metals are found on both sides of the summit south of the middle fork of the Tuolumne), to the headwaters of the north fork of the San Joaquin, thence easterly across the summit to the head of Deadman's creek, and thence northerly along the eastern base of the range to the place of beginning. This area embraces Jordan, Castle Peak, Homer, Tioga and Prescott districts, and some territory not embraced in either; and portions of Mono, Tuolumne, Mariposa, and Fresno counties, though most of it is in this county. The mountains are lofty and rugged, but can be traversed at almost any point by saddle or pack animals; water is everywhere abundant, and timber and grass plentiful in every canyon and on every slope; the climate is delightful during the entire summer, the nights being cool, and the country is as safe for travelers as the San Joaquin valley, the few fierce beasts that stray up to that altitude finding plenty of game to satisfy their appetites. The country is rich in gold, silver (in all its forms and combinations), zinc, antimony and galena. Though many valuable ledges have already been located and are now being developed in both Homer and Tioga, neither district has yet been half prospected. Lundy, being near the center of the region bounded—being in the center of Homer, four miles from the center of Jordan, six miles from the head of Green creek, nine miles from the center of Tioga, and 16 miles by good wagon road from Prescott—would be the best place to outfit at, as all articles necessary can be procured here at as low rates as they can be purchased elsewhere. Accurate assays can also be obtained here, and Tioga will probably have an assay office within a few months.—*Homer Mining Index.*

Fat of the Old and Young.—The influence of age on the chemistry of the body is a department of physiology as yet very imperfectly investigated. The composition of the fat, however, at different periods of life, is obviously one of the simplest problems connected with the question, and it has been lately investigated by Lanquer. In newly born children the fat has a particularly firm consistence, constituting a peculiar tallow-like mass, with a melting point of 45° C. The fat of adults, however, separates at the ordinary temperature of a room into two layers. The upper layer is completely fluid, translucent and of a yellowish color, and only solidifies at temperatures under zero, Centigrade. The lower layer is a crystalline mass, which has its melting point at 36° C. Further investigations were made on about a kilogram of each kind of fat. The fatty acids obtained from the fat of newly born children (after precipitation with hydrochloric acid) were found to melt at 51° C., and those obtained from the fat of adults had a melting point of 38° C. The former was found to contain three times as much palmitic and stearic acid as the latter. The palmitic acid preponderated over the stearic in each kind of fat, but much more in that of children than of adults, the proportion being in the former four to one, but in the latter nine to one. There are 86% of oleic acid, 8% of palmitic acid, and 2% of stearic acid in the fat of an adult; whereas in the child the proportion of oleic acid is only 65%, the palmitic acid 28%, and the stearic acid 3%.

Success in life depends, to a very great extent, on a good digestion, a trustworthy set of nerves, and the power of being always "there or thereabouts" when the course is cleared. The time is rapidly approaching when an interview with a really pleasant food will afford a most charming change and welcome relief from the most overwhelming knowingness and priggishness of our premature brethren. Nor is the mischief of the masculine gender only. The Juggernaut car of the driving and competitive system is crushing beneath its wheels many of our daughters and sisters. The female candidates for the "locals," the aspirants for the class lists and the trines, go in for a strain to which the average female organization is unequal. The way is strewn with wrecks, broken hopes, broken health; but we suppose that the great principle of the survival of the fittest will here assert itself, and that in a future day it will be said of some great light that "his mother was 'senior wrangler,' bracketed with the Bishop of Banbury."—*London Globe.*

TABLE OF CONTENTS.

EDITORIALS.—Consolidated Claims; Cushion Protector for Bottles; Bank Blasting; New Brake-Block; Roasting Ores in Mexico, 353. Annatto, 358. Passing Events; Cam Shafts and Cams; Timber on Mineral Lands; End Lines and Side Lines; Small Mines, 360. Production of the Precious Metals.—No. 11, 361. Notices of Recent Patents, 364.

ILLUSTRATIONS.—Thorpe's Cushion Protector for Bottles; Arrangement of Wires for Exploding Blast; Spencer's Patent Brake-Block, 353. Foliage and Fruit of the Annatto, 358.

CORRESPONDENCE.—Another Raid on the Congressional Mining Act; Ancient Gravel Channels and Ridges; Mariposa County Mines, 354.

MECHANICAL PROGRESS.—Cause of Variations in the Strength of Cast Iron; Smoke Consumption; Steel as a Structural Material; Stored Electricity, Manganese Bronze for Propellers; Durable Mortar; American Locomotives for Mexico, 355.

SCIENTIFIC PROGRESS.—Science of Value to all Men; A New Telephone; Danger from Sodium; More Scientific Prizes; A Photographic Sun; Sun-spot Periodicity; Tracing on Glass for the Lantern, 355.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board. Notices of Assessments, Meetings and Dividends, 356.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, New Mexico, Idaho, Oregon, Idaho, and Utah, 356-7.

THE ENGINEER.—The Term "Engineer;" The New Revolution in Passenger Steamships; The Underground Railway at Naples; DeLesseps' New Project, 359.

USEFUL INFORMATION.—South American Woods; A Whitewash that will Stick and Wash; Smell of Paint; Preventing Forest Fires; The Outta Percha Supply; When to Cut Timber; Machinery vs. Cheap Labor; Cleansing Lime-Choked Pipes, 359.

GOOD HEALTH.—Is Cold Weather Healthy; Dead Drunk; Fat of the Old and Young; Success in Life, 359.

MISCELLANEOUS.—Chloridizing and Oxidizing Processes of Copper Refining, 354. The Age of Gold in Chile; Oro Blanco and Arivaca Districts, 358.

NEWS IN BRIEF on page 364 and other pages.

Business Announcements.

Mill and Mining Machinery, F. A. Huntington, S. F. Dividend Notice, Bulwer Con. Mining Company, S. F. Piston Rod Packing, Gen. C. Phillips, Silver City, Nev. Mission Soap and Candle Works, M. Morgenthau S. F. Crusher for sale, F. R. J. Dixon, Greenwood, Cal.

Passing Events.

The local papers say that the rush to Wood River and to Butte still continues. Many hundreds of men are going into those regions with high hopes doomed to disappointment, unless they are provided with means to prospect with. There are so many there now that those in search of employment will find it difficult to procure. For prospectors, however, the regions alluded to hold out apparently good inducements.

Mining news generally appears to be pretty good. In this State men are busy everywhere, and the mines are doing well. Up on the Comstock they are looking for bonanzas, and no doubt, should one be found, matters along the lode would look up again.

We shall, on the 17th inst., issue a double number of the MINING AND SCIENTIFIC PRESS, filled with matter more or less pertaining to "hydraulics," and intend to make an exceedingly interesting number. Any of our readers who may be able to contribute anything of interest in this line we shall be glad to hear from.

MR. LEWIS CHALMERS, manager of the Isabelle G. & S. Mining Co., of Alpine county, has left for London, England, intending to be absent about two months. The recent developments in the company's mine (the Stella) are deemed of sufficient importance to require the manager's immediate presence at the home office. The building of a much-needed mill nearer the mine and the erection of suitable hoisting works will probably receive the proper attention of the manager.

Cam Shafts and Cams.

In California quartz mills the cam shaft is a round shaft of iron which is smoothly turned and finished, having one or two key seats or grooves cut in it lengthwise, for the purpose of securing the cams in their places. The shaft rests in boxes, which are usually supported by cobolders cut in the upright parts of the battery frame. Cam shafts vary in diameter from four to six or seven inches, according to the number of cams to be fixed upon them and the weight of the stamps to be raised. In some mills a single cam shaft is made long enough to carry all the cams for as many batteries as there may be. This is an inconvenient arrangement, however, and in this State and Nevada it is the almost invariable practice to make the cam shaft short, a separate shaft being employed for each battery of five stamps, or, in some cases, one shaft for two batteries.

Separate cam shafts are preferred, on account of the independence of each battery, so that if one be stopped by any accident to the cams or the stamps, or for repairs of any kind, the operation of the others is not interrupted. Each shaft in such case is driven by its proper pulley, which receives its motion, by means of belting, from a counter shaft. The number of stamps in each battery is commonly five. The order in which they are allowed to drop is not always arranged in the same manner in different mills, but the desired conditions are, that the weight of the stamp to be raised may be uniformly distributed on the cam shaft, so that the weight of metal to be lifted may be as nearly as possible the same at any moment of the revolution, and that each stamp may fall effectually upon the material to be crushed, and, by the force of its blow, aid in the proper distribution of the stuff among its neighboring stamps.

If the stamps are allowed to rise and fall in regular succession from one end of the battery to the other, the material is apt to accumulate at one end, and the effective duty of the stamps is thereby diminished. The order must therefore be varied. In a five-stamp battery a common arrangement is to let fall first the middle stamp, then the end stamp on the right, then the second stamp on the left, then the second stamp on the right, and finally the end stamp on the left. The order in which the stamps are to fall being determined, it is carried into effect by fixing the cams on the shaft in such position that each cam, by the revolution of the shaft, will lift its respective stamp at the desired moment. For this purpose the key seats cut in the hub of the cam must be determined with care; one common key seat being cut in the cam shaft, when the desired position of any given cam has been ascertained, the key seat on the hub is cut to correspond with that of the shaft.

End Lines and Side Lines.

The big mining suit of Tranquillity M. Co. vs. the Head-Center M. Co. was decided at Tombstone last week. There were some curious points involved in this controversy, bringing in, as it did, the question of end lines and side lines of mining claims. The suit was brought last December, and a temporary injunction granted restraining the Head-Center from working over the side line of the Tranquillity. According to the *Epitaph*, the Head-Center is a triangular claim, worked on the dip of the ledge beyond the line of the Tranquillity. The Head-Center claimed they had a right to follow the dip of the ledge so long as the croppings were in their grounds, even though the dip of the ledge passed beyond the vertical plane extending downwards through the line which cut the ledge on its strike. The Tranquillity maintained that said line crossing the ledge on its strike was an end line of the Head-Center. This position of the Tranquillity was maintained by the court, and the judge instructed the jury that said line must be considered an end line for the two claims, and, therefore, instructed that a verdict he entered for the Tranquillity.

Under this case, the first authoritative decision has been promulgated as to the rights of a triangular location, and makes the side of the triangle crossed by a ledge the end lines of the locators, irrespective of the dip of the ledge. The settlement of this case ends all litigation as to the rights of the different claims on Contention hill. The Tranquillity company have already started work on that part of the ledge which was in controversy, and in which large quantities of ore are exposed. Arrangements have been made for the use of 10 stamps of the Girard mill, and in the course of a week or ten days the Tranquillity will be shipping bullion, and gives promise of being a fine paying property. It is understood that the Tranquillity made an offer to compromise the case within a couple of months by giving the Head-Center 50,000 shares of Tranquillity stock in exchange for the acknowledgment of the demands won in the court. A bevy of distinguished lawyers contended for the demands of the two companies. The Tranquillity was represented by Lewis & Berry, Stewart & Harrin, and Earl, Smith, Campbell and Robinson. The Head-Center had Garber & Thornton, George R. Williams, and R. S. Mesick.

Timber on Mineral Lands.

A very important decision, of great interest to the mining community, has just been rendered by H. M. Teller, Secretary of the Interior, on the question of timber on mineral land. In view of its importance we print it in full:

My attention has been called to a number of cases, reported by special agent Hardin, of the so-called trespassers in cutting timber on mineral land in the Territory of Dakota. Notably, in the cases of Frank P. Hardin, who is charged with cutting 72 cords of wood; Peter T. Bye, charged with cutting 25 cords; Henry Bressert, charged with cutting 60 cords; J. H. Damon, charged with cutting a like amount; Frank Keller charged with cutting 47 cords, and Albert Holman, charged with cutting 100 cords. All of this wood appears to have been cut off of mineral lands of the United States. It also appears by the report of the special agent that the persons charged with the trespass have, in cutting this wood, conformed to the rules of the department as to size of the timber to be cut, etc. It is now proposed to compromise with these persons by allowing them to pay for the wood, at the rate of 50 cents per cord. I do not think, on the statement of facts made by the special agent in the cases of Hardin and Peter B. Bye, that they have been guilty of a trespass in cutting such. I understand that the facts are substantially the same in all the cases mentioned.

The Acts of Congress.

The Act of Congress, approved June 3, 1878, entitled "An Act authorizing the citizens of Colorado, Nevada and Oregon, to fell and remove timber from the public domain for mining and domestic purposes," clearly authorizes the cutting of timber on mineral lands of the United States for domestic uses. It does not appear that Peter Bye, or any other of the parties complained of, cut wood for transportation from the Territory, and if cut to be used in Dakota, it is clearly for domestic use. It has been alleged that the Act of June 3, 1878, does not apply to persons cutting timber on mineral lands for sale, and that to enable any person to have the benefit of that Act, he must cut timber for his personal use, and not for sale. Such a construction defeats the very intent of the Act which was to allow the settler on mineral lands to have the benefit of the timber thereon growing for use, within the Territory or State where it grew. It cannot be supposed that Congress intended to say by that Act to the inhabitants of the mineral regions, that while they might go on the lands of the United States and cut timber for their use, yet they could not employ others to cut timber for them, or purchase it of those who had cut and prepared it for use. Large and prosperous communities had settled on the mineral lands of the United States, by and with the consent of Congress.

The Occupation Lawful.

A statute had been passed declaring such occupation lawful, and provisions were made for securing a title to the mines that should be discovered and improved on such lands, yet no provisions had been made by which a title could be secured to the timber growing on such lands, until a mine had been discovered thereon. To have restricted the inhabitants to the use of such timber as should be found on mineral claims alone, would have been folly, for in many instances the mineral claims are destitute of timber. Whole mining districts are frequently compelled to procure their supply outside of their districts, either because the timber in such districts had been carted off and used, or because the district was without timber when first settled.

A Precept by Custom.

The area of the territory occupied by actually located mineral claims is entirely too small to supply the communities with timber from such claims alone, and so it became a necessity to appropriate timber on Government lands. In the absence of a law authorizing the purchase of either the timber or the land on which it grew, from the first settlement of mineral regions to 1876, such had been the custom of the miners in all mineral regions. Cities and towns, with churches and schoolhouses, had been built with timber so taken from the public land. Appeals had been made to Congress, from time to time, to provide by law for the securing of the title to timber on mineral lands. Congress, with the wise policy of keeping the mineral lands of the United States open to further exploration and occupation, had declined to pass any law by which timber on such lands could be monopolized by speculators and capitalists. Woodchoppers and lumbermen had, from the first settlement of the mineral regions, cut from the mineral lands wood, mining timbers and lumber for buildings, and sold the same to those who could not or did not wish to cut such timber for their own use. It was practically impossible for millmen, miners, and other inhabitants of the country, to go out and fell trees that were to be used to build their mills, timber their mines or supply their families with fuel. About the time of the passage of the Act of 1878 it was alleged that such cutting was in violation of the law, and ought not to be allowed.

A Prevention Worse than a Cure.

To have prevented such cutting would have compelled the abandonment of nearly, if not quite all, the mineral regions of the States and Territories named in the Act. The Act was passed to establish by positive enactment a right claim and exercised without interference on the part of the Government for a period of about 30 years. The construction heretofore given to it by this department has defeated the purposes of the Act, and has not been of any advantage, either to the Government or the people residing on such mineral lands. In most of the regions included in the Act referred to, the timber is of but little value for use outside of the neighborhood in which it grows. A comparatively small amount would bear transportation out of the State or Territory, and it cannot be used more advantageously to the people and the Government than in the product of precious metals. If the timber is cut having reference to the rule established by the department as to size, etc., no complaint ought to be made. It has been suggested that the use of wood in the quartz mills and reduction works in the mineral regions is not a use for mining purposes.

Indispensable Mills and Works.

I do not think there is anything in that suggestion. Quarts mills and reduction mills are indispensable to a mining community, and such use is clearly within the provisions of the law, and the consumer as fully protected by it as if he had consumed it in his own dwelling. You will, therefore, instruct the special agents now in the States and Territories named in the Act of June 3, 1878, to conform to the suggestions herein. The great object of a Governmental supervision of cutting timber in those States and Territories ought not to be to compel the payment for timber so cut, but to prevent an unnecessary waste by cutting the small trees under the size prescribed by the department, and to prevent a waste by fires and other means.

Small Mines.

It is not always the big mining company, with its complete outfit of mill, hoisting works, superintendent, president, etc., that makes the most money for its owners; nor is it always the mine whose name figures in the list of bullion shipments most frequently that ships the most bullion. The small mines here and there that are being worked successfully by a few men pay far larger profits to the individuals, as a general thing. There are in this State, for instance, hundreds of mines that largely swell the aggregate bullion production of California, but which people never hear of. The owners, working them quietly for what they are worth, do not care for any publicity, and are averse to publishing the results of their labor. Some of these are worked for years, yet few people except in the immediate vicinity, have ever heard the name of the claim or knew of its existence.

A case in point is shown in the Gold Hill mine, Smith's flat, Calaveras county, owned by George Osborn. The *Mountain Echo* says that this mine is what is usually termed a pocket claim, never having been worked by any other means than the pan. It was discovered about 25 years ago, and has been worked most of the time since. Statistics show that over $50,000 have been extracted from it during that time. Now, at this late day, a simple 10-ft. arastra is being put up to work the rock. This is one of many other claims worked in a quiet manner for many years by one or two men.

In El Dorado county, Armstrong and Baldwin took out $3,000 week before last from the Rich Gulch mine, and last week took out $1,000 more. This makes a total of fully $17,000 taken from this mine by two men's work, nearly all of which was taken out within the last two months. The Georgetown *Gazette*, in commenting on this, says:

These gentlemen are highly deserving of their success, which has been won through the most determined and commendable enterprise. While many have been busy upon the street crying down the mines, these gentlemen have had faith in mining and worked with a determination to win. There are others equally deserving of mention for their mining enterprise, and scarcely a month rolls by without some one of them making a good strike. Mining pays. How many men can you find who have mined to any extent in this district who have not made at one time, at least, a reasonable stake, say from $2,000 to $10,000 and upwards, enough to have secured a good home with. Energetic and careful mining, as a business, pays better to-day than farming. The trouble is, not one miner out of a dozen takes care of his money when he gets it. Is it not a fact that nearly all the men in Georgetown who are afflicted with the mania of "running down" our mining industry, have on one or more occasions done well in the mines. Of course they failed, through various causes, to retain their financial footing, but that is not the fault of the mines. Is it not a fact that there are men to-day doing well at mining, who will, in the future, be among those who cry down the mining industry?

THE Mono Lake Hydraulic mining company has turned the water upon its new and extensive field of operations near Mono lake, between Thomson's ranch and the mouth of Mill creek. At present only ground sluicing is going on, Mill creek being allowed to run, full head, over the slope; but as the ground is being rapidly cut away, and a high breast formed, the hydraulic pipes and giants will soon be placed in position. This ground is said to prospect well.

Production of the Precious Metals.—No. 11.

[An abstract of the Census Monograph on the Bullion output of the country.]

Reaume of Production Statistics.

The total product of each State and Territory, including the yield of the deep mines from ore which was raised prior to, but reduced during the census year, and also the silver contents of placer gold, appears in the complete exhibit contained in the following table, which shows the aggregate bullion output of the United States for the year ending May 31, 1880:

Production by Geographical Divisions.

PACIFIC DIVISION.

State or Territory.	Product. Gold.	Silver.	Total.
Alaska	$ 5,951	$ 51	$ 6,002
Arizona	211,960	2,325,826	2,727,792
California	17,150,254	1,150,886	18,301,840
Idaho	1,479,658	464,550	1,944,205
Nevada	4,888,247	12,430 666	17,318,913
Oregon	1,097,700	27,793	1,125,493
Utah	291,555	4,743,090	5,034,645
Washington	135,800	1,019	136,819
Total	$25,201,828	$21,143,881	$46 405,709

DIVISION OF THE ROCKY MOUNTAINS.

Colorado	$2,090,900	$16,549,274	$19,249,174
Dakota	3,305,846	70,813	3,376,659
Montana	1,805,768	2,905,066	4,710,834
New Mexico	49,354	392,337	441,091
Wyoming	17,821		17,321
Total	$7,878,189	$19,917,490	$27,795,070

EASTERN DIVISION.

Alabama	$ 1,300		$ 1,300
Georgia	81,030	$ 332	81,362
Maine	3,000	7,200	10 200
Michigan		25,858	25,858
New Hampshire	11,000	16,000	27,000
North Carolina	118,955	110	119,095
South Carolina	13,041	56	13,097
Tennessee	1,998		1,998
Virginia	9,322		9,322
Total	$239 646	$49,586	$289,232

SUMMARY.

Pacific Division	$25,201,828	$21,143,881	$46,405,709
Division of the Rocky Mountains	7,878.189	19,917,490	27,795,679
Eastern Divieion	239,646	49,580	289,232
Total	$33 379,663	$41,110,957	$74,490,620

The relative quota contributed by each of the three great arbitrary divisions into which the country has been apportioned is indicated in the foregoing abstract, from which it will be seen that the Pacific division furnished 75.68% of the gold, 51.43% of the silver and 62.43% of the total. The division of the Rocky mountains yields 23 60% of the gold, 48.45% of the silver, and 37.18% of the total. The prodoot of the Eastern divisioa represents .72% of the gold, .12% of the silver and .39% of the total.

The bullion produot of the deep mines of the United States for the year nnder review amounted to 35 tons 900 lbs. avoirdupois (1,033,973.1 ozs. Troy) of fine gold, and 1,087 tons 900 lbs. avoirdupois (31,717,299 ozs. Troy) of fine silver. That of the placer mines weighed 19 tons 1,824 lbs. avoirdupois (580,766.6 ozs. Troy) in fine gold, witb which were alloyed two tona 1,498 lbs. avoirdupois (80,177 ozs. Troy) of silver. The total weight of hne bullion was no less tban 55 tons 724 lbs. avoirdupois (1,614,739.7 ozs. Troy) of gold, and 1,090 tons 398 lbs. avoirdupois (31,797,476 ozs. Troy) of silver. These huge figures may be better grasped, perhaps, by considering that the gold represents five ordinary carloads, while a train of 109 freigbt cars of the nsoal capacity would be required to transport the silver. Historians have stated that dnring the early Spanish ocnpation, whole galleons were freighted exclnsively with silver from the mines of Mexioo and Peru. This would bardly seem to be an exaggeration, in view of the fact that the preseot annual product of the United States would suffice to form the full cargo of a large modern vessel.

Comparisons.

The relative proportion of placer gold to that produced by the deep mines, the percentage in each class of product of the preoious metals from the several mining regions of the United States, the average yield per square mile and per oapita in different localities, and the rank of tbe States and Territories in prodnctiveness, are indicated in tbe following exhibits:

Percentage of Placer Gold and Gold from Deep Mines in Total Gold Product.

State or Territory.	Placer Mines.	Deep Mines.
Alabama		100.00
Alaska	100.00	
Arizona	14.16	85.84

Production Unaccounted for in the Preceding Tables.

In addition to the returns received direotly from the mines, there are several minor points to be included in the total yield. A larger item tban it is usually oonsidered to be is the annual hoarding of rich speoimens. This is not accounted for in the mine produotion as reported. While it is impossible to state the aotnal amount thos absorbed with any degree of preoision, a careful estimate would place the value of the gold nuggets and ore annually added to the cabinets of collectors at not less than $150 000, and that of the silver ore at about $50,000. This, in view of the great number of mineral collections maintained throughont the mining territory, is certainly not an over-estimate.

There is also quite an extensive manofacture of gold quartz into jewelry and souvenirs, particularly in San Francisco. The value so absorbed does not probably fall sbort of $50,000 annually. In 1870 the United States mining oommissioner estimated the amount of gold hoarded as specimens or worked up by local jewelers at $400,000. The same authority, at that period, estimated the annual loss of gold-dust in handling as currency at $100 000. As the practice of using dnst for money has almost disappeared, the amonnt so lost is now very small.

Another indefinite quantity is the value of precious metal lost in melting, in assay grains, etc. Summing up the estimates for these additional items, the following result is reached:

Production Unaccounted for In Tabulation

	Gold.	Silver.	Total.
Bullion product shown in preceding tables	$33,379,663	$41,110,957	$74,490,620
Estimated value of specimens hoarded	150,000	50,000	200,000
Estimated value of gold quartz made into jewelry and souvenirs	50,000		50,000
Estimated value of gold dust lost in handling as currency	10,000		10,000
Estimated loss in melting and assaying assay grains, etc	20,000	10 000	30,000
Total	$33,000,763	$41 170,957	$74,780,020

Discount and Market Value.

The figures given in the tables are of assay values, and are productions therefore considerably higher than the actual market value. Disregarding express charges, commissions, and oost of refining and coining, there is still a large deduction to be made for this discount, in estimating the cash value of the bullion to the producers. Assuming the gold to have brought on the average $20 per Troy ounce, and the silver $1.12½ per Troy ounce, the cash received would have been $32,394,794 for the gold, $35,772,160 for the silver, and $68,166,954 total. The loss to the miners, as compared with the full assay valoe, would therefore have been $984 869 on the gold, $5,338,797 on the silver, and $6,323 666 altogether, or about one thirty-fourth of the full gold coining value, over one-eigth of the nominal silver value, and over one-twelfth in all, during the single census year. While there is no regular discount on gold, the large amount of placer gold sold at an undervaluation renders the average price assumed a probable one. The price for the silver is an estimate of average local rates for the year.

The Outlook.

The immediate outlook for the precious-metal mioes, as a whole, is very encouraging. The great Leadville (Colorado), Eureka (Nevada), Tombstone (Arizona) and Bodie (California) districts are maintaining a steady ou'put, while tbe new Wood River and other districts in Idaho, and a number of recent discoveries in Arizona, hold fortb great promise for the future. In fact, estimates of tbe yield subsequent to the census period indicate an actual and considerable gain."

Final Disposition of the Precious Metals—Coinage.

The receipts of bullion of domestic produotion at the United States assay offices, as previoosly explained, do not indicate the absolute amonnt of the mins outpot, but they serve as a nseful cbeok in many instances. The following tables are abstracts from the oarefully collected statistics of the Treasury Department, selected with reference to their bearing upon the question of production:

Receipts of Gold and Silver of Domestic Production at the Mints and United States Assay Office During the Fiscal Year Ending June 30, 1880.

State or Territory.	Gold.	Silver.	Total.
Alabama	$ 752.79		$ 752 79
Alaska	5 950 90		5 950.90
Arizona	158 019 75	$ 991,823 38	1,150,843 13
California	7,118 816 42	303 846.90	7,422 663 33
Colorado	2,244,069.74	1,257,790.41	3,501,860.15
Dakota	2,750,022.09	21,104.54	2,771,126.63

The following tables show the amount of coinage executed during the fiscal year ending June 30, 1880, and the total coinage of the United States up to that date:

Coinage by the United States Mints for the Fiscal Year Ending June 30, 1880.

Metal.	Coinage executed.
Gold	$56,157,735.00
Silver	27,942,437.50
Total coinage and silver coinage	$84,100,172.50
Minor coinage	269,971.50
Total coinage	$84,370,144.00

Total Coinage by the United States Mints from 1793 to Close of Fiscal Year Ending June 30, 1880.

Metal.	Coinage executed.
Gold	$1,133,104,322.00
Silver	292,333,436.90
Total coinage and silver coinage	$1,425,436,758.90
Minor coinage	13 283,167.05
Total coinage	$1,438,719,925.95

Consumption of the Precious Metals in the Arts.

Besides the demand for coinage and export, the precions metals are subjected to a further and constant drain io the large annual consnmption in the arts. Until quite recently it was impossible to ascertain the amount so absorbed with any degree of accuracy, though many attempts were made to this end by officials and statisticians. In 1870, estimates fornished by the large gold-refining houses and manufacturing jewelers showed that probably not less than $9,000,000, and possibly over $13,000,000, of gold were used in the arts during that year. Out of this indefinite sum it was impossible to segregate the proportion of bullion of domestic production so consumed from the United States coin, foreign coin and bollion, and old artioles remelted for manofacturing purposes.

Latterly fuller and more reliable data are available. A systematic investigation, conducted by the Director of the Mint, Hon. Horatio C. Burchard, has resulted in tracing this consumption with great accuracy. Records are now kept at the several mints and United States assay offices of the value of bars made and delivered by them for use in the arts and manufacturing. From these returns, supplemented by individual reports from a large proportion of the manufacturing establishments collected with much care, it is estimated that the amount of gold thus consumed in the United States in the fiscal year ending June 30, 1880, was $10,000,000, and of silver $5,000,000, or $15,000,000 in all. Of this, $5,500,000 gold and $4,000.000 silver were of domestic bullion produced during the year, together with $2,500,000 gold and $600,000 silver United States coin. The remainder consisted of old manufactured artioles and foreign coin remelted,

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 30x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists. Also, Chemical Bricks for Glove Towers.

KNIGHT WATER WHEEL.

All sizes of this Superior Wheel furnished at the shortest notice. Send for circulars to

ALMARIN B. PAUL, Agent.

Room 20, Safe Deposit Building, San Francisco, Cal.

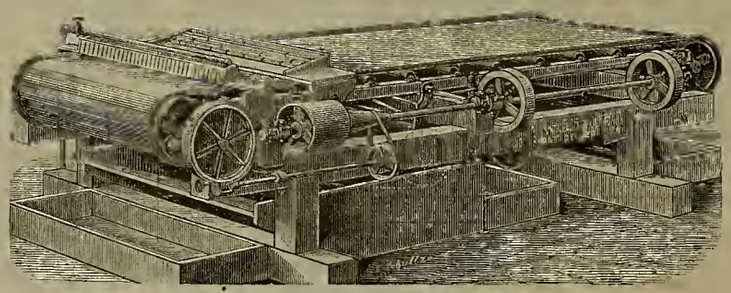
Rare Cabinet of Minerals.

A physician who has long resided in the mines and other parts of California, and gathered a large and valuable collection of minerals and other specimens, offers the same for sale at a bargain. Address "Cabinet," box 2361, San Francisco.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of **$1,000** each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

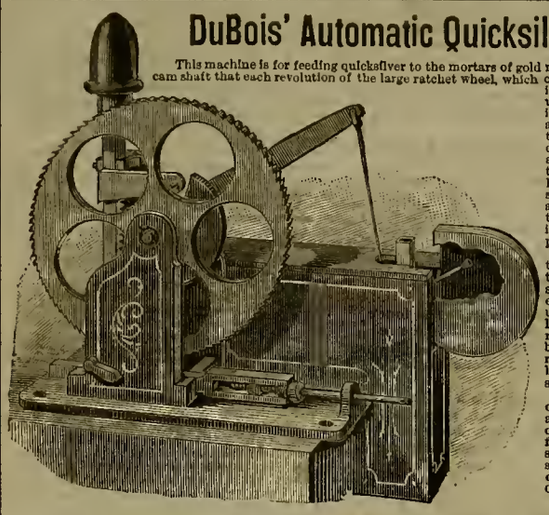
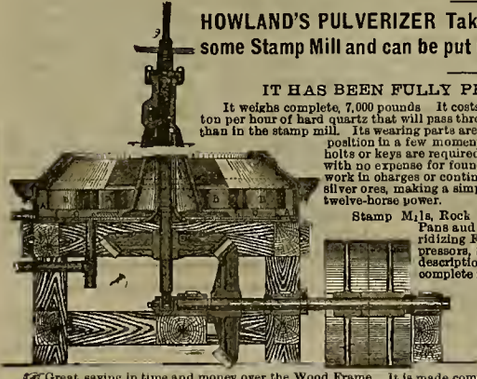
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

DuBois' Automatic Quicksilver Feeder.


This machine is for feeding quicksilver to the mortars of gold mills. It is so connected to the cam shaft that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a trip of the cam, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding the ordinary hand feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect.
The mechanism to produce this depression and elevation of the cup, is driven by the cam shaft, auxiliary to the self-feeders, over which so much ingenuity has been expended to regulate the delivery of ore to the mortar. As it is to be desired to have the ore go in constantly and regularly, so it is equally desirable to have the mercury fed constantly and regularly.
A chief point of excellence of this machine is, that it allows the quantity of mercury which would be otherwise fed in mass, in one hour, to be subdivided into a number of small portions, and fed almost continuously; *i. e.*, from every one to four minutes.
Price, complete, $100.
For Sale by **WHITNEY & MARSHALL,** Sole Agents
22 & 24 Fremont St., San Francisco.
Dealers in Iron, Steel, Hardware and Mining Supplies, Wrought Iron Pipe and Fittings, Pump Columns, Wire Rope, etc. A large stock of Boiler, Plate and Sheet Iron of every description.

MOREY & SPERRY.
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery


HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Seperators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

258,496—WIND ENGINE—Harry R. Stevens, Los Angeles, Cal.
258,503—ORE FEEDER—I. N. Templeton, Amador, Cal.
258,336—COLLAR BUTTON AND CRAVAT FASTENER—S. M. Williams, S. F.

NOTE.—Copies of U. S. and Foreign Patsnts furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All pstent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR FORMING SHOULDERS UPON VEHICLE AXLES.—George Brammar and Jacob R. Swarts, Livermore. No. 258,279. Dated May 23, 1882. This invention relates to an apparatus for cutting off or forming a shoulder upon iron bars, or the ends of the axles of vehicles, when the wheel hoxes have become too short for the length of the spindle, and for other aimilar work. It consists of a clamp or sleeve, having suitable centering and holding screws, the sleeve having a groove around its periphery to receive curved encircling arms, by which a tool-holder is supported and guided while being turned around, so that the tool will make a cut at the desired point and form a corresponding shoulder.

COLLAR BUTTON AND CRAVAT FASTENER—Sylvester M. Williams, S. F., May 23, 1882. No. 258,336. This invention relates to a combined collar button and cravat attachment, and it consists in a peculiarly constructed button having a flat head and a wide, thin shank provided with a hole, said shank being adapted to pass through the button-hole in the shirt, through the holes in the collar, and into a slot or aperture in the back stiffening of the cravat or scarf, and to engage with a peculiar spring upon the other side of the stiffening, whereby it is held in the shirt and the cravat supported. The object of the invention is to provide a ready means for attaching and supporting the cravat to the shirt, and at the same time to fasten the collar.

PICK.—Wm. L. Blythe, Mokelumne Hill, Calaveras county. No. 258,276. Dated May 23, 1882. This invention relates to that class of picks in which the blade and stock are made separate, and it consists in a novel means of securing the blade to the stock or handle whereby it may be easily secured or removed. On the outer or concave surface of the pick-blade is a notch in which fits the strap connecting the blade to the handle. This causes the strap to lie flush with the blade. Keys are wedged in under the back of the blade, and the details of construction are such that the blade and handle are very firmly connected, while at the same time the blade can be readily removed to be sharpened, and another one substituted.

DEVICE FOR COOLING TIRES.—Isaac L. Umstead, Ione, Placer Co. This device is for cooling tires when placed in a highly heated condition on the felly of a wheel; and it consists in a revolving platform or table upon which the wheel is secured, said platform being so journaled or hinged that by the operation of a lever it may be turned from a horizontal to a vertical position, in which position its lower half lies within a tank of water, and the whole platform with its wheel or tire may be revolved therein. By this means fellys of heavy wheels are not charred while buckets of water are being thrown on thick heated tires.

HOFFMANN'S COVER AND BINDER.—This device, made by Joseph Hoffmann, 208 Montgomery street, is especially adapted for binding single magazines and pamphlets in convenient form. When placed in the covers it is like a hook, and when the next magazine arrives the old one can be taken out without injury and a new one substituted, thereby keeping the magazines in perfect order, so they can be bound at the end of the volume if desired, or each number can be retained in the cover and at the end of the year have twelve nice handy volumes, avoiding the two unwieldy hulky volumes which the magazines make, and at about the same expense. With the use of rubber type the name, month and number of the magazine or pamphlet can be printed on the back, making the volume in appearance the same as other hooks placed on the shelves in the library, and always handy for reference. Various styles and sizes are made. All readers will appreciate the convenience of such an arrangement, for the magazine is not only a better form to hold in the hand, but is kept clean and protected from injury.

The Manufacture of Organs.

Until a recent visit to the factory of Bergstrom & Co., on Mission and 29th streets, we had no idea how much of an industry the building of parlor, church and concert organs had come to be in this city. There we found quite an establishment, fully equipped for work of any kind or size, with skilled workmen engaged in the various branches of the art, and all busy, with plenty of work ahead of them. Mr. John Bergstrom began this business in 1864 on a very small scale, and it has gradually grown to its present respectable dimensions. The place is now fitted to make church organs of the very largest size.

Mr. Bergstrom is now making half a dozen organs of a size to take the place of reed organs, as he can sell them at about the same price—say $600—and they have much more volume and make a much more imposing instrument. They will answer admirably for small churches that have no great space, or can afford no very large instrument. One of this type we saw in course of construction.

It is some 13 ft. high by 7 ft. wide, and 4 ft. 6 inches deep. It has pedal bass, with four stops on the manual and 244 pipes. It is quite handsome. There are 25 foot-pedal notes. This type of instrument is a very fine one for large halls, Lodge-rooms, etc.

Mr. Bergstrom is now engaged on a two-manual organ for the Episcopal church, at Seattle, which will cost some $2,000. He is also at work on one for exhibition at the Mechanics' Institute in this city, (which opens in August). This is a three-manual organ, which will cost $2,500. The largest one, on which he is now at work, is a three-manual instrument for St. Francis' Catholic church, on Montgomery Avenue, in this city. This organ will cost $5,000, and it will take to next Christmas to complete it.

Many of the larger organs on this coast have been built by Mr. Bergstrom. That in the Metropolitan Temple in this city, the largest on the coast, was built by him. It cost $12,000, and took 18 months to complete it.

Among others made here was that for the Christian Union at San Lorenzo. One for Guatemala, Central America. The one built for Miss Dillaye, teacher of music and organist of Rev. Mr. Smith's tabernacle, on Tyler street, is a first-class instrument of the type before referred to as designed to displace reed organs.

In addition, organs have been made for the Spanish church in this city; for the Methodist church, Portland, Oregon; for the Methodist church, Santa Clara; for a church in Napa City; for the Independent church (the late Dr. Hamilton's), Oakland; the Presentation convent in this city; for a church in Tucson, Arizona, etc.

They make everything here except the reeds, and no better workmanship will be found in any instrument anywhere. The mechanism is all of first-class order, and every little detail is carefully attended to. They have as good facilities for manufacture as they need, and Mr. Bergstrom is fortunate in having a number of first-class workmen. They use all California woods except in those parts where black walnut is needed.

Mr. Bergstrom has the highest recommendations from all those for whom he has worked, and organists on this coast are indebted to his skill for keeping the instruments in repair. His work is preferred to that from the East, and he has established for himself an enviable reputation for skill, reliability and good work.

News in Brief.

THE bicycle riders of the United States are assembled at Chicago for convention.

A Home Industry.

The New Buildings of the Mission Soap and Candle Works.

There are but few persons in this city who have anything like a thorough knowledge of the large number of factories which exist and are in constant running order. Some have a faint idea that there is a rolling mill somewhere on the peninsula; that there is a woolen mill at Black Point, and a few other establishments scattered around somewhere, but of the large number of these business enterprises, of the vast capital invested in them, and the thousands of men, women and children to whom they give employment, the large majority know nothing. As a rule, these establishments are as sealed books to the outside world, the proprietors either desiring to keep their business matters to themselves, or, as is generally the case, do not wish the workmen to be annoyed by the incursions of curious people.

Among the leading manufacturing interests of the city the Mission Soap and Candle Works stands at the head. These works are located on Sixteenth street, near Folsom, and occupy a plat of land 200 ft. square. The buildings thereon have just been completed, and were constructed under the superintendence of a gentleman who thoroughly understands the business for which they will be hereafter used. The main building is three stories high, built in the most substantial manner and provided with the necessary elevators and tramways. The property, as well as the business, belongs to Mr. M. Morganthau, a gentleman who has been identified with various manufacturing industries in this State for many years.

In December last the buildings and a great portion of the machinery were destroyed by fire. Mr. Morganthau at once set to work to rebuild and replace the ruined machinery, and, while this was being done, he at once secured an unoccupied factory that was standing idle, and kept on manufacturing his goods to supply the increasing demand, and has never been out of any stock since the fire took place, and now the new works start up more lively than ever, and the fires in the furnaces are kept burning night and day to make up for lost time.

The cost of the new buildings and machinery aggregates $100,000, and nearly $20,000 worth of additional machinery will be placed in position during the next 30 days. The contract for this machinery was given to the firm of William T. Garratt & Co., and, when in running order, the Mission Soap and Candle Works will be the best appointed establishment of the kind on the Pacific coast. The amount paid out monthly for material and labor does not fall short of $25,000. The employees are all white people, among the number being some 20 boys and girls. The work for the latter is light and easy, and many of the girls are very expert in handling, stamping and packing the product of the establishment. The boxes alone in which candles are packed cost from $7,000 to $8,000 annually, and, as the business is rapidly increasing, the expense account will increase in like ratio. The works manufacture the following brands of Candles, viz: Chemical Wax, Solar Sperm, Adamantine, Light Weight, Coach and Hotel Candles, and the following brands of Soap viz: Chemical Olive, Extra Family Nonpareil and White Castile Soaps, and these brands are well known all over the coast. "The Chemical Wax" is a favorite through all the mining regions of California and Nevada, and the Sperm, Adamantine, Coach and Hotel Candles are recognized as a standard with the trade.

Adjoining the main building is a large, solid wooden structure, devoted exclusively to the manufacture of soap. When our reporter called, three immense vats running from the top story, funnel-shaped, to the lower floor, were filled with boiling soap. Each vat contained 30,000 lbs. The machinery in this department is of the latest style, and all brands and styles of laundry and toilet soap are manufactured, stamped, wrapped, boxed, marked and ready for delivery.

These works were established in 1870, and, since that time, all the Government contracts for candles and soap for the Department of California have been filled by them. The general excellence of the goods fully sustains the reputation of the works. For the past 12 years over 1,000 families in San Francisco have used the Mission Extra Family Soap, and the demand is constantly increasing. The enterprise of the proprietor and his hostility to the employment of Chinese labor is sufficient to prophesy for him a successful business career in his conduct of the Mission Soap and Candle Works.

The above sketch will no doubt interest many of our readers, and those who believe in patronizing home industry can have the opportunity by calling for Mr. Morganthau's goods. He claims that his manufactures are superior to Eastern makes and no higher in price. He rightly thinks he should be supported by the people of the Pacific coast, because he spends his money here, while money paid for Eastern soap goes to build up Eastern industries instead of our own. The account above shows that Mr. Morganthau has much enterprise in his business, and he should be encouraged.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing
, Press, Box 2361, S. F.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1869; number, 5. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 22; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

Promptness Displayed, Etc.

MESSRS. DEWEY & CO., Patent Agents:—The Canadian patent obtained through you is at hand. This makes three patents received within a month. The ability, energy and promptness displayed by your firm must certainly be gratifying to your numerous patrons—as it assuredly is to
Yours respectfully,
THORPE & BELLOLI.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Laurel Glen Fruit Farm.

This place is beautifully located among the hills. A pleasant drive from railroad and beach. Deer and other game abound in the vicinity. A limited number of boarders can be accommodated for the summer and hunting season. The place is especially desirable for ladies with children. Address, for further information, Isaac Dakin, Soquel, Santa Cruz county.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

PERSONS receiving a sample copy of this MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

ANNUAL STATISTICIAN of 1882.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

CORRESPONDENCE on mining and other subjects represented by this journal is solicited from all reliable sources. Send us information, early and often, if ever so brief.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first-class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

For information on through freight rates apply to

H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agent, Carson, Nev.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. ☞Send for Pamphlet showing methods of testing the different qualities of all Powders. The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

CALIFORNIA VIGORIT POWDER CO., ENGLISH & WRIGHT, Agents

No 327 Pine St., San Francisco.

Containe no Nitro-Glycerine or Chlorate of Potash, and is the only High Explosive Manufactured in America that does not contain these Dangerous Ingredients.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressnre. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

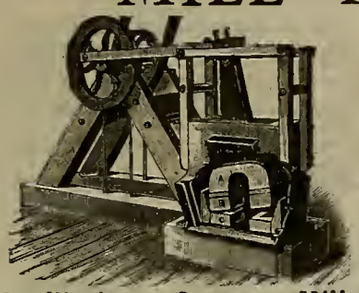
Power applied to the hest advantage. Access obtainable to all the valves by removing air chest cov_rs. Entire ahsence of springs or friction to open or shut tho valves. No valve stems to hreak and drop inside of cylinders.

Have no back or front heads to hreak. The only Machinc that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less lcakage and friction than onr competitors and a superior economy of ahont 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

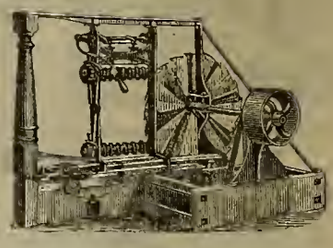
PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

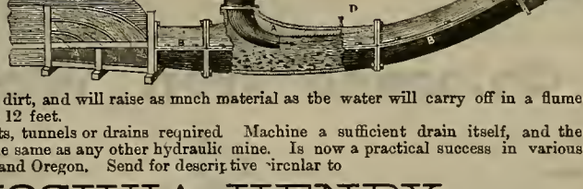
For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

F. A. HUNTINGTON,
No. 220 Fremont Street, San Francisco.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dnmp.

Sluices gravel and water np hill on an angle of 45°, and will run any kind of gravel that will run in a finme. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

VOLUME XLIV Number 23

Generation of Chlorine.

In answer to an inquiry, and for the general information of those desiring to know the method of production of chlorine gas for chlorination process, we take from Kustel's "Roasting of Gold and Silver Ores" (for sale by Dewey & Co.), a description of the generating apparatus. The gas is produced in a leaden vessel, as shown in the engraving.

The circular tub, *a*, has on the outside a circular ring, *b*, two and a half inches deep and two inches wide, for the reception of the flanges of the cover, *c*. The cover is provided with a center hole for the reception of the stirrer, *d*, with a leaden pipe, *e*, bent in the shape of the letter ∞, through which the sulphuric acid is introduced; another pipe, *f*, conveys the gas to the washing apparatus, *g*. At the bottom of the gas generator is an opening, *h*, for the discharge of the residue, and *k* serves for introducing the charge.

The cover is placed over the generator, the edge of the flange luted with clay, as shown by *m*, all round, and then filled with water, as indicated by the dotted line. The space at *n*, round the stem of the stirrer, must be filled with packing of cotton cloth strips saturated with oil, and the outlet, *h*, closed with a wooden plug wrapped like the stuff-box in cotton cloth, also saturated with oil, and the space between collar and plug luted with clay, or better, with putty. The stirrer rests on a glass button, inserted in the cavity of the lead socket. Mr. E. Riotti has discovered that oil, in contact with chlorine, forms a sticky substance, which prevents the chlorine from penetrating it; and the india-rubber hose, if oiled inside before use, retains its flexibility, especially if the oiling is repeated from time to time. It is thus very easy to stop the escape of chlorine gas wherever leakage is observed, by applying some suitable material, impregnated with oil. It would also give an excellent coating, a substitute for pitch or asphaltum, if the chlorination vats were coated two or three times with warm oil, which enters readily the pores of the lumber much deeper than asphaltum varnish.

All roasted sulphurets do not consume the same amount of chlorine gas. The following approximative charge may serve to chloridize three tons:

30 lbs. of manganese (peroxide) pulverized, 30 to 40 lbs. of common salt, according to quality, 75 lbs. of sulphuric acid of 66° B., and 45 lbs. of water; or, 30 lbs. of manganese, 30 lbs. of salt, good quality, 85 lbs. of sulphuric acid 63° B., and 35 lbs. of water.

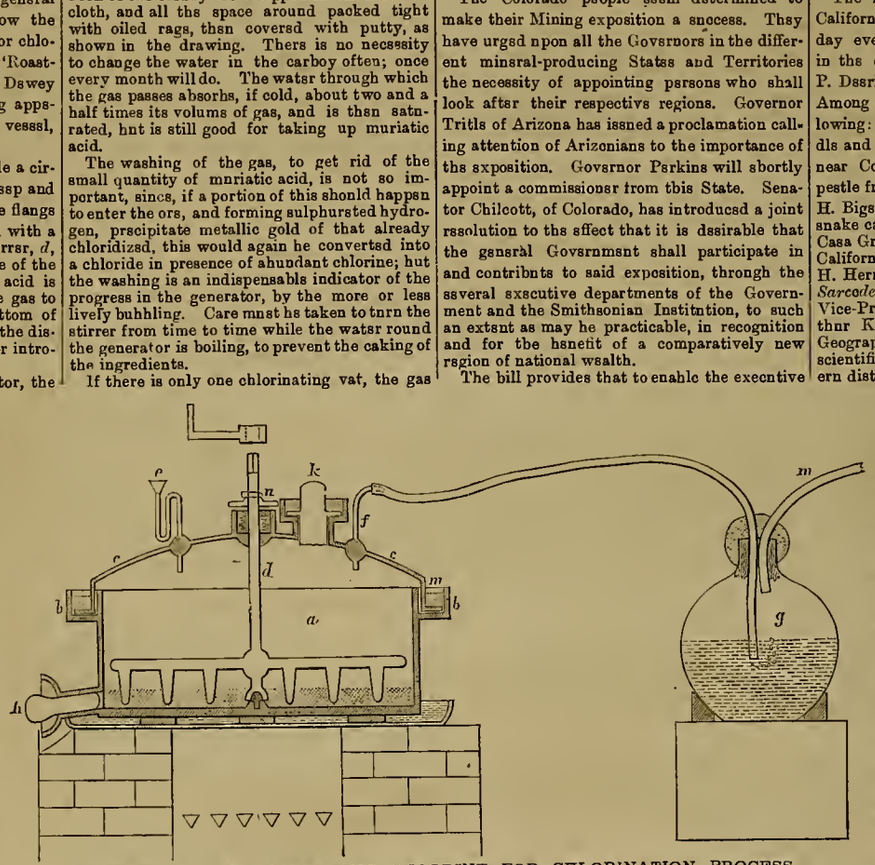
Sulphuric acid of 66° costs four cents per pound in carboys, and the same of 63°, two and a half cents; the latter charge, therefore, is cheaper, unless the freight would exceed seven cents per pound.

Water, salt and manganese are first introduced, and the charge-hole, *k*, closed with a wrapped solid plug of lead, as above described, and luted with clay. The generator is placed in a square piece of boiler iron, the edges of which are bent up two or three inches, to hold water or prepared for steam. The sulphuric acid is now introduced through the pipe, *e*, but not the whole amount at once; about 12 lbs. to begin with will answer to create sufficient heat to develop the gas, which escapes through *f* into the carboy, *g*, to be washed from acids. The gas should bubble through the water very lively; if not, the stirrer should be turned, and if this fails to produce the required effect, more sulphuric acid must be introduced and repeated as often as the bubbling appears to become less active, always using the stirrer first. After all the sulphuric acid has been used up, the fire must be started till the water below the generator commences to boil. It takes about four hours to develop all the chlorine gas.

The rubber hose from the pipe, *f* (three-fourth inch hose), after being oiled inside, is inserted into the carboy one or two inches below the water; the other hose, *m*, conveys the gas to the chlorinating vat. Both rubber pipes in the neck of the carboy are wrapped in oiled cotton cloth, and all the space around packed tight with oiled rags, then covered with putty, as shown in the drawing. There is no necessity to change the water in the carboy often; once every month will do. The water through which the gas passes absorbs, if cold, about two and a half times its volume of gas, and is then saturated, but is still good for taking up muriatic acid.

The washing of the gas, to get rid of the small quantity of muriatic acid, is not so important, since, if a portion of this should happen to enter the ore, and forming sulphuretted hydrogen, precipitate metallic gold of that already chloridized, this would again be converted into a chloride in presence of abundant chlorine; but the washing is an indispensable indicator of the progress in the generator, by the more or less lively bubbling. Care must be taken to turn the stirrer from time to time while the water round the generator is boiling, to prevent the caking of the ingredients.

If there is only one chlorinating vat, the gas from the carboy can be conveyed through one hose direct into the vat below the filtering bottom; but if there are several of these, it is better to fix a lead (three-fourth inch) along the vats, connected with those half-inch pipes before each vat, to which a piece of hose is attached. If not in use, the hose is withdrawn from under the filter and closed with a stopper.



APPARATUS FOR GENERATING CHLORINE FOR CHLORINATION PROCESS.

Classification of Mining Exhibits.

The directors of the Denver Mining exposition have adopted the following classification for exhibits directly relating to mining:

Department A, Mineralogy.—Class 1, gold ores; class 2, silver ores; class 3, iron ores; class 4, lead ores; class 5, copper ores; class 7, bituminous coals; class 8, anthracite coals; class 9, cannel coal; class 10, lignite; class 11, other metalliferous specimens not enumerated above.

Department B, Geology.—Class 1, marbles; class 2, lithographic stone; class 3, limestone; class 4, miscellaneous building stone; class 5, fossils; class 6, gypsum; class 7, precious stones and crystals; class 8, native chemicals.

Department C, Metallurgical Machinery.—Class 1. Reverberatory roasting furnaces, blast and reverberatory smelting furnaces, cupel, retort and other furnaces for separating base precious metals.

Class 2. Stamp mills for free gold ores, stamp mills for free silver ores, stamp mills for dry crushing, and furnaces for roasting refractory gold or silver ores.

Class 3. Pans and settlers for amalgamation, leaching vats for leaching process, concentrators for crude ore or tailings.

Class 4. Other devices not included in the above classification.

The Denver Mining Exposition.

The Colorado people seem determined to make their Mining exposition a success. They have urged upon all the Governors in the different mineral-producing States and Territories the necessity of appointing persons who shall look after their respective regions. Governor Tritle of Arizona has issued a proclamation calling attention of Arizonians to the importance of the exposition. Governor Perkins will shortly appoint a commissioner from this State. Senator Chilcott, of Colorado, has introduced a joint resolution to the effect that it is desirable that the general Government shall participate in and contribute to said exposition, through the several executive departments of the Government and the Smithsonian Institution, to such an extent as may be practicable, in recognition and for the benefit of a comparatively new region of national wealth.

The bill provides that to enable the executive departments and the Smithsonian Institution to participate in the exposition, they are authorized to send such maps, reports, publications, models, plans, devices, specimens, implements, products, fabrics, instruments and other articles in their possession as may (in the judgment of the heads of the several executive departments and the Secretary of the Smithsonian Institution, or subordinates severally designated by them, who are constituted a board for such purpose, of which board the Secretary of the Interior shall be chairman) be of interest or value within the scope of the exposition, the same to be transported to, cared for and returned from the exposition at the cost of the Government, and for the expense of which (including necessary preparation) the sum of $20,000, or so much thereof as may be necessary, is appropriated, the same to be immediately available, from any moneys in the Treasury not otherwise appropriated, to meet all the expenditures incurred in making such Government exhibit. That board provided shall have authority to appoint a superintendent to have general charge of all articles contributed by the Government, and also a secretary and a disbursing officer, at such a compensation to each as may be deemed just, not, however, in excess of $3,000 per annum.

The exposition opens August 1st, and closes Sept. 30th. It is by no means exclusively for mining exhibits, they only being made the more prominent features. California has been ransacked for specimens so thoroughly that it will take a good, live man and considerable canvassing to get up a respectable show from the State. If we are to do anything at all, some one ought to be at work as soon as possible.

MEXICO has taken a great step in advance by abolishing the custom house lines between the States of the republic.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held Monday evening last, Vice-President J. P. Moore in the chair. A. H. Brocksenfeldt and Frank P. Dearing were proposed as resident members. Among donations to the museum were the following: From Dr. Slocum, a stone whirl-spindle and a human skull from an Indian grave near Corinne; from B. B. Redding, a stone pestle from a mound near Salt Lake; from H. H. Bigelow, a stone incense cup with a rattlesnake carved in bas-relief around it, dug up at Casa Grande, Arizona; from B. C. Truman, a California flying fish from Monterey; from Dr. H. Herman Behr, three red snow plants called *Sarcodes sanguinia*, from the Sierra Nevada. Vice-President Moore read a paper by Dr. Arthur Krause, Ph. D., member of the Bremen Geographical Society, suggested by his recent scientific explorations in Alaska, in the southern district of which he spent the past winter, with his brother, among the Indians, collecting information. He said southern Alaska resembled the south-west coast of Norway in its minerals and fisheries, where thousands of pleasure seekers resort annually to enjoy the natural beauty of the scenery. He pronounced Alaska far more valuable than Norway in this and in most respects. He predicted the gradual extinction of the 10,000 or so Indians now in the Territory, especially should the newly discovered gold mines prove as valuable as now anticipated. Some tribes of the coast Indians differ entirely in their language and features from their neighbors. The Chilcat and Chilcoot Indians have monopolized trade with the interior, and are very anxious to keep whites traders and other tribes from encroaching on their direct trade between the coast and the Nomadic Indians at the headwaters of the Yukon river. These they reach in three days by the eastern route across the country, by river branches and lakes, with short land portages. The western route takes seven days, and passes are easy. Both routes unite near the Hudson Bay company's abandoned Fort Selkirk, which was destroyed by an expedition of Chilcat Indians. The Chilcats travel by the western and the Chilcoots by the eastern route, and this division is observed under penalty of war. They never use sleds or dogs, but pack their own burdens, using snow-shoes, and have to cross one glacier. Tobacco and blankets are largely dealt in, and they communicate with trading stations from 600 to 1,800 miles up the Yukon.

Mr. Moore described parasitical plants, especially the *Arcuthobium*, a mistletoe that grows on the digger-pine and all junipers, and spreads its glutinous seeds by explosions, through which they are projected and stick over birds, who thus distribute them. The red snow-plant was first discovered in Siberia 40 years ago, and has only been found on this continent among the Sierra Nevadas.

Dr. C. C. Parry, of the U. S. Bureau of Forestry, described his recent trip through Lower California, where he found new specimens of the flowering ash, evergreen oak, two species of horse-chestnuts, a new and very delicate fine-foliage rose, new ferns, only found in Florida and the Hawaiian islands, and a cactus, valuable for manufacturing purposes, that secretes a hard gum, which, mixed with alcohol, makes a fine varnish, and is useful for painting pottery.

BLANKETS VS. PLATES.—Cheasbro is mining on Snake river, near Mundy's Ferry. He has discarded the silver plates at first used, and blankets are now employed to catch the gold. No clean-up has as yet been made, but it is thought that the ground will pay very well. There is an immense tract of land in that locality, which, if it pays well enough, will be an important addition to the mining of Idaho.—*Idaho World.*

The Maginnis District.

A Most Excellent Country to Stay Away From.

Capt. E. A. Nichols returnsd last night from a trip to northsrn Montana. He bas been gons about a montb, had a very rough trip and is glad to get back to Bntte. He was buttonholsd by an *Inter-Mountain* rsporter tbis morning, and asksd to givs an opinion abont the socallsd Maginnis mines.

"The country is too new," said tbe captain, "to warrant me in hazarding any positive statements relating to tbe pressnt ontlook for the Maginnis conntry, bnt I sbould cstrainly advise none of my friends to go there."

"What are ths principal characteristics of tbs ledgss?"

"The most noticeable feature is their soarcity, and nsxt to tbat is their narrowness. What mines have hssn discovered are located in a gnlob on a big mountain some distance north of the Snowy rangs. Soms of tbe veins sbow good-looking carbonate and galena ores, and some little copper has bssn found, hut the ledges are very narrow and irregular. The two leading minss are tbe Chollar and a property recently pnrcbassd hy Hauser and Holter. The Cbollar is a good-looking prospect. It is yielding some rich ore, hut Haussr's mine is closed down and no one knows anything about it. Some say that it contains nothing, and nthsrs tbat it is a bonanza. You can hear anything you want to about it."

"How many men are in that country?"

"Batwssn 300 and 400. They are nearly all prospectors, with tbe exception of a fsw who work in the Chollar. Thsre ars tbres towns in the gnlch—Maidenville, Georgetown and Andersonvills. Tbe first named is the most important, bnt its bnsiness and popnlation have been grossly exaggerated."

"What did you bear about tbs Barker district?"

"Notbing very enconraging, thongh ths expenditure of capital will undonbtedly result in the development of paying mines in that locality. At present, however, tbe smelter is closed down, and the ledge which has been supplying it is not over 10 or 12 inches wide, if reports may be relied upon. I did not go tbere."

"Did you explore the wonders of tbe Clark's Fork country?"

"No. I am not an expsrt on snow-sboes, and I bave bad all the winter I want in Montana this year. It ie yet a month too soon to attempt to proepeot the Clark's Fork district. Tbere are a few promising locations there and some extent of placer ground, but the latter—like the few placer claims in the Maginnis country—can he worked only for a limited time esch year, owing to the scarcity of water. If the Maiden placers could be worked six months eteadily, tbat would be the last of them. Quartz will he the mainstay of the country in the way of mining, but I think northern Montana is far richer in agricultural and etock-raising resources than in mineral wealtb. There is room and opportunity in all the northern counties for thousands of happy bomes, bnt no intelligent prospector can afford to leave the counties of Silver Bow, Madison, Jefferson and Beaverhead in searcb of bidden treasures. We bave more right here in the Summit Valley district tban all tbe rest of Montana contains.

A Rich Oil Region.—The combination which embraces Charles N. Felton and Messrs. Scofield & Tevie are engaged just now in spending some $300,000 in developing the Pico oil district. They are now sinking eome 15 new wells, and we will jnst whisper, as a secret, not to be divulged ligbtly, tbat the company bas lately struck a stream of oil, in a new well, which anewers to tbe "flow of Iser rolling rapidly," to employ the language of the poet. To get down to tbe prosaic reality, the enterprising capitalists who have the oil qnestion in band in Los Angelee county bave struck it rich. They believe tbat, when the Pennsylvania oil field bas been exhausted, they will stsnd in the bresch and give the whole world and the rest of mankind all tbe petroleum they need. And we are heartily glad of it, firstly becanse it will give Los Angeles county an eminence independent of her orange groves and vineyards, and secondly because tbe whole enterprising band who bave developsd this local interest are whole-souled and thorough-paced gentlemen, who took hig chances and poured ont their money like water before a phenomenal success rewarded tbeir efforts.—*Los Angeles Herald.*

A Pioneer Steamer.—The steamship *Senator*, which is as old as the State, is being changed into a barge. Tbe veseel was built in 1848, in New York, and was hrongbt to this coast in 1849. Before the sliokens filled up the Sacramento river ebe made regular trips to Sacramento, and there is bardly a miner in the State who has not traveled on her. In later years she has been employed in the coasting trade, rnnning to all ports from San Diego to Victoria. The vessel has been tbe most profitable piece of property which ever floated on the waters of the bay, and has earned several fortunes for ber owners.

A simple precaution, costing neither money nor labor, ie said to increase the durability nf posts put in the ground hy 50%. This ie simply hy taking care that the wood is inverted, *i.* e., placed in the opposite direction to tbat in which it grew.

The Wood River minss are making some heavy sbipments of high-grade ore to Salt Lake,

Mining by Cheap Methods.

The Forest City *Tribune* bas, undsr ths above beading, some remarks abont mining in Sierra conuty that apply eqnally well to othsr counties. The *Tribune* says: Tbsrs are many qnartz lsdges now lying idle and partially or wholly undevsloped, beoanse of tbe idea so prevalent among minsrs that it is nscessary to work on a grand scale. They think they ars not mining nnlsss they have a 20-stamp mill, a big lsdgs and a beavy force of men. The constant cry is capital, more capital. While cspital is necsssary for working dsep minss, low-grade ore, running long tunnels, etc., yet thers are many ledges in this connty owned by poor men, and beld by tbem with tbe bops of working thsm in the fnture, which nugbt to be prospected and worked down at lsast to the depth of 200 ft. without any great outlay of money, and the rock from wbich could be crusbed in arastras, or hy otber cbsapsr metbods than suob as involve an expensive mill and machinsry.

Nothing conducss mors to ths general prosperity of any section of country than an abundance of laboring msn wbo ars working tbemselves. The flush times of California in early days wers caused by tbe fact that men could mins for tbemselvss witbont any previons outlay of money. A pick and pan wers all that was nscessary.

What is nesded now in California is a method of reducing ore at the rate of, say, one ton in 12 bours, the expenss of wbich wonld be witbin the reacb of a poor man. Tbe good old-fashioned arastra appears to be completely forgottsn. A borse power could be so attacbsd to one or two ligbt stamps as tn crnsb tbat amount of ore, and yet tbs expense shonld not exceed a few hundred dollars. We know of a ledge that has yielded $15,000, all of wbich has been worksd in a nne-stamp mill that cost but $600. And we are acqnainted with a mins, tbe ore from whicb is all crushed in an arastra, which did not cost tbat muob, and wbicb is yielding good returns to its nwners.

Grows on the Bushes.—That Plumas is one of the leading mining counties of tbe State tbere is no chance to doubt, and tbat tbe natnral resources of the county are far ahead of any other is another certainty; but we never knew nntil a few days ago that gold grows on tbe busbes. Sucb, however, ie the case. Onr old friend, Jim Lafoon, in a little talk we held with bim, states that, while working hie claim on Smith's hill, some years ago, one of his partners fonnd a nugget weigbing an onnce or more, in the forke of a little oak sappling some incbes above tbe surface of the ground. He accounts for it with the tbeory that the husb forked nnder the ground and grew around tbe nugget, and tbat later the dirt was washed from aronnd it, leaving it exposed. We are inclined to the belief, however, that tbe eoil in tbat locality is eo rich that it impregnated the oak, and it blossomed and bore frnit in the sbape of the nugget. Probably we sball rnn against the ideas of eome of the old geological fossils who infest tbis region occasionally, bnt it can't be helped. Gold grows on tbe Plumas husbes, and tbey don't want to forget it.—*Plumas National.*

Consumption of Boxes.—It looks, says tbe Reno *Gazette*, as if tbe consumption of boxee on the Pacific coast wonld continne to increase and the mannfacture of them become one of tbe greatest induetriee in the conntry. Tbere is already a vast amonnt of packing going on, and it mnst increase rapidly for many years, for the resonrces of the coast are not one-tenth part developed. The whole East ie open to tbe California prndncer nf grapes, apples, peare and small frnits, while the whole world is drawing on ber for salmon, canned goods, horax and other staples. Nevada, Utah, Colorado, Wyoming, Arizona, New Mexico and Texas send for greene and vegetables every day in tbe year nearly, and they all bave to be boxed. All this time great vineyards are being planted to grapes, the foothille are being cleared and orcharde set ont, the rivere are being stocked with salmon and trout, borax beds are being opened up in Nevada, soda ie being sbipped to San Francisoo by tbe car-load, to be refined and canned, the sugar trade is growing, manufactnres are increasing, and they are all shipped in wood. The outlook is a grand one, and it should stimulate the manufacturers to make preparations for working cheaply and to advantage. The present way of turning ont boxes is very extravagant.

At the quarterly meeting of tbe Directors of the Richmond Con., held at London, May 3d, the nenal dividend was declared. The acoounts for the year ending Feb. 28tb show a balance of nndivided profits, including reserve fund of over £100,000. The usual telegram from the mine statee tbat the week'e run was $22,000, from 438 tons of ore, with one furnace. During the week tbe refinery produced Dore bars to the value of $23,000.

Andrew F. White, coiner of tbe San Francisco mint, has finished the May statement of coinage, as follows: Double eagles, $1,060,000; eagles, $330,000; balf eaglss, $240,000; silver dollars, $950,000; total, $2,580,000.

Work is progressing steadily in the mines at Downeyville, and ore of a good grade is being extracted.

Announcement Extraordinary.

We lately notiosd the following good tbing at L. Sage's Congress Springs Hotsl, Santa Clara oonnty. It is creditable, no doubt, jointly to "Mark Twain" and "actual facts and occurrsnoes in hotel experience." We givs it for the interest of all concsrned.

SPECIAL NOTICE.

This hotel bas been built and arranged for the special comfort and convenience of summer boarders. On-sr rival each guest will be asked how he likes the situation; and, if he says the hotel ought to have been placed up upon the knoll or further down toward the village, the location of the house will be immediately changed. Corner front rooms, up only one flight, for every guest. Baths, gas, hot and cold water, laundry, telegraph, restaurant, fire alarm, bar-room, billiard table, daily papers, *coupe*, sewing machine, grand piano, and all other modern conveniences in every room. Meals every minute, if desired, and, consequently, no eecond table. English, French and German dictionaries furnished every guest, to make up such a bill of fare as he may desire, without regard to the bill-affair afterward at the office. Waiters of any nationality and color desired. Every waiter furnished with a libretto, button-hole bouquet, full-dress suits, ball-tablets, and bis hair parted in the middle. Every guest will have the best seat in the dining-hall and the best waiter in the house. Any guest not getting his breakfast red-hot, or experiencing a delay of 16 seconds after giving his order for dinner, will please mention the fact at the office, and the cooks and waiters will be blown from the mouth of a cannon in front of tbe hotel at once. Children will be welcomed with delight, and are requested to bring hoop-sticks and haw-keys to hang the carved rosewood furniture especially provided for that purpose, and peg-tops to spin on the velvet carpets; they will be allowed to hang on the piano at all hours, yell in the ball, slide down the bannisters, fall down stairs, carry away dessert enough for a small family in their pockets at dinner, and make themselves as disagreeable as the fondest mother can desire. Washing allowed in rooms, and ladies giving an order to "Put me on a flat iron" will be put on one at any hour of tbe day or nigbt. A discreet waiter, who belongs to the Masons, Odd Fellows, Knights of Pythias, and who was never known to even tell the time of day, has been employed to carry milk punches and hot toddies to ladies' rooms in tbe evening. Every lady will be considered tbe belle of the house. The office clerk has been carefully selected to please everybody, and can play draw poker, match worsteds at the village store, shake for the drinks at any hour, day or night, play billiards, good waltzer, and can dance the Germau, make a fourth at enchre, amuse children, is a good judge of horses, as a railway and steamboat reference is far superior to Appleton's or anyhody else's guide, will flirt with any young lady, and not mind being cut dead when "pa comes down;" can room 40 people in the best room in the house when the hotel is full, attend to the annunciator, and answer questions in Hebrew, Greek, Choctaw, Irish, or any other polite language at tbe same moment without turning a hair. Dogs allowed in any room in the house, including the w(h)ine room. The proprietor will always be happy to hear that some other hotel is "tbe best in the country." Special attention to parties who can give information as to "how these things are done in Yewrup." The livery connected with the establishment is complete in all its details. Our horses all can trot to the wire in 2:15 and less. Pedigrees furnished, carriages and vehicles with coat of arms and heraldic devices of all descriptions and to suit the most fastidious. Footmen and drivers uniformed and can converse on any subject, a classical education being made a condition of service. The proprietor will take it as a personal affront if any guest on leaving should fail to dispute his bill, tell him he is a swindler, the house a barn, the table wretched, the wines vile, and that he, the guest, "was never so imposed upon in his life, will never etop there again, and means to warn his friends."

The Nevada Fish Hatchery.—A Reno *Gazette* reporter recently visited tbe State fish nest, corner of Second and Nevada streets, Carson City, wbere Fish Commissioner Parker carries nn the good work whicb he organized. The eggs do not bave to be eet on, exactly, but great care is required to bring out the little fish. He bae three trongbs, 18 ft. long, 16 incbes wide, and 10 inches deep, coated with aspbaltnm and coal tar, tbrongh whiob runs a stream of fresh, cold water. One trough now contains 10,000 young salmon from the McCloud river, whicb will be turned loose in the Truckee sbortly. Tbe other two contain 50,000 New Eugland brook trout, about one inch long, hatched from eggs giveu to the State by Capt. J. B. Overton. They will be distributed tbrougbont tbe State. Mr. Parker bae an appropriation of $2,000 from tbe State. He bae carried on the work for the love of it, without any personal recompense. The State'e money has gone to bnild a canvas boat, seines, cans, build troughs and pay a man a small salary during tbe batcbing period and for distribnting. In a small aquarinm in bis house he has some pets that came a long way. They are land-locked salmon and play around like canary birds. Once in a while one leaps clear over the side. He got 10,000 eggs and only lost one-balf of one per cent., which shows scientific natcbing.

Buying Ore.—A letter from the town of Luning, on the Carson & Colorado railroad (Nevada), says: Prospecting parties are coming in every day with sacke of samples of ore for assay at the office of J. C. White, wbo ie the agent of tbe Melrose Smelting Works. of Oakland, and buys all tbe ore that is offered for sale. By this means a single man or small party of men get qnick returns for any prodnction made, and are tbue enabled to continne their developments to a greater extent, and at a faster speed, tban has ever been tbe case in southwestern Nevada.

A Notable Steel Chain.—There has lately been made at Hull, England, a chain of Siemens steel; 180 yards long, containing more tban 3,200 links, held together hy about 850 steel pins. It ia intended for lifting purposes, bas an estimated strength of 60 tons, and is tbought to be the largest cbain of its kind ever made.

By the arrival of the steamer *Otter*, from Fort Wrangle and way porte, news is received that the Sticksen river is open. The fisheries on the Naas and Skeena rivers had commenced operations, and the rnn of fish is fully up to the average for this time of the year.

Mining in Sonora.

Extent and Richnese of the Ariepe Dietrict.

Ths Sonora valley is becoming tboroughly Americanized, and nearly all the fancy mineral deposits ars gradually falling into tbs hands nf the sbrewd Yankses. Ths Arispe district, whiob has a world-wide fame for the extant and richness of its mineral deposits, has now an American popnlation nearly equal to the nativss of tbe soil. Those foreigners on the Sonora soil are neither drones or drnnkards, but hard working, intelligent men, whose presencs represents untold wsalth to any country. Tbsy are nsarly all sngaged in mining snterprises, tbongh a few have branched off into mercantile pursuits, the pressnce of so many foreigners guarantssing a respectable portion of trade.

The principal mineral bed of Sonora yet discovered is sitnated about 25 miles soutb-east of Arispe. This is tbe great Mecca of the American prospector and mining man. Here comss tbs weary prospector and his patient burro, the snterprising capitalist and bard-fistsd day lahorer, all ssger to engags in tbe pursuit most congsnial to his tastes.

From Mr. D. T. Dunbam, who arrived bers on Sunday evening from Sinaquipo, Sonora, we lsarn that several Amsricsn companies ars working mines in tbat vicinity. Mr. Dunbam is a stockholder in tbe Santa Maria Gold and Silver mining company, a cornoration baving headquarters at 39 Broadway, New York. This oompany is working nine mines, and has ordered and paid $200,000 for a 60-stamp mill that will be in opsration in less tban six montbs. The principal mines of this gronp are the Santa Maria. Carmsn, San Francisco and Granadita. The Carmen bas besn worked for more than 200 years, and is a grand mineral bed. It was abandoned by the original owners about 10 yesrs ago ou account of Indian troubles, and lay in a dormsnt state until resurrscted by the pressnt proprietors a fsw years ago. It was in a horrible state when the company bsgan to work it. Filth, mud and water abounded, and it took the present owners nearly a year to clean it out. It is now opened up in good working condition, so that a hundred tons of ore can he extracted daily. The nine mines owned by the company are situated in a group within a radius of a mile, and nnt more tban six miles directly to the Sonora river, where tbe mill will be erected. A first-class wagon road bas been graded from the mines to the mill, and everytbing is in readiness to etart as soon as tbe contractors have the mill ready for action.

Barrajita, a station on the Sonora railroad, is 85 miles west of the mill site, and a good wagon road is now being bnilt by tbe company between the two places. Tbe mines bave all been put in good working condition, tbe old shafts and drifts have been straigbtened and widened. Steam boisting works will be placsd in operation over several of the mines in a few days, and tbe work of banling ore to tbe mill site will commence. About 100 Americon miners and 150 natives are employed.

The company bae erected several substantial buildings for offices and boarding-houses, and improvements of a permanent natnre are being made daily. Developments of an important character have lately been made in tbe San Francisco and Granaditas, bnt the company are reticent abont the matter, preferring to keep tbe matter to tbemselves for some time.

Mr. Dunham states that tbe Mexican government and people treat foreign enterprises witb mnch kindness and consideration, and welcome tbe arrival of American capital to develop tbe resourcee of the conntry. Mr. Dunbam is general agent of the company, representing the Eastern stockholders, and Mr. R. E. Meyer, an old and competent mining man, is tbe superintendent.—*Tombstone Epitaph.*

Heating by Sunshine.—Professor E. S. Morse, of the Essex Institute, has devised an ingenious arrangement for utilizing the beat in the sun's rays in warming onr houses. His invention consists of a eurface of blackened slate under glass fixed to the sunny side or sides of a house, with vents in tbe walls, so arranged that tbe cold air of a room is let ont at the bottom nf tbe alate, and forced in again at tbe top by the ascending beated column between tbe slate and the glass. The out-door air can he admitted, also, if desirable. The thing is so simple and apparently self-evident that one only wondera that it has not always been in use. Its entire practicalness is demonstrated in tbe heating of the professor's study in his oottage at Salem. The value of the improvement for daily warming buildings like churches and schoolhouses, which, when allowed to get cold between using, consume immense quantitiee of heat before they are fairly warmed again, is evident. Of course some other means of heating must be available when the sun does not shine. But in tbe colder regions, say in the far Northwest, the sun shines a greater part of the time, and bencs the saving of artificial heat would he very large if the sun heat could he "turned on" for eight or ten hours out of tbe twenty-four.—*Scientific American.*

Latest advicee from Harrisburg state that tbe miners are all actively engaged in preparing for the summer work, hut it is not expected that mnch will he done before tbe commencement of July, as the ground is covered with snow,

MECHANICAL PROGRESS.

Crystallization of Iron.

The theory that pieces of wrought iron or steel will crystallize by merely hanging for a certain length of time in a vertical position seems to be confirmed as true in the following instance. At the recent meeting of the Civil Engineers' Club, of Cleveland, Ohio, Mr. N. P. Bowler read a paper on the above subject, from which we extract as follows:

We had a chain in daily use in our foundry—used for raising flasks and castings—requiring it to hang in a vertical position most of the time. It had been in use probably eight or ten years. The links were of about one-half inch wire, as you can see by this piece of it. The service usually required was light compared with the ability of the chain. One day a link broke squarely off. The chain was sent to the blacksmith shop for repairs. The smith called my attention to the fact that if he put any of the links on end upon the anvil a light blow of the hammer would break them into four pieces. He tried several of them, and they broke as easily as poor cast iron. I asked him to put a link in the fire, heat it to a red heat, and let it cool gradually. He did so, and found it would not break then, but bend like good iron. I had the chain mended, and after emptying one of our large ladles of the molten iron, thus leaving it red-hot, the chain was put into it to remain all night. That was done over three years ago. The chain has been in constant use ever since, with no signs of weakness by crystallizing.

We served all our chains the same way, by heating them and cooling gradually, and have had no recurrence of this kind. I would recommend that the ladle shanks used about this foundry be treated the same way.

A very interesting fact was related to me not long since by a division master mechanic of the Lake Shore & Michigan Southern railway. He had just made two fire-boxes for a couple of his engines from steel plats or homogenous iron. They were completed, and the engines were ready to run; steam had been got up in both, and found all right.

The following day the fireman of one was told to fire up his engine, the same as he had fired the day before. After starting a pretty good fire, and seeing no signs of steam, he ran horror-stricken to tell his engineer that there was not a drop of water in the boiler, and that everything was red-hot. The master mechanic, who happened to be there, quieted his fears by telling him to "never mind—just pull your fire and let the engine stand and cool off."

That was ten years ago, and that fire-box has been in use all the time, and is good to-day; while its mate, made of the same material, lasted but a few years before it cracked and became useless.

SAWING STONE WITH SHOT.—The *Manufacturer and Builder* replies to the query of a correspondent who seeks information on this subject: We know nothing, from personal knowledge, of the value of iron shot for stone-sawing as compared with sand, never having had the opportunity of witnessing the operation. We have, however, repeatedly been informed, on what we regard to be most competent authority, that the shot is decidedly superior to sand in cutting power, and that it has been found remarkably well adapted for the purpose. We are informed, for example, that marble may be cut from three to four times as fast by the use of shot as by the process commonly used for the purpose with the same saws, taking only about half the power in proportion to the quantity sawed. A blade one-quarter of an inch thick is found to be worn away an inch in cutting 48 inches deep in granite, or 250 inches deep in marble. The mud from working is run into catch-pits, and the fine particles of iron thus saved are used for smoothing granite, cutting faster and lasting longer, it is said, than emery. Hard, sharp sand, in being ground to the finest mud, will, it is found, wear away about its own weight of glass; coarse-grained emery, about twice its weight; while iron shot, passed through a No. 70 sieve, will, it is affirmed, wear away about 50 times its weight of glass. It is said to be necessary, however, that all journals and rubbing surfaces of the machinery be protected from the shot with unusual care, as it cuts and wears far worse than sand. We believe this process is in very general use in large establishment all over the country. The inventor is Mr. B. C. Tilghman, 1127 Girard street, Philadelphia.

FORMATION OF ALLOYS BY PRESSURE.—W. Spring has shown that, when a mixture of bismuth filings, cadmium, and tin, in the proportions necessary for the formation of Wood's alloy, is subjected to a pressure of 7,500 atmospheres, the mass thus obtained powdered and again subjected to the same pressure, a metallic block is formed which has all the physical properties of the alloy. Its specific gravity, color, hardness, brittleness, and fracture are the same; and when thrown into water heated to 70°, it melts at once. In like manner Rose's metal was made by subjecting the proper mixture of lead, bismuth, and tin to high pressure. If zinc and copper filings are repeatedly subjected to pressure, a mass resembling brass is finally obtained.

ELECTRO-MOTORS.—It is but as yesterday that it was first seriously proposed to employ electricity as a cheap motor for heavy work, and already wonderful progress has been made. The experiment carried out at Leytonstone, where a tram car was run by an electro-motor driven by a number of Faure's secondary batteries, is the most important public trial yet made, and it may soon lead to most important results. Roughly stated, the tests at Leytonstone were in this wise: A tram car was fitted with an electro-motor, which was geared to the wheels by a merely makeshift arrangement of toothed wheels. Under the seats of the car were placed some of Faure's secondary batteries. These batteries had been charged previously by a dynamo-electric machine driven by a steam engine. The electric energy stored up in the secondary batteries was used to drive the car by means of the electro-motor; and this it did very effectually, several good runs being made. It has been shown by actual experiment that a Faure accumulator weighing about 300 pounds will drive a tram car with forty-six passengers for a journey of two miles. It is, therefore, practicable to run tram cars without either horses or steam engines, each tram car carrying its own motive power; and by the establishment of a suitable number of stations, fitted with gas or steam engines and dynamo-electric machines, a constant supply of motive power could be stored up in Faure accumulators, ready for use. In this way lines of tram cars, and even omnibuses, could be worked without horses, and with the absence of that noise and nuisance which a locomotive causes.

DESTRUCTION OF RAILS IN TUNNELS.—Continental railway engineers have for some time past noticed that the destruction of rails in tunnels is exceedingly rapid, the rails showing, besides the usual marks of wear, longitudinal cracks, which gradually increase in size until, eventually, the table of the rail is completely separated from the shank, sometimes for considerable lengths. It has also been noticed that the best rails do not escape this kind of deterioration, which is attributed to the sand used for insuring the adhesion of the wheels of the engines to the rails. It is impossible to dispense with the use of the sand, since the rails are covered with a deposit of fatty nature, due to the oil used in lubrication, and to the water resulting from the exhaust steam, which is speedily condensed in the confined space of a tunnel. The grains of sand become gradually incrusted in the slightest superficial scratches of the table of the rails, and at last act as wedges under the repeated pressure of the wheels. It is naturally of great importance to introduce a remedy for this evil, and it is stated that in the Hauenstein tunnel, Switzerland, a jet of hot water from the locomotive was employed to free the surface of the rail from the fatty deposit, and perfect adhesion of the wheels was thus insured.

THE PASSIVE STATE OF IRON.—A peculiar condition of the metal, in which it is found to be indifferent to the action of substances that ordinarily exert a powerful chemical action upon it, has recently been studied by Rsmann, with the following results: He affirms that iron is rendered passive when it is heated in the air, when it forms the positive electrode of a galvanic couple, and also when it is immersed in any of the following named-liquids: Nitric acid, solutions of the nitrates of ammonium, iron, silver, aluminum, nickel and cobalt. The passive state, he holds, is due to a firm coating of the magnetic oxide on the surface of the metal, this oxide being sparingly soluble in strong nitric acid, but freely soluble in dilute nitric acid. Finely divided iron, which has been immersed in any of the above liquids, and has been carefully dried in a current of an indifferent gas, may be shown to contain a considerable quantity of oxide by the formation of water when ignited in a current of hydrogen. When iron is dipped in nitric acid, a portion of the metal dissolves, forming ferric nitrate, which is reduced to ferrous nitrate by the excess of iron present. A further reduction then takes place, the ferrous nitrate being converted into ammonia and magnetic oxide.

INFLUENCE OF MECHANICAL HARDENING UPON THE MAGNETIC PROPERTIES OF IRON AND STEEL.—Many investigations upon the relations between the molecular conditions of iron and steel produced by heat, by torsion, and by annealing processes, and the resulting changes in magnetic conditions, have been made. It appears, however, that the effect of mechanical hardening has not been properly investigated, and the results of researches by Mr. L. M. Cheesman will, therefore, probably be of interest. Mr. Cheesman's method of research consisted simply in determining the magnetic moment of the magnetic bar after it had been subjected to mechanical pressures. The results obtained may be summed up as follows: Iron in a mechanically hard condition can receive more permanent magnetism than in a soft condition. The magnetic moment of a steel magnet in a mechanically hard condition is greater or smaller than in a soft condition, according as the ratio of its diameter to its length is lesser or greater than a certain limit.

A LARGE BELT.—An English firm has recently shipped to a mill near Bruecele a double driving belt 75 inches wide and 153½ ft. long, and it is to transmit 650 indicated horse power.

SCIENTIFIC PROGRESS.

Man and Insects.

The only nerves (worth mentioning) in the human body which are not under the control of the brain, are those of the heart and other internal organs; and over these parts, as everybody knows, we have not any voluntary power. But all our limbs and muscles are moved in accordance with impulses sent down from the brain, so that, for example, when I have made up my mind to send a telegram to a friend, my legs take me duly to the telegraph office, my hand writes the proper messags, and my tongue undertakes the necessary arrangements with the clerk. But in the insect's body there is no such regular subordination of all the parts composing the nervous system to a single central organ or head office. The largest knot of nerve matter, it is true, is generally to be found in the neighborhood of the sense organs, and it receives direct nerve bundles from the eyes, antennæ, mouth, and other chief adjacent parts; but the wings and legs are moved by separate knots of nerve cells, connected by a sort of spinal cord with the head, but capable of acting quite independently on their own account.

Thus, if we cut off a wasp's head and stick it on a needle in front of some sugar and water, the mouth will greedily begin to eat the sweet syrup, apparently unconscious of the fact that it has lost its stomach, and that the food is quietly dropping out of the gullet at the other end as fast as it is swallowed. So, too, if we decapitate that queer Mediterranean insect, the praying mantis, the headless body will still stand catching flies with its outstretched arms, and fumbling about for its mouth when it has caught one, evidently much surprised to find that its head is unaccountably missing. In fact, whatever may be the case with man, the insect, at least, is really a conscious automaton. It sees or smells food, and it is at once impelled by its nervous constitution to eat it. It receives a sense impression from the bright hue of a flower, and it is irresistibly attracted toward it, as the moth is to the candle. It has no power of deliberation, no ability even to move its own limbs in unaccustomed manners. Its whole life is governed for it by its fixed nervous constitution, and by the stimulations it receives from outside. And so, though the world probably appears much the same to the beetle as to us, the nature of its life is different. It acts like a piece of clock-work mechanism, wound up to perform a certain number of fixed movements, and incapable of ever going beyond the narrow circle for which is designed.—*Grant Allen, in Knowledge.*

SOUND, LIGHT AND HEAT.—Prof. Tyndall lately delivered the second lecture of his course at the Royal Institution. The explanations given by Huyghens of the phenomena of reflection and refraction, as well as of the properties of convergent and divergent lenses, had, he said, been fully verified by the progress of time and science. The lecturer showed that there are sound lenses also, and that the wave theory affords a no less adequate explanation of their properties. He demonstrated, by the test of the sensitive flame, that cotton net, because porous, transmits waves of sound, while the interposition of a non-porous body leaves the flame unaffected. Just as the passage of light was hindered by clouds, although the air and light of which these are made up were alike transparent, so acoustic clouds obstructed sound. Acoustic cloude consisted of layers of heated air with intermediate layers less heated. The lecturer formed an artificial cloud of the kind, which was known to intercept sound; the sound was thus thrown back in miniature echoes. Another analogy between light and sound was brought out by comparing the solar spectrum with a scale of notes produced by striking a graduated series of tuning forks. To illustrate Dr. Wollaston's observation, that certain sounds are inaudible to many ears, Prof. Tyndall blew a small whistle, whose low, though shrill, note instantly agitated the sensitive flame, while full half of those present, as a scientist had predicted in conversation with the lecturer beforehand, heard nothing. Resemblance were also pointed out between the absorption of light and that of sound. On the sound struck from one tuning-fork being quenched, it was proved to have been not annihilated, but simply absorbed by an adjacent fork. In like manner the yellow ray in the solar spectrum was absorbed by sodium vapor as the metal passed under the eyes of the audience in that form, leaving the place of that color in the spectrum marked by a black band.

THE ELECTRIC LIGHT AND ACOUSTICS.—The introduction of the electric light in the Grand Opera House, Paris, has, as might have been expected, greatly improved the acoustical properties of the building. Of course, the incandescent system can produce no disturbance of the atmosphere and no heated gases.

THE TONGUE.—Of the sense of taste, Prof. McKendrick states that the base of the tongue is most sensitive to bitters and the tip to sweets. A substance must be soluble in the fluid of the mouth to create taste, but no definite relation has been found between the chemical condition of bodies and their taste.

The Creation of Electric Forces.

A water-wheel, by being employed to generate electricity, may light our rooms, cook our dinner and ripen our peaches. We can have light from it by which we can work as easily at night as in the day—a light which will neither consume our fresh air, nor vitiate it with foul gases, nor smoke our ceilings and destroy our curtains; which can set fire to nothing; the globe of which can be hooked to an invalid's bed-curtain without risk, or attached to flexible wires and taken into the most confined corner to give light to a workman without danger of fire. It would fill a volume to state at length all the practical advantages which this development of electricity has opened up already, and more than a volume to state all that it may be expected yet to accomplish. Let it also be understood that while the foregoing illustrations have been stated in relation to water power, they are equally true for the other powers, such as steam engine, gas engine, horse power or human labor. The fixed engine on a farm can do the plowing hundreds of yards off. The gas engine that pumps water by day can light the house at night. The horses that drag coal carts for many miles to work a steam engine in some outlying place, can be used at home instead, to work an electric machine, with no loss of time, and in many cases with less waste of labor. The convicts on a treadmill can be doing work by it at any part of, or even outside the prison. In a word, the power for work can be generated by any ordinary means, and at any place where the means exist, and can be economically conveyed to the spot where it is to be usefully applied without loss of time and practically in full strength. The tide on the shore can do work far inland; the stream in the mountain gorge can do work on the hilltop; the wind-mill on the eminence can do work in the valley; the horse in the yard or the man in the out-house can do work inside the dwelling. And with all its power, and its universality of application, this new servant which science has supplied us with is the most docile of menials. A touch of a lady's finger will bring into action a power which a thousand men could not resist; another touch will stop its action, or reverse it, in a moment.—*Am. Inventor.*

FOGS.—At a recent meeting of the Physical Society, London, Mr. Newth exhibited some interesting experiments illustrating the formation of fogs. In 1875, Mr. Marscart showed that mere reduction of temperature or pressure in the atmosphere might not give rise to fogs, unless the air were pervaded by solid particles of smoke or certain gases, such as sulphurous acid gas, to form a nucleus for the water vapor to condense upon. This fact was ably demonstrated last year by Mr. Aitkin, of Falkirk, and Mr. Newth's experiments were designed to show it on the lecture table. For this purpose he had arranged a bulbous flask of glass connected to an air pump, and containing a little water in the bottom of the flask. The beam from an electric lamp could be thrown through the flask so as to illuminate the interior. Mr. Newth first admitted some of the mote-filled air of the room into the flask, and by partially exhausting it, produced a thick fog; but on washing out the motes by agitating the water in the flask, the fog became far less appreciable. A small quantity of smoke introduced into the flask produced a thick fog; so, also, did the fumes from a piece of burning sulphur, and even a platinum wire rendered incandescent by an electric current gave off sufficient solid particles of dust or other matter to produce a fog. The inference is that even with gas grates and stoves we shall not get rid of fogs, though they be of a lighter color and less dense than with coal fires.

EFFECTS OF HEAT ON ELECTRICAL CONDUCTION.—Prof. F. Guthrie, F. R. S., recently read a paper on the discharge of electricity by heat. He showed by means of a gold-leaf electroscope, that a red-hot iron ball, when highly heated, would neither discharge the positive prime conductor of a glass electrical machine nor the negative one, but on cooling the ball a temperature was found at which the ball discharged the negative conductor, but not the positive one. Lastly, on cooling the ball still further, but not below a glowing temperature, it was found to discharge both positive and negative electricity. A platinum wire rendered red hot by the current also discharged a negatively charged electroscope more readily than a positively charged one. When placed between two electroscopes, one having a + and the other a − charge, it discharges neither. When the + one was withdrawn the − was discharged; but when the − one was withdrawn the + was not discharged. There therefore seemed a tendency in a hot body to throw out + rather than − electricity. These are interesting experiments, and open a little room for discussion versus positive and negative electricity.

FINE DUST falling on vessels in the Atlantic near the Cape de Verde archipelago has often been reported, but it has so often been of a reddish hue that it is known among sailors as "red fog." In Lyons, Genoa, Sicily and other parts of southern Europe the same phenomena giving rise to "blood rains," has frequently been recorded, and 20 cases, between 1803 and 1870, have been collected, by Flammarian, occurring in Europe. Prof. Ehrenberg microscopically found the Atlantic dust rich in infusorial forms belonging to equatorial South America.

The Mining Share Market.

The market has been going on for the past week with a fair amount of business, but there has been no special advance to note. Our tables give the fluctuations, which have not been marked. As to the situation on the Comstock, the *Enterprise* says:

The breasts in the lower stopes of the Union Con. (50 ft. below the 2500 level) were in very rich ore. This was where they are stoping out southward. How long this rich ore will hold out remains to be seen. However, it is good to find such ore at that depth. There are some signs of this deposit making more strongly to the northward than was at first expected—that is to the north and west.

The Mexican west crosscut No. 21, on the 2700 level, is also cutting stringers of ore, as also is north drift No. 3, on the 2700 level of the Sierra Nevada. Indeed, at the depth of 2800 ft. and 2700 ft., in almost every direction, is found as fine vein material as was ever seen in any portion of the vein. Supt. Patton says that even surrounding the big bonanza was found no finer looking vein material. It has a live and ferrule appearance and is highly metalliferous. Not only are there great numbers of streaks of quartz that carry silver and gold, but all the rock carries a great deal of iron of exactly the same kind that was found in the surroundings of the big bonanza. The scattering deposits of ore found in various directions on the 2500, 2600 and 2700 levels indicate that they are the forerunners of a big body lying somewhere below. This body will probably be found further to the eastward. Until quite recently it has been supposed that the main north and south lateral drift run on the 2700 level of Union and Mexican was at or near the east line of the vein. It has now been satisfactorily ascertained that this is not the case. What was thought to be the east wall is nothing more than an accidental separation—a sort of seam or division in the midst of the ore channel. Just where the east wall will be found is a matter of conjecture.

When found, we are of the opinion that ore will be found against it. In traveling down Seven-mile canyon a ridge of black rock resembling black dyke is to be seen on the slope of a mountain on the north side of the canyon. This rock will probably be found to form the east wall of the vein, as on the surface all is vein material until this ridge of rock is reached. This is a great distance east of the Union shaft on the surface, and is no doubt well to the east below, as it has an eastern dip that would carry it away from the shaft.

There are now beginning to be seen to the eastward on the lower levels indications that this east wall—wherever it may be—is becoming more vertical, as the stratification of the rock is bending downward. This is considered a very promising indication, as the ore, now so much scattered, would be liable to be concentrated at some point. However this may be, it is probable that the eastern part of the ore channel will soon be more thoroughly examined. Even on the upper levels the ore so long looked for may lie off on the east side of the vein.

On the 2900 level of the Union a drift has been started south from the joint Sierra Nevada station. This will almost immediately pass into very interesting ground.

On the 2500 level they have not yet sunk below the sill floor of the lower stopes, and probably will not. It is at present the intention to prospect the lower part of this deposit by raising from the 2600 level.

On the 2900 level of the Mexican a crosscut is now going into a wholly unknown region. This has been started far enough south to avoid the water that was tapped when the diamond drill was sent ahead from the face of the main north drift.

Oakland Manufactures.

We see by the Oakland *Times* that nearly all the shares of stock in the Judson Nail factory, offered to the citizens of Oakland, have been subscribed, and the company has decided to locate at the Emory tract, between the railroad and the bay. It was well known from the start that the enterprise would be a paying investment, and no difficulty was experienced in disposing of the stock. Great care was taken to place the shares in the hands of enterprising business men, and the result is that many of our best citizens are stockholders. Among those who have subscribed are Egbert Judson, C. S. Chamberlain, T. P. McFeely, J. Benedict, John Finn, Theodore Green, H. D. Bacon, E. B. Dean & Co., V. D. Moody, F. Delger, A. J. Snyder and J. B. Wyman. The capital stock is $500,000. It is proposed to manufacture horse-shoe nails, tacks, brads, finishing nails, Victor mowing machines, pulleys, hangers, files, etc. The company has such facilities and advantages that it can manufacture the peculiar stock at a much more reduced rate to the purchaser than now. The strongest iron, the Clipper Gap pig iron, of which Mr. Judson is the largest owner, will be used. The enterprise will give employment to 200 persons, and a large number of boys will have an opportunity to learn useful trades. No Chinese will be employed. Next Monday ground will be broken on the site selected, consisting of three acres of land, and the erection of six buildings will be begun immediately. Two buildings will be 100x40 ft. each; the second building, 175x100 ft.; the foundry building, 100x40 ft.; wood shop, 140x50 ft.; warehouse, 160x40 ft., one story in height.

The factory, being located upon the railroad, and not far from the bay, will have unusual facilities. Mr. Chamberlain, the manager, was in Oakland yesterday, and was jubilant over the splendid prospects. Only a few more shares are to be sold.

In Columbus district the Princess mill is being pushed steadily to completion, and will be running by the 15th of August. On the 10th of June the Princess M. & M. Co. will begin to purchase ore from prospectors in the camp. This departure of the Princess will help to develop the camp and lay the foundation of a large town, and many rich mines will come to the front as paying properties.

The *Golden Estate* says it is thought the Mescalero Apache reservation will be reduced in size sufficient to throw open to prospectors the rich mineral lands thereon, thus obviating the necessity for removal of the Indians. The occupants express a willingness to have the minerals revert to the Government.

TOMBSTONE produced in April $404,846.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

POTOSI MINE.—Amador *Ledger*: This mine during the past year has been operated by Messrs. Hobbs & Richards, under the superintendence of Mr. Chas. Thomas. The shaft is down 275 ft and levels run at 70 ft and 200 ft. In the 70 ft. a tunnel is run south for 50 ft, showing a ledge on the hanging wall 2 ft thick and 10 ft of ledge matter on the foot wall. In the 200 level, one tunnel was run 90 ft north, showing a body of ore 10 ft thick. On the south side in same level a tunnel was run 133 ft, giving a ledge of an average thickness of 5 ft. Stoping from this level kept the 10-stamp mill supplied with ore during the year. The mine is shut down for a while. As depth was gained the value of the ore increased and large quantities of sulphurets were found coming in the slate. The average value of the rock has been such that it is the intention of the company to add another 10 stamps to their mill; then, instead of making but a little over expenses, they will clear a good profit on their investment. This property is regarded as a valuable one, and great praise is given the owners for done so well on a small capital. The prospecting has been on the hanging or east wall; but every indication goes to show that the best rock will be found on the foot wall; and future operations will be carried on there as well as on the hanging wall.

CALAVERAS.

LAMPBEAR MINE.—*Chronicle*, May 22: Operations in the Lampbear mine are being pushed right along. The mine is now clear of water, and the pumps are kept working. The men have been engaged during the week in cleaning out the levels and are about commencing to take out ore. A. Pickering, Esq., of Railroad Flat, a man who has a thorough knowledge of milling operations, has been engaged to take charge of the mill, which it is expected to start next week.

MILL CLEAN-UP.—A clean-up has recently been made in the Mammoth hydraulic claim on Tunc el ridge, owned by J. F. Veith, Esq. A run of several months was made and resulted in a clean-up of about $5,000.

DEL NORTE.

HAPPY CAMP NOTES.—Cor. Del Norte *Record*, May 27: The mining season has turned out more favorable than I expected. Most of the claims have plenty of water and are running night and day, and, as there is still a large body of snow on the mountains, the water is liable to hold out until late in the season. The yield of gold for the season thus far has been quite up to the average, and I have heard but little complaint from the miners. The prines of this section will compare favorably with those to any part of this northern district. I do not wish to infer that our mines are fabulously rich, but if operations are conducted on a business basis, with the same care and careful management that one would give to any other pursuit or enterprise, the yield upon the investment is far ahead of any mercantile or mechanical business that he can be engaged in.

EL DORADO.

GOPHER-BOWLDER.—*Mountain Democrat*, June 3: Landecker has obtained control of the Gopher-bowlder mine and mill, which has been lying idle for some weeks, and he will soon resume operations upon it. We have great faith in the mine, and feel quite sanguine that it can be developed into a fine property if properly handled.

GOOD CLEAN-UP.—At the Cedar Springs mine, on Cedar ravine, near this city, a clean-up of over $3,300 was made last Saturday, as a result of a 12 days' run. This is the best clean-up made in that mine in a long time, and the prospects ahead promise an improvement on these figures.

QUARTZ MILL AND HOISTING WORKS.—A BARGAIN.—Mr. E. Myers, a San Francisco attorney, arrived in Placerville last Wednesday, to remain a few days. He is the attorney and agent of a New York company that owns the Chaparral mine and mill property, in Kelsey township. The mill has 10 stamps, 5 of which are comparatively new. The hoisting works are quite complete. The mine, having disappointed expectations, the mill and hoisting works are offered for sale at a bargain.

MARIPOSA.

MINES.—*Gazette*, June 3: The Christmas Gift mine and mill were into full operation last Monday. The mill has five stamps, and is located on Cy. Thompson's ranch, in Cathey's valley, some two miles from the mine, which is on the Guadalupe mountain. The ore is decomposed talc slate, and is considered rich.

COULTERVILLE.—Mr. Mast's force at the Fairview mine are pegging away as rapidly as possible, and he has a vein from 2½ to 30 inches wide and very regular, and of good milling ore. He also informs us that he has completed a first-class trail up the river to the old Derick mill-site, and will commence packing quartz down to the Banderita mill inside of a week, and will soon have the Banderita mill clattering away on quartz from the Fairview vein. I am also informed by the same gentleman that they will soon reach or drive the 1200-ft per on the Banderita tunnel, and that one can stand at the face of the works and see a person at work at the mouth of the tunnel. That is the straightest tunnel on the coast. Only think of it, 1200 feet as straight as a gun barrel! This tunnel was run by Mr. John Roberts, an old and well-known miner of Mariposa county.

WHITLOCK CON.—The Whitlock Con. M. Co.'s mines, consisting of the Margaretha, Golden Fleece, Bessie Collins, Fortuna and Goodman mines formerly located by Fritz, Snyder & Co., situated near the head of Whitlock's creek, about 5 miles north of Mariposa, in this county, have recently been surveyed and platted by R. B. Thomas, Deputy U. S. Mineral surveyor, and re-located by John Hirman, George H. Schofield and others, with a view to further developing said mines, which have lain idle for the last 15 years.

MONO.

THE MAY LILLY.—Homer *Index*, June 3: The Lake Canyon toll road has been put in repair, and the first teams went up to the May Lilly tramway on Thursday. The tramway is being repaired and will be ready for use by Monday. A contract has been let to John W. Stewart for hauling ore from the foot of the tramway to the mill during the season, and the work of transportation will be in charge of C. M. KNOX, who now has on the road 7 teams of 6 heavy horses each, each team drawing a wagon capable of carrying 6 tons of ore at a load. As many more wagons and teams as required will be put on. The mill is being put in order and will be started up in a few days. The affairs of the mine are under the immediate personal supervision of M. B. Kellogg, one of the general managers of the property, who is assisted by A. D. Shaw, for the past 7 months assistant and acting superintendent.

BODIE.—*Free Press*, June 6: The resumption of work at the Standard mine, and the starting up of both mills, has brightened up matters about Bodie very materially, and people are now watching developments in other quarters with renewed and increased interest. The work in the Noonday's attracts the most attention at present. The crosscut reached the vein last Sunday, and a drift was started north and south, partly in the vein and partly in the foot wall, which drift is now 12 ft long. In the winze, 75 ft above, there are five or six ft of white low-grade quartz between the foot wall and the ore body, and that portion of the drift which is in the vein is in that description of quartz, though showing more mineralization than above.

RICH FLOAT.—From time to time for some years past float rock rich in gold has been found along the eastern slope of the high mountain range over hanging the western arm of Mono lake, and at present that region is swarming with prospectors. One rich ledge has been

found above Wilson's (formerly Sim. Baker's) ranch, and as the float ceases at about the same altitude all along the mountain, prospectors feel confident that they will be able to find the main lode at several different points before the summer is over. Some of the float rock found is so rich in gold that it is suitable for the manufacture of jewelry.

NEVADA.

WASHINGTON M. Co.—Grass Valley *Union*, June 3: At the meeting of the stockholders of the Washington M Co., held on Thursday evening of this week, to take into consideration the disposition of the stock held by the company whether to offer it for sale or distribute it pro rata to the stockholders—it was determined to make no present distribution of it. The present appearance of the mine is quite encouraging, and the opinion prevailed at the meeting that the stock would command a much better price a few months hence, if offered for sale, than it would command now, and provide more funds to the treasury if a sale was then deemed necessary. It was stated at the meeting that in the drift being opened on the 265 level the mine was showing good improvement, the rock showing a solid ledge of over 2 ft in thickness, with ledge matter that increased the size to about 3 ft. The ledge is handsome in appearance, showing well in heavy sulphurets and respecting in free gold.

CANADA HILL MINES.—A nice clean-up was brought in yesterday from the Charouuat quartz claim.....The new steam hoisting and pumping works at the Wide West mine of Messrs. Keith, Johnson & Co. started up Monday, and the water is being rapidly lowered. The shaft is down 70 ft, and will be put down deeper before long. There is a good ledge in the Wide West mine, the ore taken out before the machinery was erected paying as high as $60 a ton.....Ed. Moore has replaced the wheel heretofore used on the Lincoln mine with one 20 ft in diameter, and will hereafter experience no lack of power for hoisting and pumping. He has one of the best ledges in that vicinity and has been getting good returns from it for some time.....The numerous other claims at Canada Hill are doing well. A good deal of prospecting is going on there.

PLUMAS.

INDIAN VALLEY MINE —Greenville *Bulletin*, May 31: The Indian Valley mine is in good working order; the mill is running steadily with satisfactory results. Since the substitution of water power for steam the working expenses have been materially reduced. The flow of water in the lower levels is so slight that but little pumping is necessary to dispose of it.

ELIZABETHTOWN MINE.—The Corbin & Manson drift mines at Elizabethtown have been paying well all this spring; as the season advances and the ground dries out the various drifts in the ground can be still more easily worked; there will be less expense for pumping, and the drifts can be held easier by the timbering.

TAYLOR-PLUMAS.—At this mine they are still working in the upraise. During the past few days the ore has shown more free gold than for some time before. The ledge has maintained the same width and general character for weeks past. About 200 tons of ore are now on the dump.

PROVIDENCE.—On last Thursday the ledge was struck in the tunnel of the Providence mine. The ore is rich, and, at the point where it was struck, the vein is about 3½ ft thick. Since it was struck the ledge has been opened about 18 ft and shows a good body of ore.

ALTONA.—Mr. Emmons has bought out the interest of Thomas Davis in the Altona mine. The interest held by Mr. Davis had been allowed him for prospecting. Mr. Emmons now owns the entire right and title to the mine, with all water rights and everything else belonging thereto.

GREEN MOUNTAIN MINE.—Every visit to this mine finds it improving in some particular; at present it is looking better than at any former time in its history. The ore now being crushed is all from the No. 5 level and from what is known as the sulphuret ore chute. So far this month but one shipment of bullion has been made; the amalgam for this bullion went as high as $6 per ounce That proves two things; first, that the ore is richer, and second, that the gold is of better quality than for a year or so past.

PLACER.

IOWA HILL.—Placer *Argus*, June 3: The Union quartz mine at Humbug canyon is prospecting quite well Messrs. Neff, E. G. Spencer and two or three others are the owners. The machinery of the Morning Star mine having lately been repaired and set in order, the work of crushing will be begun next Monday.

THE GOLD BLOSSOM.—*Herald*, June 3: The owners of the Gold Blossom mine, located a short distance below Ophir, are pushing work ahead with the view of a thorough development of their property. Besides the work of extracting ore, which is going on all the time, they are putting up crushing and concentrating works, using a hurdy-gurdy wheel for power. This mine has been alluded to in these columns heretofore as the Ohio. It embraces a very large and well-defined ledge, and, so far as prospected, has turned out some very good ore. It is owned mostly by residents of Auburn, and, from what is known, the general impression prevails that they have a good mine.

SIERRA.

MAMMOTH QUARTZ MINE.—Sierra *Tribune*, June 4: The Mammoth quartz ledge, located on Kanaka creek, about 5 miles southwest of Forest City, is owned by Messrs. Way & Spencer. Thus far the average width of the ledge has been from 80 to 110 ft. The formation surrounding the ledge at the footwall is porphyry, and at the hanging wall, serpentine rock. The ledge is entirely decomposed to the depth it has been worked, and the ore prospects well from wall to wall in fine gold. The owners have recently started a new tunnel, which will tap the ledge 200 ft in depth, and, if the ledge continues to pay as well as at present, the owners certainly have a bonanza. A sufficient water power for running any number of stamps can be had from Kanaka creek the year around, which fact, together with the readiness with which ore can be extracted from the ledge, would reduce the cost of reduction to a very low figure, and render it possible to work low-grade rock at a profit.

BRUSH CREEK QUARTZ MINE.—We are informed that the above company will resume operations on its claim, which is located near the Mountain house, the 1st of July. Considerable money has been taken from the mine. After lying idle several years, work was commenced on it last season by the present owners, but, after pumping the mine partially out, the shaft caved, and a suspension of work ensued. The company will erect new hoisting works and sink another shaft.

TO RESUME WORK.—Charles Benham is expected out here from New York the first part of this month, when, we are informed, he will start up work at the Golden Gate, Harlem and Black Jack mines.

PROSPECTING. — *Mountain Messenger*, June 3: The Marguerite Co. will soon start a tunnel at a point near their quartz mill at Loganville, running in the direction of the Keystone mine The company has located all the ledges that crop and has also made a tuonel location which gives it the right to all the blind ledges discovered. The course of the tunnel is south, 20 degrees east, courses magnetic.

THE Bald mountain Co. is employing 120 men. They are over 8,000 ft underground, and near the Ruby line. The gravel lead now being worked is very rich, and pays well. Oscar Jones, day boss, has our thanks for kindly attention shown us the other day, on a ride through the mine.

IMPROVING.—The Marguerite M. Co. is at work putting in 10 more stamps at their quartz mill, at Loganville. They will also put up several more buildings this summer. The mine is proving to be a very good property and improving every foot they go down.

FORT WISE.—Large cave at O. Liberty's hydraulic claim last week, but the debris is about cleaned away, and good returns anticipated for the season.

GOOD HOPE.—Mr. Hewson, the owner of the Good Hope quartz mine, has a force of men at work getting things in order to start the mill. The road and dump are being fixed and some changes made in the mill, which will probably be started this week.

THE hydraulic diggings at Morristown and Craig's flat are paying exceedingly well this season. Two more months of water expected.

SAN DIEGO.

PINACATE.—Los Angeles *Commercial*, May 27: From a reliable gentleman, just arrived from Pinacate, San Diego county, we gather the gratifying information that the camp referred to is in a splendid condition. The poorest quartz and quartzite runs from $30 to $40 per ton in gold. Three mills are crushing the quartz, one of them being a custom mill, which is of the greatest advantage to prospectors, who own rich claims without the capital necessary to erect a mill. We were shown a beautiful specimen of rock, rich in free gold, which assays a fabulous sum per ton. The California Southern railroad is now running two trains each way daily within half a mile of the mines and mills, rendering transportation easy, sure and speedy. From all reliable information that we can gather, Pinacate is destined to become one of the richest mining districts in southern California, which is another feather in our cap, already crowned with similar plumes.

TRINITY.

COFFEE CREEK.—Trinity *Journal*, June 3: Sam Borden, of Trinity Center, was in town this week, and reports everything lively there and thereabouts. On Coffee creek the Nash Deep Gravel M. Co. is running full blast with about 30 white men and 40 Chinamen at work. Their ditch is completed, water through the ditch and sluicing commenced. On the East fork of Coffee creek Rundell & Co. are at work, with good indications of success.

FORGING AHEAD.—Work is progressing satisfactorily on the new Canon creek ditch, under the direction of E. M. Benjamin, superintendent. One and one-half miles of the ditch were graded lu 0 days.

MR. F. T. HAWLEY, superintendent of the Willshire mine, at Big Bar, was in town this week. He reports a short mining season consequent on the dry winter.

NEVADA.

BRISTOL DISTRICT.

DAY COMPANY.—Pioche *Record*, May 27: The hauling of ore and coal to the Day furnace has been steadily going on during the week, and last week G. R. Barton went to Eureka for the purpose of purchasing large coal teams. The same steady work is being carried on in the company's mines, and the Day mine is holding its own.

THE FIRST LOAD.—A 10-mule team, loaded with chloriders' ore from one of our mines, passed down the street on Friday. This is the first load of ore shipped to the Day Co.'s furnace at Bristol from Pioche, preparatory to the starting up.

THE mill of the Bristol Co. is running again, and we hope it will continue so without interruption. We learn that the water supply is better than it has been heretofore.

EUREKA DISTRICT.

ANOTHER TUNNEL ENTERPRISE.—Eureka *Sentinel*, June 1: Notwithstanding the many tunnels that are being driven to pierce the old mountain, the owners of the following-named mines, located on the west side of Prospect mountain, have concluded to consolidate their properties for the purpose of developing them by a deep tunnel, commencing at the Jeff and running easterly through the Tyndal, Cosmos, Mary Ann, Nondescript, Anonyma, Jones & Kyle, Commit, Wolverine and Mountain Pride, connecting with the Sea King shaft, which is being sunk by the Richmond Co.

ITEMS.—Capt. Fuller is opening up a fine ore body on Adams' hill in the Paul Pry mine.....A fine body of ore has just been encountered in the Paul Pry mine on Adams' hill.....The Membres and the Oriental & Belmont mines have commenced shipping ore to the furnaces. .....Two leases have just been let to work the Oriental & Belmont mine, on Adams' hill. Work will be commenced to-morrow.....The Dead Broke mine, on Prospect mountain, owned by Martin Pantoni, is looking well, and has a large amount of high-grade ore to be taken out. .....Mr. John Rettis and Joseph Armstrong yesterday leased the 4th level of the Phœnix mine. They have put the shaft in good order, and will commence mining immediately.....At the War Eagle mine, on Adams' hill, owned by James Slaven and others, a strike of ore has been made that is 2 ft wide and assays from $100 to $125 per ton in gold with a small per cent. in silver .....In the Banner mine, on Prospect mountain, they have a larger body of ore than ever before, and it is of a higher grade than formerly. Twenty tons of the ore will be shipped to the Richmond works immediately. An increased force of miners will be put to work this week. .....It is understood that there is about to be a consolidation of Eureka Tunnel and Eldorado Con. mining companies under the name of the Eureka Tunnel Consolidated Mining Co. An assessment will be levied to pay off the debts of both the old companies. The new enterprise will start up with a fair prospect.

ELLSWORTH DISTRICT.

THE SITUATION.—Grantsville *Bonanza*, May 29: Last Sunday, in company with Wm. Watson, we took a trip over to Ellsworth. The people there are hopeful of enjoying a prosperous summer. The mill is undergoing a thorough repair under the superintendence of Charley Ogden, and when ready will be started up on ore from the Esta Buena mine. Mr. Riley, one of the owners in this property, is at present in Ellsworth taking in the situation. At the Kohinoor, Foreman Garrard is doing some little work. At Marble Falls the mines are looking well, and as soon as the arastra is completed an effort will be made to reduce the ores. Should it work successfuly it will prove a source of profit to its owners as the ore encountered in the mines is of a high grade. Considerable prospecting is being done in Ellsworth with varying success.

ESMERALDA DISTRICT.

HUMBOLDT HILL M. & M. Co.—Esmeralda *Herald*, June 3: Notices have been posted on the streets for the letting of two contracts at the mine—one to sink the north incline shaft 45 ft, the other to run a drift connecting the north and south shafts—pending the completion of which the mill will work on custom ores. To-day a clean-up is being made at the mill for the month's run.

GARFIELD DISTRICT.

ATTRACTING ATTENTION.—Cor. Esmeralda *Herald*, June 3: Garfield District attracts more attention than any district along the line of the C. & C. railroad, and the meritorious showings in the mines at work prove the attention is not ill-bestowed. Johl & McDonald are working about 20 men steadily, and taking out the same good quality of ore from the famous Lottie. They have now about 40 tons on the dump. The tunnel being run to tap the Lottie ledge is now in a distance of 225 ft.- Mead and others have suspended work on the Yerington & Bliss, having encountered ground that requires timbering, and there not being a supply of that necessary article at hand. The reports from the Farrington & Moss mines are very flattering. I understand that they had 40 tons of ore worked from their mine that netted about $20,000. Among the claims that have started work this month is the Black Prince, owned by Box, Hauger and others, which has a favorable outlook. Also the Baby mine, owned by Hawthorne & Hultman, which is looking well. Work has been resumed on the Wm. Eva copper mine about 5 miles southeast of Garfield, with a force of 8 men. At the depth of 90 ft the ledge is 10 to 20 ft wide and runs from 20 to 40 per cent. copper. Report has it that smelting works will soon be erected at Soda Springs for the Wm. Eva. There is now on the dump 500 tons of ore.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, May 31: The stopes in the Betty O'Neal still hold their own, and the usual amount of ore is being taken out; the ledge increases in size as the drifts and stopes are driven south. A winze has been sunk from the Bateman stope to the lower level in good ore all the way, the ore streak being about 2½ ft. wide. The shaft has been sunk 13 ft to date, and the indications are very favorable for striking a lode of ore The Eagle mill has been kept going steadily on ore from the Betty, and considerable bullion shipped to San Francisco. A clean-up will be made on the 1st of June and the mill shut down for a day or two for necessary repairs. On starting up again arrangements have been made to work a quantity of ore for the Morning Star mine, after which the Betty O'Neal Co. will again supply the mill with ore for reduction.

EAGLE MINE.—About 30 tons of ore have been extracted from one of the old stopes in the Eagle mine by tributers, 15 tons of which is first-class and will work away up; the remainder will, judging from appearance, more than pay cost of extraction and milling. There is considerable good ore yet remaining in the old workings of the Eagle mine, and good wages can be made by leasers.

MORNING STAR.—The track laying and timbering in the lower level is now completed and everything is in first-class order, ready for starting up at a moment's notice. The pack train is running steadily, bringing ore to the wagon road at the forks of Lewis canyon.

EMMA.—Work has been suspended on the Emma mine for the present and will not be resumed till after the return of the owner, J. A. Blosson, from California.

PARADISE DISTRICT.

NEW MILL.—*Silver State*, May 27: A small 4-stamp mill for the Credit Mobilier mine in Paradise district, owned by A. M. Saderns, has arrived at Golconda, and will be taken at once to the mine. Paradise district is situated about 12 miles from Golconda in the range of mountains between the Humboldt river and Paradise valley, and the Credit Mobilier mine, the first found in the district, has produced considerable rich gold-bearing quartz.

WILLOW CREEK DISTRICT.

GOOD PROSPECTS.—*Silver State*, June 3: A note from Willow Creek says there is considerable activity displayed among mining men in that district. The mines increase in size and richness as work progresses and depth is attained. The Emma tunnel is now in 165 ft, and the depth from the surface, at the face of the tunnel, is 125 ft. There is a fine body of ore in the tunnel, and the mine promises to be a veritable bonanza. Work still progresses on the Comstock, and there is a large pile of rich ore on the dump. J. T. Upson has struck a new prospect, which assays well in gold and silver, and promises to be a good mine. The owners of the Ohio mine have put on a force of men, and are opening the mine and taking out ore, with the intention of shipping it to Salt Lake, where nearly all the ore produced by the mine has been shipped at great expense. There is no mill in the district, and it is hard on miners to be compelled to ship ore to have them worked, as only the richest will bear the heavy expense attending shipping. Prospectors are coming into the district daily, and all appear well pleased with the prospects. A 10-stamp custom mill would certainly do well at Willow Creek. It would encourage mine owners to develop their claims, as ores which are now valueless because not rich enough to ship, could then be worked.

ARIZONA.

RUSSELL CAMP.—*Epitaph*, May 27: From Mr. August Joeress, of Russell Camp, who arrived in Tombstone yesterday, we learn that the smelter, recently erected at that point by the Philadelphia company, is running along smoothly and doing excellent work. The smelter was started up on the 16th and made a trial run for 24 hours, and was then shut down for a few repairs. It was started up again on last Tuesday, and since then has been doing some excellent work and turning out bullion at the rate of 6 tons daily. The Hughes Brothers, formerly of Bisbee, are managing the smelter, which, under their able management, is destined to do work. The Philadelphia company own a group of rich mines, of which the Peabody, Copper King, Highland Mary, Dona Ana, and Tam O'Shanter are the principal. A number of miners are employed extracting ore from these, and the management hope that enough ore will be hoisted to keep the smelter in a steady run. The ore is of a high grade, averaging $37 in silver and 60 per cent. in copper.

SILVER KING.—Pinal *Drill*, June 3: This company is making considerable improvements in the interest of economy and convenience. The foundation for a new assay office, above the dump, adjoining the mill, is completed. It will be 30x33 ft, divided into 4 rooms. The old office will be used as a storeroom. Adjoining the new assay office will be a blacksmith and carpenter shop, 40x46. By drifting in the well, they have now secured a supply of water, sufficient for any reasonable number of stamps, so that question is now definitely settled. The working force has been somewhat reduced, by dispensing with superfluous hands. On the 27th ult., the mine shipped four bars, value $7,425 This small shipment was made so as to get the bullion into the San Francisco mint before it closes down for the regular summer clean-up. On Wednesday, 22,468 pounds of concentrations were shipped.

REVIEW.—Tombstone *Epitaph*, June 1: The mining outlook in Tombstone never appeared brighter or gave promise of more brilliant results than at the present moment. The leading claims are yielding more than the average quantities of ore, and the mill results are fully up to the usual standard. The litigation which has impeded the prosecution of work on some of our most valuable mines, has been brought to a close, and operations will be resumed on a larger scale than ever before. With the starting of the Tranquility and the Intervener, several hundred men will be set at work. Thus far the work of development in the district has demonstrated the fact that as depth is reached, the ore bodies improve in size and richness. As near as we have been able to ascertain, the bullion yield for May is fully up to the preceding month, and with the starting up of the Boston Co.'s mill near Charleston, we look to see it largely increased for June. Now that the Huachuca Water Co. have their works nearly completed, it is almost certain that one, or perhaps two new mills, will be erected near town.

COLORADO.

BLACKHAWK.—*Reporter-Call*, May 26: The sampling works of the Miners' Sampling Co. are being reorganized. It is said that the firm of Cochrane & Watson have, or will assume management of the works. The lessees of the Sleepy Hollow mine were hoisting ore this afternoon. The tunnel below the Bull's Head corral, worked last year by Kelly & Co., is to be driven another 50 ft, and connection made with a shaft sunk some years ago for air. Henry Guerney is cleaning up the debris around the old Tomlinson mill, which he is having crushed at the Cashier's 35-stamp mill. He is making good wages for the time occupied, the debris running from 4 to 6 ounces per cord. The down freight train from this place for the valley numbered many cars laden with mill tailings and smelting ore.

DAKOTA.

ABOUT DEADWOOD.—*New Northwest*, May 27: Seth Bullock arrived here last Friday, and is looking after some property interests. He says the old Montanians in the hills are generally doing well, and the quartz mills running prosperously. The Homestake Co., which absorbed nearly everything else in the hills, is capitalized at $10,000,000, and shares of a par value of $100 are quoted at $30, and the company is paying 30 to 40 cents per share dividends monthly. The Deadwood Co., in which G. S. & Co. are heavily interested, pays 25 cents per share monthly. The Belt mines, which a year or two ago were in doubt, are all paying. The Homestake Co., which some 6 or 8 months ago built and completed a railroad 14 miles to Lead City and Elk creek for a wood road, is now extending it to Deadwood and Rapid City, making it 45 miles long, and will carry passengers and freight. The iron is now being hauled in and the cars are being built in Deadwood. Population has fallen off some in Deadwood, but the valleys are increasing in population, and agricultural and stock interests are prosperous. A. J. Simmons is operating the Harney's Peak Hydraulic M. Co He organized the company last year, expended about $25,000 in fitting up for operations, and Mr. Bullock thinks the enterprise will make $100,000 this year.

IDAHO.

PROSPECTORS.—*Idaho World*, May 30: Al Oertz, the newly elected Recorder for Lower Squaw Creek district, was in town this week and dropped around to see us. Al says a crowd of Squaw creek prospectors will go down to Cherry creek, which empties into Payette just below the mouth of Squaw creek, on the hunt of placers, in a few days. It is reported that good prospects were obtained there in early days, and a company was organized to bring in a ditch, but for some reason or other gave it up. The boys say that ground that would even attract the attention of gold-hunters in those days would now come under the head of good paying diggings, and they are going for it, and will soon find out whether there is any truth in the report.

MONTANA.

WALLACE DISTRICT.—Cor. *Inter-Mountain*, May 27: This new camp is located 2½ miles from the line of the Northern Pacific. The Mountain claim is owned by Prof. James House, and shows a 3-ft vein of copper ore. No assays. The Northern Pacific, owned by the same man, shows 4 ft of copper ore. No assays. These two claims have been very recently discovered. The Hidden Treasure is owned by Brent, Milton & Co. The ore body, as developed in the shaft, is 20 ft wide, and assays from $2 to 300 ounces in silver, from $5 to $20 in gold and from 7 to 25 per cent. in copper. The shaft is 40 ft deep. The West Point lode is owned by Richard & Dickenson, the latter being the Missoula postmaster. The latter has a 30-ft shaft showing an 8-ft vein of ore, averaging 42 ounces silver, $10 in gold and and a large percentage of copper. The St. Lawrence is owned by N. Gouin & Co. This lode has a 90-ft shaft with a 10-ft vein, the ore averaging 65 ounces silver, $9 in gold and a large percentage of copper. The Aladine lode is owned by Frank Keim & Co. This lode, developed by a 30-ft shaft, shows 4 ft of ore, carrying gold, silver and copper, but in what amounts I am not advised. There are about 65 locations in the camp, of which the above-mentioned are by far the best. Some of the others may prove good with development, but many of them are worthless. The veins run northeasterly and southwesterly and the formation is granite. An abundant and reliable supply of water is available and the surrounding mountains are densely wooded with the finest kind of mining timber. Prospectors are coming in every day and some very promising locations have been recently recorded.

A VIEW OF MAGINNIS MINES.—Butte *Miner*, May 27: The development of the less notable but not the less valuable mines of Butte furnishes the surest index to the substantial wealth of the camp. Yesterday Wm. McNulty contracted for the erection of hoisting works on the Mannie, a mine situated northwest of the Alice. Mr McNulty is the owner of the Goldsmith No. 2, which has for some time been bonded to the Moultou Co. Turning from this illustration of the worth of the Butte mining district, we encountered E. A. Nichols, who has recently returned from a month's visit among the Maginnis mines and along the Yellowstone. Mr. Nichols is pretty thoroughly acquainted with what constitutes a good mine, or a good prospect, and his opinion of the Maginnis mines is not a bad criterion for people who have heard so much but seen nothing of the wealth of these mines. The shortest route from here to Maiden, the center of the Maginnis district, is via Helena, White Sulphur Springs and the Judith gap, making a total distance of about 270 miles from Butte. He says Maiden is a place of only a few hundred actual inhabitants. There are 300 or 400 miners there and a number of houses which are not occupied, but which were built to enable claimants to hold lots. In regard to the mines of the Maginnis district, Mr. Nichols says he has seen none that he thought better than Butte mines, and that in reality most of the mines were as yet simply prospects, the real value of which no one could tell.

NEW MEXICO.

MINERAL PICK-UPS.—*News and Press*, May 27: Gov. Tabor contracted for 250,000 ft of lumber for his smelting works at Cerrillos station. Boston capitalists who recently visited the Black Range will soon erect a smelter for custom work below Chloride City. Little activity in Oscura mountains, on account of scarcity of water; the camps are 10 or 20 miles from water. A Chicago man contemplates erecting a sawmill and smelter in the Sweepstakes mining district near Las Vegas. Ore carrying ruby silver and assaying $200 to the ton struck in Nick O' Time mine in Hungry Gulch, near Carbonateville, New Placers. Mine recently purchased by a Davenport, Iowa, company. The McGregor and Commercial group of mines at Georgetown consists of four mines, on which 8,000 ft of development work has been done The ore is chloride of silver and mills from 200 to 8,000 ounces to the ton. The San Pedro company, near Golden, have shut down on the smelter and will start up the stamp. The furnaces are not suited to the character of ore to be treated, and new appliances generally are required. There is a large quantity of milling ore that can be worked with great profit.

COPPER.—Number 1 furnace at Paschal is working beautifully. Number 2 furnace will be ready to fire up to-day. The capacity, after the bottoms of the four furnaces are properly set, will be 200 tons per diem. The company will ship a carload of copper early next week. At the Sherman mine, the 100 level has been connected with the main shaft. From this level a winze has been started and will be sunk 100 ft in the contact. The stopes above tunnel level have produced daily about 10 tons of good ore. The average mill pulp for the week has been about $50 per ton. The Valverde smelter of the Bros is now under full blast, and to encourage the miners to open their mines, the company is offering to buy all ores delivered at their works at the following rates, to-wit: Ores running 15 to 25 per cent., $1 per unit; ores 25 to 35 per cent., $125 per unit; ores 30 to 60 per cent., $1.50 per unit. Any good miner having a fair copper prospect should make at the above rates $10 to $20 per day, and at the same time be developing his claim.

GEORGETOWN MINING ITEMS.—Very rich ore has been found to exist in the second, third and fourth levels of the Naiad Queen. The main shaft on this mine is now down considerably over 400 ft on the porphyry wall, and in drifting from the wall into the silurian lime at various depths, it is found to contain streaks and deposits, some of which will no doubt prove to be very extensive and of high-grade ore. The richest ore and largest deposits in the Naiad Queen, as well as in the McGregor and the Commercial mines, appear to be near and under Parapet mountain, and several drifts now extend pretty well under this mountain. Some very rich strikes have recently been made in the Commercial and McGregor, some of which are in what is termed the second level, 18 to 20 ft below the surface of the lime, proving very satisfactorily that ore in large quantities exists all through the silurian lime, which is several hundred ft in depth, and the deep prospecting now going on will no doubt prove Georgetown to be a far more permanent and better camp than has been heretofore even imagined.

UTAH.

THE EMMA MINE.—Salt Lake *Tribune*, June 2: One of the largest mining properties in Utah, the past few years, is that of the Emma mine, located at Alta, Little Cottonwood. From the best data that can be obtained, this mine has produced ore to the value of $5,000,000, and paid to its New York and London owners dividends aggregating $2,800,000. The past few years the mine has not been worked to any great extent, because of various entaglements among claimants; but just now there is a fair prospect of the mine being made to produce largely again. George Cummings, the manager of the property, received a cablegram yesterday from the Board of Directors in London to at once begin the work of mining upon the property on a more extensive scale than has been done lately. The force will be very much augmented within a few days, and we hope to see a very large output of ore in the future. The dispatch indicates that all differences have been settled and that the property is now fully in the hands of the English company.

Our Mountain Lakes.

As the summer heat becomes more and more oppressive, the dwellers in the valleys will flee as birds to the mountains to breathe the clear, cool air, and enjoy the crystal waters girt about by the grand forests of the Sierras. The mountain lakes are the chief centers of resort, and they have a charm peculiarly their own.

We would make special reference at this time to the far-famed Donner lake, which is shown in the engraving on this page. As introductory to his well-known book on the "Fate of the Donner Lake Party," C. F. McGlashan introduces the following description of the lake, which was the scene of their dread sufferings, and the death which brought to many of them release from woes unspeakable.

Three miles from Truckee lies one of the fairest and most picturesque lakes in all the Sierras. Above and on either side are lofty mountains, with castellated granite crests, while below, at the month of the lake, a grassy, meadowy valley widens out and extends almost to Truckee. The body of water is three miles long, one mile and a half wide, and 483 ft. in depth.

Tourists and picnic parties annually flock to its shores, and Bierstadt has made it the subject of one of his finest, grandest paintings. In summer its willowy thickets, its groves of tamarack and forests of pine, are the favorite haunts and nesting places of the quail and grouse. Beautiful speckled mountain trout plentifully abound in its crystalline waters. A rippling breeze usually wimples and dimples its laughing surface, but in calmer moods it reflects, as in a polished mirror, the lofty overhanging mountains, with every stately pine, bounding rivulet, blossoming shrub, waving fern, and—high above all, on the right—the clinging, thread-like line of the snow sheds of the Central Pacific. When the railroad was being constructed, 3,000 people dwelt on its shores; the surrounding forests resounded with the music of axes and saws, and the terrific blasts exploded in the lofty cliffs shadowing the cañons with reverberating thunders, and hurled rugs bowlders high in the air over the lake's quivering bosom.

In winter it is almost as popular a pleasure resort as during the summer. The jingling of sleigh-bells and the shouts and laughter of skating parties can be heard almost constantly. The lake forms the grandest skating park on the Pacific coast.

Yet this same Donner lake was the scene of one of the most thrilling, heart-rending tragedies ever recorded in California history. Interwoven with the very name of the lake are memories of a tale of destitution, loneliness and despair which borders on the incredible. It is a tale that has been repeated in many a miner's cabin, by many a hunter's camp-fire, and in many a frontiersman's home, and everywhere it has been listened to with bated breath.

VIEW OF DONNER LAKE, NEVADA COUNTY

Our mountain lakes are well described in the following paragraph by Prof. John Le Conte:

Hundreds of little Alpine lakes, with their clear, deep, cold, emerald waters, are embosomed among the crags of the Sierra Nevada mountains. Their origin may be traced to the more powerful actions of glacial agencies in past times; in some cases, gorges dammed up by ancient moraines. The streams that now supply these "Gems of the Sierra" are born in the cold, gloomy solitudes of the upper mountain region, amid perpetual snow banks. Many of these charming lakes are nestled in the least-explored portions of the "High Sierra," and have not been mapped or described; nay, some of them have as yet no designating names. They are the reservoirs of melting snows, and some of them—as those near the headwaters of the Yuba—are the sources of summer supply for hundreds of miles of mining ditches. Hence, the existing condition of our topographical knowledge of these wild and imperfectly explored mountain fastnesses renders it impossible to furnish anything like a complete catalogue of the mountain lakes of the Sierra Nevada.

Mountain Lakes of the Sierra Nevada.

NAME.	Max. length in miles.	Max. width in miles.	Approx. area in square miles.	Hight of surface above the sea level in feet.	Max. depth in Feet.	Hight of bottom above sea level in feet.
Gold	4	2	.....	.....	.....	.....
Truckee	3	3	.....	6,804	90	6,814
Eureka	.....	.....	.....	.....	65	.....
Meadow	2	1	.....	.....	180	.....
Donner	2	1	.....	5,964	.....	.....
Washoe	3	2	.....	5,003	.....	.....
Tahoe	21	12	192	6,247	1,645	4,602
Tenaya	1	1	.....	.....	.....	.....

The foregoing table embraces some of the conspicuous lakes embosomed among the crags of that portion of the Sierra Nevada extending from Lassen's peak (lat. 40° 30′) in the north, to Mt. Brewer (lat. 36° 30′) in the south. With the exception of Tahoe, most of them are comparatively small.

These Alpine lakes, with their clear, fresh, snow-fed waters, surrounded by lofty snow-clad peaks, whose slopes are covered with magnificent groves of pine and fir, constitute the most attractive feature in the lesser summit valleys of the Sierra Nevada. The charmingly picturesque character which they impart to the wild and rugged scenery of these mountains has not been overlooked by tourists, poets and artists. But the inaccessibility of most of these "emerald gems" has prevented them from receiving that notice which their exquisite beauties deserve. As civilization penetrates into these mountain retreats, they will become more accessible, and consequently better appreciated by cultivated visitors. The most extensive, as well as the most celebrated, of these bodies of fresh water is Lake Tahoe.

Trips for Pleasure in California.

California is so much of a pleasure resort, as a whole, it is difficult to point out any part of it not worthy of a visit. Still more difficult is it to select that portion pre-eminent over all others for beauty of scenery, salubrity of climate and general attractiveness; and in another column we have arranged a list of the more prominent places, by consulting which the tourist may select which suits him best.

The dimensions of California preclude the possibility of a trip which will include the whole scope of the State. But, as there is no finer country in the world for summer excursions and camping out than this, a jaunt over a portion of it will suffice for most persons. One can, moreover, choose the kind of scenery he prefers, and, to a great extent, the climate also. The moist, cool atmosphere of the coast, the warmer and drier air of the mountains, or the heat of the valley, present a variety difficult to find elsewhere in the same area. In summer we do not need, in our excursions, to count on rainy days. It never rains here during what is known as the "dry season." One can sleep in the open air or in tents for six or seven months in the year without inconvenience. We have before given a general sketch of the more frequented routes of travel, and repeat here much previously said.

Tourists are somewhat apt to think that after they have seen Yosemite, Lake Tahoe, the Geysers, the Big Trees and a few more of the "sights" of the State, they have seen it all. But there are many beautiful spots in California which lie off the routes of travel, which are worthy of a visit. The number of "springs," and other health resorts, has increased greatly of late; and there are now numerous camping grounds, where those who prefer camping out to hotel life will find all the necessary conveniences.

Going south from San Francisco on the peninsula there is a pleasant road from San Mateo over the hills, by Crystal Springs to Spanishtown and Purissima creek, noted for the finest trout in the State, as they are perfectly pure, the creek falling over the cliffs into the ocean. Further on is San Gregorio creek, with its lagoon famous for fishing. There is a hotel here. Then we come to Pescadero, a coast town much frequented in summer and noted for its "pebble beach." The Pescadero and Butano creeks, near by, afford fine sport for the angler. Beyond that is Scott's valley, and then Santa Cruz, the well-known watering place. Between Purissima and Santa Cruz there are numerous creeks other than those mentioned, with plenty of fine hunting and fishing. Camping grounds will be found all along at many points.

Another trip, starting from the city, is to go by the railroad by way of San Mateo, Redwood City, Menlo Park, etc., to Santa Clara and San Jose, the beautiful towns in the Santa Clara valley. From the first, one may branch off to the foothills of the Santa Cruz mountains, where he will find Blackberry farm, Congress Springs and Los Gatos. From San Jose one may go to the famous Almaden quicksilver mines, and in the opposite direction, a beautiful ride is out to Alum rock, on Penitencia creek, and from there up to the summit of Mt. Hamilton, where the Lick observatory is being built. From San Jose, the S. P. R. R. carries its passengers down the valley past Gilmore (from where one may go to the Gilroy Hot Springs), through the San Juan pass into the Pajaro valley, and across to the noted watering-place of Monterey, where the railroad company has erected a magnificent hotel. There is the beautiful bay of Monterey, with its splendid beach running around from Monterey to Santa Cruz. At various points on the line of the beach are hotels, camping grounds, and various accommodations for tourists and campers. Aptos and Soquel are the most prominent points.

Back of Santa Cruz the range of mountains of that name offers a splendid opportunity for camping, fishing and hunting, and there are numerous public resorts and springs, such as Magnetic springs, Wright's and others. The climate in the vicinity in summer is beautiful, and the mountains usually filled with campers.

Following on down the coast, we strike back through the Salina valley to Soledad, and from here may visit the Paraiso springs, seven miles distant. Then continuing on down the valley again we meet the plateau on which is Paso Robles springs, a noted health resort. Then further on we arrive at San Luis Obispo, an old Spanish town surrounded by grain fields and sheep and cattle ranges. Between there and Santa Barbara these ranges prevail. Santa Barbara is on the coast and is usually reached by steamer and not by the route we have mentioned, which is the way one would have to go by wagon.

To see the coast and its towns below Monterey, the best way to do is to take one of the Pacific Coast Steamship Co.'s steamers and go as far as San Diego and, back. In this way Santa Barbara may be visited conveniently. You can also stop at Los Angeles, and by lying over a trip, visit Santa Monica, the orange groves of Los Angeles, and vineyards of Anaheim.

Back from the coast is the charming city of Los Angeles, with its lovely environment. Beyond is San Gabriel valley, with the famous Sierra Madre Villa, popular far and near. By rail eastward one reaches the valley of the Santa Ana, and sees Riverside, a horticultural jewel, with the Glenwood cottages in the midst of orange groves. Beyond is the beautiful San Bernardino valley with the lovely Crafton retreat at its head, the Arrowhead springs, with their medicinal waters and enchanting traditions, and Waterman's hot springs, which have wide fame, but are not now open except for transient visitation.

Returning to the coast one may take the steamer and see San Diego with its magnificent harbor and splendid climate. Returning, as the steamer comes up it passes through the Santa Barbara channel, between the islands and mainland, and coasting along up, finally enters the historic portal of California—the widely famed Golden Gate.

Starting again from San Francisco, as a center, going north along the coast we visit Sausalito and San Rafael, and back of them Mt. Tamalpais, and horne by the North Pacific coast narrow-gauge road, we pass through a beautiful country, up along the shores of Tomales bay, passing on the way Paper-mill creek, Taylorsville, and many beautiful camping spots; then on through the redwood timber to Duncan's mills and the Russian river, famous for its beautiful scenery.

Then again by a route ending at the same place, one may go to the S. F. & N. P. R. R. to Donahue, Petaluma, Santa Rosa (where you leave for Mark West springs), to Healdsburg, on the Russian river. From here Litton springs, Skaggs' springs, the world-famous Geysers, etc., may be visited.

A beautiful trip is up through the fine vineyards of the Napa valley, where are hosts of summer resorts. In this county many pleasant summering places are established in the neighborhood of Napa City, St. Helena, Calistoga, Kellogg, and other places. Among the well-known resorts are the Napa Soda Springs, Litton Springs, Nook farm, Sulphur springs at Calistoga, Etna Springs, near Pope valley; Sulphur Springs ranch, near Knoxville, and Petrified Forest.

Entering Lake county from the west, the Highland Springs is the first resort reached by stage from the railroad station at Cloverdale. From Ukiah to Lakeport by stage, the Blue lakes and the Pierson Springs are approached. Entering the county from the south, by stage from Calistoga, the traveler passes Mt. St. Helena, and can take a magnificent view from the summit by tarrying at the Mt. Toll House, and take a short horse-back ride. Anderson Springs, Harbin Springs, Glenbrook, Adams' Springs, Siegler Springs, Howard Springs, Soda Bay, on Clear lake; Sulphur Banks and Borax lake, Mound cottage, Bartlett Springs are among the notable attractions of Lake county. Lake county seems admirably and wonderfully adapted for a universal tourists' field, and is some day destined to attain a world-wide reputation.

Shasta county, from the well-watered bottom lands of the upper Sacramento valley up to the refreshing Strawberry valley, at the base of Mt. Shasta, some 70 miles or more, is a pathway full of joy to the hardy tourists who delight in rugged walks of nature. The United States fish-hatching establishment on McCloud river and Soda springs, clear fishing brooks and rivers, good fishing, etc., are here met with.

In Contra Costa county, the view from the summit of Mt. Diablo, on a clear day, is grand and wonderful in the number of cities and towns embraced in the vast extent of populated territory brought within the scope of the tourist's vision. A Byron, in this county, are hot sulphur springs which are lately becoming quite noted. The Piedmont springs in Alameda county, back of Oakland; the hay baths at Alameda; the sulphur springs in Colusa county; the White Sulphur springs near Vallejo, in Solano county; Webber lake, Donner lake, and hosts of other attractions, might be mentioned.

In Calaveras county, six miles from Knight's Ferry (Stanislaus county), are the Lane springs.

A warm and remarkably dry climate is found, early and late in the season, on the western borders of the Sacramento and San Joaquin valleys, which is remarkable for its sanitary qualities, which seem specially kindly and favorable in many localities to sufferers from pulmonary afflictions.

The whole range of the Sierras, which extends the length of the State, abounds in magnificent scenery. It would take more than a page of our space simply to mention the points of interest. At different points in the range and the foothills, hydraulic and quartz mining are carried on extensively, and those who have never seen the former should visit at least one gravel mine while in California.

It is, of course, impossible, in a brief article, to enumerate all the pleasure and health resorts of California, or all the thousand and one places where people go to amuse themselves in the summer months. We shall, in future issues of this journal, take occasion to mention other than those spoken of here. Every little canyon and glen, every mountain valley, every nook has its picturesque points, known to a chosen few. Here and there are places more widely famed. The vineyard regions of one section, the orange orchards of another, the wheat fields of another, possess charms to allure people of different temperaments. Others, again, prefer the solitudes of the hills, where the unbroken forests reign supreme, where they can retire for a time from the busier scenes of life.

Prospecting for Water.

There is a good deal of talk about boring artesian wells in the eastern part of the State at various points, but as yet no one seems to have actually commenced the work. A dispatch from El Paso, Texas, says the Southern Pacific railway builders sunk an artesian well to the depth of 700 ft., in the neighborhood of Fort Quitman, and found streams of flowing water. At Ven Horn, on the Texas and Pacific railroad, another artesian well has been dug, and water found at a depth of 500 ft.

All this should encourage our people. It is almost positively certain that flowing wells may be had everywhere in our valleys, surrounded as they are on all sides by high ranges of snowy mountains.

Another and still better proof that flowing, and even spouting, wells may be obtained, provided the well-borer has coin and courage to go to a sufficient depth, is the fact that everywhere in Nevada the flowing springs are found near the tops of, or on the highest ranges of mountains and hills. All old prospectors know that when suffering for water on the deserts, it is useless to look at and about the mouths of ravines and canyons for water. The traveler must follow up the first big canyon he reaches, and at the head of this, on the top of the highest mountain, he will soon find springs and grass. Nearly everywhere the water of the springs sinks after flowing a short distance down the canyons.

Strangers are astonished at finding all the springs of this country on the highest ridges of the hills, it being just the reverse of what is seen in most places in the Eastern and Western States. However, when the geological formation of the country is carefully examined, it is easy to see how this happens. The tops of the hills and mountain ranges are the edges of strata that have been heaved upward from great depths by volcanic or other convulsions of the earth, and the water is forced up through these breaks, which is its only outlet to the surface. Were the streams that supply these springs topped by wells bored in the valleys, it is easy to see that the water would spout up with great force.—*Virginia Enterprise.*

WAGES IN OREGON.—The following is from a circular of the Oregon Railroad and Navigation company, in answer to one of many questions propounded by intending immigrants: Farm labor, $1 a day and board; harvest work, $1.50 a day. On the Sound wood-choppers earn from $60 to $90 a month. All good hands find work on railroads at the following prices: Common laborers, $1.75 to $2 a day; foremen of gangs, $75 to $100 a month; blacksmiths, $2 to $4 a day; carpenters, $3.50; tracklayers, $2 to $2.50; team and driver, $4.50. These figures are intended to apply to Willamette valley, and are equally applicable to southern Oregon. In Jackson and Josephine counties a good many hands are employed in placer mining, the wages generally being $1.50 a day and board.

DISTRICTS AROUND LUNING.—A letter from this region, on the Carson & Colorado railroad, says: Luning may be said to be the base of supplies for four mining districts. Silver Star district lies almost directly north; New Boston, the once lively camp, on the south; Santa Fe, a promising mineral region, on the east, and the last becoming familiar district of Garfield on the west. The latter is plainly visible from the town, though situated eight miles away in an air line. Piles of ore, in sacks and ready for shipment, are stacked about the platform at the depot, giving the place an air of permanency, from a mineral-producing standpoint.

A SUCCESSFUL PULVERIZER.—The Winnemucca *Silver State* says: "J. V. McCurdy, a practical millman of 20-years' experience, has been experimenting with one of Hoyt's ore pulverizers at the Bullion of Paradise mill. He says they proved beyond doubt that a machine three feet in diameter will grind, with one-fourth the power required for stamps, 25 tons of ore in 24 hours. The machine grinds it finer than it can be crushed in a battery."

THE new flumes of the Cal. W. & M. Co., at Frazer flat, near Greenwood, El Dorado Co., were completed Wednesday, May 24th. They have a capacity of 2,000 miners' inches, are five feet on the bottom, three feet on the sides, and 28 feet high at the highest point, with an average hight of about 12 ft. The aggregate length of the three flumes is about 1,400 ft., and 59,000 ft. of lumber were used in their construction, which had to be hauled a distance of eight miles.

THE corner stone of the Denver mineral exposition building has been laid by Gov. Pitkin, in the presence of several thousand people. An eloquent oration was delivered by T. M. Pattarson and an address by Judge W. S. Decker. The occasion was made a partial holiday by business men and citizens. A large force of men is actively employed on the building, which insures its completion in time to open the exhibition Aug. 1st.

AT Blackfoot, Idaho, there are teams enough to take all goods for Wood River as fast as they arrive. Up to the present, 2,000,000 lbs. of Wood River and Salmon River freight have been sent forward. The roads are in good condition now, and the stages are carrying all the passengers, mail and express without any delay whatever. Travel over the road is very large at this time.

USEFUL INFORMATION.

To Take out Milk and Coffee Stains.

These stains are very difficult to remove, especially from light-colored and finely finished goods. From woolen and mixed fabrics they are taken out by moistening them with a mixture of one part glycerine, nine parts water, and one-half part aqua ammonia. This mixture is applied to the goods by means of a brush, and allowed to remain for 12 hours (occasionally renewing the moistening). After this time, the stained pieces are pressed between cloth, and then rubbed with a clean rag. Drying, and if possible, a little steaming, is generally sufficient to thoroughly remove the stains. Stains on silk garments which are dyed with delicate colors, or finely finished, are more difficult to remove. In this case five parts glycerine are mixed with five parts water, and one-quarter part of ammonia added. Before using this mixture it should be tried on some part of the garments where it cannot be noticed, in order to see if the mixture will change color. If such is the case no ammonia should be added. If, on the contrary, no change takes place, or if, after drying, the original color is restored, the above mixture is applied with a soft brush, allowing it to remain on the stains for six or eight hours, and is then rubbed with a clean cloth. The remaining dry substance is then carefully taken off by means of a knife. The injured places are now brushed over with clean water, pressed between cloths and dried. If the stain is not then removed, a rubbing with dry bread will easily take it off. To restore the finish, a thin solution of gum arabic, or in many cases beer is preferred, is brushed on, then dried and carefully ironed. By careful manipulation these stains will be successfully removed.

How to Make Brick Walls Water-Tight.

The Sylvester process was successfully applied to the interior walls of the gate-houses of the Croton reservoir in the Central park in this city, in 1866, on the advice of the late William Dearborn, C. E., and under the immediate supervision of George S. Greene, Jr., C. E., now the engineer-in-chief of the department of docks.

The process and its results in this case are described fully by Mr. Dearborn in a paper read by him before the American Society of Civil Engineers, May 4, 1870.

The process consists in using two washes or solutions. The first composed of three-quarters of a pound of castile soap dissolved in one gallon of water, laid on at boiling heat with a flat brush. When this has dried, 24 hours later apply in like manner the second wash of half a pound of alum dissolved in four gallons of water. The temperature of this when applied should be 60° to 70° Fahr. After 24 hours apply another soap wash, and so on alternately until four coats of each have been put on. Experiments showed that this was sufficient to make the wall water-tight under 40 ft. head of water.

At the time of application the walls had been saturated and the weather was cold. The gate chambers were covered over and heated thoroughly with large stoves. The drying, cleaning the walls with wire brushes, and applying the mixture, took 96 days. Twenty-seven tons of coal were used for the drying, and one ton for heating the soap solution. Eighteen thousand eight hundred and thirty square ft. of wall were washed with four coats. The drying and cleaning of the walls cost six and a half cents per square ft., and the plant, materials, and labor of applying the wash cost three and three-eights cents per square ft.

TO EVICT RATS.—A writer in the *Scientific American* says: "We clean our premises of the detestable vermin, rats, by making whitewash yellow with copperas and covering the stone and rafters with it. In every crevice in which a rat may go we put the crystals of the copperas and scatter in the corner of the floor. The result was a perfect stampede of rats and mice. Since that time not a footfall of either rats or mice has been heard around the house. Every spring a coat of yellow wash is given the cellar as a purifier, as a rat exterminator, and no typhoid, dysentery, or fever attacks the family. Many persons deliberately attract all the rats in the neighborhood by leaving the fruits and vegetables uncovered in the cellar, and sometimes even the soap is left open for their regalement. Cover up everything eatable in the cellar and in the pantry, and you will soon starve them out. These precautions, joined to the services of a good cat, will prove as good a rat exterminator as the chemist can provide. We never allow rats to be poisoned in our dwelling. They are so apt to die between the walls and produce annoyance."

TO MAKE STENCIL INK.—A good and cheap stencil ink, in cakes, is said to be obtained by mixing lamp-black with fine clay, a little gum arabic or dextrin, and enough water to bring the whole to a satisfactory consistency.

A ROAD locomotive for war purposes, lately tried, weighed 28½ tons, and drew easily 40 tons' weight of guns mounted on their carriages, fully equipped. Its maximum traction power is 150 tons, and its cost of maintenance is about 30 cents an hour.

Cutting the "Key Log."

The first thing to be done is to find out where the jam occurred, and then to discover what is called the "key log," that is to say, the log which holds the base of the "jam." An old experienced "stream driver" is soon on the spot, for the news is soon carried up stream that there is a "jam" below. Every minute is of consequence, as logs are coming down and the "jam" increasing in strength. The "key log" being found, there is a cry for volunteers to cut it. Now, when you consider that there are some hundred big logs of timber forming a dam, and the instant the key log is cut the whole fabric comes rushing down with a crush, you will see that unless the axe-man gets instantly away, he is crushed to death. There are usually in a camp plenty of men ready to volunteer; for a man who cuts a key log is looked upon by the rest of the loggers just as a soldier is by his regiment when he has done an act of bravery. The man I saw cut away a log which brought down a whole jam of logs was a quiet young fellow, some 20 years of age. He stripped everything save his drawers; a strong rope was put under his arms, and a gang of smart young fellows held the end. The man shook hands with his comrades, and quietly walked out on the logs, axe in hand. I do not know how the loggy-road one felt, but I shall never forget my feelings. The man was quietly walking to what very likely might be his death. At any moment the jam might break of its own accord, and, also, if he cut the key log, unless he instantly got out of the way, he would be crushed by the falling timber. There was a dead silence while the keen axe was dropped with force and skill on the pine log. Now the notch was near half through the log; one or two more blows, and a crack was heard. The men got in all the slack of the rope that held the axe-man; another blow, and there was a crash like thunder, and down came the wall of timber, to all appearances on the axe-man. Like many others, I rushed to help haul away the poor fellow; but, to my great joy, I saw him safe on the bank, certainly sadly bruised and bleeding from sundry wounds, but safe.—*The Field.*

GOOD HEALTH.

Infant Food.

There are about 20 European preparations styled infant foods, and at least twice as many American, all of which profess to furnish complete nutrition for the infant during the first few months of its existence, while yet the conversion of starch into dextrine and sugar is beyond the capacity of the untrained digestive function. The examination of these with a microscope, assisted by such simple tests as iodine, which turns starch cells blue, and gluten (or albuminous) granules yellow, has engaged the careful attention of Dr. Ephraim Cutter, of Cambridge, and his reports will startle most mothers who have relied upon the extravagant pretenses set forth by the circulars of manufacturers. Eliza McDonough, who preceded Dr. Cutter in this field, has been in a measure discredited; but it appears that her assertion—that the starch, so far from being transformed into dextrine, was not sufficiently altered to render the recognition of its source difficult, whether from wheat, corn, rye or barley—was strictly true, and that these pretentious foods are, without exception, nearly valueless for dietetic purposes. All of them consist of baked flour, mainly, either alone or mixed with sugar, milk, or salts. In some cases, the baking has been very inadequately performed, and the doctor found one that consisted merely of wheat and oats whose starch cells were proximately in their natural condition. The general result of Dr. Cutter's examination may be stated in brief terms as follows:

There was scarcely a single one of the so-called infant foods that contained a quantity of gluten as large as that contained in ordinary wheat flour. That is to say, a well-compounded wheat gruel is superior to any of them, particularly when boiled with a little milk; and others are in error who place the slightest dependence upon them. As respects one very expensive article, professing to possess —— parts in every 1,000 of phosphatic salts in connection with gluten, Dr. Cutter was unable to find any gluten at all. The thing was nearly pure starch, sold at an exorbitant price for nerve and brain food, and a great remedy for rickets. So all through the list. Sometimes a trace of gluten was present; more frequently none at all. In one case, there were 90 parts of starch to 10 of gluten; but this was exceptional, and the majority were less valuable, ounce for ounce, than ordinary wheat flour. Considering the pretensions that have been put forth by the manufacturers of these foods, some of them sustained by the certificates of eminent physicians, the report of Dr. Cutter is one of the dreariest comments upon human nature that has recently fallen under the notice of the journalist. But if the revelation he has made of fraud and pretense on the part of manufacturers in this field will serve to protect mothers from further betrayal, and to rescue infant life from quack articles of nutriment, his work, though giving a tremendous shock to our sensibilities and to our faith in medical certificates, will not have been done in vain.—*New York Times.*

The Cause of Bright's Disease.

What is the cause of so much Bright's disease? asks a victim of this malady. To which we reply, there are many causes. One is the taking of a cold. A cold may go to the kidneys as well as the lungs, and do a great deal more harm there, for the tubules in this organ are very multitudinous and very minute. When inflamed they suffer in the same way that the nasal and bronchial tubes do; that is, get catarrh. A slight inflammation of these tubules is called a catarrhal one; but when it becomes deeper seated, then it is called croupous. About the only difference is one of degree, not of kind. Another cause of the disease is the excessive use of flesh food, and of hot, stimulating spices and drinks. Lager beer, it is said, is a frequent cause of Bright's disease. Alcoholic drinks, we know are. Many medicines are said to cause it, as, for instance, chlorate of potash, used so freely in many diseases; and it would not be at all strange if it was also caused by the use of the various baking powders so much in vogue. A person suffering from this malady should lead a sober and careful life, live on a plain, unstimulating, but nutritious diet, take moderate exercise, avoid lean meat, or use it only sparingly, and keep the skin active, so as to relieve the kidneys as much as possible from work. In its first stages, its ravages may be stayed, and, if the constitution be a good one, the person may live to a good age. In its worst form there is no remedy of much avail. Those advertised by the quacks, and, we are sorry to say, those given by the doctors, are of about equal worth, and both are valueless.—*Herald of Health.*

PERSPIRATION.—The amount of liquor matter which passes through the microscopic tubes of the skin in 24 hours, in an adult person of sound health, is about 16 fluid ounces, or one pint. One ounce of the 16 is solid matter, made up of organic or inorganic substances, which, if allowed to remain in the system for a brief space of time, would cause death. The rest is water. Beside the water and solid matter, a large amount of carbonic acid (a gaseous body) passes through the tubes; so we cannot fail to see the importance of keeping them in perfect working order, removing obstructions by frequent applications of water, or by some other means. Suppose we obstruct the functions of the skin perfectly by varnishing a person completely with a compound impervious to moisture, how long will he live? Not over six hours. The experiment was once tried on a child in Florence. Pope Leo X., on the occasion of his accession to the papal chair, wished to have a living figure to represent the Golden Age; so he gilded a poor child all over with varnish and gold leaf. The child died in a few hours. If the fur of a rabbit or the skin of a pig be covered with a solution of india-rubber in naphtha, the animal ceases to breathe in two hours.

RELATIVE SAFETY OF ANÆSTHETICS.—Dr. Ormshy, of the Meath Hospital, Dublin, has compiled the following table of the absolute and relative mortality caused by the use of the leading anæsthetics. The table is based mainly on statistics gathered by Dr. Andrews, of Chicago, and Dr. Richardson, of London:

Agent Employed.	Deaths.	Admins.	Deaths.	Admins.
Ether	4 in	92,815,	or 1 in	23,204
Chloroform	53 in	152,260,	or 1 in	2,873
Mixture of chloroform with ether	2 in	11,170,	or 1 in	5,585
Bichloride of methylene	2 in	10,000,	or 1 in	5,000

HOT MILK AS A RESTORATIVE.—Milk that is heated to much above 100° Fahr. loses from the time a degree of its sweetness and its density; but no one fatigued by over exertion of body and mind who has ever experienced the reviving influence of a tumbler of this beverage, heated as hot as it can be sipped, will willingly forego a resort to it because of its having been rendered somewhat less acceptable to the palate. The promptness with which its cordial influence is felt is indeed surprising. Some portions of it seem to be digested and appropriated almost immediately; and many who fancy they need alcoholic stimulants when exhausted by labor of brain or body, will find in this simple draft an equivalent that shall be abundantly satisfying and more enduring in its effects.

PEPSINE IN SEA-SICKNESS.—A note in the *Pharm Zeitung* states that pepsine has been taken in about 20 cases by travelers who had never made a previous voyage, and has proved quite successful in warding off sea-sickness. As much pepsine as will lie on the point of a knife is dissolved in a wine-glassful of water containing five drops of hydrochloric acid. This dose is taken three times a day, and especially if feelings of sea-sickness threaten. Finzelberg's pepsine is especially named as having been used.

THE ELECTRO-MAGNET.—The question—"What constitutes the strength of the electro-magnet"—is answered through the *Scientific American*, as follows: The magnetic strength of an electro-magnet depends upon the size of the iron core, the number of turns of wire surrounding it, and the strength of current charging the wire of this helix. In practice these helices are seldom wound to a diameter exceeding three times the diameter of the core, as what is thereby gained in magnetic moment is more than lost in increased resistance of helix circuit.

TABLE OF CONTENTS.

EDITORIALS.—Generation of Chlorine; Classification of Mining Exhibits; The Denver Mining Exposition; Academy of Sciences, 369. Passing Events; Bureau of Mines and Mining; Blasting with Lime; Smelting Rich Silver Ores, 376. Production of the Precious Metals—No. 12; An Improved Chair Brace; Imprisoned Miners; New Ore Feeder for Stamp Mills, 377.

ILLUSTRATIONS.—Apparatus for Generating Chlorine for Chlorination Processes, 369. Gallagher's Patent Chair Brace, 377.

MECHANICAL PROGRESS.—Crystallization of Iron; Sawing Stone with Shot; Formation of Alloys by Pressure; Electro-Motors; Destruction of Rails in Tunnels; The Passive State of Iron; Influence of Mechanical Hardening upon the Magnetic Properties of Iron and Steel; A Large Belt, 371.

SCIENTIFIC PROGRESS.—Man and Insects; Sound, Light and heat; The Electric Light and Acoustics; The Tongue; The Creation of Electric Forces; Fogs; Effects of Heat on Electrical Conduction; Fine Dust, 371.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meetings and Dividends, 372.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, New Mexico, Idaho, Oregon, Idaho, and Utah, 372-3.

USEFUL INFORMATION.—To Take out Milk and Coffee Stains; How to Make Brick Walls Water-Tight; To Evict Rats; To Make Stencil Ink; Cutting the "Key Log," 375

GOOD HEALTH.—Infant Food; The Cause of Bright's Disease; Perspiration; Relative Safety of Anæsthetics; Hot Milk as a Restorative; Pepsine in Sea-sickness; The Electro-Magnet, 375

MISCELLANEOUS.—The Maginnis District; Mining by Cheap Methods; Announcement Extraordinary; Mining in Sonora, 370. Prospecting for Water, 375.

Passing Events.

The accident which occurred at the Alta mine on the Comstock, with its tragic story of impending death, suspense, attempts at rescue, and final saving of lives by the heroic exertions of fellow miners, two of whom lost their lives in their bold endeavors, is one which has carried a thrill of excitement through the mining community. The details of the affair we give in another column. To the men who so bravely risked their lives in the attempt to save their fellow men, all unite in doing honor. The memory of those who died while performing this duty will be kept green in the hearts of their fellow men.

We record also in this number of the PRESS the death of Prof. W. Frank Stewart, of Nevada, a man well known in mining circles on this coast.

The rush to Wood river and Butte still continues, and both places will soon be overcrowded, no doubt. Maginnie district, Montana, also attracts many, but its isolation prevents any but men with means from going there. Doubtless new regions will be discovered by the hardy prospectors in their wanderings this summer.

SECRET CANYON.—The Eureka *Leader* says From Secret canyon we learn that the outlook for that camp is more than usually favorable. The chutes at the mill are full of ore ready for crushing, and the dump at the mine is overflowing with high-grade ore. A miner who has resided in Secret canyon for the past nine years, and who is familiar with the ore extracted from the Geddes and Bertrand in its palmiest days, states that the rock now being taken out is far superior to any that has ever been seen in that section of the country.

Bureau of Mines and Mining.

The plan has been repeatedly brought forward to establish a bureau of mines and mining, similar in scope to the Department of Agriculture, in order that the Government should assist the mining interests of the country in some substantial way. Although frequently urged, it is only of late that any decided move was made toward bringing it officially before the Government. A bill was introduced, however, this session of Congress, providing for the establishment of a bureau of mines and mining. This bill we gave in full at the time of its introduction. The House Committee on Mines and Mining, to which this bill was referred, has considered the matter and reports that the United States Geological Survey is, to all intents and purposes, practically a bureau of mines and mining, and that all the legislation that is needed is to enlarge somewhat its jurisdiction.

This action of the committee will probably end the matter for the present. It is sincerely to be hoped, however, that the agitation of the subject will result in the United States Geological Survey paying some attention to the *practical* part of the mining interests.

What we mean is this: While the survey is working up the general geology of the country, describing its topography, scenery, etc., let a branch of it be at work collecting information which will be of practical service to the miners in their every-day work. General geology is all very well for a scientist, but it will not tell a miner anything about how to make his rock pay. The Agricultural Department not only makes experiments, but raises seeds and sends them to different people in different sections to try for themselves. It is not necessary for the survey to make experiments, but it can report upon and record the results of the work of other people. If a man is working a peculiar ore in a peculiar way, let the officials so report in their volume, so other miners elsewhere can get the experience.

There is nothing impracticable in this. One of the most valuable contributions to metallurgical knowledge extant is the report on mining industry issued by Clarence King's U. S. geological exploration of the fortieth parallel. It was written by James D. Hague, and described the mining and metallurgical appliances and the processes in use on the Comstock, besides giving a large amount of general information. This work is still an authority, though published in 1870, and long since out of print.

Why should not the Government now tell the miners what improvements have been made since then? Why should it not describe the smelting processes, lixiviation processes, gold mining appliances, and methods of copper mining, lead mining, etc.? These are the things miners want to know about. They have a very slight interest indeed in a lot of catalogued minerals and rocks that to them represent no economic value. Abstract geology interests them not at all. As to finding mineral, an old prospector could "give points" to the most learned writer of works on geology; and it is mineral we want to find.

The fact is, there is too much science given us. Science is very well, of course, and necessary; but it should not crowd out the bread and butter feature. Is it not more important to tell a miner how to work ore that he has, than to tell him, for instance, about the "Birds of the Colorado Valley," or "Ethnography and Philology of the Hidatsa Indians," or the "Geology of the Henry Mountains." All these things are very well and very good, but they do not cover the practical ground that the mining community would appreciate.

The mining community is not scientific. It is eminently practical in every sense. Its principal need of science lies more in the direction of metallurgy than any other. It is there the miners want applied science. As far as mere mining is concerned, science has not made an unquestionable record. Its mistakes have been so many and so frequent that what are known as scientific miners are in bad odor. Theories borne out by results in one district are totally upset in another, and this lack of uniformity, and the evil results attendant on the acceptance of reports based upon false premises, have weakened confidence to a great extent.

But if record is made by the Government of what men have accomplished, and are accomplishing, with the different appliances and processes, or practical information is gathered which men can apply to their own cases, then the utility of the Survey will be more promptly recognized by the mining part of the community, and it will never have difficulty in obtaining appropriations. There are plenty of men fit for the work; it needs only a step in the direction indicated to bring about valuable results.

THERE are many rich mines north of the Elk Range mountains, Montana, and near the headwaters of Musselshell river. Some of them are being worked with great assidnity, while others are still undeveloped, awaiting the arrival of the iron horse to make them valuable. Copperopolis, in this district, contains the famous copper mines. The Barker section contains the camps known as Gold Run, Hugher City, and Meagher City.

THE Copper Queen now yields 13 tons of ingot copper daily.

Blasting with Lime.

A new method of mining coal has, for several months, been in operation at the Shipley collieries, in England. These mines are fiery, and the use of powder had been prohibited, owing to liability of accident. Therefore the arduous system of breaking down the coal by wedges had to be adopted to provide a method of coal getting such as would avoid accident. In consequence, however, of the substitution for blasting by powder of the more costly process of wedging, the owner of these collieries was placed at a considerable commercial disadvantage with others working the same seam as that at Shipley, who still continued the use of gunpowder. Many systems were tried by which it was hoped the coal could be more economically got, and the numerous accidents constantly happening from wedging avoided, but without success. Nearly two years ago experiments were commenced by some of the officials at these collieries with a view to practically utilizing the power of lime, which, when concentrated and used in a confined condition, produces successful results; while the process has for its recommendations safety, simplicity and economy.

The present mode of operating is to employ lime in a specially caustic state, made from mountain limestone. This is ground to a fine powder, and consolidated by a pressure of about 40 tons into the form of cartridges two and one-half inches in diameter, having a groove along the side. These are then packed into air-tight boxes to protect them from damp, and are ready to be conveyed to the mine for use. The cartridges are made by hydraulic power in a press specially constructed for the purpose, which can be erected at a small cost at any colliery. The shot-holes are first drilled by means of a light boring machine, and an iron tube, about one-half inch in diameter, having a small external channel or groove on the upper side, and provided also with perforations, is then inserted along the whole length of the borehole. This tube is enclosed in a bag of calico, covering the perforations and one end, and has a tap fitted on to the other end. The cartridges are then inserted and lightly rammed, so as to ensure their filling the bore-hole. After the cartridges have been enclosed by tamping, in the same way as with gunpowder, a small force-pump is connected with the tap at the end of the tube by means of a short flexible pipe, and a quantity of water, equal in bulk to the quantity of lime used, is forced in. The water being driven to the far end of the shot-hole through the tube, escapes along the groove and through the perforations and the calico, flowing towards the tamping into the lime, saturating the whole of the charge and driving out the air before it. The tap is then closed, so as to prevent the escape of the steam generated by the action of the water on the lime, and the flexible pipe attached to the pump is disconnected. Experience has shown that after introducing the water there is always an interval before the steam attains a high pressure, so that all danger can be avoided. The action of the steam first takes place, cracking the coal away from the roof, and this is followed by the expansive force of the lime. The pressure of steam generated by the usual charge of seven cartridges, as employed at Shipley, is 2,850 lbs.

To demonstrate the power contained in these cartridges, Mr. Paget Mosley, of London, recently exhibited to a society of mining engineers two pipes which had been burst by lime cartridges used in the same way as in a shot-hole in the coal. The one broken into small pieces was burst at a lecture given by Prof. Abel at the Royal Institution, on April 28th, last. The piece not broken showed that the force was not exercised in throwing out the tamping if properly rammed. That piece—the larger—was previously tested by water pressure to a strain of 953 lbs. per square inch without bursting, that being the limit of the testing power employed. The thicker pipe was burst at Shipley collieries, it being thought unsafe to try an experiment with a pipe of such strength in a lecture-room. The time occupied in drilling a hole three feet deep and two and three-fourths inches in diameter, inlnding setting up the drill, averages 12 minutes; charging a hole with cartridges and tamping up, four minutes, and pumping in the water, one minute; thus effecting a considerable saving of time, as compared with drilling, charging and tamping a hole for gunpowder. The sprage are left in under the coal so as to allow the force to exert itself as far back as possible, and in many instances the coal is forced off and falls for a distance of several inches behind the end of the drilled holes. In ten to 15 minutes, on the removal of the sprags, the coal falls clean from the roof, in large masses ready for loading, practically making no small. If all the sprage are removed at once, the entire length of coal operated on falls; but the collier can, if more convenient, remove two or three sprage at a time, and let down as much as he requires for loading, leaving the rest to remain spragged up till wanted. In places with bad roofs this is especially advantageous. To show comparative results, experiments were made, and it was found that 140 tons more coal were obtained with 100 hours less labor by the use of the lime patent than by wedging.

Smelting Rich Silver Ores.

In the last number of the PRESS we gave a paragraph on "Roasting Silver Ores in Mexico." This described briefly the preliminary process to the smelting. This smelting process, as stated last week, is only applied to richer silver ores, by far the larger proportion being treated by the patio process. The fusion of the roasted ors is effected in a small blast furnace having, according to John Arthur Phillips, the following dimensions: Hight to the charging hole, four feet, six inches; depth from the front to the back wall, 15 inches; width at top, 11 inches, and at bottom only about nine inches. This is, of course, a very small furnace, but is one any miner can build. It is one he can make money with, too, provided his ore is rich enough.

The aperture through which the fused materials make their escape is about two and one-half inches in diameter, and is situated at the bottom of the furnace, whilst the copper nozzle through which the blast is supplied is placed about nine inches above it. The breast, which is built of fire-stone, is taken down whenever the furnace becomes choked, or when it is found necessary to re-line the interior with a fresh coating of refractory clay, which is usually required at the expiration of a week from the time of first getting the apparatus into blast.

In front of the furnace, and below the aperture through which the various fused matters make their escape, is a breast pan 10x13 inches, in which they accumulate, and from which the lead and other fused matters are, from time to time, tapped into a basin, situated at a still lower level; while the slags are removed from the breast pan whenever any portion of them becomes sufficiently solid.

The blast is supplied by bellows, set in motion by cams, fixed in a horizontal axle connected, by toothed gearing, with a vertical shaft, to which a mule is attached. A couple of these furnaces are usually built side by side under a hood of masonry, open at the top for the escape of metallic fumes and the products of combustion. In front of each is a series of bins containing the ores to be smelted, which are mixed in various proportions with the different fluxes employed. The fuel made use of is, in most instances, charcoal, prepared either from pine or green oak.

This furnace, which was first introduced into the country by the Spaniards, and appears to have undergone but little modification during the last three centuries, is that still almost universally employed in the different native establishments, although furnaces on the model of those used in the metallurgical works of the continent of Europe have replaced them in the larger haciendas, conducted under the superintendence of Europeans.

The ore, after having been previously roasted, is placed in hutches before the furnaces, from which it is taken to be mixed with the various fluxes and furnace products constituting a charge.

The campaign of a blast furnace begins on the Sunday evening, and extends to the morning of the following Sunday, at the expiration of which time the bad quality of the materials employed renders it necessary to suspend operations for the purpose of making repairs. After getting the apparatus into blast, 300 lbs. of lead ore are first passed through it, and of which the yield of metal is not calculated in the results obtained. As soon as the preliminary charge has been fused, the mixture of ore and fluxes is thrown into the furnace, with alternate charges of charcoal, as often as its contents descend sufficiently below the level of the charging hole.

The smelter, who has charge of two furnaces, takes care to keep the eye constantly open, and for this purpose frequently introduces an iron bar, with which he gently raises the slags and fuel which occupy the lower portion of the apparatus; he also attends to the proper regulation of the blast, and the proportion of fuel to be employed. When a sufficient amount of lead to form an ingot has accumulated in the breast pan, the blast is stopped and the eye of the furnace is closed by a plug of clay; after which the dam, between the breast and receiving basins, is pierced, and the fused metal and matte are allowed to flow into the latter, when the eye of the furnace is again opened, and the operation continued until enough lead to yield another ingot has been produced.

As soon as the contents of the tapping pan have become sufficiently cooled, the mattes are removed from the surface of the bath of lead, and at once passed through the furnace with the next charge, after which the metallic lead is ladled into a convenient mold. The foreman is assisted during this work by a man who charges the two furnaces, and by another who attends to the preparation of the mixture of ores and fluxes; he is relieved every 12 hours by another smelter and his assistants.

The quantity of charcoal consumed during the production of an ingot of metal varies from 50 to 75 lbs.; and from eight to twelve are produced in the course of 24 hours, according to the nature and richness of the ore treated. When the minerals operated on contain a considerable amount of lead, each furnace will sometimes smelt as much as a ton of roasted ore in the course of 24 hours, with a consumption of about 55% of charcoal; but such results can only be obtained under very favorable circumstances.

Production of the Precious Metals.—No. 12

[An abstract of the Census Monograph on the bullion output of the country.]

This large amount is absorbed mainly in the following principal industries: The manufacture of jewelry, plate, and plated ware, and articles of *vertu;* watch-case, gold pen, instrument, and spectacle making; dentistry; gilding; photography; and to a less extent in glass staining and in various chemical processes. In addition to the leading uses enumerated, there are many others, insignificant individually, but in the aggregate demanding a considerable supply of the precious metals.

Bullion Produce of the World

The world's annual output, so far as ascertainable, is shown in the following tables, which state the sources according to political divisions, and also by continents. The data are for calendar years, except for the United States, British Columbia and Japan. Accurate statistics of the small production of gold and silver in Central America, that of silver in Canada, and gold in Nova Scotia and not available. The totals given are probably slightly under the actual amount. A comparison of the individual figures shows that the United States produce 33.13% of the gold yield of the whole world, 50.54% of the silver, and 40.91% of the total. Of the aggregate supply of the precious metals, North America (including the United States, Mexico and British Columbia) furnishes 55.78%.

The census monograph upon the precious metals will be accompanied by a series of lithographic plates, containing charts showing the distribution of the product of the United States and of the world, and the annual fluctuations in the yield of the country from 1848 to the close of the census year.

An Improved Chair Brace.

A recent invention, patented through the Mining and Scientific Press Patent Agency, and one which is deserving of meritorious notice, is the chair brace of Mr. John A. Gallagher. This is shown clearly in the accompanying cut, by reference to which the utility of the device may be seen. Chairs receive more or less rough handling, especially those known as bar-room chairs. The result is that in a short time the legs are loosened in their sockets and the arms and back grow insecure, the whole chair becoming rickety and unsafe. Wire braces of all kinds have been tried, but none are found effective, besides generally presenting a bad and uncouth appearance. Mr. Gallagher uses four rods or wires, secured under the seat of the chair and to the lower portion of the legs, all the wires converging to the center of the space under the chair. Upon these are two discs or plates, which are adapted to approach to or recede from each other by means of a thumb-screw or bolt. Their separation tightens all the wires equally, and such power is gained that the legs may be firmly bound together to strengthen and brace the chair. To brace the arms and back, other wires descend therefrom, and are secured to the upper portions of the wires underneath. The separation of the actuating plates draws inward their wires, which movement draws downward upon the back and arm wires, thus, by one operation, tightening up the entire chair. The device does not detract from the appearance of the chair, and, at the same time, is so simple and effective that it must be regarded of value in preserving a chair long beyond the usual term of its use.

Imprisoned Miners.

Grave Danger and a Heroic Rescue.

On Wednesday, the 31st ult., the main pump column in the Alta mine, on the Comstock, was broken. Men were at work making the necessary repairs, when, at 11 o'clock, the bulkhead recently placed in the main east drift on the 2150 level gave way. This bulkhead was constructed of plank and timbers, and was placed in a part of the drift where the rock was hard and perfectly solid. It would seem that it at first gave way at one end, as the first rush of water was not very alarming, though it was thought best for all to get off the level. Three or four men, who were near the shaft, went up, and Richard Bennett, the shift boss, at once started out into the main west drift to notify the men at work at that point of the danger. About the time he started on his errand it would seem that the whole bulkhead went down, and there was a tremendous rush of water.

This drift is 1400 ft. long, and the last seen of Bennett was when he started in on his errand of mercy. At the face of the drift six miners were at work, whose names are as follows: P. Denney, Malachi Curran, T. McDonald, John Black, John Mulligan and Morris Connere. The drift was run with a raise of about one foot in each hundred, therefore, at the face it would be 14 ft. higher than the floor of the station at the shaft. This circumstance gave some hope of being able to save the seven men who were imprisoned. Every possible effort was made to keep the pump going at best speed, but there were over 2,500 ft. of drifts in the level to be emptied.

It was found that the men were tapping on the compressed air pipe as a signal of their existence. A boat for navigating the drift was made, but it was too high. Another boat, made of canvas and used for gunning purposes, was lowered into the mine. All the time the bailing tanks and pumps were kept at work all day Thursday and Friday. During this time the excitement was, of course, intense. Two men, George Gorneet and Anthony Smith, tried to penetrate the drift, but had to return.

At four o'clock on Friday morning the water was so far lowered that it was thought the boats could venture in. William Bennett, a nephew of Richard Bennett, the shift boss, and Denis Callahan took the canvas hunting boat belonging to Fred Ritter, the gunsmith, and the flat wooden boat, constructed at the mine, and ventured into the drift. They had placed in the boats ice, water and some refreshments, and hoped to be able to force their way in to the end of the drift. They pulled out into the drift and that was the last seen of them alive. It appears that they started off without the knowledge of Superintendent Boyle or John Hosking, the foreman, who had not intended that the venture should be made at that time. It would seem that the two men were very anxious to reach their friends, and supposed the air was no worse at any point ahead than near the mouth of the drift. Both these men died.

We condense from the Virginia *Enterprise* a very exciting account of the incidents:

A Man in Armor Penetrates the Drift.

In the afternoon, about three o'clock, when the water in the month of the drift had been reduced to about three feet, John Van Dusen entered the drift. He had on him an apparatus invented and constructed by Andrew Peasley, of this city. This armor consisted of a mask for the face, from which there was a rubber-breathing tube passing into a tin box strapped on the man's back, which box was filled with fragments of ice and perforated with holes to allow of air passing in through the pounded ice. Wearing this armor, Van Dusen struck boldly into the drift.

He was gone about half an hour, when those at the station heard a call for help. Men went in the direction of the cry, and when out about 100 ft. from the shaft found Van Dusen in an exhausted and fainting condition.

As soon as Van Dusen was able to converse he said that he had found the seven men originally imprisoned in the drift alive and all right. He said they were in the cooling-off house, about 100 ft. from the face of the drift. With picks or bars they had broken the pipe carrying compressed air and had then so bent it as to carry the end into the cooling-house. In this house, when they were first imprisoned, they had nearly a barrel of ice water. When this was exhausted they poured into the barrel hot water from the drift. Then they twisted the end of the compressed air pipe down into the water in the barrel, and allowed it to exhaust there. This rendered the water quite cool and drinkable. They had a light in the cooling-house, but nothing to eat. The great heat rendered them weak and feverish. Mr. Van Dusen told the men he would inform their friends that they were all right, and assured them that a host of brave men were outside doing all that could be done by human beings for their rescue. As his ice was fast melting away, Mr. Van Dusen could not remain long with the men; besides he was anxious to get out and give notice of their being alive and of their situation. It was owing to the consumption of the ice in the box at his back that Mr. Van Dusen came near losing his life. There being but a few lumps rolling about, much hot and foul air entered his armor, whereas, had there been the proper quantity all the air entering the mask must first have been cooled and purified by coming in contact with the fragments among which it passed.

The Rescue.

That evening, about seven o'clock, six men entered the drift and, at the risk of their lives, pushed their way through to the cooling-house. They carried with them some milk punch and some ice. They found the men about as described; indeed, the six men were in a worse state when they reached the cooling station than were those they found in it. However, they recovered on reaching the fresh air sent in by the compressor.

GALLAGHER'S PATENT CHAIR BRACE.

The men in the cooling-station tried to persuade the new arrivals to remain and take their chances with them instead of venturing back. This, however, they dared not do, as it would have left their friends on the outside in doubt as to their fate, and would have caused great uneasiness. Though the six men had seen the bodies of Bennett and Callahan, while on their way in, they thought it best to say nothing about their having lost their lives.

Work was then pushed on with great vigor on the air pipe, and at length a current from the blower was sent through its whole length. This gradually forced out the belt of foul air.

The men about the mine became so exhausted by about nine o'clock last night, that they sent up from the mine to superintendent McKenzie, of the Sierra Nevada, to send down a fresh force from his mine.

Meantime the air had so far improved that the imprisoned men could be visited. By the advice of the physicians they were given stimulants and refreshments, and kept in the cooling-house to get some strength before an attempt was made to bring them out. The men told their visitors that they had at no time been much alarmed for their ultimate safety. They said that before the accident happened they had frequently talked about what they would do in case of the bulkhead giving way, and had concluded it would be best to remain in the upper end of the drift and wait for the water to be pumped out.

When the men were all safely out of the drift, the Alta whistle began a prolonged scream, and this was taken up all along the lode. It was kept up for about five minutes, just as in case of fire in the early days, and for a time the whole country was made to howl. The only drawback to the general joy was the sad fate of the two brave men, William Bennett and Denis Callahan. It is saddest of all, to find how unnecessary was the noble attempt and the willing sacrifice they made.

It is said that the scenes that occurred at the shaft when the men were brought up and restored to their wives, children, relatives and friends were such as no pen could describe. Among all the spectators present there was the wildest excitement. In this city, when the whistles sounded the signal that the men were at last saved after their imprisonment of some seventy hours, people rushed out into the streets and shook hands right and left, and were so full of joy that they could hardly speak.

New Ore Feeder for Stamp Mills.

In the crushing of ore by means of vertically-moving stamps in a battery, it is necessary for the most efficient work that the ore should be kept at a certain depth upon the dies, not decreasing, so that the stamps shall fall upon the dies; nor increasing, so that the quantity shall impede the fall of the stamps or their efficient action by its depth. This feeding is best effected by some automatic device so connected with the stamps that it will be actuated by their rise and fall, and regulated by increasing or diminishing amount of ore beneath them. It has hitherto been effected by means of inclined shaking or rotating tables placed beneath a hopper, so as to receive the ore from it and carry it to the battery, or by revolving cylinders beneath the hopper, having pockets which receive a certain amount of ore from the hopper and carry it forward and discharge it into the battery. These methods are open to some objections, especially when the ore is wet or sticky.

Isaac N. Templeton, of Amador, Cal., has just patented through the Mining and Scientific Press Patent Agency, a form of ore-feeder which is constructed somewhat different from those in use. His invention contemplates the employment of a chute or hopper having a bottom so inclined that ore or other material would flow downward upon it by gravitation, and having a front with a slide, by which the flow of the ore may be regulated, the principal weight of the ore being supported upon the incline bottom. At the lower end of this chute, and outside of the hopper itself, is mounted a smooth cylinder, lying horizontally across the end of the chute and turning upon a shaft. This cylinder is so mounted with relation to the inclined bottom of the chute that the latter would, if convenient, pass just above the center of the axis, so that the one is checked by the upper part of the cylinder, while its tendency is to move forward and discharge whenever the cylinder is rotated. In order to cause this gate or check to rotate and allow the ore to flow when required, a flanged pulley is secured to one end of its shaft, to be operated by a clutch. This clutch consists of an arm having slide-pieces bolted to or formed with it, and bent or fitted to clasp the edges of the pulley.

The clutch is loosely connected with a vertical rod, the upper end of which is attached to a horizontal lever-arm. This arm extends to a point near the stamp-stem, by which it is to be operated, so that a tappet upon the stem will strike the end of the arm at each fall of the stem, until the amount of ore within the mortar is sufficient to raise the stamp so high that the arm ceases to act. The tappet, striking an arm, operates the clutch, which impinges upon the pulley, giving the latter a partial rotation, which causes the feeding from the hopper or chute of a quantity of ore. Upon the upward stroke of the tappet the arm will be released and the clutch allowed to assume its original position, without affecting the pulley or cylinder, ready to repeat the former operation when the tappet makes a downward stroke. By means of a screw, or other device connecting sections of the rod together, the action of the clutch can be varied, so as to control the feeding action of the cylinder. This is effected by turning a sleeve or nut, which will lengthen or shorten the rod, and consequently affect the normal position or relation of the clutch to the pulley of the cylinder.

By this mechanism it will be seen that a sensitive feeding apparatus is secured, because the instant the ore in the battery falls below a certain point the lever-arm will be struck by the tappet, and the clutch is so accurate in its action that it will turn the wheel and cylinder by the smallest possible movement. This is an advantage over a pawl and ratchet, as the movement of the latter is effected only at prescribed intervals, or when the action of the lever or arm is great enough to move the pawl the distance between two teeth of the ratchet.

The clutch has side pieces capable of adjustment by slots and bolts, to permit the application of its jaws to the rim of the pulley of the cylinder.

The cylinder has no wings, scrapers, pockets, indentations, or any attachment or device by which it serves as a feeder, but is intended, and acts, only as a gate or stop for the ore upon the chute, from which it would naturally flow by gravitation alone. By being placed with one-half its diameter below the plane of the bottom of the chute, the pressure of the ore is against its upper half and in a line above the shaft on which it turns. This makes it easy to turn, and when turned, it overcomes the friction on the cylinder and slight cohesion of the ore particles which prevents the mass from moving when the cylinder is stationary, and thus allows the ore to feed itself to the battery.

Cylinders having corrugations or depressions to receive ore from a mass within a hopper have been employed to feed furnaces, and such compartment cylinders have also been used with a pawl and ratchet to feed ore to a crushing mill, said cylinders being placed directly within or beneath a hopper, so as to receive a considerable weight of the ore. The objection in such cases lies in the force necessary to separate the ore in the depressions of the cylinder from the superincumbent mass above, and to carry it forward out of the hopper. Moist ore will also stick in the depressions and will not be discharged at all.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LAROEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x00, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

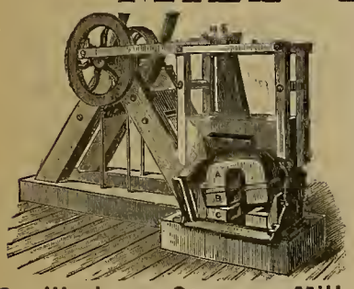
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,900 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

Is has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

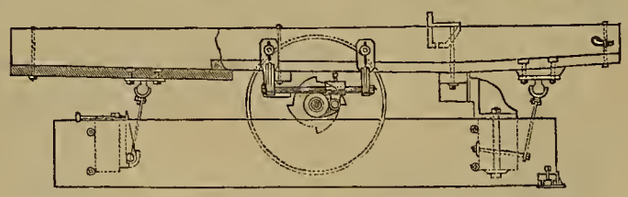
Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 220 Fremont Street, - - San Francisco, Cal.

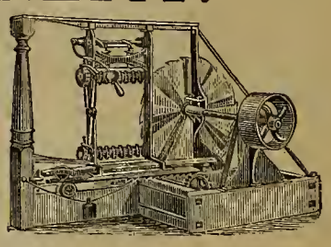


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

F. A. HUNTINGTON,

No. 220 Fremont Street, San Francisco.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

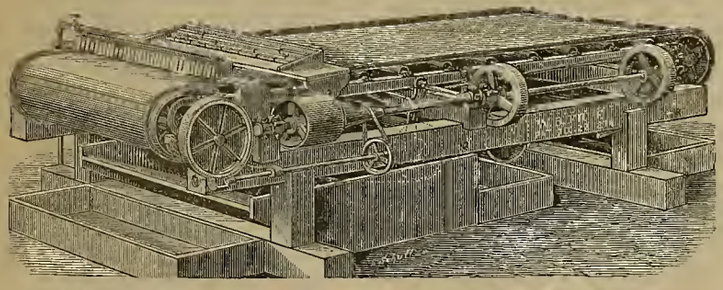
PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

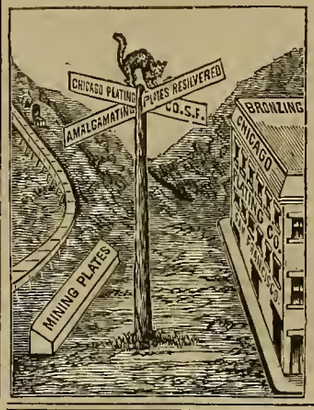
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.



Amalgamating Plates

REPLATED OR MADE TO ORDER BY THE

CHICAGO PLATING CO.

Pacific Power Building, 23 Stevenson St., S. F.,

And 261 & 263 Randolph St., Chicago.

Having opened a branch house in S. F., the largest Plating and Polishing Establishment on the Pacific Coast, with all the latest improvements in machinery for plating in Gold, Silver and Nickel, with 12 years' experience in the Eastern States and Europe, we claim that our Silver Plated Amalgamating Plates are the most economical, durable, and successful Plates on the Pacific Coast for saving gold. Every description of metal goods plated in the most durable manner by the

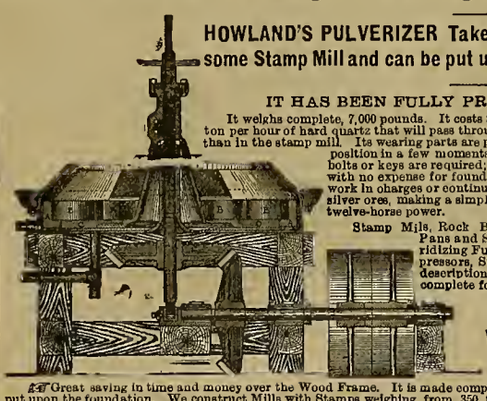
MOREY & SPERRY.
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING MAY 30, 1882.

258,562—GUIDERAIL FOR ROPE RAILWAY CLUTCHES—Chas. S. Drake, S. F.

258,563—ATTACHMENT FOR WIRE ROPE RAILWAYS—Chas. S. Drake, S. F.

258,564—APPARATUS FOR COVERING SLOTS IN CABLE RAILWAYS—Chas. S. Drake, S. F.

258,645—CABLE POWER WHEEL—Egbert D. Haven, Albany, Oregon.

258,860—REVERSIBLE SHIRT—David Lubin, Sacramento, Cal.

258,861—ENVELOPE—David Lubin, Sacramento, Cal.

258,661—FIRE BRICK COMPOUND—Edward A. Martin, Virginia City, Nev.

258,679—REIN HOLDER—R. E Shannon, S. F.

258,682—ICE MACHINE—Geo. W. Stevens, S. F.

258 763—GRATE FOR STOVES AND RANGES—Thomas Kearns, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ICE MACHINE.—Geo. W. Stevens, San Francisco. No. 258,682. Dated May 30, 1882. This invention relates to ceatain improvements in apparatus for refrigerating or ice making of that class in which ethereal fluids are used, and it consists principally in certain details of construction, embracing traps by which the inventor is enabled to free the refrigerating liquid from certain impurities which will collect in it in time; and also a means for agitating or breaking up and distributing the liquid as it flows from the condenser to the freezer, so that the expansion and consequent refrigeration will be more rapid and more equal. It further relates to a means for increasing the surface over which the liquid is spread and for thawing out the pipes when frozen up.

REIN-HOLDER.—Richard E. Shannon, assignor one-half to A. T. F. Ohermeyer, S. F. No. 258,679. Dated May 30, 1882. This invention relates to a new and useful horse-holding attachment for vehicles of that class in which the motion of the wheel is caused to wind up and draw upon the reins through intermediate gearing. This patent covers improvements upon a previous one granted to the same inventor, and consists simply in a novel intermediate mechanism, whereby the motion of the vehicle is caused to wind up the reins.

FIRE-BRICK COMPOUND.—E. A. Martin, Virginia, Nevada. No. 258,661. Dated May 30, 1882. This is a new and useful composition of matter suitable for and forming a fire-brick. The constituents are such as to form a first-class fire-resister.

Gold in California—An Early Record of its Existence.

EDITORS PRESS:—As respects the first knowledge of gold in California, I here give you an unwritten history which antedates the reputed discovery of 1848; which it is well to recite, or otherwise it will he as facts floating in the air.

When I tell you I knew of gold in California in 1845, you will wonder why I was not among the very first to venture hitherward and to-day he crowned with the glory of its grand development. You may also wonder why these statements should remain so long unpublished. Now for the facts: In 1845, with other young adventurers, I visited the Lake Superior copper region, and soon took up with the excitement, and became interested in several companies. As superintendent of the Massachusetts Mining Co., working in Point Kerneshenaw, was an Englishman by the name of Cleme—Capt. Cleme, as we called him. Capt. Cleme, previous to going to Lake Superior, was

A Gold Miner in Brazil.

This fact made him to me a very interesting man, for gold mining, even in my youth, was my grand idea of all industrial pursuits. My youthful ambition was to he a gold miner; and how for 33 years I have labored over the field of my hoyish inspiration the people of this coast well know. Sometimes, as I look back to the beginning and through the intervening years, I say, truly "there is a divinity that shapes our ends," and that we often build wiser than we know—that we are mersly instruments conforming to an unfathomable law, and as laborers in the treadmill of universal progress.

About the 1st of November, 1845, I expected to leave Lake Superior for my home (St. Louis, Mo.), by the last trip of the only vessel at that time on the lake; but as luck would have it, a great storm came up, which prevented my going in a small boat as I had intended, to the point of embarkation some five miles distant. Rather than he left myself, I concluded to leave my haggage, and started through the wood on a run in hopes of reaching the vessel before her departure. But what was my sorrow on reaching Copper Harbor, to find the craft off and just beyond hailing distance. Left! Left! to be buried up in snow and solitude for five long months at least. It was a sad reflection. As fate so decreed, I finally concluded to make the most of the situation, and determined on spending my time in the study of mining, and gold mining particularly, and that Capt. Cleme would he my tutor.

Capt. Cleme's quarters and mine were some 20 miles apart. Still, on snow-shoes, we, about every week, exchanged visits. It was a wild, weird, snowy, uninhabited country, save the isolated mining camp. At all of our meetings, gold mining was the interesting topic. The iron, lead, silver and copper came in, necessarily, for some of our attention. How well do I remember his explanations as to how gold was found, reduced, washed and saved by hides, sheep skins with hair turned up, riffles, etc.

It was at one of our meetings the Captain spoke of gold in California—upper California. He said he believed it to he a great gold country; that he knew gold was there, as he had seen it—the gold brought to Brazil by native Californians, who told him they got it in upper California. This fact fired my brain, and from this time on, the Captain having some maps of the country, I took up the study of California—how to get there, etc.

I was bound for California as soon as I could get away in the spring. My enthusiasm for the venture soon kindled a corresponding one in the Captain's mind, and he, knowing I could command capital and influence for the venture, framed out an expedition. I at once opened correspondence, detailing everything, with my friends in Boston. Letters, at this time, had to he carried to Green Bay, Wisconsin, some 300 miles, on the backs of Indians wearing snow-shoes; and, of course, it took a long time to get answers. Finally, an answer came. The project was warmly entered into by my friend Bernard and his friends in Boston, among whom, if my memory serves me right, was Henshaw, Ward & Co.

The arrangement was: $10,000 was to back the venture; four persons were to compose the expedition, and they were Capt. Cleme, Almarin B. Paul, Joshua Childs (then of the Copper Falls Co.) and a young man of Green Bay, Wis.—I forget his name. All were then at Lake Superior. As soon as navigation opened in the spring, we were to go to Boston, mature our plans and get to San Francisco by some vessel up for the Pacific, or that could he induced to go. So far, all was propitious.

Well do I remember the plans laid, and how queer sounded the names of Rio de la Americanas (American river), Rio de la Plamas (Feather river), Yuha and Sacramento. How we were to reach San Francisco (Yerba Buena) was the undetermined question. Once there, we were to procure a boat, in which we would journey up the hay and the Sacramento to the American river, and on this river commence the search for gold—not finding it (which we would have done), we were

To Croee Over the Country

To the Yuba and Feather rivers and explore them before the search was to he given up.

It was a well-laid plan; I can see now how well, as I have traveled our route many times. The Captain evidently had (as he impressed me) unquestionably reliable data for his guide, as well as the fact of gold. The only dark cloud that hovered over our mind was the talk of war with Mexico, California being then a Mexican province. No mail had been in for a long time, so this question was an unsettled one. This, however, was finally solved; war was declared. The first vessel up, arriving the latter part of April, brought us, I believe, the first news, and as a consequence our expedition had to be abandoned. I now concluded not to return to St. Louis until fall, and spend the summer prospecting for copper along the lake shore. In one of my trips I fell in with a young lawyer from St. Lonis, "away on a lark," full of dash and daring. He suited me to a T. We soon became "chums," when I proposed that we get a birch-bark canoe, a half-breed guide, and start for St. Lonis via the head of Lake Superior, cross over (carrying our canoe) to the headwaters of the St. Croix; go down the St. Croix to the Mississippi, and down the Mississippi to St. Louis. This was no sooner proposed than accepted. This was in 1846, and to cut a long and romantic journey short, we made the trip, meeting on it hundreds, I may say thousands of Indians. But to get back to our subject.

When the Newe Came,

In October, 1848, of the discovery of gold in California (I read it in the *Missouri Republican* at the breakfast table), I at once said, I am bound for California; I know it is all true, and told how I knew it. From that hour on I made business lively to enable me to get off, and it seemed the harder I worked to that end, the more difficulties came up to prevent it. I got ready to start in December, 1848, when a failure stopped me. Again in February, 1849, and a like difficulty arose.

By this, having lost so much time, I now concluded to take out a stock of goods, and bought out an entire establishment of building hardware, packed my goods, arranged for their shipment, and

Started In April, 1849,

Via the plains. No sooner was I well started some 200 miles beyond St. Joe, when an express messenger overtook me, informing me that parties with whom I had left the goods had failed, and I must at once return or lose all. I returned, but to find the principal had decamped after only one interview. Getting a clue to his route, I started after him, overhauled him, forced his return to St. Louis, got my goods and started for New Orleans. It was now about the first of June, but no steamer for cargoes, so I took a sailer, in hopes of reaching Panama for the Orsgon's trip; arrived in due time, but the Oregon had run on a rock and would he laid up for probably two months. All these set-backs made me wild almost. I thought I never would get to California. When I arrived in Panama I found several hundred awaiting passage. A lot of us got together and chartered the whale ship *Eugene*, which floated on so leisurely that it was the 3d of November, I believe, before the hopes of 1845 were realized in 1849. I now stood

Upon the Golden Shores

Of California, where my golden dreams could be realized. I was happy then in being here, and have been ever since.

Of the four adventurers, Capt. Cleme, Joe. Childs and your humble servant all came. When they reached California I do not now remember. Joshua Childs I saw in Sacramento in 1850. Capt. Cleme was then up on one of the rivers. Our Green bay friend had passed on to that land where gold is as drosa (as it ought to be here). So ends my history.

This is the third time I have written this up—once about 23 years ago, again about 15 years ago. Why it was not published I do not know. It was not, and now will it be? Time may obliterate the general interest in the first knowledge of gold in California, and yet it is one of the links in the chain of historical facts which make up correctly the beginning and ending of States, countries and empires for time's great book of records. ALMARIN B. PAUL.

San Francisco, Cal., June, 1882.

Promptness Displayed, Etc.

MESSRS. DEWEY & Co., Patent Agents:—The Canadian patent obtained through you is at hand. This makes three patents received within a month. The ability, energy and promptness displayed by your firm must certainly be gratifying to your numerous patrons—as it assuredly is to

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing

Press, Box 2361, S. F.

Back Numbers Wanted.

We will pay 10 cents a copy for the following numbers of the MINING AND SCIENTIFIC PRESS: Volume, 13; year, 1866; number, 1. Volume, 18; year, 1869; number, 5. Volume, 20; year, 1870; numbers, 1 and 26. Volume, 22; year, 1871; number, 1. Volume, 30; year, 1875; numbers, 2, 3, 4, 7, 10, 11, 12, 13 and 15.

DEWEY & CO.,
252 Market St., S. F.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We shall send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

ANNUAL STATISTICIAN of 1882—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 502 Taylor st. Price, $4.

Canvassing Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first-class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper which will be rented on favorable terms. Stair entrance, No. 252 Market St. Elevator, No. 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS. ☞Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT. No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Bank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

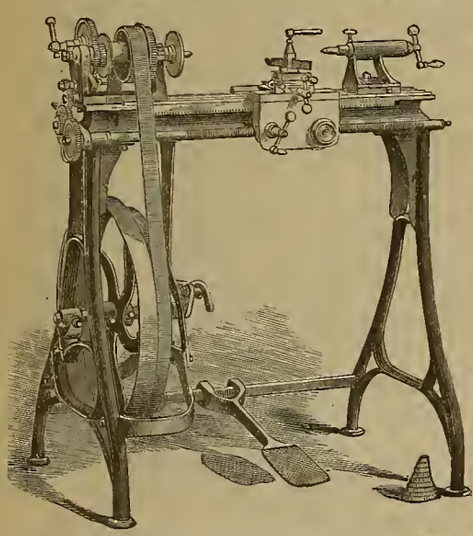
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

SCREW CUTTING LATHE.



This cut represents a new screw cutting Foot Lathe which was put on the market about two years ago to meet the demand for a first-class tool at a low price, which will do a great variety of work, both in metal and wood, and is the best Lathe made, considering its capacity and price. The cut gives a good idea of its appearance, and below we give dimensions of parts and general description.

Description of Lathe, 4 ft. Bed.

The Lathe occupies a floor space of 28 by 48 inches, the centers being 44 inches high from the floor; the bed is 48 inches long, 6½ inches wide, 5½ inches deep, with double Vs. for Carriage and Tail Stock. It swings 10 inches over bed and 6 inches over carriage, and will turn 26 inches long.

The Head Stock is back geared, and the Cone has three speeds for 1¾ inch belt, the smaller being 3 inches diameter, the larger 6 inches diameter; this, with the back gears gives six different speeds, the fastest giving about 1,000 revolutions of the Arbor to 100 of the Balance Wheel; and the slowest, 75 of the Arbor to 100 of the Balance Wheel; this gives a sufficient range for all kinds of work.

The Arbor in Head Stock has a ⅜ inch hole through it, which is very convenient for turning the ends of long rods, making small screws, studs, &c. The Centres are ½ inch diameter. There is an attachment in Head Stock for reversing the motion of Carriage.

The carriage has a rack and pinion for moving it by hand, and a split nut moved by a cam on the face of Carriage to throw it in gear with screw; the reversing motion is in Head Stock.

The Tool Post has a slot for tools ⅝x1½ inches; the tool is adjusted by a wedge made on the arc of a circle and fitted to a convex washer. The leading screw runs the whole length of Lathe, and has 10 threads to the inch. A set of gears go with the lathe which will cut all common threads and a great variety of other sizes by compounding them; there is a screw stop on the Carriage for screw cutting, &c.

The Tail Stock can be set over for turning tapers, &c. The spindle of Tail Stock is 1 1-16 inches diameter, and has a motion of 3 inches. The center is fitted to a taper hole, which is the method adopted by all the best makers, and is the same size as the one in Head Stock, so that chucks and other tools fitted to one can be used in the other.

The Foot Motion, we consider the best made, the crank is adjustable and the shaft has swivel bearings; the balance wheel is 22 inches diameter and has 3 speeds to match Cone on Head Stock.

Send for Circular on Lathes.

VOLUME XLIV Number 24

Water Required in Working Quartz.

The quantity of water consumed in the battery varies with the character of the ore and the degree of fineness to which it is to be crushed. Usually, in the Washoe mills, the consumption is between 250 and 300 cubic feet per ton of rock treated, or from one-third to one-half of a cubic foot of water per stamp per minute; but this includes the water used in the pans which does not pass through the batteries.

In a 24-stamp mill, in that region, the tank contained 4,400 cubic feet of water, which was sufficient for eight hours' work of full duty. This mill, which crushes 55 tons per day, discharges at one side of the mortar, through a No. 6 punched screen.

The consumption in this instance is equal to 240 cubic feet of water per ton of rock, or .38 of a cubic foot of water per stamp per minute. Making a due allowance for a portion of the water used in amalgamation, without having passed through the batteries, the quantity actually used in crushing does not exceed one-fourth, or, possibly, three-tenths of one cubic foot per stamp per minute.

The method of measurement in the delivery of water is by miners' inches. A miner's inch is the quantity of water that will pass through an orifice one inch square in the side of the measuring box under a head usually of six inches. The measurement is not uniform throughout the crushing, as different heads are used in different places. Generally, however, in this State, the aperture is made two inches deep, and as long as need be in order to furnish the number of inches, and the water in the measuring box, which is at one end of the supplying flume, is allowed to attain a hight of six inches above the center of the orifice.

The quantity of water that will pass through an orifice of one inch square in the side of the box, under a head of six inches, is determined by Mr. Hagne by multiplying the area of the orifice by the theoretical velocity $\sqrt{2gh}$, and taking two-thirds of the product as effective discharge, ie .02633 cubic feet per second, 1.578 cubic feet per minute, and 94.68 cubic feet per hour. The mill just referred to uses five inches of water. Assuming that its measurement is uniformly in accordance with the above conditions, the amount delivered in 24 hours is 11,361 cubic feet; equal to about 2063 cubic feet per ton of rock treated. Taking the operation of this mill as a criterion, one inch of water is a supply for five stamps, including the quantity required for amalgation as well as crushing.

According to Clarence King, the consumption of water in some of the Colorado mills, where the subject was investigated, was about 400 cubic feet per ton, costing about 18 cents per ton of rock.

The circular of the Union Iron Works, of this city, gives the amount of water required in working quartz as follows: Each stamp uses 10 lbs. per minute; each pan uses 16 lbs. per minute; each settler uses nine pounds per minute.

If the water is run from wells into settling tanks, it can be saved with a loss of 20%. This will make the actual supply of water required in pounds per minute to be as follows: 1 stamp, 2; 1 pan, 3.2; 1 settler, 1.8.

For a 60-stamp mill the following amount will be required: 225-horse power will require per minute 169 lbs.; 60 stamps, 600 lbs. per minute; 22 pans, 352 lbs. per minute; 11 settlers, 99 lbs. per minute. Total water required, 1,220 lbs.

Of this, 1,051 lbs. used for stamps, pans and settlers can be re-pumped to the tank at a loss of 20%; and the 169 lbs. for the engine can be condensed at a loss of 50%. This will leave the actual amount to be supplied as follows:

20% of 1,051 lbs.	210.2 lbs.
58% of 169 lbs.	84.5 lbs.
Total water per minute	294.7 lbs.

DISASTROUS floods have occurred at Worseley, Hungary. A number of houses and two bridges were destroyed. Twelve children and several adults were drowned.

Ore Sampling.

Mr. S. A. Reed contributes to the Columbia School of Mines *Quarterly* an article on "Ore Sampling," which we here reproduce, with the engravings.

With the growth and multiplication of large custom works for the reduction of ores of the precious metals, has come sharp competition in the purchase of such ores. In the purchase of ores according to an established schedule, a prime necessity is an accurate estimation of the value of each lot—an estimation which shall satisfy both purchaser and seller. Where a mine reduces its own ores, very accurate estimation of the value of separate lots is seldom necessary—all that is required is a tolerably close notion of the working of the process, general percentage composition for the calculation of charges, and an approximate valuation of principal and by-products so as to minimize losses. But with a dozen concerns bidding for a single mine's product, as is often the case in Colorado, exact sampling must be assured, or a bid becomes merely a bet.

Again, a variety of causes have contributed to the strengthening of metallurgical works at large railroad centers, at the expense of works near the mines, so that it often pays better to ship ore of a certain character than to reduce it locally. The business of shipping ore has led to the establishment of a special class of mills called sampling works, whose sole function it is to determine correctly the coin value of lots of ore brought to them.

The sampler acts in one of several capacities. He is either a special agent or buyer for some particular metallurgical works at a distance—or he is an independent buyer, buying all lots coming to him, and shipping on his own account to the best market for the particular kind of ore in hand—or he is a broker to whom the miner ships his ore to be sampled and sold by the sampler, as the miner's agent, to the highest bidder. In any case, the object is to make a determination which shall be first accurate; second, simple and easily inspected; third, cheap. Various methods of ore sampling are in use, but it can be safely said that the subject has been more scientifically studied and carried nearer to perfection in Colorado than anywhere else. By observing a few fundamental principles, almost any one of the sampling methods in vogue will give a good result, and a sampling works does well occasionally to check its favorite method by some other.

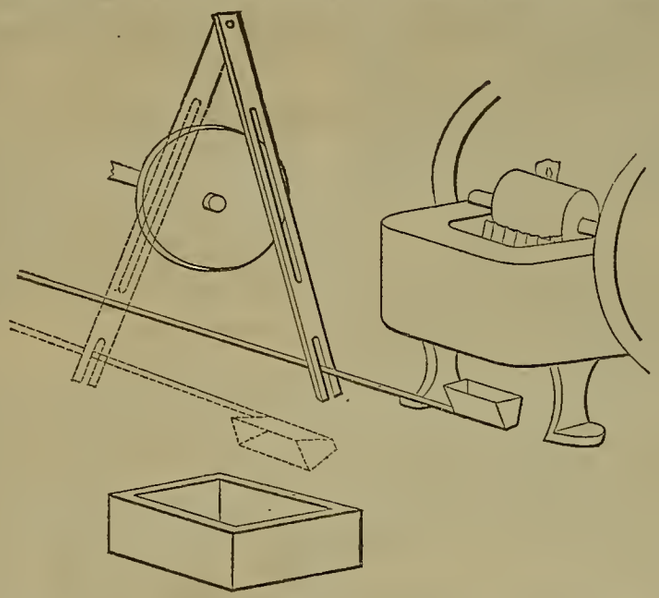

FIG. 1.

FIG. 1—AUTOMATIC SAMPLER FOR INTERMITTENT ORE SAMPLES.

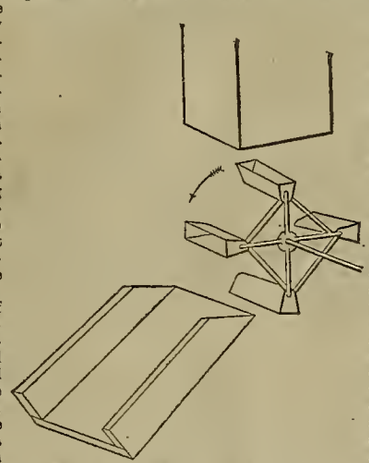

Fig. 2—Revolving Ore Sampler.

The particular method vary in different works. Stamp mills take samples from the batteries at stated intervals; some works take every tenth shovelful as a sample; others mix in a heap by raking the heap around with the shovel in a spiral, from the center out, and then quartering, taking diagonally opposite quarters, re-mixing and re-quartering; others throw everything over a narrow scoop which catches a portion from each shovel; and finally, some adopt automatic devices for performing some one of these methods. The tendency is undoubtedly toward the general adoption of the scoop-shovel in some form. Automatic devices are excellent in some cases.

An automatic sampler used in a Leadville mill for taking intermittent samples directly from a Blake crusher is shown in Fig. 1. A Georgetown mill has a sampling device, also on the intermittent principle, consisting of four cups, as in Fig. 2, caused to revolve slowly under a falling stream of ore, the cups discharging their samples into a receptacle at one side. (To be continued.)

Sluice Boxes.

These are the highways on which hydraulic mining is carried on, and their greater or less efficiency has an influence upon this business like that of the establishment of railroads or common wagon roads upon general commerce. Just as, by the cheapening of carriage, railroads open coal fields, grain-producing regions, etc., to the markets of the world and to a brisk commerce, where common wagon roads would barely sustain a weak home trade, so well-adapted sluice boxes will render inferior gravel deposits "paying institutions," while, per contra, rich gravel deposits, without proper facilities for the placing of sluice boxes, are worked at a loss.

Some mines are worked with as little grade as three inches, others as high as nine inches, to each box of 12 ft. In the first instance, abundant and cheap water generally compensates in some degree for the lack of grade, in the other a very high grade is given to make up for the limited supply of water.

Six inches for each 12 ft. is established as the general grade, though many prosperous mines are worked with four and one-half and five inches for the same length of box.

The establishment of undercurrents and drops must be borne in mind when the grade for sluice boxes is being laid out, as it is advisable to establish a number of undercurrents on a long line of sluice boxes, even at the sacrifice of some grade.

Sluice boxes, with five inches grade per 12 ft., with a number of undercurrents, are preferable to sluice boxes having six inches grade without undercurrents.

The size of sluice boxes must necessarily depend on the work they have to perform, and may vary from four to six feet in width.

Whenever a current occurs in the line of the sluice boxes the larger bend or outside ought to be raised from ½ to 1 inch, according to the degree of curvature. This will check the force of the current towards the outside curve, and distribute the flowing matter evenly over the entire bottom of the flume, preventing the wearing of a deeper channel in the pavement on the outer side of the box.

TRADE MARK DECISION.—The decision of Superior Judge Allen in the case of Buckingham & Hecht vs. Porter, Slessinger & Co., both wholesale manufacturers of boots and shoes, has resulted in another action in the United States Circuit Court by Porter, Slessinger & Co. against Buckingham & Hecht, for damages and accounting. In the original suit it was claimed by plaintiffs, that Michael Hecht devised, and the firm adopted and appropriated the word "Ironclad," as a trade mark applied to rubber boots, in March, 1879. The word was chosen as an arbitrary symbol to distinguish their boots from all others in the market. The plaintiffs claimed that they had the sole use and proprietorship of the trade mark to October, 1880, when Porter, Slessinger & Co., began selling a water-proof leather boot under the same trade-mark, and have been using it since that time. Plaintiffs asked that defendants be enjoined from further use of the word "Ironclad," and that damages be awarded for an infringement. Judgment was rendered in favor of Porter, Slessinger & Co., who now bring suit against Buckingham & Hecht for damages and an accounting. The decision of Judge Allen in the former case says: "The word 'boots' does not denote a class; 'rubber' boots and 'leather' boots belong to different classes, and no one is deceived by defendants using the word 'Ironclad' on their leather boots." As the case involves questions as to the force and reach of the trade-mark laws, the decision in the new action will be looked for with interest among business men. By the above decision of Judge Allen, Porter, Slessinger & Co. have the sole right to the trade-mark "Ironclad," on all leather boots and shoes.

RECENT soundings show that Tulare lake is only 20 ft. in depth at the deepest place, whereas in 1873 it was 31 ft. This fall of 10 ft. within nine years is quite remarkable.

The Engineer.

Brickwork Under Pressure.

During the construction of a tunnel under Dorchester hay, in Boston, it becams necessary to construct a brick hulkhead that had to withstaud the pressure due a water column 160 ft. high, and as it was intended to shut off a leak amounting to 240,000 gallons per 24 honrs, it had to he watsr-tight. D. Stauffer gave the following description of this work before the Engineer's Cluh, of Philadelphia:

The tunnel section at the point selected for the bnlkhead was practically 10 ft. square. The hulkhead was huilt directly across the tunnel, 50 ft. in front of the heading where the water was struck. Plank dame filled with puddled clay were first thrown across the tunnel each side of the hulkheed site, and a six-inch wrought-iron pipe used to carry off the water during construction—the pips being huilt into the brickwork. An arch-form was adopted, four feet thick at the crown and two feet rise in a span of 10 ft. Herd-hurned hricks were used, leid in morter made of one part English Portland, and one part Newark Rosendele, and two perts clean, sharp send—e compound found eqnally strong with Englisb Portland and send, one to one, aod having the advantage of working smoother on the trowel, and adhering hetter to brickwork in wet places. Skewhacks for the arch were roughly picked out in the rock at the sides. After the cement had set, the water was shut off hy screwing a cap on the outer end of the six-inch cap. The pressure ageinst the wall was 72 and one-tenth pounds per square inch, or ahont 519 tons distrihuted over the face of the hulkhead. The wall was tight for ahout 48 hours; then water ceme throngh the hrick itself, rather than through ths joints, in amount equal to one-half the original volume. The water was let off and a second experiment tried. The main wall was torn down sufficiently to allow men to pass behind it, and a second wall only 12 inches thick was huilt hack of the first, and two feet distant. The space hetween thsse walls was well rammed with puddled clay, extending to the rock on all sides. The eecond wall was made pnrposely light, as its yielding to the pressure would only more effectually consolidete tbe clay hetweeu it and the unyielding wall in front. The hond used in the main wall wae one so laid that there were no continuous horizontal joints through the wall. The result of the lest contruction was to completely shut off the water from thie leak, at a saving of fnel and pumps. The Dorchester Bay tunnel is 7,000 ft. long, with its average invert grade 143 ft. helow low-tide mark in the hay under which it passes. The tunnel is driven through a formation of clay, slates and conglomerates for its entire length; rock very seamy, and much water encountered.

We may add that in mining hulkheade which often must carry much greater pressores, the practice is to let the water rise slowly behind the hulkhed, hy allowing a portion of the water to flow through a safety-valve at the hottom of the level. It has heen the experience in all such cases that in the beginning quite a quaotity of water will come through the pores of the hrickwork, which is said to he "sweating." Gradually, however, the pores are filled with carbonate of lime, aod a thick coat of thet suhstance forms on the face of the hulkhead, completely cutting off the flow of water. A column of from 400 to 500 ft. has heen horne for many years hy such hulkheads.—*Industrial World.*

An Elevated Electric Railway in Berlin.—The question of an electric railway for Berlin is heing considered. The railway wonld run from the west to the east of the city, and would establieh direct communication with the metropolitan railway. It is to he constructed overhead and supported on high columns. The trains are to lower themselves, on arriving at eech station, to the level of the etreet, for passengers to get out and enter, and will then agein he elevated to the level of the line overhead, all this heing accomplished hy power supplied hy means of electricity.

The Channel Tunnel.—The Englisb Channel tunnel is to he 22 miles long, 18 ft. hy 20 ft. wide, and have two railroad tracks. From each end there will he down grade of one to 80 for four miles, aod then a rise of one to 2,460 in the center. The rock and earth to he taken out would make a pyramid as large as the great one in Egypt. It is estimated that the yearly receipts will be £850,000 from passengere, £300,000 from freight and £50 000 from mail. If expenses take 40% of this, there will he £732,000 left for interest on the capital.

The Corinth Canal.—The ceremony of turning the first sod on the line of the proposed Corinth canal was performed hy the King of Greece, April 5th. The canal will connect the Gulf of Corinth with the sea of the Archipelago, and considerahly shorten the route from the western parts of the Meditsrranean and the Adriatic esa to Athens and the ports of the Egean sea.

The next meeting of the American Institute of Miniog Engineers will he held at Dsnver, Col., on Mondey, Angust 21, 1882. The time they fixed will occur during the continuance of the Colorado Mining Exposition, which commences at Denver, Aug. 1, 1882.

Useful Information.

To Cleanse a Soiled Chamois Leather.—Many workshops contain a dirty wash lsather, which is thrown aside and wasted for the want of knowing how to clean it. Maks a solution of soda and warm watsr, ruh plenty of soft sosp into the leather and allnw it to remain in sosk for two hours; then ruh it well until it is quite clean. Afterward rinse it well in a weak solution composed of warm watsr, soda and yellow soap. It must not he rinsed in water only, for then it would hs so hard, when dry, ae to he unfit for nse. It is the small quantity of soap left in the leather that allows the finer particles of the leather to eeparate and hecnme eoft like silk. After rinsing, wring it well in a rough towel and dry qoickly; then pull it ahout and hrush it well, and it will become softer and hetter than most new leathers. In using a rough leather to toncb up highly polishsd surfaces, it is frequently observed to scratch the work; this is caused hy particles of dust, and even hard rouge, that are left in the leather, end if removed hy a clean, rougy hrush, it will then give the brightest end hest finish, which all good workmen like to eee on their work.

About Buckwheat.—A French authority (G. Le Chartier) says that freqoently huckwheat straw is richer io phosphoric acid then the grain itself, which is never the case witb other cereals. A crop of huckwheat takes more fertilizing matter from the ground than other grain does if the straw is removed from the ground. Buckwheat straw rotted and used as manure is a valoahle fertilizer for any grain crop. Buckwheat sbould he well hulled before it is passed to stones or rolls. Rollers with sharp corrugations have heen used successfully for making huckwheat flour recently. Cranson's hnckwheat huller is a good machine for the purpose. Old stock e'one of a very porous nature ehould be used. The furrowe should he smooth and have a fine feather edge. From 8 to 14 cracks per inch ehoold he put in. Ahont 60 pounds of flour should he prodnced from 100 pounds of buckwheat. It should he run through a No. 14 holting reel after the first grinding, and that which does not holt through ehould he returned to the stones end re-ground and bolted again. A great deal of huckwheat is reised in the New England and Middle Stetes and in the province of New Brunswick. It is however raised, we helieve, in all of the Northern and Western States to a greater or less extent.

The telephone is an invention of such recent origin thet it hae scarcely yet lost its novelty, bnt already the telephone service has attained astoniehing proportions. The Americen Bell Telephone company has now no less than 189,374 instrnments in use hy cnetomers. It has 592 exchanges in operation, 70,525 snbscribers and 49,168 milee of wire. These figures show an enormous increase during the past year. The chief difficulty of extending the service in greet cities appears to he that of conveying the innnmerable wires throngh the streets. The company is etill experimenting in regard to the use of underground wires, and if successfnl in this direction will he able to greetly incresse the extent and efficiency of its service. It should, then, also largely decrease the charge for the oee of instrnments, which at present ie excessive.

Aluminum silver is made hy melting together one part of silver witb three or four of aluminum, and is very valuable for articles in which one of the main nhjects is to ohtein lightness, snch as the instrnments used for marine observatione. Octants and sextants of this alloy have been received with great favor by practical navigators. Those parts of euch instruments which, if made with other metal, would weigh four pounds, will, when made of the ahove alloy, only weigb one pound. Mechanics like to work this alloy, as it can he turned and filed away, whicb ie not the case with the pure aluminum, which is too soft, and, as no doubt all know who have worked this interesting metal, it has the objectionable property nf sticking to the file.

Shrimp canning is an industry which might he advantagoosly introduced into California. Tbis business has recently heen added to the industries of New Orleans. One new estehlishment employs 150 boys and girls and from 20 to 30 skilled workmen. Already the output is 10,000 cans a day, and it is expeoted that the product will soon he douhled. The shrimps are cooked and cenned hy a new process. It is intended to undertake also the canning of oysters, which are ahundant along the gulf coast, and, during the proper seeson, the figs and otber froits of the South.

A New Floor Covering.—A Jersey City man has patented two improved floor coverings. One is a fahric coated with a mixtnre of ground leather and mineral liher and a hinding of herd varnish, and the other is a coating of ground wood, or some other vegetahle fiher, mixed with mineral fiher and a hinding of copal. These coverings are claimed to he remarkahly cheap and durahle.

Stockings divided so as to separate each toe, as a glove does the fingers, are now hsing introduced, and an eminent medical authority recommends them, as they are likely to promote cleanliness, prevent troublssome soft corns, and abolish foot deformity.

Rubber-stamp Ink.—The following proportions ars said to give an excellent rubher-stamp ink, which, while not drying up on the pad, will yet not readily smsar when not impressed upon the paper: Aniline red (violet), 90 grains; hoiling distilled water, ons ounce; glycerins, half a tsaspoonful; treacle, half as much as glycerine. The crystals of the violet dye to he powdered and rubhed up with the hoiling water, and ths other ingredients stirred in.

An Early Oil Well.—Forty-one years ago a well was sunk to the depth of 1,000 ft. in Stoyestown, Somerset county, Pa., in the expectation of getting salt. A greasy, foul-smelling fluid csme to the surface instead of salt, and the well was ahandoned. The facts about this well having come to the knowledge of some oil operators, they visited the place, found favorable indications, and leased 3,000 acres of land in the vicinity, and are ahout to begin the sinking of test wells.

To Clean Silver.—The simplest and cleanest suhstance for cleaning silver articles is, according to Prof. Davenport, hyposulphate of soda. It acts quickly, and is inexpensive. A rag or hrueh moistened with a saturated solution of the salt cleanses even strongly oxidized silver surfaces in a few seconds, without the epplication of any polishing powder.

Waterproof muslin is hstter for coverings to chicken coops in cold weather then hoards, as it admits heat from the sun. To render fahrics waterproof, dip them into water which contains one-fifth of its hulk of soap in solution. Let the cloth dry, and then immerse in water coutaining 20% of sulphate of copper in solution.

To fasten emery to leether, hoil glue very thin, add a little milk, raise the pile of the leather, and put on the glue with the hrnsh. Then sprinkle on the emery and let it cool.

Good Health.

Meat a Cause of Nervous Disease.

A writer in the *London Lancet* hae recently discovered the fact thet flesh food is stimulating in character—a discovery made at least half a century ego hy a large number of thinkere, and advocated for nearly that length of time hy the memhsre of the Vegetarian Society of England, and by numerous writers in this country, as well as in Germeny and in many other European countries. We qnote the remarks referred to as follows:

"Nervous diseases and weaknesses increase in a country as the popnlation comes to live on the flesh of the warm-hlooded animals. This is a point to which attention has not heen adequately directed. 'Meat'—using that term in its populer sense—is highly stimulating, and supplies proportionally more exciting than actuelly nourishing pahulum to the nervous system. The meat-eater lives at high-pressure, and is, or ought to be, a pseulierly active organism, like a predatory animal, always on the alert, walking repidly, and consuming large quantities of oxygen. In practice we find that the meat-eater does not live up to the level of hie food, and as a consequence he cannot or does not take in enough oxygen to satisfy the exigencies of his mode of life. Thereupon follow many, if not most, of the ills to which highly civilized and luxurious meat-eating classes are liahle."

We cannot strengthen the ahove statement in any wey, unless it he hy indoreing it, as it presents the facts in their strongest light, and so unequivocally that there is no room fof cavil. There is no douht but that the free use of flesh food is an evil against which the puhlic sbould hs thoroughly warned.

How to Prevent Spring Biliousness.—Several correspondente who are efflicted with what is termed "spring biliousness" are interested to know how it may he prevented. Biliousness is not, as meny people suppose, a disease of the liver, hut pertains almost altogether to the stomsch. It is chiefly the result of over-eating, eating too freely of eweets, pastry, fate and highly seasoned dishes. The cold, tonic air of the winter monthe antidotes the bad influence of these digressions in diet in some degree; hnt as the warm, relaxing weatber of spring comes on, the stomach hegins to fail more perceptihly in its efforts to accomplish the unnecessery and injurious labor imposed upon it. Indigestion is the result. By-and-hy the poor stomach gets so far hehind in its work that it is altogether overwhelmed and disahled, and the difficulty culminates in a bilious attack, which is nothing more nor less than a cessation of work on the part of the etomach. The overworked organ needs rest. A hilious attack can always he prevented by giving the stomach rest hy fasting for a meal or two before the final crasb comes. No organ in the body will endure more ahuse and still patiently continue its work than the stomach. But finally, forbearance ceases to he a virtue, and the faithful servant rebels against ahuse. Correct and propsrly regulate the diet, and there will he no more trouble with hilious attacks at any season of the year.—*Good Health.*

Biliousness.

What Causes Biliousness?

Answer.—Food is of two kinds—nitrogenous, or tissue-making, snd non-nitrogenous, nr heat-producing. The first serves to huild up and repair waste in the human system; ths othsr is composed of carbon and hydrogen, which is oxidized or hurned in the systsm, furnishing the heat snd force of ths animal sconomy. One goes to huild the machinery; the other supplies the heat, or force, which runs it.

The heat-making elements are carhon—as starch, sugar, etc.—and hydrogen, which is furnished in combination with carhons, in oil of every kind. These hear ahout the same relation to starchy food that stone-coal does to charcoal—a given weight furnishes more heat. Hence it is that these hydro-carhons are demanded as food in extreme northern latitudes.

The amount of heat or force the system can generate is not limited hy the capecity of the stomach for food, hut hy the ahility of the organism to oxidize, or burn, the cerbon and hydrogen. The heat or force that cen be produced is determined and limited hy the capacity of the luuge for air, and hy the power of the system to absorh oxygen and comhine it with the carhon and hydrogen of food. Increase the amount of air hreathed, of oxygen absorhed into the circulation, and the amount of heat generated and force exhihited may he proportionally increased; but if a man eats two pounds, instead of one, of carhonaceous food, the amonnt of force generated is not thereby increased, for but a limited amonnt of it can he oxidized.

The Cause of Biliousness.

Answer.—Pleese remember that the product of the combustion which we are considering is cerried hy the blood to the excretory organs of the hody. The hlood also carriee off, as impurity, the worn ont tissue, which is replaced hy the nitrogenized food appropriated hy the system. These impurities are thrown off by the lungs and skin, are secreted by the kidneys, or are strained from the blood hy the liver. That which the liver removes from the hlood ie the *bile*. It is thrown hack into that pert of the alimentary canal called the *duodenum*, or eecond stomach. Here, in normal quantity, it is of use in quickening peristaltic action, and promoting digestion and absorption. Now, suppose a person takes more food than the syetem requires, what becomes of the excess? How does it get out of the system? Most of it passes into the circulation. It is there a foreign matter, to he removed. To remove it, the kidneys are overworked; the pores of the skin become clogged. The lungs refuse this work, and throw off only the product of comhuetion. The blood, overloaded with these impurities, is continually strained through the liver. The flow of hile is increased; the liver is enlarged, or, at least, it is unnaturally active; the hile overflowe into the stomach, and all the distressing symptoms of hiliousness follow.

Bilious diseasee are less frequent in cold climates, hecause, to keep up the animal heat, more food is needed and oxidized. The hurning of chercoal on a fire is hut the uniting of the osrhon of the coel with the oxygen of the air; thie generetes heat. So the nnion of the carhon of food with oxygen, in tbe humen system, gives heat. In cold climates, all the food eaten may he needed to supply heat enough to enahle a person to resist the intense cold. But if the same amount of food is taken in a warm season, or climate, it is unconsomed in the system. It becomee foreign matter in the hlood, to be removed hy the excretory organs; end hiliousness results, as hefore explained. Hence, we find that Northerners, going to Southern cities, are subject to fevers. They take with them an appetite for, and habit of eating, the heat-producing food which they require at the North. For the same cause, hilioos complaints are more prevalent in summsr than in winter.

Want of cleanliness and impnre air, also, cense biliousness, hy preventing perspiration and the exhalation of impurities from tbe lungs. —*Life Crystals.*

The Best Gymnasium for Girls.—The exercise that is hest adapted to develop all parts of the hody in a netural, healthy manner ie domestic lahor. It ie always at hand; it can he taken regularly every day, and there is such variety that almost every muscle can he exercised. Housework ehould never he considered menial or degrading; it is nature'e lahoratory, in whicb the girl may ohtain, not only the hest physical development, bot most valuahle knowledge thet will fit her for the practical doties of life. This traioing may he supplemented by other kinds of exercise, soch as walking and ootdoor sports. The very general introduction of foreign help into domestic service has proved most nnfortunate for the health of American women. Closely connected with this neglect of physical training at home is an evil of great megnitude—that is, eupreme devotion to hrain work. The practice, pursued very generally at the present day, of confining girls in schools or seminaries for a series of yeere consecutively, ie attended with the most serious evils. In the language of a popular writer, "it is edncating our girls to death." While we would not discard education in all its various departments, extending to tbe highest culture, we maintain that it is no advantage or hlessing if it ie to be ohteined at the expense of the physicel eyetem. There are other parts of the hody hesides the brain that need faithful training. The highest accomplisbments and mental acquisitions will not compensate for impaired constitution and poor health.—*Our Continent.*

MECHANICAL PROGRESS.

The Effects of Heat on the Bending Qualities of Iron.

A few weeks since we noticed the results of an interesting series of experiments respecting the influence of temperature on the strength and ductility of steel and iron, which had been made hy Mr. J. F. Barnahy, the resident Admiralty overseer at Sheffield. That gentleman has also carried out a series of tests with samples of iron pletes, with the view of ascertaining the heat or temperature at which iron that is neither cold nor hot short is liahle to fail in hending, and is nnsafe to work. The results of these tests are given in a copiously illnstrated report. Oot of tho many experiments made, Mr. Barnehy illustrates a number which show the general character of the results obtained. He observee that iron is very similar to steel in this respect, hnt the fracturee are different, for while steel, at the temperatures shown hy him in his former report, fractures nearly through the sample, on account of its homogeneous charaoter, iron, at the temperature shown, fractures to the depth of one or more of the hars or layers of which the plate is made, iron plates being made from a pile made np of various hars, according to the weight, size and quality of the plate reqnired; thus the frequent laminations which occur. These defects are very rare in steel, and only occur when pieces of ganister, etc., from the runners, linings of the furnaco, or converter, get, by accident, into the molten metal, hut in the case of iron, if great care is not taken in making the pilee for rolling, and also caro in heating, laminatione will frequently occur. In making these experiments, Mr. Barnahy endeavored, by testing the iron at various degrees of heat, to ascertain that which is most dangeroos, and he ie of opinion that at from 400° to 550° F. it is more liable to fail in bending than if hent cold. In hie former report it ie shown that these different temperatures have the effect of increasing the tensile strength of the material, and, to a certain extent, reducing the ductility, which, together, show that the iron or steel is considerahly stiffened. Thie, he thinks, will account for the falling off in its hending qualities. He states that he has arrived at these temperatures by the color of the fractures as given in scientific works. The report is of a very interesting and instrnctive character.

Mechanical Arts Early in the Eighteenth Century.

Chamberlayne, in bis "Present State of Great Britain," 1726, says: "Here (in Great Britain) are the hest clocks, watches, locks, harometers, thermometers, air-pumps, etc., in tbe world. The late Queen Mary had a clock, made by Mr. Watson, late of Coventry, worth £1,000, in whicb are all the motione of the celestial hodies. Locks are here made of iron and brass, of £50 a lock. Watches so corieus that one part of the movement of a repeating watch comes to £10, which makes them ordinarily £50 or £60 a watch; and yet these prove profitable merchandise when we send them into foreign countries, so valuable and eo inestimahle is the work. Curious telescopes, microscopes, perepective mirrors, spheres, globes, charts, maps, and all sorts of mathematical instruments, dials, halances, sea-compesses, etc.; the late improvement in making glass; of polishing the insides of great iron gnns; of weighing up ships that are sunk to the bottom of the sea; in fisbing, as they call it, for money lost, it may he, 100 years ago, and many other nohle inventione and improvements, as weaving silk etockings, mills of copper, gunpowder, polishing glass, etc.; Mortlake tapestry, earthenware of Fulham, epeaking trumpets, making of luetring, enginee for raising of glass, epinning of glaes, cutting of tobacco, printing stuffs, linen and paper; making damask linen, watering eilks; the way of eeparating gold from eilver; bolting mills, lanterne of divere eorts, cane chaire, making hornware, etc.—all theee inetancee ehow how excellently the Englieb nation ie turned for all manner of mechanical arts."

COTTON BELTING.—It is hut a short time that cotton helts have heen menufactured in such a manner ae to jnstify their general adoption as driving helts. Some of theee have lately heen brought into the market, and are known as Scandinavian belts, appearing to answer their purpoee admirably. They are eimply a cotton fahric, which is lighter, more elaetic, and more durahle than leather, and, therefore, particularly adapted for high epeeds. For most purposee, and especially for heavier helting of thie kind, a coating of wood tar is found an advantage, while for emall hands, euch as are used for spinning machinery, the unprepared raw cotton helt ie used. The cost of mannfactnre of theee helts ie very small, as compared with leather, and by the peculiar method of weaving them, they do not fray out at the edge or break after being worn at the edge hy running againet a helt fork. The woven helte have, however, their disadvantages; they etretch and ehrink more than leather helts, hut, once taken np sufficiently, they run more smoothly than leather, eince they have hot one joint, and are perfectly uniform. When they get damp they have the disadvantage of shrinking slightly. Experiments have heen made in regard to their tensile strength, and it was found that a cotton helt three and one-half inchee wide hroke under a load of 4,187 lbs., while a leether helt of good quality, four inches wide, was hroken with 2,100 lbs. It is, nevertheless, advisahle to use wider belts when replacing leather hy cotton, since they are hest used of ordinary thickness; this is, however, also in accordance with good practice in leather helting, thick helts having heen found not to answer eo well as thin wide helts, or, at least, requiring disproportionately large helt pulleys.

Steel in Marine Engines.

English engineers are employing steel in the construction of marine engines to a much greater extent than in former years. They nse it for hollow crank shafts, pietons, crank pins and piston rods.

What ie known as steel, however, is a very different material from that universally recognized under this title. It has no characteristics of it, except, poseibly, in its fracture. It is tough, ductile and exceedingly tenacious; so much so that a wagon tire made of it can be hent back and forth several times in the vise, even after a deep nick has heen made in it with a flat chisel, without breaking. When it ie turned in a lathe, or planed, or worked by tools, it is more like horn than metal, but for all this its tensile strength is not bigh. It will not harden in fire and water, and in short hae none of tho characteristics of steel. Indeed, when it ie imported it is termed ingot iron, to evede the duties. It is steel when it ie to make part of an engine, but iron in commerce.

Its character may be judged of by mechanics when it is known that this so-called eteel ie worked up into scrap forgings. Two heavy stern frames, weighing 20 tons, for an English steamship company, were made from eteel scrap, as also eeveral details, such as link motions. It is, in fact, a very superior qoality of iron, hut perhaps it sounde hetter to call it steel.

In this connection it may he proper to say that steel rivets are not universally popular ahroad, owing to the difficulty in getting the hoys to heet them properly. Not heing able to distingoish the difference in the heat needed on steel as compered to iron rivets, they hurn the former so often as to disconrage the introduction of them in general use. One firm, however, mede 1,800 tons of them last year.—*Industrial World.*

A Novel Motor.

An interesting engine, of whioh we here give a hrief description, has recently heen invented hy Messrs. Roettger and Bay, of Brnssels. Motion is produced hy subjecting a compound plate, composed of two metals, the degrees of expansion of whicb are different, to the action of heat and cold alternately. Tbe compound plate oonsists of pieces of steel (not tempered) and hrase riveted one upon the other, the latter heing placed helow the former. Any other suitable combination of metals may, however, he used, the important point being that the expansion of the two metals should differ by an appreciable amount. By applying heat to the lower portion of the plate, it will expand and assume a convex shape as regards tbe source of heat. Resistance opposing thie expansion may he overcome, and motion will he developed in a certain direction. When tbe heat applied to the plate has attained a suitable degree of inteneity, the gse flame or other beating medium is removed, and the plate, on cooling, will tend to return to its original state, thus developing a further motive nower. A current of cold air or a jet of water directed against the plate will accelerate this action. One end of the plate is fixed to a euitable standard, in a horizontal poeition, while the outer or acting end is connected with a lever. The long arm of thie lever ie jointed, at ite end, to a connecting rod, whicb transmite tbe power produced to a pump, crank or any other suitable mechanical means of utilizing the power thus communicated. By changing the length of the arm of the lever, the etroke may, of couree, be varied when it ie required to obtain greater power than can he prodnced hy one of the compound plates mentioned; a eeries of these plates may he employed, and eoorcee of heat other than gas may he need, sucb as, for example, currente of highly beated air. The apparatus, judging hy present available information, bae not yet heen eucceesfully utilized for practical purposee, and its general introduction appeare to be extremely douhtfol.

THE original eource of power obtained from a water-wheel ie the heat of the eun. In fact, nearly all the power made uee of on thie glohe, whether animal, steam, water or wind power, has its origin in the eame great light-giving, life-sustaining eource. The amount of power thus given out daily hy the eun in the form of radiant heat muet he enormous, and far heyond our comprehenoion. But a very small fraction of it reachee our glohe, and yet when the attempt ie made to eetimate the amount of even that small fraction, onr arithmetic ie too limited.

SCIENTIFIC PROGRESS.

The Electric Age.

The accumulated capital of Europe is seeking "fresh fields and pastures new." There is a redundancy of money in the great financial centers, an overstocked labor merket — as evinced hy the enormous immigration here, and by the eocial uneasiness that in some shape or another is to he seen in almost every European country. How to find employment for these vast savings, and how to find work for the great army of idle hands, is hecoming a serione prohlem. There has heen an enormoue increase of population in Enrope. Small cities have hecome immense hives, containing populations that would formerly suffice for an entire state; some coontries, like England, have donhled their population within half a century; others, like Belgium, have attained a limit which was never dreamed of even hy the most decided of anti-Malthusians. Machinery, on the other hand, has increesed prodoction to sucb a degree that only a vast foreign demand can either justify or sustain it.

But there has heen another canse, the importance of which is certeinly least of all appreciated here. Tbe railway age is, so far ae Europe is concerned, almost over. Much remains to he done, certainly; new countriee will require roads, hut the vast work of reconstructing the transport waye of the great commercial countries, whicb hegan in 1847-48, is now over, like "the glorious days of Aranjuez."

The immense worke which were necessary in adapting steam to every indostry heve heen in great part finished. Chemietry and other sciences are tending more to save lahor and capital now employed, than to find any new uses for them. At the eame time the economized earnings of the nations are continually growing. Savings hanks are loaded; ordinary hsnks will give little or no interest. Governments are endeavoring to fund their debte at lower rates of interest, and that very interesting clase that live on "the interest of their money" are greatly worried in mind, for they are euspicions of "furriners," and dreadfully afraid of Mexicans, Egyptiane and Turks: gentlemen who can he depended upon for one thing—not to pay their dehts. States, too, are huying up all the great railway lines, snd gss shares are regarded with distrust.

In this crisis, electricity comes in to take the place of steam. As light, it will not only replace gas over the world, thus involving an immense hut remunerative outlay of capital, hut will, as an illuminsting power, he used where gss never would he. As a motive power, and the force that cleaves the rocks and girdlee the earth in a few moments, it is the greatest; it will supplant steam in many ways. It will draw trains and coal and ore from mines, and separate the pure ore from the dross; it will propel vessels that, perhaps, may some day he no longer known as steamers; it will run our factories, nnd act as time-keeper and as faithful overseer, showing the error of a grain of overweigbt in the delicate thread; it will give the warning of fire in huildings, and put it out at the same time; it will necessitate an immense reconstruction of maohinery and method in every industry and every art. It will turn night into day in more senses and ways than one. The inventive power and genins of the world is now heing turned to it, for it alone, of all agents, can he utilized in every manifestation of hnman labor.

The steam age is ending; but the world, everlastingly and eternally yoothful, in contradistinction to human empires, knows no degeneration; neither does human civilizstion. We have had an iron age, we are now entering on a golden one. Electricity will give new prospects for progress, new outlets for capital.—*The Electrician.*

ANTS OR MONKEYS.—Letely Sir John Lubbock has heen coosidering the ant family, and after a protracted investigation declares that "antbropoid apes" must yield tbe eecond place in the order beneath man, for his friende the "ants," muet he placed there. "When we conceider the babite of ante," eaye he, "tbeir eocial organizetion, their large communitiee, elahorate hahitatione, their roadwaye, their poeseeeion of domeetic animale, and even in eome casee of slavee, it muet he admitted that they have a fair claim to rank *next to man* in the scele of intelligence." So, according to theee theories, it now appeare that in intelligence, whicb is the crowning glory and epecial attrihute of menkind, the monkey must give place to the ant. Many yeare ago one wise man euggeeted that some of the gentlemen of leieure, who found time hanging heavily on their hands, would do well to "go to the ant" and "conceider her ways and he wiee." It eeeme now that the advice contains more philoeophy than hae generally heen accredited to it.

SENSIBLE EVIDENCE OF THE ROUNDNESS OF THE EARTH.—In a late eession of the Helvetic Society of Natural Sciences, Prof. Dufour epoke of the change whicb imagee that are produced upon a great expanee of water undergo, in conoeequence of the roundnese of the earth. If the luminoue ray from an object etrikes a tranquil lake in a nearly horizontal direction, the image ie made upon a convex eurface and appeare emaller than the object iteelf. Prof. Dufour arrived at these conclueione hy calculation, but he supposed that they could never he verified on account of the difficulty of finding a lake sufficiently calm over a hroad extent of eurface. His friend, M. Forel, however, informed him that he had seen sooh images in the lake of Geneva, and that they appeared exactly as the calculation had indicated. Prof. Dufour snhsequently fonnd that the days upon which soch observations are poseihle are hy no meane unoommon, hut the images can often be seen on lake Lemsn, especially if one has a spyglass at his disposal. After having looked for a moment, the roundncss of the earth hecomee visible as plainly as that of a howl that is held in one's hand.—*Les Mondes.*

THE SUMMIT OF THE EARTH.—Adolphus Schlagintweit, the immortsl, though unpronoucable, explorer of central Asia, calls the highland of Pamir "die Welt-Zinne"—the roof of the world. On the road from Puojsuh to Yarkand four passee have to he crossed that are bigher than 17,500 ft., and for a distance of 280 milee the balting gronnd is not helow the hight of Pike's peak. On the eastern plateau of tho Beloor-Dagh there is a shelter house near a cliff from whose summit the main chain of the Himalayas, with all its giant peaks and immeasurable ice fields, ie in full view, from the highlands of Lassa to the sources of tbe Indns, while in the west the head waters of the Oxue and Jexertes can be traced to the horders of Cahool, where the peaks of tbe Hindoo-Koosh, lift their crests of everlasting snow. In the spring the echo of the avalanche resemhlee the heom of continuous thunder, and io midwinter, when the storm wind sweeps the tableland, whirling pillars of snow scud along the ridges, and often seem to dance together like spectres in their flottering winding sheets. Our "Lend of tbe Sky," in the southern Alleghanies, must be ae a mere pizza compered with that top roof of the earth.—*Popular Science Monthly.*

CAUSES OF MAGNETIC VARIATION.—F. Folie discusses the hypothesis, whicb ie accepted hy many geologists, that the earth is composed of a solid crust, together with a mass, more or lese fluid, heneath the crust. Hopkins bad previously calculated tbe precession and nutation which would result from a fluid nucleus, but his conclusions were not eatisfactory, and Folie gives new reasons for rejecting them. He thinks that the crust would partake, to some extent, of tbe disturbances of the interior, and that the only way in whicb tbe exact latitude of a place could he found would be hy taking observatione when there ie no disturhance by nutation; or hy distrihuting tbe oheervations equally over the whole period of nutation. He further supposee that if tbe solid shell of the glohe oscillates ahout the fluid nucleus, the friction which results from the pressure of the nucleus upon its envelope during this movement should conetantly engender a great qsantity of electricity, which may he one of the principal causee of terrestrial magnetism. The gredual cooling of the interior ought according to this hypotbesis, to he shown hy a diminution of the constant of nutation, and a like diminution of magnetic inteneity. —*Bull. Royal Society Belgium.*

OBSERVATIONS IN THE CLOUDS.—The French Society of Aerial Navigation recently entrusted M. De Poitevin with a series of baloon observations, among which was the study of the formation of cloude, taking into acconnt the vapor tension in neighboring etrata of air, hut of different temperature, and also the study of the release of the latent heat of vaporizstion at the moment of precipitation. One set of three obeervations was made on an opaque cloud which covered the region of Paris for several days. The cloud was hardly 300 meters thick. The upper part of the guide rope was covered with boar-frost. The mean temperature of the cloud was five degrees. The various observations yielded the following resulte: 1. The clouds are formed in tbe zone of mixture of two layers of air saturated with moisture. 2. The clouds originate in the warm layer and dissolve in the colder layer. 3. They move in the direction of the helt of air whicb has the highest temperature. 4. The winds which are observed at the enrface of the ground, which are only effects of the reaction of the principal wind, msy have a hight of eeveral hundred yarde, and may have different directione in neigbboring localities, while the upper current bae a great regularity of direction and inteneity.

SCIENCE.—M. Renan bas, in an intereeting passage of bie own autobiography, given it ae bie belief that a century hence mankind will study very little elee than phyeical science. The time, he thinke, will come when the bietorical eciencee will be thruet into tbe background; all that they have to teach will he known, and men will feel comparatively little interest in tbeir own paet. On the other band, tbe more they know of nature the more there will be to he known. Chemistry and physiology offer inexhaustible fielde for reeearch; and the truthe which they reveal will prove more and more interesting to mankind. It is very difficult to eay what men will think or do a hundred yeare hence; hut it eeeme likely enough that thie will he the tendency of study. Certainly, even now, the men of eelence are hecoming more and more important factore in the life of ue all.

ELECTRIC LIGHTING ie in euccessful operation on more than 60 eteamers of tbe Miseiseippi river and ite trihutariee. It ie helieved to add much to the eafety of that kind of traffic and traveling.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Horn Silver, June 8th, $25,000; Mammoth, 8th, $4,500; Alice, 8th, $11,207; Monltou, 8th, $11,520; Frisco, $24,448; Germania, 10th, $2,200; Hananer, 10th, $2,100; Overland, 10th, $1,585; Contention, 3d, $15,857 84; Northern Belle, 8th, $12,249 95; Bodie, 12th, $8,313; Star, 5th, $3,637.58; Christy, 12th, $2,184; Silver King, 6th, $12 000; Bodie, 9th, $1,562 54; Contention, 10th, $38,551; Christy, 13th, $2,327; Eureka Con., 4th, 5th and 6th, $15 492.86; Bodie Tunnel, 14th, $3,837; Gold Hill (Quartzburg), 3d, $15,000.

THE *Tidings'* Truckee correspondent says, under date of June 8th, that 80 head of stock, consisting of horses and mules, arrived in Truckee on Thursday, the 8th, from the State of Nevada. Their owner has taken one of the largest hauling contracts that has ever been let in that section of the country. He is to haul during the season, for the Truckee Lumber Co., 5,000,000 ft. of logs.

The Mining Share Market.

The market is rather dull yet. The only spurt this week was that in Albion, as our tables show: As stated in a dispatch, the Richmond injunction against the Albion has been dissolved and the latter can now extract ore from the ground in dispute. This explains the sharp advance.

As to the Comstock situation, the *Enterprise* says: At almost any other time in the past 10 years the present developments and outlook at the north end would have caused quite a boom, but at present they hardly cause a ripple in the current of the market.

The stopes on the 2500 level of the Union Consolidated are looking well, and the yield (with a small amount of ore taken from the 2600 upraise) will be about 700 tons. The yield of the mine for the past month was $91,800.48. The raise from the 2600 will be carried up into the 2500 stopes, in order to secure a circulation of air, when stoping will be commenced from the 2600 level.

The winze on the 2700 level of the Mexican is down 23 ft. It is in the vein material of the ore channel. Streaks of ore are cut in it which are going straight down, showing a change of dip at this point. The indications at present are that it will not touch the ore body, 12 ft. east of which it was sunk. The west cross-cut on the 2900 level has been advanced about 30 ft. during the week in a mixture of quartz, clay and porphyry. A joint Ophir winze is about to be commenced on this level. The station is being cut out, and will be completed next week. This will be a first-class winze, and will be sunk to the 3000 level; indeed, to the 3100 level, if water does not prevent the attainment of that depth.

At the Best & Belcher and Gould & Curry joint shaft they are cutting out a tank pit at the 2500 level, and will soon be ready to commence drifting at that depth.

The Savage folks are exploring promising sections of their 2200 and 2400 levels, by drill and by drift, and with good indications of finding a paying deposit of ore.

The middle mines are awaiting the sinking of the Chollar-Norcross-Savage shaft to the 2600 level. This shaft is going down at the rate of nearly 30 ft. per week, and will soon reach the level named. Connection with the shaft at this depth will allow of the middle mines being very rapidly and economically drained.

LEAVING WOOD RIVER.—The Wood River *Times*, of June 2d, says: Forty-five men started out of Bellevue on foot, and packing their blankets on their backs, yesterday. All of 20 followed their example to-day, and more will probably do so for some time. The fact is, that there are too many laborsrs for the labor that there is to do; and this state of affairs will continue until the railroad gets within reaching distance, at least. The *Times* and *News* repeatedly warned men without means to keep away from here. The wisdom of the advice is now apparent. The country will doubtless give employment to thousands of men in time, but that time has not come.

Eagle Mining District, White Pine Co, Nevada.

EDITORS PRESS:—This district has been known to a few prospectors for a number of years. But all muscle and no money does not develop as extensive a mineral district as this is very rapidly. Prospectors are very free to acknowledge that they never saw as many and as fine mineral-producing ledges in one district as are to be seen in Eagle mining district. The Recorder's books show that there are more than 300 locations recorded. The ledges are from 10 inches to 200 ft. in width. Some true fissure veins are traceable from three to nine miles. The ore is free milling argentiferous galena, and quite a number of other varieties of silver, gold and lead ores. We have wood in abundance in all parts of the district, and a good supply of water. The formation is mostly granite, the remainder being lime. There are as fine opportunities for men who have a few thousand dollars to use in the completion of the development (which is now far advanced) of some first-class locations here, as were ever offered to men. A miner who has some 11 locations of 1,500 ft. in length, by 600 ft. in width, and has worked hard for more than eight years, in running tunnels in and sinking shafts on them, offers the 16,500 ft. of ledges, five houses, one of which is 16 ft. by 36 ft., all hewed logs, and cost $1,100 when built, and complete outfit of mining tools—all for $30,000 cash. With a little money properly expended the property could be made to bring ten times the amount. He has three locations in granite, on the first of which he has run a tunnel in 100 ft. to the ledge, and drifted on the ledge 80 ft.; ledge at face of drift is six ft. wide. Second location granite; has four ledges on it, varying from ten inches to five ft. in thickness; all ore. He has run a tunnel in this 255 ft. through very hard rock, and used 40 kegs of black powder, besides a large amount of giant. When in 75 ft. farther will tap the ledges 150 ft. deep. The ore assays, at Salt Lake City, $40 in silver, $4 in gold, and 33% lead. He has two locations in lime formation; one ledge six ft. thick, the other four ft. thick. He has sunk 65 ft. on both. The one that has a ledge six ft. wide produces ore that resembles the Star ore of Cherry creek, assaying from $20 to $50 per ton. Another one in lime; he has a shaft down in the gouge on the foot wall 110 ft., and a crosscut 43 ft., but has not got to the hanging wall yet. Ore from this mine has assayed $190 per ton. Another in lime; shaft 32 ft.; drift from bottom of shaft 12 ft. So far he has worked in broken ground, but the ore vein appears to be two and one-half ft. thick, though the ledge is 200 ft. wide; ore free milling, and assays about $100 per ton. Another in lime has a shaft down 20 ft.; ledge four ft. wide; ore mills $200 per ton. He courts a thorough investigation by all who wish to invest in mining property. Our post office is Shelhourne, White Pine county, Nevada. W. D. MALLORY.

WE are glad to hear that Wood River ore is meeting with a ready sale in this market, and will soon begin to arrive in large quantities. McCornick & Co. have just made a sale of 100 tons of Jay Gould ore, and also 200 tons of Mayflower, all of which is to be delivered as soon as possible.—*Salt Lake Tribune.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

THE GINOCCHIO MINE.—*Dispatch*, June 10: The parties who bonded the Ginocchio mine, near town, have gone to work in good earnest, and intend developing the mine as rapidly as possible. Shifts are being run night and day, and we understand they have already struck some fine looking rock, but it will probably be some time before anything definite can be ascertained as to extent and richness of the ledge.

THE TELLURIUM.—A clean-up was made at the Tellurium mill, near Pine Grove, last Tuesday. The amount of ore crushed during the run was about 80 tons, and the yield was a fraction over $16 to the ton. This is a very encouraging result, and as there is an abundance of this kind of ore in the mine, the company have concluded to add 5 more stamps to their mill as soon as possible.

MISCELLANEOUS.—*Ledger*, June 10: The Tellurium mill has lately crushed 80 tons of ore from that mine near Pine Grove, and we are informed by the millmen that it averaged about $16 per ton. The mill has only 5 stamps, and is too small to work the mine to advantage. The property is idle at present, but is expected to start again in a few days. The Consolidated Amador mill at Sutter Creek has been running 30 stams, and more men have been employed at the mine. Hoisting machinery has been purchased for the South Spring Hill, and work is to be resumed at once. The water is all out from the Jackson mine, and sinking is in progress. Samples of rock broken from the 4-ft ledge this week are said by experts to be of excellent quality and prospect well.

BUTTE.

BUTTE RECORD.—Cor. Butte *Record*, June 10: Mr. D. King has taken Pres Longley's claim, on Sycamore flat, to work on shares. Mr. Hedges has hired the Shepherd ditch water and is making big pay, working night and day. The claim of John Hupp has made a good clean-up of $3,000 for three weeks' work, and Hupp and his brother are quite happy. The celebrated Cole claim has discharged all its men but 5, there not being water sufficient to wash all the dirt for so many men. Mr. Crow, the efficient superintendent of the Mammoth tunnel, has got 400 ft under the lava, but has not struck the gravel yet. Capt. Moss, of the Butte Creek Hydraulic Co., has moved to Whiskey Flat to operate, where he hopes to strike a big bonanza. Billy Beauman and Joe Rice have a claim that is paying $8 per day to the man. Jim and John Foley, after prospecting for many years, have struck pay at $5 per day.

EL DORADO.

NEW MINING ENTERPRISE.—*Mountain Democrat*, June 10: A. J. Burnett, former superintendent of the Ætna mine, has organized a new company, entitled the "Brass Wire Deep Gravel Gold Mining Co.," and will soon commence work. The mine is on Coyoteville hill, to which he is leading water from Cedar creek, having already laid over a quarter of a mile of new pipe. He is now cutting a ditch which will carry the water 150 ft higher on the hill than ever before. Mr. Burnett is a careful, skillful, painstaking and reliable miner, and anything he undertakes to do he does well.

COOD PAY.—Georgetown *Gazette*, June 4: S. C. Adams has leased one-half of the Rich Gulch mine from A. Baldwin for one year from June 12th. Mr. Armstrong will continue to work his half interest. Mr. Adams starts in with a most favorable showing. Mr. Baldwin retires with the snug little sum of $10,000 or $12,000, which isn't bad for a month's work.

ST LAWRENCE.—Cor. El Dorado *Republican*, June 8: The Amherst mine is being opened by Mr. Lee. A fine pocket was taken out of this mine last spring, since which time, until very recently, work was suspended. The mine is looking very well, and indications are favorable for another good raise. I was shown some very fine-looking ore, and there was more in sight of the same sort. The Cincinnati mine is another fine-looking property, having a shaft 100 ft in depth, ledge large and well defined; the ore on the dumps looks well, showing free gold. The next mine visited was the Gold Deposit. There is a good 10-stamp mill, hoisting works, etc. The mine has not been in operation for about 2 years. I was informed the shaft had been sunk about 80 ft, and some very rich ore extracted. The Big Sancho mine is located about 300 yards above the Gold Deposit, and is supposed to be an extension of the St. Lawrence vein. A tunnel has been run about 100 ft along the ledge, and the ore prospects well the entire distance. At this time a crosscut is being run to ascertain the width of the ledge, when, if satisfactory arrangements can be made, the ore will be crushed at the Gold Deposit mill. This mine was located last September, and has been under bond to an Eastern party for the past 4 months. The owners appear gratified that the mine was not sold, as the price to be paid can soon be extracted from the ore now in sight. The owners are Messrs. Ball, Burlingham & Newbery. The Lone Jack mine, another good property, located about one-quarter of a mile east of this place, St. Lawrence, is looking well and paying well; it is a seam mine, but is being worked in a different manner from the usual working of mines of like character—the quartz being saved and crushed, the owner, Mr. Jensen, having a small stamp mill at the mine for that purpose. I am informed that he makes more than his expenses from material that was formerly sent on its way to the cow counties. The Old Judge, an extension of the Lone Jack, is at present under a cloud and idle. This mine has produced large quantities of gold, being known as the Daggett mine, will, I hear, be in operation some time in July. There are several other good prospects in this vicinity.

INYO.

RUNNING.—*Independent*, June 10: Mr. Chalfant now has the Brown Monster mill in operation, at least one battery of the same. The high state of the river has occasioned him some considerable trouble in keeping the 6-mile head race in water-carrying condition, but, barring delays from that source, the mill will be kept running steadily for an indefinite period.

MARIPOSA.

MORNING STAR.—Stanislaus *News*, June 10: The Morning Star Gold Mining Co. has been organized at this place. The company has secured the title to a quartz mine formerly owned by Philip Gosser, located at the head of Sebastopol gulch, south of Mariposa creek, in Mariposa county, near to, but west of the Mariposa grant. We have been permitted to see a report of the committee who examined the mine, and negotiated for its purchase. We have also seen some splendid specimens of free gold-bearing quartz found on the claim. The company intends to erect machinery at once and open up the mine. We notice the names of Messrs. Walthall, Beckman, Wells and Briggs attached to the report. The owners have every confidence they are in possession of a valuable mine.

BLUE MINE.—Mariposa *Gazette*, June 10: In company with Mr. John R. Bothwell, of New York, who was spending a day in Mariposa, on Monday last, we took a horseback ride out to the Diltz mine, and finding no one at home, except the Captain's oriental cook, we pursued our way until we struck the new wagon road, which is in course of construction from the mine to a timber belt about 2½ miles distant. After following the graded road about 2 miles, we found the Captain with a force of men hard at work grading and removing rock and trees, filling up hollows and laying the foundation for a work of incalculable value to his extended plans, and the future growth of mining interests in that whole section of country. This road will open an avenue to a large belt of timber which has hitherto been inaccessible. Along the line of the road the Captain contemplates a continuous line of pipe to convey water from lasting springs to his

mine and mill. The Captain accompanied us upon our return back to his home at the mine, where a few moments were spent in resting and showing Mr Bothwell the outer works of the mine, for it was too late in the day to examine the tunnel and shafts, and return home before night. As it was, Mr. Bothwell declared himself pleased with what he saw, and judging from the great amount of surface mining that had been done, he thought it was evidently a valuable mining property. The afternoon's ride with Mr. Bothwell seemed to be an enjoyable one, and about as severe as 200 lbs in the saddle could well endure in the time taken and the distance traveled.

MONO.

LUNDY.—Bodie *Free Press*, June 10: Work in the May Lundy mine has been started up for the season under the supervision of M. B. Kellogg, one of the owners of the property. The mill is now in operation. Quite a force of men are also at work on the Gorilla mine, and another force will soon be employed at the recently incorporated Silver Group mines. Considerable work of less importance is being done on other claims. The Great Sierra Co.'s operations in Tioga district are a great benefit to Lundy. At the mouth of Mill Creek canyon and between that point and Mono lake, the Mono Lake Hydraulic Co. are now operating upon a pretty extended scale, and the result of their labors is likely to excite great attention to hydraulic mining in that neighborhood.

NEVADA.

NOTES.—*Tidings*, June 10: There is very little to be said in the mining line this week. All the prospects look well, and the regular mines are turning out their monthly dividends.....The hoisting works at the East Eureka have been running all the week, and the work of cleaning out and repairing the shaft is being rapidly done. The mill is about completed, and will start up on Monday next.....The Washington is looking exceedingly well, the ledge in the breast of the north drift being 34 ft thick, and the rock shows well in free gold and heavy sulphurets. A contract will be let to-morrow to run the north drift in 100 ft further.....The Ford & Mullen keeps up its regular lick of turning out specimens. Several boxes of very rich ore have been deposited in the vault at Judd's store, during the past week.....The Empire is looking better than it has ever looked, and the mill is kept running day and night on excellent milling ore.....Work at the Nevada mine, located on Ophir hill, adjoining the Empire, is being pushed forward with diligence. Another crushing will soon be had.....The shaft at the Maryland is now down 130 ft, and is mostly in ledge matter. It will not be long before the ledge is reached. .....No particular change in the Idaho since our last report. The ledge in the 12 and 13 levels looks as well as ever. It will be about 4 months before the 14 level is opened up.....No water has yet been found in the Imperial. The shaft will be sunk to water level and then the ledge will be again cut and another crushing taken out. .....The Champion Co. are making an upraise in their east crosscut. They are working 2 shifts in the west crosscut. The Champion Co. expect to reach the ledge in about 100 ft further.....The Nevada City mine will be run entirely by water power in a short time. Water from the South Yuba Canal Co. is now being brought into the hoisting, pumping and mill works. Steam will be done away with entirely. Ten stamps mill soon be added to the mill.

O'CONNOR MINE.—Grass Valley *Union*, June 10: The mill and hoisting works on the O'Connor mine have been put in complete repair, except that the mill batteries are not quite ready. The pump and hoisting shaft has been cleaned out and retimbered where necessary, and in a few days the pump will be put in preparatory to pumping out which will take but a short time, when a drift will be started to open up the ledge. For several months past companies of tributers, numbering 20 men, have been raising rock along the croppings of the ledge, and have now a large quantity ready for the batteries as soon as the stamps commence dropping. Some of this rock looks very well, and it is expected to give good results, while all of it, it is believed, will pay the expense of mining and milling. It is the intention to do custom work at the O'Connor mill, and the Washington company will mill all their rock there, as the haul will be shorter than to any other in the district. The prospectors on Greenhorn creek, and all other prospecting in the north-eastern portion of the district will also avail themselves of the same facilities, and the result of the starting up of the mill will be to stimulate prospecting in all the country in that part of the district.

HARTERY MINE.—Work upon the Hartery mine has been resumed, after a suspension of some months, and will be conducted under the superintendency of Stephen Moore, formerly superintendent of the North Star mine, who is a miner of many years' experience. For some days past the pumping and hoisting machinery has been in process of the necessary repair, and is now about ready to start up. The drain tunnel, which was badly caved on account of the mine standing idle for many years, was opened last season, and the mine completely drained down to the tunnel level. The old shaft was partially reopened at the same time, but, before reaching the drain level, work was suspended; owing to some complications in the company affairs. The shaft will now be opened in good shape, the mine pumped out, and the extraction of quartz commenced as soon as practicable. The company now operating the mine consists of San Francisco and Eastern men and is understood to be on a good financial basis. The Hartery has not been worked in many years, but at one time was regarded as one of the most promising mines in the district, and is yet considered a desirable property, owing to its situation on the rich gold belt between Massachusetts hill and the famous old Allison Ranch mine.

PLACER.

MICHIGAN BLUFF.—Placer *Argus*, June 10: Bob Lewis and Owen Griffiths, owners of the Damascus cement mine, which adjoins the Mountain Gate claim, are reported to have lately struck rich pay—half an ounce to the man. The Mountain Gate mine is also said to be doing very well.

PLUMAS.

ROBERTSON MINE.—Oroenville *Bulletin*, June 7: About 15 years ago prospectors found a ledge on the mountain east of Genesee valley that looked well, but after doing a small amount of work they abandoned the place. At that time there were no mills within a long distance of the place; roads were very bad, and but little attention was yet given to quartz mining in that region. Prospectors being then more intent on finding gravel diggings. Nothing more was done with the claim till last fall, when C. Robertson and L. Lester relocated it and ran an incline in the vein to a depth of 60 ft; all that distance it opened out well, keeping an average width of something over 2 ft. About a month ago a quantity of the ore was sent for assay and was found to contain $553 gold per ton, and $67 50 of silver. The nephew of Mr Robertson, James Stromberg, has lately become a partner in the mine and the owners are now making a road from the highway to the mine; when this road is completed machinery will be hauled in and a mill built as rapidly as possible. The facilities for mining and milling are all that could be wished; timber and water are abundant.

BUSHMAN CLAIMS.—Plumas *National*, June 10: Since Messrs. Munson & Corbin have leased those well-known claims on the head of Blackhawk, considerable improvement has been made. The pumping machinery at the old incline has been repaired and put in order, a new flume and dump built, and a force of men are now at work opening the ground at the foot of the incline. They are probably in pay gravel by this time, and are certain to find some coarse gold and probably "coarse pay." Work will soon be commenced down the creek some distance, to open the channel by a tunnel, and the Bushman claims will be a busy place during the summer.

GOOD QUARTZ.—On Wednesday Mr. L. L. Cariepy brought us some fine specimens from a ledge which he is opening, about four miles north of Genesee valley. He calls it the "Old Magpie Ledge." It is about four ft in width, and prospects well in free gold, besides carrying a large percentage of copper and silver. The rock is heavy and evidently valuable. A nice specimen can be seen in the *National* cabinet.

SIERRA.

STARTED.—*Mountain Messenger*, June 10: Mr. Hewson, of the Good Hope quartz mine, started his 20-stamp mill last week. With the exception of a few slight drawbacks incident to new machinery, the mill worked splendidly. This week the mill has been running steadily on excellent rock. Mr. H. will undoubtedly make a success of this mine.

NOTES.—The old Alaska quartz mine at Pike City is paying handsome dividends to the owners. The company have a splendid 20-stamp mill running continuously. Mr. Burke, superintendent of the Golden Gate, informs us that he expects to commence work on the mine in a short time. R. D. Williams, of Jim Crow, was in town this week. He is recently up from Nevada county, and is getting things fixed to put a crusher on his quartz mine in the canyon. The mill is new style and was described in the *Messenger* several weeks ago. The Rainbow company at Chip's flat, are grading for a mill on the bank of Kanaka creek. It is proposed to carry the ore from the mine to the mill by a Halliday wire tramway, viz: A series of buckets on a wire rope traveling in a circuit; the rope being supported by wheels attached to posts. This will be a very cheap and reliable manner of transporting the ore. The distance is about 1,700 ft.

BLACK JACK.—This mine, located on Jim Crow canyon, became the property of John B. Johnston, banker of New York City, by redemption of a judgment and sale of property prosecuted by Charles Heintzen, of Forest City. The old company came to grief not from any fault of the mine, which is considered by competent judges a good property, but from faulty management. The new owner proposes to at once open and develop the mine, avoiding, if possible, the mistakes made by former owners.

TRINITY.

PROSPECTING.—Trinity *Journal*, June 10: Mr. Joseph Eastman, late of San Bernardino county, accompanied by M. D. Butler and son, formerly of Cinnabar, in this county, arrived here this week on a prospecting tour and propose to commence operation in the hills surrounding Weaver Basin. The particular thing they are looking for is what is known as seam or pocket diggings, in the search for which Mr. Eastman has of late been quite successful in Shasta county. He tells us that indications hereabouts appear very favorable, and should he find some good pockets here, it will doubtless stir some of our own folks up to the prospecting point. No pockets or seams have ever been looked for in this county that we are aware of. Success to the prospectors.

LOOKING AT MINES.—A party arrived this week consisting of Messrs. Oscar Townsend, a railroad magnate of Cleveland, Ohio, M. C. Fox, a prominent mining operator, of Salt Lake, Utah, and H. H. McClellan, of Placerville, El Dorado county, Cal. These gentlemen are here to inspect mining properties with a view to investment and we hope they may find satisfactory inducements.

ANOTHER FATAL MINING ACCIDENT.—Last Tuesday, about 1 o'clock in the afternoon, the ground in Coyle's drifting claim, above Trinity Center, suddenly fell, caused by the giving way of a false set of timbers. At the time, Jos. Lawton and Jas. Dockery were working in the drift and Charley Osgood—who had been working a short distance from them—was sitting near them, having left his work for a short time to allow the pump to drain the bedrock. In the first fall, which came without warning, all started to run, but the lagging and wet sand caught Osgood's foot and leg and held him fast. The others returned and attempted to pull him out but could not do so, and the dirt kept falling so fast that they were compelled to abandon him and run to save their own lives. The alarm was at once given that Charley Osgood was caved upon and 9 men started to work with a will to dig him out, working 3 at a time. It was not, however, until near 11 o'clock at night—10 hours after the first cave—that they came upon his lifeless remains, he having been literally crushed to death.

TUOLUMNE.

MINES.—Tuolumne *Independent*, June 10: The Blagg mine, situated at Dear Flat, is looking splendidly. Some of the richest gravel ever seen in the southern mines has been uncarthed, and the boys are in high spirits. The Tioga claims are again coming to the front. A number of owners of claims in that district are going over next week. Austrians are still taking it out at Brown's Flat. The Stayton Bros. and Wm. Bell, of Columbia, have entered into a contract with J. T. Murnan and Geo. McQuade, to work the latter gentlemen's claim—a quartz claim—situated one-half mile south of Sonora, and which is said by experts to be a promising lode.

NEVADA.

WASHOE DISTRICT.

UNION CON.—*Enterprise*, June 11: Are stoping out ore on the 2500 level. On the 2600 level the west crosscut has been extended 20 ft and the upraise 15 ft. South drift No. 2 on the 2700 level has been advanced 25 ft. During the week 736 tons of ore have been extracted, and 928 tons and 180 pounds have been sent to the mill. Amount of bullion shipped during the week, $87,180.95.

CONSOLIDATED VIRGINIA.—The joint California east drift on the 2700 level has been advanced 16 ft. The joint west drill hole, on the same level has been advanced 160 ft.

MEXICAN.—West crosscut No. 2 on the 2760 level has been extended 24 ft, and winze No. 1 sunk 20 ft. On the 2900 level west crosscut No. 1 has been advanced 19 ft. Are cutting out on this level for a joint Ophir winze.

CALIFORNIA.—The main south lateral drift, on the 2700 level, has been advanced 19 ft. The joint Consolidated Virginia east drift has been extended 16 ft. The joint west drill hole, on the same level, has been advanced 160 ft.

OPHIR.—On the 2900 level the main south lateral drift has been extended 16 ft, and is now being timbered up. Are cutting out a station for a joint Mexican winze. During the week 97 tons of ore have been extracted from the croppings.

SIERRA NEVADA.—Winze No. 2, down from the 2500 level, has been sunk 6 ft. On the 2700 level main north drift No. 1 has been extended 27 feet; north drift No. 3, 7 ft, and the west crosscut, from north drift No. 3, 20 ft. Are repairing winze between 2300 and 2400 stations.

SUTRO TUNNEL.—Main tunnel, repairs, 2300 to 2700. Two repairmen were employed 6 days of this week on main tunnel repairs. They repaired 400 ft of the track, put in 3 posts and lagged up 5 sets; also, braced down the boxes at point 11 000. The flow of water is equal to 0,650,137 gallons per 24 hours.

BELMONT DISTRICT.

EMERSON'S MINE.—Belmont *Courier*, June 10: Work progresses finely in George W. Emerson's mine. They are now sinking on the ledge, and a tunnel is also being run to tap the front ledge at a depth of 35 ft. Mr. Emerson feels confident that he will soon be able to extract chloride ore in large quantities. During the present week many improvements have been made to his mill. He has now a plentiful supply of water for steam and leaching purposes. Mr. Emerson will commence to roast ore to-day or to-morrow. Work is progressing rapidly in the Monitor-Belmont mill, and Superintendent Fassett is having ore hauled from the Belmont mine to the mill.

BRISTOL DISTRICT.

DAY FURNACE.—Pioche *Record*, June 3: The Day furnace is in the best of order. Foreman Dick Walsh, one of the most experienced furnace men in this State, has spared neither labor or expense in placing it in this condition for the coming run. Everything about the premises is as neat and tidy as possible—in fact, could not be more so. When the furnace starts up, Foreman Walsh is going to surprise the natives by the vast quantity of ore he will shovel into it and the large stacks of rich bullion he will take out. Long may she wave.

NOTES.—The Bristol Mine is working along as usual. Of late the working face at the Mayflower has been greatly reduced—some of the men being discharged and others quitting on their own account—but the mine is now being worked into shape. They are now doing work that ought to have been done in the first place, and would have saved the company considerable inconvenience, and was so advised by Charles Roe and Foreman McQuaig, but their advice was not accepted. The company is now working as economical as possible. The mill is running as well as can be expected under present circumstances. The teams hauling ore from Royal city, and a few loads coming in from Highland and Pioche, together with the coal teams, gives Bristol a lively appearance, but there is not any money to be had. The engine at the Tempest mine was completed a week ago and commenced running then. The work of timbering the shaft is drawing near completion. A force of 8 men is employed at the mine. Men wishing to obtain employment will do well to keep clear of Bristol. The little engine placed on the Tempest mine was packed up there on mules. There is not as much prospecting going on at the mines in this district as there has been.

COLUMBUS DISTRICT.

NORTHERN BELLE.—*True Fissure*, June 10: Advantage has been taken of the grading and removal of the ore bin by the railroad company to make some repairs to the hoisting machinery. It was stopped for four days, during which time the work on the fifth shaft level was suspended. In consequence the main drift on this level was extended but seven ft. Its total length now is 192 ft. Work has since been resumed in all parts of the mine and the machinery is running again. The other shaft levels are showing no material change, and looking fully as well as at the time of the last report. The levels above the adit present about the same appearance as last week. Very little work has been done on the ninth level, for the reason that the ore at that point was so easy of extraction, and the stopping of the hoisting works considered, it was thought best to continue such work in the stopes where more labor was required. The ore chutes in the mine are becoming filled up, but will not inconvenience the taking out of ore, as hoisting was resumed yesterday. Mill No. 2 is running steadily and doing its usual good work. The shipments of bullion on May account amounted to $72,071.09. The shipments on the June account to the 8th instant were valued at $12,249 75.

MOUNT DIABLO.—Winze No. 1 is now very nearly 200 ft vertically below the third level. A drift will be started westerly on the ledge. For the last 20 ft no ore has shown but the ground has good indications. The raise from the east drift on the second level, nearly north of the shaft, is yielding a small quantity of ore, assaying from $50 to $75 per ton; the ledge shows strong with small streaks of pay ore. The south crosscut from the east drift on the first level is in 172 ft, and shows coarser ground, with small stringers of ore that look promising. There is no change of note in other portions of the mine.

FLORENCE DISTRICT.

SEDAN.—Belmont *Courier*, June 10: The Sedan mine in Florence district, this county, is looking better and better as work progresses. The shaft is now down 110 ft, at the bottom of which they are extracting ore that assays over $30 in gold and $22 in silver.

JEFFERSON DISTRICT.

LOOKING WELL.—Belmont *Courier*, June 10: The mines at Jefferson continue to look well, and very rich ore is being extracted from the St. Charles, the property of the Harrison Brothers.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, June 10: The ore bodies in the Betty O'Neal mine still improve, and the mine looks better than ever. The shaft is being sunk and timbered in good shape. The flow of water has increased some as the shaft has deepened, but the pumps handle it with ease. We cannot but agree with Mr. Wm. Oidley, the foreman of the mine, when he exclaimed in answer to our inquiries about the mine: "She's a daisey."

MORNING STAR.—But little work is being done on the Morning Star mine. Work will not be resumed till after the ore has been reduced. About 80 tons of ore will be worked in the Eagle mill, the greater portion of which is now in the mill. The old trail to the mine has been straightened out and about half the distance widened, making a good wagon road. An assay office has been added to the main office under the control of Mr. W. S. Smith, and everything being placed in readiness for starting up in good style.

EAGLE MINE.—The tributers in the Eagle mine have taken out about five tons of first-class ore during the week, making over 20 tons of first-class and nearly the same quantity of second-class. We hear that the ore will be milled as soon as the Dahlgren company clean up in the Eagle mill. Several of the boys are gathering together their picks, drills, etc, and will develop their claims. Notwithstanding the dark cloud overhanging our camp we are satisfied that before next winter we will be able to show the silver lining in the shape of bricks of bullion.

TYBO DISTRICT.

DIFFICULTIES SETTLED.—Cor. Belmont *Courier*, June 10: We have just learned that all the difficulties have been amicably settled between N. S. Trowbridge and the Tybo Consolidated M. Co., and the cloud which has been hanging over the Tybo for the past two weeks has entirely disappeared. It is expected that the mill at this place will start up as soon as Mr. Trowbridge returns from San Francisco, and it will be kept running for some time to come, as there are 1,500 tons of ore on the dump awaiting reduction. The 2-G mine never looked better; there are large quantities of good ore in sight—sufficient to keep the 20 stamps pounding away for a long time to come. The Mountain View M. Co.'s mill will be ready to start up inside of two or three weeks. Their mine is opening out fine as they go down on it, and it will prove a bonanza for its owners. The New Philadelphia at Hot creek, too, is giving some signs of life again, for they have just let a 200-ft contract on one of their mines. The time is not far distant when this section will take a place in the front rank as a bullion producer.

ARIZONA.

REVIEW.—*Epitaph*, June 10: The mining world of Tombstone was not excited by any unusual occurrence during the past week. Everything went along in the usual course. The mines are producing ore, and the mills are turning out bullion. From all quarters we hear of nothing but prosperity, and the managers of the mines are enthusiastic in their belief that Tombstone has yet to see its days of most prosperity. The bullion-producing mines are increasing their yield, and the number of new mines being opened up and developed is considerably augmented since our last. The Randolph is gradually but surely exhibiting its grand proportions. The more this grand mineral deposit is developed the greater seems to be its capacities, and, from present appearances, we should not be surprised to see it take its place in the front rank of the bullion producers of Tombstone at no distant day. The Ingersoll is also making a decided mark in the mining world. Large bodies of high-grade ore have been discovered recently, and the more the work of development is prosecuted the greater seems to be its wealth. The bullion yield of the Grand Central last month was the largest ever turned out by that mine. The same quantity of ore was worked to reach this result as heretofore, so it can easily be seen that the quality of the ore is increasing. There is a general boom among the smaller and less developed mines, and it is fair to assume that ere long there will be more mines worked in this district than in any other in the United States.

TURKEY CREEK DISTRICT.—Prescott *Courier*, June 10: Mr. Theodore L. Chase, superintendent of the Hidden Treasure M. Co., Turkey Creek district, is working 10 miners on two of his New York company's mines, which are pretty well prospected by shaft and tunnel, or rather shafts and tunnels. Mines belonging to the company were, we believe, purchased from McAuliff & Co., men who have done a great deal of hard work in this district, for which they have been partially rewarded.

CAMP CREEK.—*Citizen*, June 10: A. B. Wiley left last Monday for his mines on Camp creek. He informs us that he is down some 45 ft on the Lodestone, with a fine ledge at the bottom. He brought in some fine rock.

THE CASTLE CREEK MINE, owned by Messrs. Roudebush & Campbell, and operated by them as the Castle Creek M. Co., has a 2-ft vein of copper and galena ore, and employs 15 men. We understand that they have considerable machinery at Maricopa, to be used in working this mine.

COLORADO.

KING.—*Reporter-Call*, June 9: The King M. Co. have at last got their working shaft on the King mine cleaned out and timbered up. It was found to be 160 ft in depth. This week levels will be driven. This property has been lying idle for the last 16 years. It is the intention of the superintendent, Mr. F. C. Whitaker, to thoroughly and systematically develop the mine throughout.

MAPLE LEAF.—The owners of the Maple Leaf mine on Clifford mountain have let a contract for the erection of a shaft-building on that mine 20x30, with 14 ft posts, which will contain an improved hoister, 40-horse boiler and a 20-horse power Leidgerwood engines. The present depth of the main shaft is 82 ft. It is 11x4 ft in the clear, and has been timbered up very substantially and conveniently arranged for ladder, pump and skipways. The skip to be used will be capable of containing one ton of ore. Adjoining the Maple Leaf on the west the Clifford M. Co. have received their new Embry table, which is a pronounced success in ore concentration. The table is so arranged as to receive the slimes after being run under stamps directly from the battery and tables. The mill has a capacity of 8 tons per day. The entire management of the mill and table is so conveniently arranged as to permit one man's labor to put through that amount of ore every 24 hours.

CONTRACT FINISHED.—Manning, Briggs & Co. have finished their contract for sinking 100 ft in the working shaft of the Gold Hill M. Co.'s galena lode. The completion of this contract gives the company a main shaftage of 325 ft. The lower workings have materially improved in the last few ft; that is to say, the crevice matter is more mineralized than for some time past.

DAKOTA.

TURTLE MOUNTAIN DISTRICT.—Dispatches from Fargo and Grand Forks, Dakota, say that there is great excitement there over the decision of Secretary Teller, opening Turtle Mountain district in that region. It includes 9,000 - 000 acres of the first land in Dakota, comparatively well wooded and watered, lying to the north and west of Devil's lake. It has been closed hitherto by a claim of a wandering band of Chippewa Indians, which is declared invalid by the Secretary of the Interior. Two railroads, the Northern Pacific, St. Paul & Minnesota and Manitoba, will build to this region, and thousands of the settlers are ready to rush in as soon as it can be formally opened.

IDAHO.

SALE.—Wood River *Times*, June 9: The Wolf Tone mine on Deer creek, has changed hands. The transfer was accomplished yesterday, and the first payment made. The price agreed upon is $25,000—of which $0,000 was paid last evening, the remaining $19.000 to be paid within 30 days. The Wolf Tone was located by John Manniug, Thomas Finnegan and Patrick Leehan—the first-named having 300 ft, the second 450 ft, and the third 250 ft. The purchaser is J. F. Bailey, of the Philadelphia rolling mill's, one of the original stockholders in the Philadelphia company, of Ketchum. Bailey has taken out of that company, having become dissatisfied with Col. Green's management, and he proposes to operate for himself in his own behalf, and that of a few moneyed friends of his in Philadelphia.

WOOD RIVER HAPPENINGS.—*Times*, June 7: The most notable event of the past week in this region was the starting up of a concentrating jig at the Jay Gould mine, in Bullion. Being only intended as an experimental machine, run by hand power, it was erected as cheaply and on as small a scale as possible. Its utmost capacity is, therefore, about two tons of first-class ore per day. This quantity of ore is obtained by running through the jig rock which has heretofore been thrown on the waste dump. As the concentrated ore is of as good, if not better, grade than the first-class ore extracted from the mine, it follows that it must be worth at least $150 per ton. The saving effected by this small jig and the labor of a couple of men, therefore, amounts to over $300 per day. This sum of money will more than pay all the expenses of running the mine.

THE PHILADELPHIA SMELTER.—*Miner*, June 3: The smelter belonging to the Philadelphia M. and S. Co. is ready to begin operations as soon as a sufficient amount of fluxing can be obtained to insure a continuous run. Fine coal kilns, with 1,000 bushels capacity each, have been burning wood upon the ground for the past 4 weeks. It takes from 4 to 5 days to burn a kiln, consequently about 1,000 bushels are turned out daily. Mr. Bohler has the contract for burning 60,000 bushels, and is building 6 new kilns of brick and stone. Over 300 tons of high-grade ore, taken from the Elkhorn mine during the past winter, have been delivered at the smelter and assorted.

ORE BUYING.—The next important occurrence was the resumption of ore buying by the smelter at Ketchum. In one day last week the superintendent issued checks for over $30,000, in payment of ore which has just been sampled. The disbursements at the same works, in payment of ore, will probably average $2,500 per day from this time until the close of the open season. The arrival of C. W. Cortright, Captain Owen, and a number of other prominent mining and millmen operating in Sawtooth, and their evident determination to immediately open the grade across the Sawtooth range, notwithstanding the depth of snow covering it, was another of the notable events of the past week. Men are already at work shoveling the snow off the grade, and within a very few days teams can reach Sawtooth and Vienna without difficulty. The strike in the Silver Fortune up the East Fork, and of the Robertson brothers, on Deer creek, and the sale of the Wolf Tone mine to a Philadelphia capitalist, deserves rank among the notable events of the past week through out the Wood River region.

MONTANA.

HIGH-GRADE ORE.—*Inter-Mountain*, June 9: The Late Acquisition, it will be remembered, was closed down last fall and was idle all winter, as cold weather came on too soon for the building of a shaft house and the placing of the machinery. Within the past week operations have been resumed and important developments have already been made. About 125 ft east of the shaft an air shaft, which was started last year and which is 85 ft deep, shows 5 ft of very fine ore, assaying well in both gold and silver. Sinking is steadily progressing. Seventy ft south of the main shaft Menary was rambling around a few days ago with a pick in his hand and stumbled upon a ledge which had never been known to exist. The surface rock assays very high, and, as the croppings could be traced for several hundred ft, it was decided to sink a shaft and prospect the new find. For the past few days sinking has been progressing, and a fine-looking vein is being developed. To-day Menary took a sample across the ledge, which returned, according to Davis & Bennet's assay, 191 ounces in silver and 7 ounces in gold. The ore body from which this sample was taken is 20 inches wide, and if it will hold out, even to water level, Menary will realize a handsome little stake from the new discovery.

OREGON.

GOOD CLEAN-UP.—*Sentinel*, June 10: Alex. Watta informs us that he has just made the best clean-up at his mines near Williamsburg that he has made for a number of years past. He has also got his mines in a much better shape than ever before, promising good returns in years to come.

MORRIS JOY, the miner who fell down the Mendha shaft and paralyzed his lower limbs, and was taken to Salt Lake for treatment, writes that there is no hope for his recovery.

The Mineral Springs of California.*

Locations Descriptions, Analyees and Virtues.

Various classifications of miusral waters have heen made. The simplest is ths hest for preseut purposes. Thsy are all based upon the predominancs of some one or more principal iugrsdients. Hence we havs the alkaliue waters, the distinguishiug constituents heiug carhonates or bicarhonates of soda, potassa, lime, magnesia, etc., and containiug considerable carbonic acid gas; the saliues, most of them heiug apsrieut with the chlorides of sodium and magnesium, sulphates of soda, potassa and maguesia, etc.; sulphurous waters, characterized by the presence of sulphursted hydrogen, in other respscts heiug alkalius or saliue, in accordance with the predominance of one or the other class of iugredients; and the chalybeate, containing a certain proportion of iron, in combiuatiou with euhstances belonging to one or another of the above classes. Thsu, again, ws have the thermal watere of differeut degrees of temperature, from 75° to 100°, or eveu 140°.

Waters of the alkaline class, kuowu also as carhonated or acidnlous waters, have beeu chiefly advised in certain affsctious of ths etomach aud inteatiues, catarrhal in character, in bronchial catarrh uncomplicated by cardiac dieease, in gout, for the relief of which they have attained celebrity, in chronic rheumatism, in functional disturhances and engorgement of the liver, in catarrh of the bladder, in diabetee mslitus and in dropsy. They aie advissd in the dyspepsia attended with excessive acidity of the secretions, "with eour or rancid eructations and regurgitations," and flatuleut distention of the ahdomeu. Pure alkaline waters are seldom purgative; but, heiug uenally associated with the salines, they may become so. They are often more properly alkalo-salines. They are commonly decidedly diuretic, and correct an acid condition of the uriuary secretion. Hence, probahly, their utility iu rheumatism. For the chronic forms of this disease they are used intsrually or in warm haths, and are of decided efficacy.

The saline waters are aperient, diuretic, and excitant to the liver aud ite secretions, and to other members of the glandular syatem. They are, as above remarked, commonly associatsd with one of the other classes, and hence their medicinal effect will be accordingly modified. Many of them are thermal. They are used hoth internally and for bathiug, aud have been found efficieut in various cutaneous diseases; in scrofula, aud in gout aud rheumatism. They have also hsen employed euccessfully in diahetss, and Bright'e disease; in calculous coucretions of the gall-duct, and in uterine eugorgements.

Both of the above classes of miueral springs are frequently associated with iron in greater or less proportion, and hence are called chalybeate waters, whenever the iron is in sufficieut quantity to become promiuent. Chalyhsate waters possess, in a high degree, the virtues of ths ferruginous preparations, beiug in a form acceptahls to the stomach, aud which is readily introduced into the blood, improving its quality aud effecting the gradual removal of those states of tbe system knowu as chlorosis aud anæmia. They are of great benefit in disturbance of ths functious of the uterus, characterized hy amenorrhœa, when accompauied with a debilitated condition of the system, and also in excessive meustruation. Probably the improved hygieuic couditions hy which the patient is surrounded add greatly to the salutary effect of these waters.

Sulphurous Waters.—The medicinal effects of these waters depend mainly upon the combination of sulphureted hydrogen with the ingredients already described as composing the saline, alkaline, and chalybeate waters. They are admitted, howevsr, hy all authorities, to exert a sedative action peculiar to themselves, more or less marked, accordiog to the qnantity of the sulphursted hydrogen they contain. To the same snhstance is dne, in part, their diuretic action. They have attained considerable reputation iu chronic skin diseases, and in scrofula. For their curative virtue in chronic rheumatism they have very justly gained a great notoriety, bnt in such cases their sfficacy seems to depend more upon their external uss, in warm baths, than upon their internal administratiou. In paralysis, without organic lesion, they are of ssrvice, while in the same diseass attended with cerebral or spiual apoplexy, they are regarded to be injurious. (Stills.) "In eugorgemsnt of the livsr, abdominal plethora, and hemorrboids, tbe saline-sulphur watsrs have loug been justly esteemed as trustworthy remedies." (Walton.) Accordiug to Dr. Thompson (Cycl. of Pract. Med.), they are injurious to those lahoriog nnder general plethora, or are affected with inflammatory fever. In lead-poisoning they constitute a very valuahle remedy, effectually eliminating the poison from the system. They are also strongly advised, used internally, and as haths, in cases of amenorrhœa or defective meustruation, and in chlorosis.

Hints on the Uee of the Watere.

From what has now been said—which is but a geueral outline of the history of mineral springs and their nses—it may readily be understood that they are complex ageuts, varying according to their combination and temperaturs, and uot to be ussd indiscrimiuately or igno·rantly. That thsy are capable of doing great good has been ahundantly dsmoustrated; that thsy may exert a power for svil, is uot less certaiu; and these opposite effacts may result, not alone from the diffsrent kiuds of water used, but also from the method of using it. For example, a salins or alkalo-saline watsr may bs purgative or diuretic, almoat at ths pleasurs of the person takiug it. Large drafts taken before breakfast will probahly produce an apsrient effect; emaller oues at intervals during the day will be dinretic.

As to the quantity to be taken during the day, it may he etated, as a geueral rule, to he two or three glasses before hrsakfast, and as many during the day. It is better to pause, or eveu walk for a few minutes betwesu each glass. Miueral waters should not be used withiu an hour of the time of meals. When visiting the Ætna Spring, the writer was informed by visitors that a full draft of the water, taken soou after meals, invariably caused vomiting.

Small does are often preferable to large oues. Except in the case of aperieut waters, designed to regulate the bowels, a principal effect sought to he obtained is that resulting from the alterative actiou of the water—a slow modification of the system, a gradual stimnlation of the organic processes—by which the eecretory organs are improved and glandular obstructions rsmoved. Thus, judiciously used, many of the watere may prove a valuable tonic, while taken with less caution the principal purposes of their administration may be thwarted. Ordiuarily, several weeke of treatment are required to fulfill the indications. Miueral waters taken with all due care occasionally disagree, or they are strangely inefficient, or even do harm in cases apparently suited to their use. Iu such iustances, competent medical advice is needed to correct the trouble, to regulate, iucrease, or diminish ths quantity takeu, or to chauge the time of taking it.

Baths.

The exterual uee of mineral watsr is often more efficieut in disease that its internal administratiou. It is atteuded, too, with greater risks. It may be cold, tepid, warm or hot. Certain general rules have been laid down regulating the use of baths. They are better employed on an empty stomach, as in the morniug before breakfast, or at hed time, or an hour before dinner. Wheu two baths are used daily, as ie ths oustom at many watering places, probahly the bsst times are before breakfast and an hour before dinner; or, when it is desirable to promote perspiratiou, in ths evening, the patient retiring to bed immediately. Cold baths should, as a general rule, not he of longer duration than five miuutes; warm haths, 15 miuutes; hot baths, five to fifteen minutes. "In some cases, especially when the bath is used for cutaneous diseases, the patieut may profitably remain in for a much longer period, even from half an hour to an hour. As a gensral rule, and especially for delicate persons, active exercise should he avoided while in the hath; and always, on comiug out, the bather should be well rubbsd over the whole body with a ccarse towel." (Moormau, "Mineral Springs of the United States and Canada.")

Hot baths are decidedly stimulating in their actiou, increasing the force of the circulation and exciting the heart. The author above quoted, justly regarded as high authority in the use or mineral haths, states that they are "potent and positive agents. Wheu applied to the humau body they aie uever negatives in their influsnces, hut will do either much good or much harm, accordiug to the judgment and skill with which they are employsd. * * * * They should never be prescribsd merely for the uame of a disease, however carefully its nomenclature has been selected. The precise existing state of the eystem, whatever may be the pathology of ths disease, ought always to hs carefully looked to hefore a course of hot bathing is directsd."

Hot haths should never bs used hy persone having organic disease of the heart, or are the snbjects of hemorrhage from the lungs, or of a plethoric condition, with tendency to cerebral congestiou, as indicated by vertigo or ewimming in the head. Warm baths are likewise contra-indicated in such cases in proportion to their temperature.

Cold hathiog, though cousidered tonic in its effect, should he avoided hy those much debilitated, and in whom reaction is feehle or elow in coming on.

Consumptives, sven in the early stage of disease, should keep away from these watering places. Many of them are well adapted by location and climate for pereons of this class, it is true, and so far may he resorted to; hnt there is no fact in medicine, or in the history of cousumption, more fully attested than that the treatment of that disease hy mineral waters, especially the saline and alkaline waters, and their combinations, is positively hurtful.

The followiug springs have heen hrought to the notice of the writer. Some of them have heen personally visited and examined, and of others every reasonable effort hae heen made to obtain an authentic history.

Alkeline Springs.

California Seltzer Water.—This spring is located in Mendocino county, in the Coast mountains. It has an agreeable alkaline taste, ia antacid, slightly diuretic, and, in large quantities, is laxative. An analysis in our possssion gives ths followiug result to each pint:

	Grains.
Free carbonic acid—abundance	
Bicarbonate of soda	6.65
Carbonate of lime	8.80
Carbonate of magnesia	5.65
Chloride of sodium	2.15
Carbonate of iron and siliceous acid—traces	
Total	23.33

The nams of ths anthor of the above analysis ie not in the possession of the writer.

Adame' Spriug.—It is located in the mountains of Lake couuty, about eight miles south of Clear lake. Each gallon of water contaius the followiug:

	Grains.
Carbonate of lime	28.714
Carbonate of magnesia	99.022
Carbonate of soda	57.038
Carbonate of iron	.517
Chloride of sodium	4.112
Silica	7.218
Organic matter	2.811
Salt of potash—traces	
Nitric acid—traces	
Total	199.430

Each gallon also containe 304 cubic inches of free carbonic acid gas. We have not been able to visit this epriug. It bae attained a high reputation for the relief of the disorders to which this class of waters is especially suited. It has afforded marked relief in rhenmatism, and is much esteemed by those who have used it for the correction of certain diseases of the stomach assooiated with deficient secretion of bile. It is also thought by many who have visited it to be nssful in chrouic metritis.

Allen Springs, Lake County.—Amoug the many springs with which Lake county abounds, these are regarded by those who know thsm best, as being among ths most valuable. Their location is in a cauyon near the head of Cache creek, about 45 miles from Williams, in Colusa county. As just stated, the location is near the head of Cache creek, a beautiful spot, shaded by live oaks. There are two principal mineral springs. The following qualitative analysis, by W. T. Wenzell, has been brought to my notice: Chloridee of sodium, magnesium and potassium; bicarbonates magnesium, sodium and calcium; sulphate of sodium; phosphate of iron; silica, carbonic acid. It is strongly ærated with carbonic acid; salte of sodium and magnesium predominate. The waters of Allen springs have acquired considerable reputation in hepatic affections, and especially in chronic reual diseases. Dropsy, associated with ths latter, has been greatly relieved, and in an extreme case, reported to the writer, cured by the use of the water.

Geyser Spa Spring.—This spriug is located in Sonoma county. The solid contents in ons quart of water are reportsd as follows:

	Grains.
Bicarbonate of soda	5.87
Bicarbonate of magnesia	2.45
Carbonate of iron	0.95
Carbonate of lime	1.14
Chloride of sodium	2.40
Sulphate of soda	0.85
Silica	0.45
Loss	0.08
Total	14.28

The water of this epring, like some other mineral waters, is bottled aud eold for ordinary use. It is esteemed by many as an antacid, and mild corrective of disordered digestion.

Now Almaden Vichy Water.—The spriug containing this water is located in Santa Clara county, near the Nsw Almaden miues, about 60 miles south of San Francisco. It has been much used in old rheumatic and gouty affections, and is of value in debilitating and chlorotic affections, and in some gastric disorders and diseases of the liver. It has been advised in renal affections and gont. Analysis gives tbie result to each quart (name of the chemist not known):

	Grains.
Carbonic acid	28.02
Bicarbonate of soda	50.03
Bicarbonate of lime	8.00
Oxide of iron	1.02
Sulphate of lime	10.05
Sulphate of magnesia	3.00
Chloride of sodium	8.04
Solid constituents, with traces of silica	108.16

Alkalo-Saline Springs.

Hot Borate Spriugs.—This remarkable epring is situated in Lake county, near the town of Lakeport, at an elevation of abont 1,500 ft. It is easily reached by the Napa Valley railroad to Calistoga, and thence 30 milee by stage.

The water of thie spring, as analyzed by Mr. Moore, is found to be of a remarkable character. Hie analysis is snbjoiued:

	Grains.
Chloride of potassium	Trace.
Chloride of sodium	84.62
Iodide of magnesium	.09
Bromide of magnesium	Trace.
Bicarbonate of soda	76 96
Bicarbonate of ammonia	107.76
Biborate of soda	103 29
Sulphate of lime	Trace.
Alumina	1.26
Carbonic acid, free	36 37
Silicic acid	8.23
Matters volatile at a red heat	65.77
Total, in one gallon	484.35

In this table the constituents are necessarily calculated as anhydrous salts. The hiborate of soda, however, contaiua about 47% of water when crystallized, and the 103.29 grains given above correspond to 195 35 of crystallized horax. The most extraordiuary feature in the above analysie is the large amount of ammoniacal salt shown to be present in this water; in this respect exceeding any natural spring water which has ever heen analyzed. The horate spring has heen used in nephritic and calculous diseasss, dependent on sxcess of lithic acid, and also in certain scaly cutaneous sruptions.

Bartlett Springs, Lake County.—Ths Bartlstt springs are among the most popular of any of the numerous resorts of Lake county, at least among the population of the central portion of the State. They ars located in the southsrn portion of the couuty, near the head of Cache cresk, and about 45 miles from the town of Williams, in Colusa couuty, from which place they ars reached hy stage. The situation ie upon a flat surrounded by hille; upon the southeast elope of one of these lie the spriugs. There are two principal springs—one yielding the "Bartlett" water proper, and the other said to contain soda and iron. No thorough or authentic analysis of either of these springs has been made, but a doubtful qualitative examination is said to have revealed arsenic among ingredients in the "Bartlett" water. It is pleasant to the taste, ie cathartic, and very decidedly diuretic; it ie also alterative; and the fact cannot be denied that it has heen shown by abundant testimony to be of very considerable efficacy in many cases of chrouic rheumatism, skin diseases, and hepatic and renal affections. It is much eeteemed in dropsy, in uterine catarrh, and in functional derangemente of that organ; in neuralgia and chrouic malarial affections.

Toleuae Spriug.—The water of this spring is to be classified as alkaline, or alkalo-salius, thongh no analysis has yet bsen made of it. The location ie about five miles north of Suisun, easily reached hy the liues of the Ceutral Pacific R. R. from Sacramento or San Francisco to Snisun, and thence private conveyauce. The place is eaid to bs resorted to by many invalids from that portion of the State, who, for the most part camp in the vicinity. Small cabins have heen erected for those who prefer an indoor life. The water is estsemed by many who have used it for its efficacy in chrouic dyspspeia, and in renal disease. It is charged with carbonic acid gas and hottled at the epring.

Chalyheate and Alkalo-Chalyheate Springe.

Pacific Congress Spring, or Saratoga Spriug.—This ie a saline watsr arising in the Coast range mountains, 10 or 12 milee southwest from Santa Clara. The locality is one of natural beauty, healthful, aud admirably suited as a resort for those seeking a pleasant retreat from the cares and excitemsnt of city life, whsre pure air and varied sceuery combiue to invigorate both body and miud. Excellent accommodatious have been provided, the grounds have been improved, shady walks laid out, bathhousee erected, the water being artificially warmed to any desired temperature, and everything is arranged to ensure the comfort and enjoyment of the visitors. It has become, of late years, one of the most fashionable watering places of California. Like the watsr of the Napa and Litton springs, this too is bottled upon the premisee, and sold in the cities of the State. It is highly prizsd by many for its agreeable taste and antacid propertiss. Iu acidity of the stomach, in indigestion, in casse of faulty and depraved secretione from the liver, its use has become familiar to many who recsive it at their own homss. The large amount of iron it containe would almost entitle it to hs ranked as a chalybeate water, and rsudere it of essential service in chlorosis, anæmia, and wherever iron in combination with saliuss is indicated. Used freely at the springs before breakfast, thie wator acts as a purgative. It has a decided diuretic actiou when taken during the day in non-laxative doses. Analysis yields the followiug result in each gallon of water:

	Grains.
Chloride of sodium	119.159
Sulphate of soda	12.140
Carbonate of soda	123 351
Carbonate of iron	14.030
Carbonate of lime	17.295
Silica, alumina, and traces of magnesia	49.882
Total	335.857

Temperature, 50° Fabrenbeit.

The above analysis was made, I believe, by Bauer.

Napa Soda Springs.—Probably no mineral water in California is so well known, or has maintained its reputation among the community to the same extent, ae has that wbich goee under the name of Napa soda. It is sold and used as a beverage in almost every city and town in the State, and is esteemed as a pleasant, exhilsrating drink during the summsr monthe. The spriug is located on the western slope of the mountains east of Napa Valley, and ouly seven or eight miles from Napa City, and has from an early day been a favorite resort of the invalid. Its mineral combinations are such as to make it valuahls as a touic in anæmic conditions of the system, and in chronic dyspepsia where there is a predomiuance of acidity. It has been fonud to he an efficient aid to digestion, and a useful tonic, yet gentle aperient, when taken in the morning before eatiug by delicate females, and is rendered more efficient hy the addition of a grain of the sulphate of iron to a hottle of the water.

L. Lanzwnrt reported the followiug analysis, representing the constituents of one quart of water:

	Grains.
Bicarbonate of soda	3.28
Carbonate of magnesia	0.53
Carbonate of lime	2.72
Chloride of sodium	1 30
Subcorbonate of iron	1.96
Sulphate of soda	0.46
Siliceous acid	0.17
Alumina	0.15
Loss	0.62
Residuum from evaporation	17.19

*The account of the mineral springs of California is condensedfrom a review of the subject in the report of the State Board of Healtb for 1880, by F. W. Hatch, M. D., permanent Secretary of the Board. It is not complete, but is as comprehen-ive as was possible with the data attainable, and the publication of its leading parts in a popular medium will, we believe, be of public value.—EDS. PRESS.

Besides the value of this water medicinally, its location upon the mountain side of the beautiful and healthful valley from which its name is derived, gives it decided advantages over many other watering places in California.

Litton Seltzer Spring, Sonoma County.—This spring is pleasantly located near Healdsburg, Sonoma county, on the line of the San Francisco and North Pacific railroad, by which access from San Francisco is rendered easy. It is a carbonated alkaline water, clear, sparkling, and pleasant to the taste. The locality is much resorted to as a retreat from city life and cares, and on account of the medicinal properties of the water. The latter has been introduced into the market in bottles, and forms an agreeable beverage and antacid. It contains a larger proportion of iron than most other mineral springs in the State. The following analysis has been reported by Henry G. Hanks: Specific Gravity, 1.0038. When freshly drawn, the water is slightly acid. After standing, it becomes alkaline. One wine gallon of water contains of solid constituents 228.69 grains, in the following proportions: Carbonic acid (combined), 42.96; chlorine, 78.38; sulphuric acid, 2.36; silicic acid, 2 92, oxide of iron, 2.85; lime, 4 41; magnesia, 5 24; soda, 62.19; alumina, ammonia, potash, lithia, boracic acid, organic matter, 27.38; total, grains, 228.69.

Summit Soda Springs.—The location of these springs is near the summit of the Sierra Nevada mountains, 12 miles from the Central Pacific Railroad. The access is by that road, from Sacramento to Soda Springs station, thence by stage to the valley in which the water is found. The road to the springs is good, winding along the mountain side, so as to afford an easy descent to the valley below, the eye being continually greeted, during the route, by scenes equal in grandeur to almost any which the Sierras afford. The springs themselves are beautifully located in an expansion at the head of the deep canyon, along which winds one of the forks of the American river. The accommodations for visitors are excellent.

This might, according to the arrangement of some authorities, be called an "earthly-saline" water, although the large amount of carbonic acid it contains allies it to the *carbonated* waters. It should, therefore, if we can judge from its constituents and their known properties, possess, in a high degree, the remedial virtues which are supposed to pertain to these classes. Thus, the carbonic acid gives it a place in torpid digestion and certain dyspeptic troubles, while the association of its gaseous element with the alkalies and earths, with chloride of sodium and iron, makes it efficacious in diseases due to a scrofulous diathesis, in rachitis, in chronic affections of the mucous membranes, especially of the intestinal canal, in rheumatism, and in cases requiring its diuretic action. In fact, in some of these, more particularly in chronic catarrhal disorders and in rheumatism, it has been used with marked benefit. Probably, also, taken in connection with the climate of the locality, its elevation, its invigorating influence, it would prove effectual as a tonic and restorative in some nervous disorders, in anæmia and chlorosis, in atony of the mucous membranes, debility, and in convalescence from acute disease. Analysis yields the following results in a wine gallon:

	Grains.
Carbonic acid, 186 35 cubic inches	
Bicarbonate of lime	43.20
Carbonate of magnesia	4.20
Carbonate of soda	0.50
Chloride of sodium	26.22
Oxids of iron	1.75
Silica	2.06
Alumina	1.75
Potassa—trace	
Total	88.68

This water was analyzed by J. F. Rudolph.

Seigler Springs.—The value of these springs has long been recognized by the people in the central part of the State, and they have been much frequented by individuals. The location, near the head of a canyon, at an elevation, according to my informant, of more than 2,500 ft., is a pleasant one, and the scenery attractive. There are hot and cold springs—a soda spring, and a chalybeate spring. There is a hotel on the premises, and the surrounding grounds are suitable for camping. All the usual conveniences are provided for visitors—bath-houses and a spacious plunge bath. One of the springs is said to contain arsenic, and to have been found decidedly valuable as a remedial agent in chronic cutaneous diseases. An analysis is said to have been made of the Seigler springs for a private individual by whom they were purchased and extensively improved. I have not been able to obtain a copy.

Soda Springs, Shasta County.—So far as has been ascertained, no analysis has been made of these springs. The locality is of frequent resort, not so much on account of the medicinal value of the water, though this is held in high estimation, as for the advantages afforded in their vicinity for fishing and hunting. Prof. J. D. Whitney thus speaks of the springs in his Geological Report, Vol. 1: "There are two groups of mineral springs in this vicinity, one of which lies on the east side of the Sacramento, nearly opposite the mouth of Castle creek; the other is three and a half miles farther up and eight miles from Strawberry flat, at the base of Mount Shasta. The first lies called 'Lower Soda,' the other 'Soda Springs.' The latter are in the canyon of the Sacramento, at an elevation of 2,363 ft., and they are considerably resorted to, the water having a high reputation for its tonic effect, and being reported to have a specific action on the kidneys. The water is a chalybeate, there being an extensive ferruginous deposit around the spring. It is also highly impregnated with carbonic acid, sparkling like soda water, whence the name which is usually given in California to springs giving off carbonic acid, and not to those containing carbonate of soda. The temperature of the water was 52° in September, 1862."

Saline Sulphur Springs.

Tuscan Springs, Tehama County, California.—These springs have long been regarded by the residents of that portion of the State as possessing decided medicinal properties. They are located about nine miles from Red Bluff, on the Sacramento river, easily accessible from the latter by a good road. The locality itself is rough, rugged, and uninviting, being surrounded by evidences of volcanic convulsion, at an altitude of about 600 ft. A hotel on the premises affords plain but comfortable accommodations. There are three principal springs, two of which are used for drinking purposes. They belong to the class of "cold sulphur waters." Bath-houses have been erected, the water being heated by utilizing the carbureted hydrogen evolved. Experience has abundantly demonstrated the efficacy of the Tuscan waters in chronic rheumatism, cutaneous diseases of several forms, and constitutional syphilis. They are also said by Dr. Cameron, of Red Bluff, and other physicians, to be almost infallible in the cure of intermittent fever. They have a strongly saline taste, not unlike the Blue Lick water of Kentucky. They act, in most cases, efficiently upon the kidneys, and, with many, as an aperient. They are exceptional in their composition as containing iodine in considerable quantity. The temperature was determined at 78° to 80° for the "Red spring," 68° for the Black, and 66° to 70° for the White. A partial analysis of what is called the "Red water" gave the following results: Acid, sulphuric; acid, carbonic; acid, hydrochloric; iron, as bicarbonate; lime; potassa, as chloride; soda, as chlorids; magnesia; lithia; alumina; iodine. Quantitative analysis, roughly made, gave iodine to the extent of 0.06 grams per imperial gallon; nearly 25 grains of soda; one gram of lithia; a large amount of potassa.

Alkaline-Sulphur.

Witter Spring, Lake County.—This spring is situated in a deep canyon of the Coast Range mountains, three miles east of the Blue lakes, five miles from the town of Upper Lake, and 15 miles from Lakeport. The scenery is attractive, a fine view of Clear lake being afforded from the surrounding hills. The elevation is not known. There is a good public house, and a number of cottages or cabins for the use of visitors. There are several springs, the principal one, most relied upon by the afflicted, going under the emphatic name of the "Dead Shot," reference being had to its remarkable efficacy in chronic rheumatism, and in skin diseases, scrofulous and syphilitic. It is cold. In addition to the above there is one sulphur spring, which is artificially heated for bathing purposes, and one chalybeate spring.

Pearson Springs, Lake County.—The Pearson springs are located in an elevated valley, about 200 yards wide, between two high mountains. The situation affords superior accommodations for parties camping out. They are about one and a half miles distant from the Blue lakes, 14 miles from Lakeport and one mile west of Witter Spring. The elevation is not known, though it must be above 2,500 ft. On the hillside, east of the valley, are five springs; the most northern is known as the "Sulphur and Soda" spring; next on the south is the "Bartlett" spring, so called from its resemblance to the principal water at the springs of that name; next south is the "Soda" spring; next is the so-called "Gas" spring, this name being applied on account of the large amount of carbonic acid escaping; it is said to be strongly chalybeate; the character of the next spring, the last going south, is unknown. The gas spring is gently cathartic, and its continued use is said to be an excellent remedy in *habitual constipation;* it is also diuretic, and is supposed to exert a specific influence upon the liver, relieving cases of *jaundice.* It has a reputation as a tonic. The "sulphur and soda" spring is resorted to for the purposes to which that class of waters are usually applied, and has the asserted merit of curing obstinate *catarrhal* affections and *sick headache.* It is used more than any of the other waters here for bathing purposes, being artificially heated for the purpose. The "soda" spring is used as a beverage. All these springs are *cold.*

Thermal Springs.

Paso Robles Springs.—These springs belong to the "thermal sulphurous" class. They are so named from their locality being in a *pass of oaks.* The location is in San Luis Obispo county, access being by stage from the city of San Luis Obispo—a half day's ride—or, by the same mode of conveyance, from Soledad. Probably few of the mineral springs of California have acquired a greater or more favorable reputation than these. There are several springs, varying in temperature from 110° to 140° Fah. The water is used for drinking purposes, as well as bathing, and swimming baths have been prepared for both sexes.

The analyses given below show these springs to be particularly rich in bicarbonate of soda and chloride of sodium. They are actively diuretic and diphoretic, and, when liberally used, laxative. They are particularly distinguished for their curative properties in constitutional syphilitic disease, in chronic rheumatism, and in intractable malarial affections.

A number of instances have come under the observation of the writer, in which great benefit has resulted from a course of treatment at Paso Robles in syphilitic neuralgia, and obstinate cutaneous diseases arising from the same constitutional cause. Analysis in imperial gallon:

	Grains.
Free carbonic acid	19.50
Sulphate of lime	3.21
Sulphate of potassa	0.88
Sulphate of soda	7.85
Peroxide of iron	0.30
Alumina	0.23
Silica	0.44
Bicarb. magnesia	0.92
Bicarb. soda	50.74
Chloride of sodium	27.18
Iodides and bromides—traces	
Organic matter	1.64
Solid contents	93.44

In addition to the drinking water and baths at Paso Robles, there are what are known as the mud or "moor" baths, in which the patient is immersed for a certain length of time. They are stimulating to the skin and nervous system, promote the secretions, and have been thought to be particularly indicated in anæmia, chlorosis, old and obstinate rheumatic and syphilitic affections, in chronic hypertrophy of the liver and of the uterus; also, in old indolent skin diseases. The analysis of the mud or "moor" bath of Paso Robles makes its constituents as follows:

	Grains.
Sulphate of lime	17.90
Sulphate of potassa—traces	
Sulphate of soda	41.11
Carbonate of soda	5.21
Carbonate of magnesia	3.10
Chloride of sodium	96.48
Silica	1.11
Organic matter	3.47
Total	168.38

It contains, also, of carbonic acid, 47 84 cubic inches, and of alumina and the protoxide of iron, traces.

Alum Rock Spring, Santa Clara County.—This spring, or rather the several springs to be found here, is located about seven miles from San Jose, in what is known as the Penitentiary canyon, a romantic passage on the western slope of the Coast Range mountains. The locality is a pleasant one, the surroundings wild and romantic, and in the streams near by facilities are afforded for trout fishing; while the hills everywhere abound in quail and other game. There were noted four springs: the first, nearest the house, used mainly for bathing purposes, and running into the bath houses, temperature, 85°; second, what is called the drinking water; third, the sweet sulphur; fourth, also sulphurous, but weaker than the last mentioned in sulphur and acidulous salines. It is not known that any complete analysis has been made of those springs. They are considered beneficial in anæminic and atomic conditions of the system, in chlorosis, in chronic malarial cachexia, and in debilitated states generally.

Ætna Springs, Napa County.—These springs lie at or near the upper end of Pope valley, at an altitude of 1,000 ft. They are easy of access from the town of St. Helena, from which they are 16 miles distant, by an excellent, graded road over Howell mountain. The location is a pleasant one, the surroundings wild and picturesque, and the atmosphere dry and sufficiently equable. Cottages have been erected for the comfort of visitors, while the grounds afford ample facilities for camping. There are two principal springs, seemingly nearly identical in composition. The temperature is 98° Fahr., and the water is used mainly for drinking purposes. Another, with a temperature of 106° Fahr., supplies the bath-house. The two first-mentioned springs are clear and sparkling, carbonic acid gas being seen to be continually bubbling at the surface. There are also springs called "soda" springs, said to contain iron.

The Ætna springs, though open to the public for only a few years, have already attained considerable reputation, and appear to be rapidly gaining the confidence of certain classes of invalids. Testimonials—perhaps a better test of the value of a mineral water than the most elaborate analysis—from intelligent persons, some of them medical men, have been given, of relief afforded by the use of the water in renal affections, rheumatism, neuralgia, hepatic engorgement, and other similar diseases. They have been compared, not inaptly, in composition and effects, to the Eme water of Europe. The following comparative analysis has been published:

Contents in a Gallon.	Ems. Frescnius.	Ætna. Bauer.
Carbonate of soda, grains	84	75
Carbonate of magnesia, grains	7	14
Carbonate of lime, grains	10	10
Carbonate of iron, grains	trace	
Sulphate of soda, grains	trace	8
Sulphate of potash, grains	2	
Chloride of sodium, grains	62	23
Silica, grains	3	trace
Total solids, grains	170	137
Carbonic acid, cubic inches	59	58
Temperature, degrees Fahrenheit	115	98

Skaggs' Hot Springs, Sonoma County.—These springs are located in the Coast Range mountains, 14 miles northwest of Healdsburg, and 8 miles west of Geyserville. The springs and chalybeate well are on the verge of a small "flat," caused by the convergence of the sloping bases of several hills. A hotel has been provided, neat in appearance and well kept, and a number of small cottages for families or invalids, and the excellent accommodations, together with the pure air, the scenery and medicinal properties of the water, render the place attractive. There are two springs of hot water, a small cold soda spring, and a chalybeate well. The principal spring—that most used for drinking and bathing purposes—is situated in the bed of Dry creek, a tributary of the Russian river. It has a temperature of from 130° to 140° Fahrenheit, is clear, sparkling, pungent to the taste, from the large amount of free carbonic acid it contains. This water has been much recommended for rheumatism, sciatica, neuralgia, some forms of indigestion and in chronic diseases of the kidneys. It is believed by the writer to be one of the best springs of which an analysis has yet been obtained, in the indigestion induced by the too free indulgence in alcoholic stimulants, and for the kidney difficulties which complicate such cases. The following analysis was made by Prof. E. W. Hilgard, of the State University; another, made by the writer, giving substantially similar results, is omitted:

	In 10,000 Parts.	Grains per Gal.
Chloride of potassium	0.035	0 200
Sulphate of potassium	0.043	0.260
Chloride of sodium	1 012	5 900
Iodide of sodium	trace	trace
Bicarbonate of sodium	27.672	161.270
Biborate of sodium borax	4 542	26 470
Carbonate of lithium	0.010	0.060
Carbonate of barium	0.040	0 240
Carbonate of strontium	0.004	0.024
Carbonate of calcium	0.377	2.197
Carbonate of magnesium	0.191	11.113
Carbonate of iron	0 009	0 054
Alumina	0.004	0 004
Silica	1.205	7.023
Total solid ingredients	35.144	205.215

White Sulphur Springs, St. Helena.—These springs are located in Napa valley, about two miles from St. Helena. The grounds have been beautifully laid out and ornamented with shrubbery and evergreens, neat cottages have been erected for visitors, and the entire place with its surroundings, is one of the most pleasant of our summer retreats. There are nine springs, possessing substantially the same medicinal properties, varying only in temperature and in the relative proportion of their solid constituents. Of three of these a quantitative analysis has been made by Prof. LeCompte, the result being the following, in a wine gallon.

	No. 2.	No. 6.	No. 7.
Temperature of spring, August, 187	89.6 F.	86.0 F.	69.8 F.
Specific gravity	1.00026	1.00040	1.00038
Solids.	Grains.		
Carbonate of lime	1.25	2.44	5.56
Carbonate of magnesia	0 62	0.56	4 36
Sulphate of soda	8.26	11.23	12 84
Chloride of sodium	21.72	24.41	14 23
Chloride of calcium	1.32	0.86	0.78
Chloride of magnesium	0.87	2.22	0 05
Sulphides sodium and calcium	2 05	1.85	1.02
Total	36.09	42.67	40.04
Gases.	Cubic Inches.		
Sulphureted hydrogen	5.15	4.25	trace

The other springs, of which only a quantitative analysis has been made, possess the same ingredients. The waters are used both internally and for bathing.

These springs belong properly to what are called the "light sulphur" waters. Taking into consideration their temperature, more especially that of Number One, which is used principally for bathing purposes, and which is thought to contain a greater portion of sulphureted hydrogen than the others, we can image them useful for the general purposes to which this class of waters are adapted. At the present time, and under present management, the place is kept rather as a pleasant, healthful and fashionable resort for the wealthy citizens of the metropolis and other cities than as a sanitary retreat. For the former it is delightfully adapted; for the latter it might be profitably employed.

Calistoga Springs.—Nine miles from St. Helena, at the present terminus of the Napa railroad, lies the pleasant locality of Calistoga, 500 ft. above the sea. There are five or six principal springs. They are sulphurous and thermal—the temperature of one which was tested being 97°. The waters are employed both for drinking and bathing, and suitable conveniences for the latter have been prepared. They appear to be similar to those of St. Helena, yet probably lighter, containing less of the sulphureted hydrogen and of the metallic sulphides. They have been used with advantage in the diseases to which this class of waters are suited, especially in rheumatic affections. Like the springs at St. Helena, there is the additional advantage of a good hotel. Analysis yields the following result in each gallon of water:

	Grains.
Sulphureted hydrogen gas—3.271 cubic inches	
Chloride of sodium	32.250
Chloride of calcium	3.263
Carbonate of soda	3.406
Sulph. soda	1.616
Sulph. magnesia	0.466
Silica	6.500
Alumina—trace	
Total	37 501

The above analysis was made by J. F. Rudolph, of Sacramento.

Harbin Springs.—Twenty miles from Calistoga, in a wild and picturesque canyon of the Coast range of mountains, are what are known as the Harbin springs. Here too are numerous springs, possessing substantially the same medicinal and chemical properties. Like the others of which mention has been made, these are thermal, the principal spring having a temperature of 118° at its source. From this the water is led into bath houses, arranged in such a manner that baths can be obtained of any desirable temperature, either hot or tepid, according to the distance from the source of the supply. Connected with each bath are facilities for the application of steam. No accurate

Passing Events.

The event of the week is the decision, by Judge Temple, in the Gold Run suit, which involved the vexed debris question. The vital points are that the miners have no right to deposit material in the water courses; and that they must detain the bowlders, cobbles and heavier sands. The miners will, therefore, be compelled to build dams to hold back this material. The decision is quite voluminous, and we publish four pages extra, in addition to our eight-page supplement, in order to give space for it. Comments on the decision will be found in another column.

This week's MINING AND SCIENTIFIC PRESS contains a large amount of information of an interesting character, and we have been even compelled to defer to another number some matter which we intended giving.

THE *Herald's* Fort Keogh (M. T.) special says: Among the good results of Villard's visit to the West is an order that hereafter there shall be sold to no person more than 160 acres of the Northern Pacific lands. For months past the West, and especially the Yellowstone valley, has been swarming with Eastern speculators buying up large tracts of land to be held for a rise. Villard's order completely checkmates these speculators.

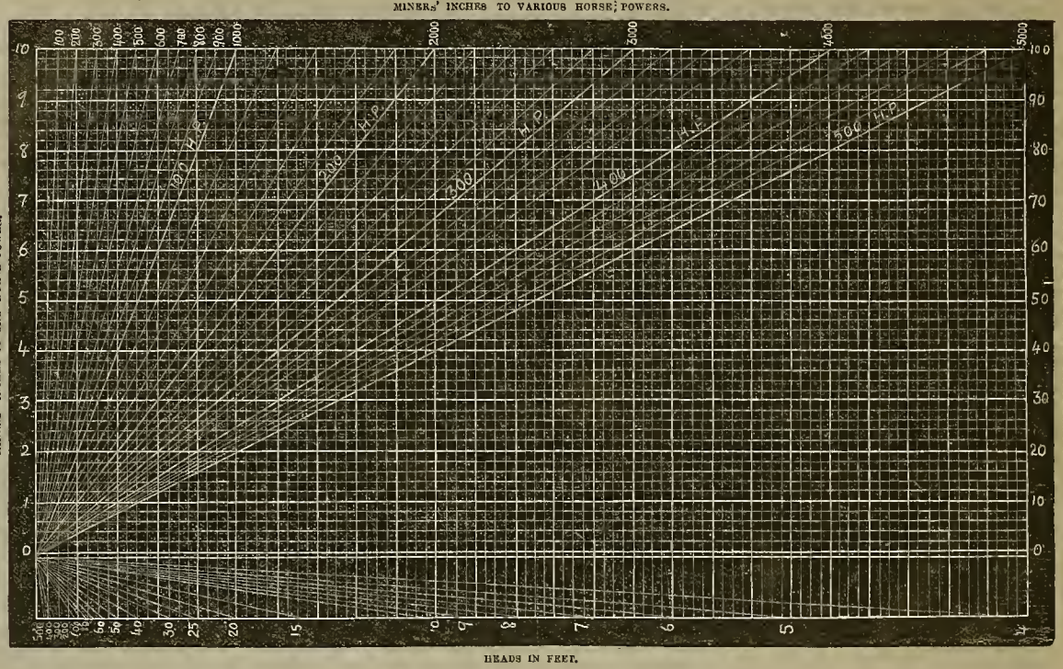
THE Central Arizona Co. (Vulture mine) produced $19,135 during the month of April.

Miners' Inches for Various Horse Powers.

Since the measure of a large quantity of water is most apparent to the mind from a consideration of the size of the opening which is required for its passage at a certain fixed velocity, the miners' inch forms a good standard of measurement. Four miners' inches will permit the passage of sufficient water in one minute to give an effect, with a fall of 100 ft., of one-horse power, at a percentage of 80. The scale on the page here has been constructed upon this standard by the "Union Iron Works," to the proprietors of which we are indebted for the engraving and the following description:

The diagonal lines in the left-hand section represent heads of water from four feet to 500 ft. The column at the bottom shows the number of miners' inches to one-horse power for the various heads. To find how many inches are required for one-horse power at any head, the horizontal line occurring at the intersection of the line on the right with the margin, is followed to the diagonal marked 500 HP. The perpendicular line at this intersection is followed to the column of miners' inches, where the amount is indicated. Thus, with ten feet head, the horizontal line at the intersection with the margin is followed to the line marked 500 HP. Here a vertical line intersects, which, on being followed to the column of miners' inches, indicates 40 inches to one-horse power.

The remaining portion of the scale is simply a scale of multiplication. The diagonals represent horse powers from 10 to 500. The perpendicular lines represent miners' inches to one-horse power, and are numbered from one up to ten. By following the line of inches to the line of the horse power, and then taking the horizontal line to the margin at the right, the number of miners' inches for the horse power are found indicated in the margin. Thus, four inches followed to 300-horse power and then carried to the margin at the right, indicates 1,200 inches. The result may also be found by one operation. Suppose that there is required the number of miners' inches necessary to 200-horse power at a head of six feet. The horizontal line followed from the intersection of the six-feet line on the left margin, to the line 500 HP., gives the vertical line of 64; this line carried to the line of 200 HP., gives the horizontal line of 1,280; but, since the line of 64 has 10 times the value at the end from which we have worked that it has at the other end, the horizontal line will in this case have a value 10 times as great as the margin indicates. This will make the result 12,800 inches for 200-horse power at six feet head.



FIVE men arrived at Mullan tunnel, Montana, a few days ago. They said they were destitute and anxious to work. The superintendent gave each man an ax, with instructions to go into the timber and chop wood. Five days they came and went, looking each evening like men who had done an honest days' work. The sixth day arrived, but the five hewers of wood were missing. Failing to find them, the superintendent went into the timber to see how much wood had been chopped. His disappointment can be imagined when not even a chip was visible, but in a cosey nook five beds of the softest pine boughs were found.

THE Greenville *Bulletin* says good miners are in demand there. Plenty of men to work are there, but few of them understand mining.

THE railroad shops in Sacramento employ over 1,500 men, and in a short time this number will be increased to 2,000.

The Debris Decision.

The decision in the famous Gold Run suit, which we give in full in a supplement to this number of the MINING AND SCIENTIFIC PRESS, is a "setback" to the miners; but it is by no means as bad as it might be, or as bad as a mere casual reading would lead one to infer. An analysis of the decision is much more encouraging to the miners than appears at a glance.

The immediate effect will be to depreciate the value of gravel deposits temporarily, and to temporarily depress the mining interests of the State. It will bring down the value of the bonds of the mining companies, depreciate their stocks, and cause them more or less embarrassment, in one way or another.

The case will be appealed, of course. A new trial will be applied for, which will be denied, and the case will then go to the Supreme Court of California. There are several technical points to be made in the appeal, among them the question of the competence of the Attorney-General to bring the action.

The decision gives the miners the right to continue mining, *provided* they impound or detain the bowlders, cobbles and heavy sand, which can easily be done. As a matter of fact, in the Gold Run mine, none of this sort of material came down at all. The judge says himself it will take 12 to 20 years for the material to reach navigable waters. The miners can soil the waters with lighter mud if they so choose, and they cannot be prevented from doing this.

The general conclusions of the decision are perhaps correct. The miners will accept the decision as rendered with fairness by an able judge. The trial lasted many weery days, and an immense mess of contradictory testimony was presented. Experts on both sides testified voluminously. All this the judge had to thoroughly digest, separate the "wheat from the chaff," and there is no doubt, from reading the decision, that the gentleman has given the whole subject close study, careful attention and impartial judgment. Partisan feelings may bring other conclusions, but a careful reading of the decision will convince most persons that, whether right or wrong in the abstract, the conclusions are evolved from arguments duly weighed and considered

Nine out of ten of the mines are prepared to control their heavy gravel, rocks and sand. In fact, nearly all can do it, and will construct such dams as will keep back the heavy material. They will comply with the decision the more cheerfully, knowing that the expenses for so doing will not exceed those of litigation.

The main point of the decision, as we understand it, is this: The miners claimed a prescriptive right to dump the tailings into the stream. The effect of the decision is, that no such rights ever existed or were acquired. The miners thought they had this right, and exercised it in good faith. Judge Temple now decides that they had not; but, at the same time, he says they can carry on their industry, provided they restrain the heavy material.

Temporarily, capital will be withdrawn from the hydraulic mining industry, until the whole question is settled.

We venture to predict, however, that this will not affect the gold product of California for more than one year. During that time such dams will be constructed as will comply with the conditions of the judgment.

The judge has tried the whole case on the *known* damage on Bear and Yuba rivers; and he admits that, as far as the Gold Run mine is concerned, he is "unable to say that this mine, without reference to the debris from other mines, materially contributes to the evils mentioned; or, in other words, if there were no mining operations save those of the defendant, I am not prepared to say that it would materially injure the valley lands or the navigation of the river. It is the aggregate of debris from all the mines which produces the injuries mentioned in these findings."

This paragraph shows that if the miners had confined their defense to that particular mine, the suit would probably not have been lost. But the miners have been liberal in this matter and have met the issues broadly and fairly.

There is a sort of panic just at the moment among hydraulic miners, of course, but second thought will convince the most despondent that if the decision says they must impound the heavier material, it also gives them the right to let the lighter material pass on. It is not the heavy material of which the farmers complain so badly. If the miners contended that they had vested rights to dump tailings into the water courses, and the judgment is that they have not, the same judgment says they can soil and muddy the waters if they choose.

There are now some 32 of the larger hydraulic mines under injunction, but they are all working. Dams will be built, jointly or separately, and it is not probable the mines will shut down. By taking the proper means, the industry is allowed to proceed, and the radical measures prompted by those who contend that the whole business shall be stopped, are, of course, to be thrown aside, and have received judicial rebuke.

The decision is, in effect, a judicial enunciation of the doctrine that the miners cannot empty their sand into the streams. The miners contended they had vested and prescriptive rights to do this. Judge Temple says they have not. The decision not only settles the question as far as this court can settle it, but also does something unusual for a judicial document, viz., suggests the remedy for the evils complained of.

THE CHARGES AGAINST COL. MENDELL.—The Executive Committee of the recently formed Anti-Debris Association met at Sacramento last week, and evolved some very curious resolutions. The principal business, however, appeared to be to adopt a memorial to the Secretary of War, asking the dismissal of Col. Mendell, of the U. S. Engineers, mainly on the ground of his having been accessory to fraudulent surveys of the bay of San Francisco. Of course, such a charge, to those who know the gentleman whose integrity is assailed, is simply absurd. The Miners' Association had, some time since, a trip on the bay, to ascertain the character of the deposits, and samples of the bottom were taken. Mr. Randall, Mr. Skidmore and Mr. Smith, all officers of the association, took the samples. A number of newspaper men and engineers were invited guests, among them Col. Mendell. There was no survey made at all. The trip took one day only. As the samples of deposits were never submitted in court, and Col. Mendell was not called as a witness in the case, it is hard to see what he had to do with it. The gentleman was instructed by the War Department to make a report on the navigable rivers and the debris, which he has done in an impartial and intelligent manner. Because his conclusions do not agree with those of men who have a superficial and biased knowledge, his removal is asked. It is not probable the matter will be heard of again, as Col. Mendell stands high as an officer and a gentleman, and a man of sterling worth, integrity and conscientiousness.

Shaft Sinking.

An Interesting Account of a Difficult Job.

In the Columbia School of Mines *Quarterly* appears an extract from a memoir of Messrs. Vondy and Emrich (by R. H. Vondy), giving an account of shaft sinking under difficulties. It is stated that, had these difficulties been anticipated from the start, no doubt some other plan of work could have been adopted. The shaft referred to is shaft "B," Barnum mine, Ishpeming, Mich.

In the month of June, 1879, a diamond-drill hole was bored 750 ft. west of the present location of shaft "A," and 75 ft. north of the location of shaft "B." A thick bed of iron ore was reached at a depth of 266 ft., which, it was thought, could be worked profitably.

Having succeeded in sinking shaft A to a good depth, it was decided to sink another, for two reasons: first, that it would be more economical to work with two shafts than with one; and, second, that in case of any accident in the mine, or in one of the shafts, the miners would have the other to escape by.

The quartzite and the ore-deposits are here covered by a bed of sand, 102 ft. thick. The first bed, which is of lean ore, is 170 ft. 8 inches below the surface of the quartzite and is 3 ft. 6 inches thick. The next bed, which is good ore, is at a depth of 242 ft. 4 inches, and is only 8 inches thick, under which lies a bed of ore mixed with chlorite, which is 26 ft. 10 inches thick, and under this again (261 ft. 1 inch below the ledge) lies the bed of good ore, which is 26 ft. 5 inches thick.

On January 26th, 1880, the company commenced the sinking. The ground was leveled off, and cedar logs, 40 ft. long and 9 inches in diameter, were laid in two horizontal layers (the logs in one layer lying across those in the other) in such a manner as to leave a space in the center about 14 ft. square; then 4 large pine timbers, 16 inches square and 40 ft. long were laid across these, the second two lying at right angles with the first two, leaving a clear space in the center 12 ft. square.

The 40 ft. square of cedar logs was intended as a foundation for the shaft-house and also to support the large cross-timbers from which the timbering of the shaft was suspended.

The shaft house is 19 ft. 6 inches square at the base, 12 ft. square at the top, and 22 ft. high. It consists mostly of 12-inch by 12-inch timbers.

The sinking was commenced by driving 3 inch planks down into the sand, outside of the 16 inch timbers, and shovelling the sand from the inside space as the boards went down until a depth of 5 ft. was reached, when the first set of timbers was put in place. These were 14 inches square and 14 ft. 4 inches long, and when put together left a space 12 ft. square inside. The timbers were held in position by 16 iron bolts 1¼ inch in diameter and 6 ft. 6 inches long, 4 to each timber. They went through holes in the large foundation timbers and through holes in the first set below, when the washers and nuts were put on and the timbers drawn up until they were squeezed firmly against 4 pine blocks, 14 inches square and 4 ft. long, set on end, one at each corner. This set being firmly placed, the sinking was continued until a depth was reached at which another set of timbers had to be put in, this set being suspended from the set above in exactly the same manner as before.

This continued until the first set of sheeting-boards had reached its depth, when the boards had to be driven from the inside and the regular fore-poling system was adopted. The poling-boards were made of hard wood and were about 7 ft. long, 2 inches thick, and 8 inches wide, sharpened at the entering end. There was a set of round timbers, 9 inches in diameter, put in midway between every two sets of square, to give the poling-boards the necessary support and also to guide them; but, as they were not needed after the poling-boards had left them, they were taken out and used over again below. When the wedges between the lower ends of the poling-boards and the timbers were taken out, and a new set of boards started, there still remained a 3-inch by 6-inch plank between the boards to keep them apart. See Fig. 3 of plate.

This system worked very well, and by the end of February about 31 ft. of sand had been taken out, but after sinking a little deeper, quicksand was met with, and with great difficulty the shaft was sunk about 10 ft. lower, when the water and sand rushed in from below, and filled up the bottom of the shaft so quickly that the men just escaped with their lives.

When the water and sand rushed in at the bottom, the whole structure, shaft-house and all, commenced to sink with a terrible groaning and cracking noise, and it did not stop until it had sunk about 5 ft. or more.

After a short time the damages were repaired, the pumps started, and the shaft was soon free from water; then the workmen went down and began to take out the sand that came in, but when they got down to about the same distance from the bottom as they were before, the sand and water came in again with the same result, the workmen having a narrow escape, and the structure sinking about the same distance as before.

Before work could be resumed the shaft-house had to be raised some, and timbers 12 inches square crossed under it; then the operation already described was repeated, with exactly the same results as before.

A thorough examination of the timbering was then made, and it was found to be very much strained and twisted, and it was then decided to change the system of sinking.

The next plan adopted was to sink an iron caisson by weighting it and then pumping the water out and allowing it to rush in again, thus making room for it to drop down by the displacement of the sand. The larger part (48 ft. in length) of the caisson was made during the month of August. It is 10 ft. 6 inches in diameter inside, and consists of sections or rings four feet high, each section being made in three parts. The sheet iron of which it is made is one-half of an inch thick, and each part has a three-inch flange all around its edge, so that it can be fastened securely to the parts on each side of it, and to the sections above and below. The flanges are braced by angle irons three-sixteenths of an inch thick, and the parts forming the sections and the sections themselves, are bolted together by ¾-inch bolts, four inches apart between the centers. To keep it from leaking, pieces of ⅜-inch hemp rope, well tarred, were placed between the flanges before fastening them. A steel section, one foot high and in three parts, was fastened on the bottom by rivets. Its edge is quite sharp, and it projects about six inches below the sheet iron.

When a number of sections of the caisson were ready, they were put together, one by one, directly over the shaft, and as the work proceeded the caisson was lowered, and when it stood on the bottom there was about two feet of the sixth section above the water; the remaining sections were then put on, making 12 in all, and the timbering commenced on the inside, beginning at the bottom and proceeding upward, the bottom timbers resting on the lower flange of the seventh section, which is 24 ft. from the bottom of the caisson.

The timbering was so arranged as to leave a clear shaft with a cross-section of nearly five feet by nine feet, and the spaces left on each side of this were closed in with thick plank and ailla placed across, every eight feet. These cells were filled, as the timbering proceeded, with old iron, poor ore and any heavy substance that could be found, care being taken to keep the weights on each side as nearly equal as possible.

The ladders were fastened vertically against the timbers at one side of the shaft, and a pump was placed in the shaft in a small space left for it in one of the cells, a little above the level of the water, and the discharge-pipe arranged so as to empty the water into a launder, which carries it off to the swamp.

When everything was ready the pump was started and the water all pumped out, and a number of men set to work to send up the sand, which they continued to do until they nearly reached the bottom of the caisson, at which point the sand and water rushed in, the caisson sinking as the sand was carried from under it, until it had settled about 10 ft. The workmen, always being on the watch for this occurrence, escaped without much danger.

The pump was again started, the shaft pumped dry, and the excavation resumed; but the sand became more treacherous and the men had more difficulty working with it. Consequently, the results were not nearly so good, and the work progressed very slowly. It was, nevertheless, continued until a depth of 58 ft. was reached when, after a hard and long struggle, a further drop of two feet was accomplished.

It was now discovered that the valves of the pumps were completely worn out by the action of the sand passing through them, and before proceeding a new pump had to be procured, which was ordered to be made very large and so constructed that it could pump sand mixed with water without injury to the valves. As the pump had to be made it caused a great delay, but as the men were needed to repair damages done to shaft *A* by a fire, they were kept at work in the meantime.

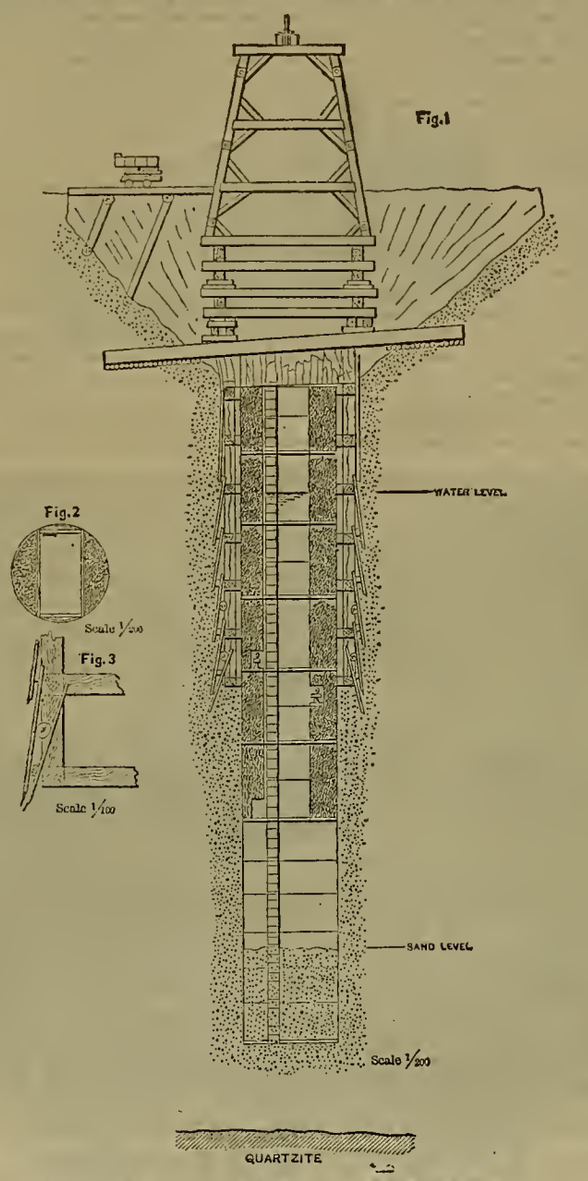
As the caisson stands now, it is 71 ft. long, new sections having been put on at different times. The last or top one is made of ¼-inch plate, and is only three feet high, but it will have more than one foot of its length out of the water when the caisson rests on the ledge. The timbering has been carried up to the top and all the cells loaded. The total weight of the ballast is about 75 or 80 tons.

The top of the caisson is 21 ft. below the grass level, and the bottom is only 10 ft. from the ledge, but the sand is about 10 ft. deep in the bottom of the caisson, and the water is within 11 ft. 6 inches of the top.

There are two pumps still in the caisson; one is a No. 5 Cameron, which is 18 ft., and the other is a No. 8 Knowles, which is 22 ft., below the surface of the water. The supply pipe, which is two inches in diameter, is not large enough, and will have to be replaced by a larger one; but the discharge pipes, four inches in diameter, and the exhaust pipes, two and one-half inches in diameter, are all in good order and can be used again.

The large foundation timbers have sunk down about 18 ft. in the sand, and having sunk faster on one side than on the other, have consequently broken the iron rods on one side which held the timbers together, and made it necessary to block up the shaft-house so as to get it plumb again.

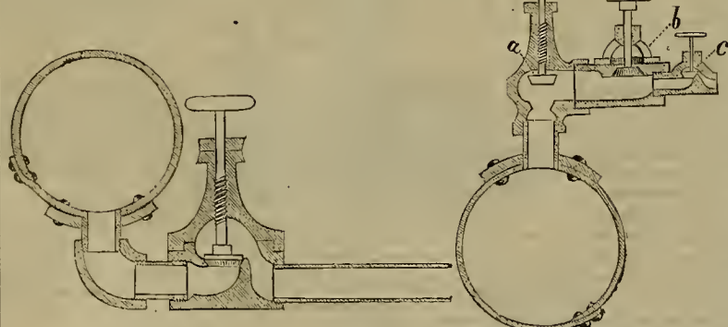
Arrangements had been completed for the repair of these damages, and to have things ready to resume work when the new pump came. This was expected about the first part of August.



SECTION SHOWING METHOD OF SHAFT SINKING.

Blow-Offs and Air Valves in Hydraulic Pipes.

We give herewith engravings showing the method of regulating the air in pipes in use by the Virginia and Gold Hill water works. At their water works the body of water passed through an inverted syphon over seven miles long on very irregular ground, in doing which the enormous pressure of 1,720 ft. has to be overcome. This pipe now contains the greatest pressure of any in the world. The average diameter is 11½ inches. At the point of heaviest pressure the iron is No. 0 thick, and is but riveted with five-eighths inch rivets. The pressure is 1,720 ft. perpendicular, or 750 lbs. to the square inch. This pipe crosses a great many sags and spurs, and devices had to be arranged to relieve the air. Fig. 3 shows the blow-off used in every low place, and Fig. 4 shows the self-acting air valve. The latter is used at each high point on the line of pipe. When the water is on the valve, *a*, is kept wide open; the small valve, *c*, is shut while the valve, *b*, is shut by the pressure. If any air accumulates in the pipe, on the elevation where the air cock is placed, it is occasionally blown off by opening the cock, *c*. Should a break occur in the main pipe line at a point lower than the air cock, and within its district, the valve, *b*, falls down and admits the air into the main pipe so as to prevent a vacuum. Should the valve, *b*, get out of order, the valve, *a*, is shut and the other valve, *b*, taken off and repaired. After a break on the main line is repaired, and the water let on again, the valve, *b*, being, down or open, the air rushes out at *b*, its stem being weighted by the weight, *d*, so as only to close when the solid water commences to rush out.



BLOW-OFF USED IN LOW PLACES. SELF-ACTING AIR VALVE.

When Como Comes Out.—The Carson *Appeal* says: "The most sanguine miners in the State are those of Como. They frequently visit Carson, telling big stories of their expectations." No person ever saw an old Comoite that was not hopeful for the future of Como—always talking about "when Como comes out." But Como never comes out with the bullion.

The Mineral Park mill, Mohave county, is running in full blast, and turning out about $1,000 daily in silver bullion.

THE BALDWIN HOTEL, SAN FRANCISCO.

The Baldwin.

BY J. C. H.

San Francisco, the emporinm of the empire of the Pacific coast, is second to no city in the United States in msgnificent and well-appointed hotels. Standing at the head, without an eqnal in design, elegsnce and comfort, the "Baldwin," of this city, is what the Palmer house is to Chicsgo, and the Fiftb Avenne hotel is to New York. Mr. E. J. Baldwin, one of onr enterprising and public-spirited, active bnsiness men, by secnring the aid of the leading artists and builders of this conntry and Europe, has succeeded in erecting and fnrnishing, at a cost of $3,500,000, a hotel which is the pride of a great city and the resort of the cultnred and refined people of this State and the resting-place for the tonrist and traveler.

As onr engraving shows, this pslace of luxnry is bnilt in the French Rennaissance style of arohitectnre, having six stories, inclnding the Mansard, and so designed as to carry np each bay window projection a completeness in itself —the entire faces being banded and held in unity of design by belt corses, cornices and balustrades. These faces, or bays, form the entire facade of the building, and alternate in size according to the external and internal arrangements; the lsrge bays having side windows opening into the parlors of the various suites of rooms, while the smaller bays serve to light the front chambers. One of the striking features of the design as carried ont is, that the Mansard finish of the bays gives two or three different hights or elevations, according to the location, as affecting the symmetry of outline; and also varying in size and design in the same ratio as regards their hight.

The dome surmounting the angle of Market and Powell streets is hexagonsl in plan at the hase, and is carried up to the apex in the same general form; this contour being made to snit the angles formed by Market, Powell and Eddy streets, which form the three sides of a hexagon. The hight of this main dome above the pavement is 168 ft. It contains in itself five stories and a bull's-eye or lookout at the top.

The principsl dome on Powell street has an altitude of 120 ft., and is of the same general design as the one jnst described. It is, however, sqnare in plan.

The fonr extreme angles of the fronts are carried np into towers, baving two stories and forming ontposts, showing to great sdvantsge shie trnly immense architectnral display contained within them. No pen can do justice to the snbject. A carefnl and prolonged view mnst be had to obtain any idea of the extreme beanty and finish of the entire etructnre. Tbe lot occnpies the irregular-ehaped lot bonnded by Market, Powell and Ellis etreets, and has a frontage of 184 ft. on Msrket, 25 ft. on Eddy, 275 ft. on Powell and 138 ft. on Ellis etreet. Tbe basement of the building is entirely brick and iron. The outside walle have a thioknese of 3 ft. 2 inches, with footings 9 ft. wide. The interior walls and walls of the theater have a thickness of 3 ft. 2 inches, with footings 7 ft. wide. All the piers are ospped with granite slahs 10 inches thick, sub-basing the iron work of the firet etory. All cross and partition walls and interior supports are of briok laid in cement, and 10-inch cast-iron heavy colnmns, no woodwork whatever being nsed in basement. The sidewalk, vaults, boiler and engine-rooms, coal-bunks, etc., all conetruoted of iron beams and brick arches. The first story of building ie entirely iron, both the exterior and interior colnmns, the exterior front being donbled, having 12-inch heavy cast-iron columns, with 12 inch cast-iron sqnare pilasters. This frontage is capped and surmonnted with a row of heavy csst-iron lintels of the "Hodgkinson pattern," 26 inches high, 22 inches wide, and with an average thickness, of two-inch metal with donble heads, bolted together with wrought-iron holts; thus making the entire circnit of the building 622 ft. at the first story, one solid, heavy mssa of bolted metal, and of the best quality standard American Eastern iron, a qnslity which is not used in San Francisco only under direct and special specifications. This is the first outside msin brace or tie against the effect of earthqnakes. The wooden partitions in the first story between stores, sre dividing and not sustaining works, and are made of this material to contract or extend the size of stores, as occasion and the march of improvements may hereafter demand in this new quarter. The rear walls, cross walls, and walls of all permanent divisions, are of brick laid in cement, and are 2 ft. 2 inches, 21 inches and 13 inches thick, from the first story iron lintel course upward.

The entire outer walls and superstructure to roof and domes can be drenched with a stream of water, requiring the attention of no fireman or attendant from the stories below. Two artesisn wells, capable of snpplying 71,000 gallons daily, exist in the basement; this, with a reservoir, with a cspscity of 60,000 gallons, in the basement, and tanks on the roof holding 82,000 gallons, give an immediate supply in case of necessity of 205,000 gallons.

Uniting utility and art in every department, with a cuisine presided over by a master, this pslace of lnxury has as patrons the noted personages of the world and the elite of our city. The lsrge number of sunny suits, with snrronnding appointments, has made this the popnlar place for families who desire the comforts of home and the luxuries attending a first-class hotel.

Connected with and a part of this grand edifice is

Baldwin's Academy of Music,

Which is the leading place of amusement of San Francisco. In its contour, arrangement and interior finish, decorative art, architectural design and elegant embellishments, have produced a gem of art combining comfort with luxury that reminds one of the oriental mag-

THE BALDWIN HOTEL, SAN FRANCISCO, CAL.

nificence of the palmy days of the Roman and Eastern empires. The Baldwin is situated in the heart of the city. The stores and hotel accessories are among the best, and, in many respects, the most attractive in San Francisco. The hilliard saloon, containing eight tables of the finest pattern, is the chief resort of disciples of the cue and of leading business men for recreation.

Barber Shop and Baths.

Messrs. Lampe Bros. are the proprietors of the Baldwin barber shop snd baths. This tonsorisl department and baths are, in their appointments and msnagement, equal to any in the United States or Europe.

Baldwin Cigar Store,

Of which Schlesinger & Green are the proprietors, import the best brande of Havana cigars, which are carefully selected to suit their patrons. They make a specialty of supplying choice brands by the box, and are the sole agents for the celebrated "Baldwin" 10-cent cigar.

Baldwin Clothing House,

Of which Psuson & Roman are proprietors, has a line of gents', youths' an l hoys' clothing and furnishing goods of a varied assortment, and of the finest quality. Tourists can find in this leading clothing house all the latest etyles and patterns to make up any kind of an outfit.

Millinery.

In this line, Mrs. A. Bassler & Mrs. E. L. Hevener have established a millinery palace snited to the place they occupy and their genteel pstrons. They are direct importers of French millinery, and are second to none in San Francisco as artietic and fashionable milliners. Having a large stock, they make a specialty in furnishing choice goode for interior cities and the conntry.

The Tallac House.

The attention of excursionists and tourists is called to the Tallac house, which has lately been thoroughly renovated, improved and furnished. This fine summer resort is beautifully located on the southern and sheltered side of Lake Tahoe, nesr Emerald Bay Soda Springs, Fallen Leaf and Cascade lakes, and amid magnificent scenery, shady groves, grassy meadows. Broad verandas encircle the honse; Chinese lanterns adorn the groves; swings, croquet, lawn tennis and archery gronnds; with fine drives through the valleys; good trout fishing; horses, carriages, boats and fishing implements at the command of guests. The table will be first-class in every respect. Billiard tables, piano, dance hall, and, in fact, everything possible for the pleasure and comfort of patrons will be found at the Tallac house. This well-known resort is now open. Fare from San Francisco, via Truckee, is $16.50.

Lake Tahoe.

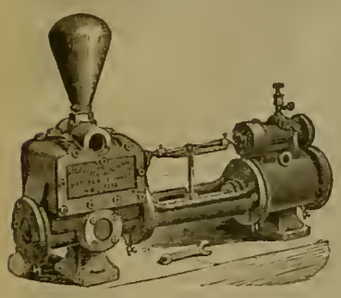
This lake is 1,700 ft. deep, is on a line between California and Nevada, is ice-cold and of crystalline clearness. Although hundreds of millions of gallons flow off through the Truckee river every day, the snpply is ever kept np by melting snow and great subterrsnean springs. Its fine b aches and shore groves of pine make it the most picturesque and attractive lake in the world. While calm, it is one of the loveliest sights conceivable—serenely beautiful—but during mountain storms its glassy bosom is lashed into white-crested billows, which dash in fury on its pebbly shore. To nnderstand its beauties, one must go there and spend some time. The route from San Francisco is via C. P. to Truckee, 259 miles, stage 14 miles. Passengers coming from the East and desiring to visit the lake, should leave the C. P. R. R. at Reno, then via V. & T. R R. to Carson City, and thence by Benton's stages, 18 miles, to Glenbrook, on the eastern shore of the lake, from which a steamer runs to the Tallac house, at the southern end of the lake, a fine hotel with magnificent surroundings. This house is owned by Mr. E J. Baldwin, of the famed Baldwin hotel.

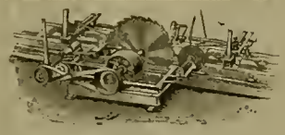
Tahoe trout, fresh from the cold waters of the lake, are served at every meal, and the visitor will find smple facilities in the way of boats and tackle to try his hand at the enticing sport of capturing the fish himself. It is in the form of a parallelogram, lying northeast and southwest, partly in Nevada and partly in California. At a distance of three miles from shore its depth is from 1,000 ft. to 1,200 ft. The greatest depth yet found is 1,800 ft. The water is so transparent that trout and other objects can be seen at the bottom, where the depth is from 80 ft. to 100 ft. Owing to the rarity of the atmosphere the water has little buoyancy. In order to swim in the lake one must be very industrious. Nothing is ever seen floating on the lake but boats or rafts of logs in transit. Stray logs, driftwood, and even shingles soon sink. The bodies of persons drowned in the lake never rise—are never seen again.

This celebrated lake is about 25 miles long by from 10 to 14 miles wide, and it forms a miniature inland sea. Its elevation above the sea is 6,700 ft., and the mountains which surround it are covered with snow for eight months ont of the twelve; its water never freezes, but remains about the same temperature throughout the year.

Grand old mountains stand about the lake like sentinels. Here is a feast of mountains for such as hail from level lands. On all sides they tower—mountains that are pine-clad and mountains that are hut stupendous piles of rugged granite. It is a region of granite. To the west rise mountains cold and stern, covered with snow, while on the north and east are mountains clothed in groves of pine, fir and spruce. The entire distance around the lake is 144 miles.

Lake Tahoe is the great sanitarium of the Pacific coast. It possesses climate, scenery snd means of health-giving pleasure to the careworn and debilitated, far ahead of any other place of resort. The business man is bound to forget his business while here. The scenery is too grand, the air too quieting and dreamy to allow business cares to absorb the attention.



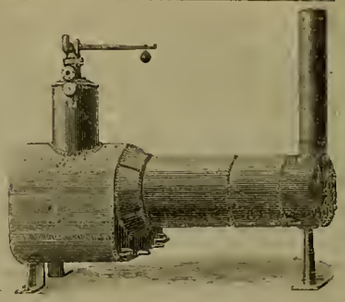


TATUM & BOWEN,

No. 12 California street, - - San Francisco;

—AND—

187 FRONT STREET, PORTLAND, OREGON.



MANUFACTURERS OF

Corliss and Slide Valve Engines,

BOILERS, HOISTS,

Sawmill and Mining Machinery.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition, 1880), and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. A valuable and carefully written work. Postpaid, $3. Sold by Dewey & Co., S. F

AARON'S LEACHING GOLD AND SILVER ORES.—The most complete hand-book on the subject extant, 164 pages octavo. Illustrated by 12 lithographic engravings and four woodcuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by Dewey & Co., S. F.

PHILLIP'S EXPLORERS' AND ASSAYERS' COMPANION (Third Edition). Price of Vol. I, post-paid, $6. Sold by Dewey & Co., S. F

COPP'S AMERICAN MINING CODE, to replace Copp's Handbook of Mining Laws, now out of print United States, State and Territorial Mining Laws and Land Office Regulations; Digest of Land Office and Court Decisions; List of Patents Issued, and Dr. Raymond's Glossary, with Forms for Mechanics' Liens, Location Notices, etc. Price, postpaid, in paper, 50 cts. Sold by Dewey & Co., S. F.

THE EXPLORERS' MINERS' AND METALLURGISTS' COMPANION, by J. S. Phillips, M. E., comprising a practical exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy, containing 672 Pages and 33 Engravings. Price, bound in cloth, $10.50. Sold by Dewey & Co., S. F.

CHURCH'S "COMSTOCK, LODE, ITS FORMATION AND HISTORY."—Illustrated with diagrams and colored charts showing sections, ore bodies, etc. Post-paid, $7.50. Sold by Dewey & Co., S. F.

U. S. MINING LAWS AND COAL LAND LAWS.—Containing instructions and blank forms. Postpaid, 50 cents. Sold by Dewey & Co., S. F.

MINING, ENGINEERING, MECHANICAL, FARMING, SCIENTIFIC, INDUSTRIAL AND NEW BOOKS in general can be ordered through Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, S. F., at publishers' rates.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

The Mineral Springs of California.

(Continued from Page 391.)

analysis has yet heen made of the water, though an imperfect qualitative analysis is said to show the principal constituents of the two main springs to he, of the one, magnesia and soda, and of the other, the additional ingredient of iron, hoth heing impregnated with sulphnreted hydrogen. The Harhin springs are believed to possess the virtues of the weak thermal earthy-saline and chalyheate-saline sulphurons waters. Several obstinate cases of rheumatism, in the chronic stage, coming under the observation of the writer, have been materially benefited hy them, and they have been much recommended in some chronic uterine disorders, such as metritis with hypertrophy. As with most of our springs, we find, from personal observation, as well as from the reports of others, that no system or order is observed hy those nsing the water. Each visitor is free to exercise his own judgment, which he often does to his serious injnry.

Agua Caliente, or Warner's Ranch Springs.—These springs, which have acquired considerable celebrity in the southern part of the State, are located on what is known as Warner's ranch, in San Diego county, ahont 50 miles from San Diego city. They are thermal-sulphur waters, and are much resorted to hy those suffering from rheumatism, cutaneous diseases and dropsy. At the present time they are in charge of Indian families, who provide rude hnt, it is said, comfortable quarters for those who prefer not to camp ont. By the Indian nations of the conntry the Agua Csliente springs are regarded as affording an infallible remedy for all bodily ills; and an intelligent friend who visits the locality annually has informed the writer of what are supposed to he remarkable cures of chronic renal and hepatic diseases.

San Bernardino Hot Springs.—These springs, which belong to the calcareous thermal class, are situated five miles from the town of San Bernardino, and ahout 60 miles from Los Angeles, in an easterly direction. They are easily accessible hy the Southern Pacific R. R. from Los Angeles to Colton, and thence hy stage. They lie on the side of the San Bernardino mountain. There heing no other availahle account of theee springs, I sgain extract the report of W. F. Blake from the paper of the late Dr. Logan: The warm and hot waters gush out from the granitic rocks on the flanks of San Bernardino and adjacent hights. In one place the springs are so numerous, and the water rises in such volume, that a good-sized mill stream of hot water is formed, which flows down into the valley, and is one of the principsl tribntaries of the Santa Ana river. This brook of hot water retains a temperature of 100° Fahrenheit three or four miles from its source. In the immediate vicinity of the springs, however, no vegetahle growth was visihle. The rocks and gravel in contact with the water were covered with a snow-white incrustation. The white crust was not found in eqnal qnantities at all the springs. It appeared to he most ahundant at one of them. * * * An analysis of the crust, hy J. D. Easter, Ph. D., since the retnrn of the expedition, gave the following results: The aqneons extract contained ouly a small proportion of chloride of sodinm. In hot hydrochloric acid, the mass dissolved with strong effervescence, leaving a residue of silica and alumina. The solution contained: Lime (carhonate), chief constituent; silica (soluhle in acid); magnesia; alnmina and oxide of iron, traces; phosphoric acid, trace.

Gilroy Spring.—This spring is located in the mountains of Santa Clara county, ahont 30 miles from the town of Gilroy. The access from San Francisco is hy the northern division of the Southern Pacific R. R. to Gilroy, thence hy stage to the spring. The spring—for there is hut one principal spring—is situated in a little mountain valley snrrounded hy hills. The latter are harren and uninviting, except for the artificial adornments which have heen made hy cnltivation immediately around the spring. The spring itself is located near Coyote creek. The water is clear, hot, containing, according to an nnauthenticated analysis, snlphur, magnesia, iron, arsenic, and iodine. It is used hoth for hathing and drinking. Gilroy spring has a wide reputation for its efficscy in rhenmatism and cutaneons diseases, and has become a place of fashionahle resort. The locality presents ahundant sources of amusement and recreation —trout in the creeks, game of all kinds in the hills. The accommodations at the hotel, hoth at the tahle and in the sleeping apartments, are excellent.

Howard Springs, Lake County.—These springs are located ahout five miles from the "Adame" spring, and one and a half from "Seigler," about five north from "Harhin's" in a direct line hy trail. They lie in a flat or hasin at an altitude of 2,220 ft., surrounded hy hills covered with luxuriant pines. There are said to he 14 springs, hot and cold; the temperature varying from 58° to 109° Fahrenheit. Oue called the magnesia and potash spring, hot; a warm spring, said to he very strongly chalyheate, with some sulphur, hut which is highly ehsrged with carhonic acid; a "horax" spring, a "silica" spring, an "alum" spring, and others. All of these have heen named in accordance with the supposed predominance of some particular ingredient, there having heen no analysis made of any of them. Excellent hathing facilities have heen provided; a hot plunge hath, the temperature being not lese than 95° or 98°, and six hathhouses arranged in line, in which water of any ieired temperature may he obtained. Number one, the hottest, is said to he about 98°; number two, slightly less warm, and so on to nnmher six, which is cold. There is, in sddition, a very cold, sparkling and effervescing "soda" spring, so called, hut which is clearly acidnlous, which is much nsed as a heverage with syrup, or with the addition of a little hicsrhonate of soda and syrup, when it is drank during effervescence. The diseases for which these springs have heen recommended are mainly rheumstism, dropsy, renal and hepatic diseases. There is abundant evidence of their ntility in dropsy, dependent upon Bright's disease, and in nterine congestion.

Bonanza Springs, Lake conuty.—The locstion is upon the monntain side, among pines which surronnd and shade them, at sn elevation somewhat higher than thst of "Howard's," from which they are distsnt about one and a quarter miles. They are reached hy Napa railroad to Calistoga, and thence hy stage. There is a warm chalybeste spring, a sulphur spring and a cold plunge hath. These springs are not open for the accommodation of the puhlic, heing the property of a Mr. Duke, whose residence, during the season for visiting the watering-plsces, is on the premises. Parties camping out npon the surrounding hills may, however, avail themselves of the henefits afforded hy the water. The writer is not awsre of any analysis having heen made of either of the springs. They are used medicinally in renal snd hepatic disesses, rheumatism, etc.

Fulton Wells, Los Angeles Conuty.—Tbis pleasant resort is situsted about three miles north of Norwalk station, on the Los Angeles snd Anaheim railroad, and 13½ miles from Los Angeles city. There are two flowing wells of mineral water, hored to a depth of 350 ft. The water is cold, strongly impregnated with sulphur, and containing a considerahle quantity of carbonic acid gas. The grounds are the property of Dr. J. E. Fulton, an intelligent physician, who devotes his time to the improvement of the place, and the comfort and health of the guests. The salts are mainly held in solution as hicarhonates, the hicarbonate of iron amounting to 13 grains per gallon or 231 cubic inches. The waters from these wells has been found heneficial in cutaneous diseases, rheumatism and scrofnlons complaints. Benefit is also said to have heen derived hy those sfflicted with chronic indigestion. It acts gently upon the the howels, and decidedly npon the kidneys. Hot and cold baths are provided, and a swimming hath, the water in which is heing constantly re-newed, ahout four ft. deep and 40 ft. in diameter. The following is the analysis of the Fulton wells.

In one gallon of water.	Grains.
Bicarbonate of soda	2.20
Bicarbonate of lime	12 00
Bicarbonate of magnesia	16.50
Bicarbonate of iron	13.00
Sulphurate of soda	.90
Chloride of sodium	10.40
White sulphur	23.00
Total	78 00

Sulphurated hydrogen gas and carbonic acid gas in abundance.

Santa Barhara Hot Sulphur Springs.—The drive from Santa Barbara to these springs, a distance of ahout five miles, is through a canyon shaded with thick foliage, and surrounded hy wild and varied scenery. From the springs themselves the prospect is heantiful, commanding a view of Santa Barhara and the mountains, on the south and sonthwest, and the hroad ocean on the west. The location is near the head of the canyon, nearly 1,500 ft. above the sea, and the atmoephere pnre, dry and invigorating. Although the writer has visited the springs himself, the account given of them hy Dr. M. H. Biggs, of Santa Barhara, as recorded hy the late Dr. T. M. Logan, will give a better idea of their character than would he conveyed by the record of a single hasty examination: "It is said that while this country was in possession of the King of Spain, a corps of scientific men was sent out to this coast, commissioned, among other things, to test the properties of the several mineral springs known to abound there; and, in their report, they pronounced the Santa Barhara hot sulphnr springs to be the hest and most medicinal, and snperior to any other in California 'for the cure of many diseases.' Whether they came to this oonclnsion from actnal analysis or from simply witnessing their effect, is not known. Certain it is that at the preeent day they are hecoming famous for their curative effects in many cases of rheumatism, paralysis, various diseases of sypbilitic origin, and skin diseases generally; and from persistent use of the waters (drinking and hathing) many individuals have heen cnred of such affecciosa." A large, deep spring, or excavation, is used as a plunge hath for those who desire it. The locality of these springs is adapted for a resort for those snffering from other diseases than those to which the water is applicahle. The dryness of the atmosphere, the altitude of the place, and its exemption to a very great extsnt from the northwesterly currents which prevail below, make it a snitahle place for the victim of consumption in its early period of development. It possesses, even in a more marked degree, the advantages usually ascribed to the climate of Santa Barhara.

Wilhur Springs.—These somewbat noted springs are located in Colusa conuty, prohahly about 30 miles from Colusa. The water helongs to the hot sulphur class, and contains carhonate of soda and sulphates. The following ie an analysis of this spring:

Acids.—Sulphuric, 29.05; muriatic, 19.20; hydriodic, 7.10; alumina, 9.48; free sulphur, 30.07. The acids combine with the bases as follows: 1. Sulphate of potassa; 2. Sulphate of soda; 3. Sulphate of iron; 4. Sulphate of alumina. Hydriodic acid is set free without change.

1. Muriate of potassa; 2. Muriate of soda; 3. Muriate of iron. The iron is in a natural state of oxide—the sulphate of the protoxide.

The water has attsined a reputation in rbeumatic and cutaneous diseases, and other complaints to which springs of the kind are nsually adapted.

Simmons' Hot Snlphnr Springs.—Located not far from the above in Sulphur canyon, in Colusa county. Tbey are stronger in sulphur than the Wilbnr Springs, and one is said to have a temperature of about 170° Fahr. No analysis has heen reported.

Byron Springs, Contra Costa County.—These springs, although hut recently hrought to the notice of the puhlic, have already acquired considerable reputation. There are said to be numerous springs, sulphnrous and saline, hot and cold. Some of them are sctively cathartic, others diuretic; some sparkling witb carhonic acid, others containing sulphnreted and pbosphureted hydrogen gas. They are said to have been found useful in the diseases to which mineral wsters of this kind are nsually adapted—in rhenmatism, and in renal and hepatic affections. They are located ahout a mile from Byron station, on the railroad from Martinez to Sacramento, and near the base of the Mount Diablo range, and of easy access from San Francisco or Sacramento.

The Geysers.—These springs, about which so much has heen written, snd which form an object of so much curiosity among travelers from the Eastern States, as well ss among the people of California, are located in Sonoma conuty, in a deep gorge of the mountains, through which runs Pluton creek, and ahout 1,700 ft. above the sea. They consist of many springs, numbered hy hnndreds, extending along the canyon for a dietance of a mile or more, the temperature varying from 200° to 210° Fahr. Then, near hy, ahout three or four miles up the canyon, are the "Little Geysers," consisting of several springs, at a temperature of from 190° to 200° Fahr. Down the canyon, only a mile or two distant, are the "Indian Springs," so named from their having been the resort of the Indian tribes of this vicinity, and from which Edwin Forrest, while in California, was supposed to have derived much henefit. They are not original springs, hut are snstsined hy the nnion of three streams from the Geysers themselves—the snlphurous, the chalyheate, and the aluminous. These springs are much lauded hy the local residents for their efficacy in chronic rheumatism. No analysis, so far as known, has heen made of the water. Also, unanalyzed, four or five miles up the canyon, are the "Blue Lick Springs," closely resemhling the springs of the same name in Kentncky.

The Geysers, at the present time, are objects of curiosity, rather than of medical interest, though the water of some of them possesses active medical properties—epsom salts springs, iron springs, soda springs, alum springs, and many others in which some ingredient is supposed to predominate. There are aleo cold water springs, and facilities are sfforded for bathing—hot or cold—or these successively.

Unclassified Springs.

Highland Springs, Lake County.—These springs are sitnated in Lake county, ahout seven miles from Lakeport and Clear lake, at an altitnde said to be about 1,700 ft., free from fogs, and in a climate which, like almost all parts of Lake conuty, is remarkahle for its healthfulness. Good accommodations have been provided for guests in the hotel and in cottages. The springs are of easy access from San Francisco hy steamer to San Rafael or Donahne, thence hy the S. F. and N. P. R. R. to Cloverdale, in Sonoma county, and thence hy stage 16 miles. No analysis has been made known, so far as the writer is aware.

Other Springs.—Other springs have been reported, supposed to possess medicinal virtue. One on the mountain near Silver Lake, in Amador county. It is a cold, saline spring, strongly chalybeate. Prof. Price, to whom I am indebted for a knowledge of it, states that it is more highly ferruginous than almost any of the springs of this State.

Another, a soda spring, on the west side of Clear lake, in Lake conuty.

Another, a saline cold spring, in the Sierra Nevada mountains, near Falling Leaf lake. A quantitative analysis has been made, showing the presence of carhonate of soda, iron, magnesia and lime.

The Magnetic spriug, near Watsonville.

Mark West Springs, Sonoma county.

Anderson's Springs, 19 miles from Calistoga. There are hot and cold eulphur springs. No analysis known.

Paraiso Hot Sulphur Springs, Monterey county, six miles from the terminns of the northern division of the Southern Pacific railroad. Said to contain soda, sulphur and iron.

Piedmont White Sulphnr Springs, three miles from Oakland. A pleasant place of resort. No analysis has heen made known.

The following analysis has heen sent me of what purports to he a mineral water discovered in Inyo conuty, Cal.:

Volcanic Mineral Spring.—This remarkahle spring is said to he located in Inyo county, sonthern California, in what is called Death's valley. If genuine, it is the most wonderful natnral water supply which has ever heen brought to the notice of the writer. It is a cold spring. The following analysis hy Dr. Price has been furnished, the figures giviug results in grains per gallon:

	Grains.
Chloride of sodium	1,840.12
Chloride of potassium	132.30
Carbonate of soda	1,724 11
Sulphate of soda	651.62
Sulphide of sodium	46.34
Lime and magnesia	traces.
Silica	14 24
Organic matter	13.48
Iodine and bromine	traces.
Iron	traces.
Boracic and phosphoric acids	traces.
Total	4,422.25

The water, of which the foregoing is an analysis, is a very remarkahle one, heing at once a sulphur, salt, carhonate, alkaline and slightly ferrnginous water. The digestive snd nriuary organs are specially affected hy alkaline waters; the liver and the slimentary csnal hy saline ones. The skin and mucous respiratory membranes are, according to the hest medicsl authorities, influenced hy sulphur waters, while a special action on the blood has always heen attributed to ferruginous sources. When used either internally or externally, it is directed thst the water he diluted with pure water. Internally, the dose is fixed at a teaspoonful in a wineglassful of water; externally, it is mixed with one or more parts of water. In its pure state it has a hitter, saline and acrid taste. It is highly praised for its curative properties in rheumstism, catarrhsl affections, diseases of the kidneys and liver, dyspepsia snd neuralgis. It is powerfully purgative with some, bnt with others not at sll so.

Route to the Yosemite From Nevada.—Tonrists seem to think that when they have heen to Yosemite valley and the Big Trees, with a flying trip to Tahoe, that they have "done" all the wonders of the Pacific coast. In this conclusion they are away off. For four months in the year tourists can reach Yosemite from this side of the mountains. Taking cars at Reno, the trip down the C. & C. is not devoid of interest. From Hawthorne to Bodie is hut 37 miles, and from there to Mill Creek canyon 25 miles. The ride from Bodie to Lundy is full of attractions. Several of the highest mountsins of the Sierra are in sight, with Mono lake on one hand, and grand old Castle Peak towering 13,000 ft. high on the other. But the grandest of all mountain trips in the world is through Mill Creek canyon and Tioga district to Yosemite valley. There are changing scenes of awful grandeur along this route wbich excite continual wonder and admiration; heantiful lakes and streams teeming with trout, and game in ahundance. The trip from Lundy to the valley of the Merced, can he made leisurely on horsehack in two days in summer. Some enterprising man will, hefore long, put on a train of saddle animals hetween these two points. When one party goes over it, the route will advertise itself. The expense of the trip will he less than hy the usual route.—*Reno Gazette.*

Philadelphia Mining Affairs.—Mining affairs in this city are not characterized hy any really startling advance or improvement. A heautiful state of uncertainty pervades the whole market, and prices keep tumhling; the owners of shares inwardly groan, and the bears are juhilant. The proepects are anything hut promising at the present movement for the advancement of the mining interests in this section, and will continue to the had until the common sense and honesty are more strictly adhered to than they have been for some months, by the promoters and (not) protectors of the various mining companies' interests.—*Bullion Miner.*

By the hurning of the Giant smelting works, at Leadville, the largest smelting works in Colorado were destroyed. The production of bullion of the smelter for last year amounted to over $4,000,000, and this year, if the works had remained standing, the output would have been largely increased. The main building was 350 ft. long hy ahout 150 ft. wide, hesides numerous charcoal and coke hins, which were all destroyed. The loes, as stated hy Mr. James, amounts to $400,000, with an insurance of only $65,000.

The Utah Mines.—The mines of Utah, says the Salt Lake *Tribune*, are making a record this season which will surprise tne expectations of the most sangnine miner. Twelve millions in solid hullion, taken from the hills in twelve short months, is something to make the heart glad. This is what the Gentile miners of Utah will accomplish in the year of our Lord 1882.

The Music monntains are located in the north-western portion of Arizona, hut owing to no known water springs, prospectors have, until lately, feared ventnring among them. Prospectors have at last gotten into these mountains and uncovered gold ledges.

Wells, Fargo & Co. have acqnired 3,500 miles of additional route, hy transfer from the Adams', American, and United States Express companies, which acquisition gives them control of the express husiness in the entire section west of the Missouri.

The Union Pacific isn't letting the grass grow nnder its enterprising tracks this season. Beside its Oregon Short Line, it will complete about 300 miles of new road in Colorado. It is expending millions of money and opening millions of acres of new country to settlement.

The Debris Question.

Full Text of Judge Temple's Decision.

We append the full decision of Judge Temple in the famous Gold Run suit, which has been so long pending. The suit took some 45 days to try, and the testimony adduced was not only very voluminous, but very contradictory in its character. Naturally, the decision will not please the mining community, but a grain of consolation appears in the concluding paragraph of the decree, because the heavy bowlders, cobble stones and heavier sand *can* be held back. In addition to our eight-page supplement, we print four pages extra this week, to admit of giving the decision in full:

The Findings of Fact.

In the Superior Court, Sacramento county, California. The people of the State of California, plaintiff, vs. the Gold Run Ditch and Mining Company, defendant.

This cause was tried by the court, a jury having been waived. Having fully considered the evidence, I now find the facts as follows:

First.—The Sacramento and American rivers are wholly within the State of California; the latter is a tributary of the former, flowing into it about one mile north of the city of Sacramento.

Second.—The Sacramento is navigable, and has been continuously navigated by steamers, barges, schooners and smaller craft, and up to 1862 was navigated as far as the city of Sacramento without difficulty by steamers of deep draft, to wit, by boats drawing nine or 10 ft. of water. That said river has been declared navigable by law to the mouth of Middle creek, which is above the confluence of the American and the Sacramento. That since 1862 the navigation of said river has been seriously impaired by deposits of mud and sand therein, which have in part come from hydraulic mines; so that now the city of Sacramento can be reached by boats of deep draft during the high stages of the water only, instead of at all times, as formerly.

Third.—That hydraulic mining, as that term is generally understood, consists in washing and removing from their natural positions into the water-courses and rivers, by means of water, high banks of earth and gravel containing gold, and thereby separating the gold from the earth, seeding the residue, consisting of bowlders, cobble-stones, gravel, sand and clay, into the water-courses, the larger portion of which finds its way into the principal confluents of the Sacramento river, and is deposited along said streams from the place of discharge or dump to San Pablo and San Francisco bays, the heavier material being first deposited.

Fourth.—Hydraulic mining has been practiced for 20 years to some extent in the mountains of the Sacramento basin. It attained great magnitude as an industry before 1875, and is still extensively carried on, principally in the counties of Butte, Yuba, Sierra Nevada and Placer.

Fifth.—The tailings from some of the hydraulic mines are deposited in the North Fork of the American river, and large quantities thereof have been deposited in the channel of said North Fork and of the American river, throughout its entire course, and a large portion thereof has been washed and carried down into the Sacramento river. That the tailings from other hydraulic mines are washed and carried into the Middle and South Forks of said river, and in the Yuba, Bear and Feather rivers, which are tributaries of the Sacramento.

Sixth.—That the tailings and deposits from said hydraulic mines, with other matter carried by the waters of said rivers, has filled up and raised the bed and channels of said Sacramento river to a great extent below the mouth of the American river, to wit, from 6 to 12 ft., and has filled up and raised the American river below Alder creek from 10 to 20 ft., and in places even more. Such filling has been materially increased by the tailings from the hydraulic mines.

Such fillings have shallowed the channels of the Sacramento river, and materially impaired the navigation thereof, and has materially increased the liability of the Sacramento river and of the American river below Alder creek to overflow their banks, and has caused the frequent floods in said rivers to be more destructive than they otherwise would have been.

That the debris from mines, including the mine of the defendant, has materially contributed to such filling of the river channel, and thereby has interfered with and obstructed the free and comfortable use and enjoyment of large portions of the land upon the American and Sacramento rivers.

The American river is, however, obstructed by the levees and the levee system on the Sacramento, which cause the water to be dammed up and made to flow back into the American river and over the banks thereof, during the stages of high water in the Sacramento, and thereby large tracts of land are submerged and heavy deposits made thereon, which would not exist but for such levee system, or the defects in the same. That one of the principal sources of damage by the overflow of lands on the Sacramento river is from the erosion of the bank nearly opposite the mouth of the American river and the break in the levee at that point. That the more immediate cause of this erosion and break was the change in the course of the American river, which manifestly would have produced the break and much consequent damage although all mining operations had been suspended.

That during the highest stages of the water of the Sacramento the channel of said river is insufficient, and even if it had not been filled up would have been insufficient to carry one-half of the volume of water sent down by its various confluents, and at such times would break the present levees, even though no mining were carried on.

Still the mining debris does increase and aggravate all these evils, and renders the problem of controlling the streams and the protection of the valleys more difficult and expensive, and causes more land to be injured and the free enjoyment thereof to be interfered with than would have been interfered with or injured but for such mining debris.

Seventh.—That defendant is, and since August, 1870, has been, a corporation under the laws of the State of California, for the purpose of mining by the hydraulic process and selling water to miners and others. That it is now, and for several years last past, it and its predecessors have been in possession of certain mines and mineral land situated adjacent to the North Fork of the American river, on the north side thereof, near the town of Gold Run, in Placer county, and consisting of about 500 acres of land. The surface of said land is about 1,000 ft. above said North Fork of the American river. All the material of said mine is capable of being worked off into said American river, and consists of about 20,000,000 cubic yards of material, composed mostly of sand, gravel, small stones, cobbles and bowlders, mixed with small particles of gold.

Eighth.—Defendant, by means of ditches and iron pipes, has conducted to its aforesaid mines a large quantity of water, which it is using and will continue to use under a vertical pressure of several hundred ft., to mine its said tracts of mining land by the hydraulic process, discharging water through Little Giants and Monitors, and dumping all the tailings from such mines into the North Fork of the American river.

Ninth.—Said defendant has been mining its said tracts of land for about eight years past in the mode and process aforesaid, and up to the time of commencing this action, and during about five months of each year of said period, has been daily discharging into the said North Fork between 4,000 and 5,000 cubic yards of solid material from its said mine—to wit: of bowlders, cobbles, gravel and sand, making a yearly discharge of at least 600,000 cubic yards, and will continue to discharge that quantity annually, if the working of said mine is permitted to continue, and at such a rate, it will require some 30 years to mine out and exhaust said mineral land.

Tenth.—That a large portion of the material so dumped by the defendant into the North Fork of the American river has been washed down said river by the water and commingled with tailings from other hydraulic mines, and still other material, which is the product of natural erosion, has been deposited in the beds and channels of the Sacramento and American rivers, but mostly in the American river, and upon the lands adjacent to said rivers; and by said mining of the defendant and other mines the filling up, raising and shallowing of said rivers has been materially increased, to the impairment of the navigation of the Sacramento river, and to the excessive overflow of the lands adjacent to said rivers, to the great injury of said land, and damage, discomfort and annoyance of a great number of citizens of the State, owners of said land and residents of said valley.

Eleventh.—That the power of water to preserve its channels and to clear out and to carry off deposits in the same is proportioned—other conditions remaining the same—to the depth of the stream and the freedom of said water from earthy matters.

That the beds of said rivers have already become so widened and filled that the depth of the water therein has been greatly lessened; that said water, at all times, is heavily laden with earthy matters, chiefly from mines; therefore, said rivers are likely to fill more rapidly in the future, in proportion to the quantity of hydraulic tailings, than in the past.

That thousands of acres of good land in Sacramento valley have already been covered by such debris, and, if some preventive is not applied, much further and greater injury is likely to ensue in the future, and large tracts of land will probably be rendered, within a few years, unfit for cultivation and inhabitancy.

Twelfth.—That the discharge from the defendant's and other mines so fouls the water of the American river at all points below, as to render said water unfit for any domestic use by the inhabitants.

Thirteenth.—That the filling of the beds of said rivers has, to some extent, obstructed the natural and artificial drainage of the valleys of said rivers, and has interfered with the percolation and flow of the water through the soil, and has raised the soil water to such an extent as would naturally increase the tendency to malarial diseases; but I do not find that heretofore, it has had any effect on such diseases, and the material carried down by the rivers is singularly free from matter which could ferment and induce malaria.

Fourteenth.—That if the said acts of defendants and others, mining as aforesaid, are allowed to continue, there is imminent dangor that the beds and channels of the lower portion of the American river, and of the Sacramento river below the mouth of the American, will be so filled and choked up by tailings and other deposits that said rivers will be turned from their channels, cutting new waterways, injuring or destroying immense tracts of land, and probably will result in greatly imparing the navigability of the Sacramento river.

Fifteenth.—That the filling in of said rivers below Alder creek has been accumulating from year to year. The largest deposits were made by the floods of 1861 and 1862, since which time there has been a steady increase in deposit and a slow but constant working down in the channels of the rivers of the heavier material; that it is not possible to determine the proportions of such deposits which come from mines now working in other sources, but it is quite probable—in fact, almost certain—that very much the larger part of that which injuriously fills the rivers is composed of material dumped into the river from mines within 10 years previous to the fill in the river.

Sixteenth.—That the waters of the American river and its tributaries, during the recurrence of high water in each year, move and transport portions of the debris then in the river further down the stream, and most of such matter finds its way ultimately below Alder creek, which is a point in the American river near where said stream emerges from the foothills, about 27 miles above the mouth of said river.

Seventeenth.—The grade of the American river above Alder creek to Canyon creek is about 30 ft. per mile, and below Alder creek is not more than three ft. per mile.

The mine of defendant is about 83 miles, by the river, above Sacramento, and is a blue-gravel mine, and constitutes a portion of the ancient river channels which cross the present river system diagonally.

Eighteenth.—That the Gold Run mine, in 1854, was within the mining district known as the Gold Run district.

That mining rules and regulations were in force in that district, as in all other districts in this State, which prescribed the size of the mining claims, the manner of locating and recording them, and the amount of work to be performed to enable the locators to hold their claims.

Miners' rules and regulations had no force beyond the district.

Claims in the Gold Run district were in small parcels, about 100 000 square feet, and were taken, held and worked by a large number of persons, commencing such work in some of the claims as early as 1852, and were so held until sold to defendant, which has since acquired title to said lands by means of patents from the United States.

That between the years 1854 and 1874, the upper levels of the Gold Run mines were practically all worked off, leaving the lower portions thereof next to the bed-rock to be worked off. Such lower portions now constitute the mines of the defendant, and yield in gold from 5 to 20 cents per cubic yard.

The mining and ditch property cost the present company $253,000, including tunnels and all improvements in the same.

Nineteenth.—The rules and regulations of miners did not purport to regulate the manner in which mining claims should be worked, nor the manner or places in which the mining debris should be dumped; but the universal practice was to discharge the tailings into the most convenient stream or gulch, even though it should interfere with claims located in the streams or ravines below.

It has been a custom, almost universally acquiesced in, in the mining communities of this State, to regard the streams as common ways or the discharge of mining detritus. The exceptions being where such stream has been previously occupied by some works, such as a ditch to convey water. Such right on the part of the mine-owners is, in most cases, essential to the economical working of the mine.

Such practice is necessarily confined to the mining localities and has not been recognized or acquiesced in elsewhere, except that the waters of the streams throughout their entire course have been rendered turbid and foul without complaint until within the past few years.

Twentieth.—That neither this State nor the United States has licensed the defendant or any mine to dump his tailings into the streams so as to be transported into any navigable river, stream or bay, nor has this State legalized the same.

Nor have the Sacramento or American rivers been dedicated to the use of miners as a place of deposit, or for a way to transport mining material, nor is either cause of action set forth in the complaint barred by the provisions of Secs. 315, 338 or 343 of the Code of Civil Procedure of this State, or of either or any of said sections.

Twenty-first.—That the acts threatened to be performed by the defendant in continuing to prosecute its mining industry in the manner set out in these findings, as it will do, unless restrained, if allowed to be done, will, in connection with like acts by others, obstruct the navigation of the Sacramento river, and fill up, to some extent, Suisun bay, destroy or injure large amounts of land, and constitute an obstruction to the free use and enjoyment of the property of a large number of citizens of this State.

Twenty-second.—Ancient gravel channels exist, at least 200 miles in extent, from Mariposa county to Siskiyou, crossing the present river system diagonally and at higher altitudes. These channels are from 200 to 2,000 ft. wide, and contain gravel sometimes several hundred ft. deep. Gold is distributed quite uniformerly throughout the length of the channels. The first mining was generally in the present rivers below where they had washed out the old channels.

Competent persons estimate the entire product of gold from California mines at $1,154,689,036 up to June, 1881, $900,000,000 being from the ancient channels. The present yield varies between $15,000,000 and $20,000,000 per annum, and there is no doubt much more gold still remains in these ancient channels than has been washed out.

Present investments in California mines are estimated at $150,000,000, $100,000,000 of which is in hydraulic mines. Some portion of this is, no doubt, in mines which cannot be profitably worked.

Mining for gold is the principal industry in 15 counties of the State, and the population of the mining counties is over 100,000.

In the past eight years the amount of material washed from hydraulic mines has diminished, owing to change from washing light surface gravel with few bowlders to heavy bottom gravel, and from steep grades in the sluices to light grades.

The amount washed from a mine will depend upon the amount of water used, the character of material and grade and size of sluices.

Late improvements in hydraulic mining do not increase the amount of material mined.

The various mines in the drainage area of the Sacramento river have reservoirs in which they store about 7,600,000,000 cubic ft. of water, which is gradually drawn off in the five months after the middle of July, and to that extent increases the flow in the Sacramento river.

General Finding.

To the foregoing findings of fact I desire to add a general finding, explaining, amplifying and perhaps to some extent qualifying them.

The case involves the consideration of the operation of natural forces on a large scale, and many conclusions are necessarily to some extent matters of theory or opinion. Conclusions upon such matters when expressed in legal findings often seem to imply a certitude which does by no means exist.

The field of observation is so vast that the full case cannot be presented in the findings; much must be left unexpressed, being presumed to be within the judicial knowledge of the Court; as, for instance, the geography and generally the geology of the country over which our inquiries have extended; the nature of the ancient river channels and the different forms and methods of mining which have prevailed, as well as the general history of the country—matters which everyone is presumed to know.

THE AMERICAN RIVER.

The drainage area of the American river is 1,889 square miles, mostly on the western slope of the Sierra Nevada mountains. This slope is composed of numerous deep canyons and ravines, high and steep ridges and lofty mountains. The formation is mostly granitic, is largely covered with deep soil, generally of decomposed granite.

Originally, there were very extensive forests of immense pine trees. Since the settlement of the country there has been a continuous destruction of these trees for the lumber, although large forests still remain. Numerous roads have been cut and trails made within this area. Considerable industries in fruit raising are carried on in some places, and every summer thousands of sheep are driven from the valleys into the mountains to be pastured.

As early as 1852 there were mining in the American river, in Placer county, 20,000 men, and in El Dorado county, 40,000. The earlier mining was in the bars and beds of the river or its tributaries, or in the dry diggings, which were probably older bars made in former geologic periods. The work was chiefly in mining the gravel and sand composing the river bars into the river, generally leaving the heavier cobbles in the claims.

The so-called dry diggings were worked during high water. Much of the material being light soil, was sent down the stream, leaving innumerable small pits and piles of debris on the slopes of the mountains.

In the winters of 1852 and 1853 there was

A LARGE FLOOD,

But from that time until the winter of 1861 and 1862—the memorable flood year—there was no flood of moment.

Of course, at this time, an enormous amount of material would naturally be exposed to the transporting power of such deluge, and, accordingly, we find that for the first time the inhabitants of the valleys become aware that the water was filled with sediment which menaced the navigability of the rivers, and which left large deposits of sand upon their margins. It is probable that more sediment was brought down by the river during that year than any year since.

It is contended by the defendant that most of the sediment in the river is from other sources than mining. Perhaps this is not so important an inquiry as it is deemed. What proportion of sediment is from mining, and what from other sources it is impossible to determine; but it probably may be safely claimed that the greater portion is from mining deposits made within the periods of the recurring high floods, which are from 8 to 10 years apart.

The Sacramento might be expected to bear 19,000,000 cubic yards of sediment, independently of mining debris, per annum. The drainage area of the American river is about one-

twelfth of the Sacramento hasin. The erosion upon the American river would, however, naturally he much above the average. Let it he placed at twice the average, and then natural erosion cannot he held responsible for half the material which is carried in suspension to the Sacramento, and which is rolled along the bottom of the river, at least helow Alder creek. Again the character of the material is

AN IMPORTANT CONSIDERATION.

Generally the wash from other sources than mining is the very lightest material; the exceptions are land slides and sudden cutting of gullies on the hill sides. The wash from such sources, therefore, would he easily managed by the great volume of the lower rivers, and would he carried in suspension to Suisun bay, which is the great settling reservoir of the hasin. The damage to the rivers or the adjacent land would he slight.

Mining dehris, however, is of all degrees of fineness. The question as to what will he carried down will depend upon the size of the rocks which the water has sufficient force to roll along. In other words, it will furnish the heaviest material which can he transported. This is just the material which naturally fills the rivers below the foothills more or less permanently while slowly but constantly creeping further down the stream.

It is probably from this source mostly, rather than from causes other than mining, that the material has come which has filled the channels of the Yuha, and the Bear, near their confluence with the Feather.

It is contended hy the defendant that all the dehris which it puts into the American river (save a small per cent), remains permanently above Rice's hridge—a point about nine miles below Canyon creek—and no question in the case has heen more minutely examined. This portion of the river is through a rocky gorge with hanks sloping at an angle of from 30 to 40 degrees.

According to a profile furnished hy the defendant, the grade of the original hed from canyon creek for about two miles, was over 70 ft. per mile; then for a distance of over four miles the average grade was a little less than 40 ft. per mile, with occasional spaces of several hundred feet each, in which the grade was ascending. The remaining distance the grade was about 21¼ ft. per mile. There is a large fill now in the river, commencing about one-half mile helow Canyon creek.

THE SURFACE GRADE

Of the present hed for this portion of the first section which contains any fill one and one-fourth miles is 46 ft. per mile. The grade of the next four miles is 40 ft., and the remainder over 36 ft. per mile—the last quarter of a mile being 25 ft. per mile.

Prior to the commencement of the work in the present pit, or lower portion of the mine, it is estimated that there had been washed from the upper, or old washings, 67,000,000 cubic yards of material, which also come into the American river through Canyon creek. Also large quantities of material were placed in the same sections of the rivers from the Iowa Hill mines.

The surfaces of the old washings was principally light red earth, with sand and pipe clay. In the channel, however, the old washing was chiefly composed of gravel, sand and cobble stones.

The old mines ceased to he operated because, as the miners say, they ran out of grade, and not because of a change in the character of the material. The banks are of a mixed character of sand, gravel and cobbles, from the top to the bottom. In the present pit, however, there is no pipe clay in the ribhon or channel which will he worked, and none of the red earth, and there is a constant increase in the average size of material as we approach the red rock. There was no clear line of distinction hetween the present and old washing. The great proportion of material in the lower pit, therefore, cannot reasonahly be heavier than 10% of largest material in the old washing. It seems that, prior to 1875, this portion of the river was filled with this dehris to a much greater depth than at present. All this material was washed out and went down stream, as also vast quantities of material put in from the Iowa Hill mines.

The material in the river is naturally graded as to size down stream; the heavier being first lodged, and then the next in size, and so on.

THE HEAVIER MATERIAL,

Therefore, cannot hold hack the lighter dehris which has been separated hy the water, and is constantly washed lower down. If all the detritus from the top washing has gone down over the lower grades of the original bed, certainly that portion of the material in the present pit, which is not heavier than the largest cobbles in the old washing, will pass over the present increased grades of the river, if we suppose that the hill now there is so impact that it will remain.

But I think it altogether probahle that the profile is incorrect. The surveyer who made it is evidently competent and apparently candid, but he did not measure the depth of the fill. The estimate must he very much in excess or considerable of the old fill must still be there. In either event the case must he taken as established against the defendant—that a considerable portion of the material will and does come down the river.

It may he added that at high water the current of the river at this point must have a velocity of at least from six to eight miles per hour. There are few cohhles or howlders which will exceed 10 inches in diameter. Theoretically they would all come down.

THE CONDITIONS IN THE AMERICAN RIVER

Differ widely from those at the Polar Star dump in Bear river, aside from the fact that the material at the Polar Star is heavier and the stream of less force. At the Polar Star, if I have rightly understood the evidence, the fill is immediately at the dump, some of the material rolling up stream above the point of discharge.

The larger howlders, therefore, do hold hack the lighter material. At Canyon creek the material, after it reaches the river, is transported by the water from half a mile to six and eight miles before it finds lodgment, and is, of course, completely graded hy the action of the water. It settles on a steep incline and is so distributed as to huild up the hed of the river to a uniform grade. It forms nothing like a dam, hut at the upper end rests against the steep grade so as to form a continuous incline, over which most of the material passes, even at ordinary stages of the water while the mine is working. I think it may he assumed that the new grade at Pickering's Bar—40 ft. to the mile—is just the grade over which the very heaviest material of the mine will not pass at ordinary winter stages of the river. It certainly all passes over the grade from Canyon creek to Pickering's Bar, and will continue to he completely sorted hy the water, and therefore, as it seems to me, a large portion of it must inevitably come down.

THE COARSER MATERIAL

Will travel very slowly, probahly requiring many years before it reaches Alder creek—10, 20 or more, according to the size. No doubt much which was thrown into the river many years ago is still slowly moving down and, though all mining should cease, will continue to come for many years. This is important, as showing to what extent stopping the work at the mines will afford a remedy. It appears that this part of the injury is easily remedied, and at comparatively little expense, hy the erection of dams to impound the dehris. If the experts are correct in their conclusions—and I am bound to so conclude—all that is very greatly injurious could he so impounded.

Of course during its slow journey the detritus is very greatly comminuted; much of it will he carried off as clay in suspension; the proportion cannot he determined.

On the American river, and its tributaries, a vast amount of mining was done in early times, and up to this time a great deal is being done heside that hy the defendant. No other mine contributes annually more detritus to the river than the defendant; still I am unable to say that defendant's mine alone, without reference to the dehris from other mines, materially contributes to the evils mentioned; or, in other words, if there were no mining operations save those of the defendant, I am not prepared to say that it would materially injure the valley lands or the navigation of the river. It is the aggregate of dehris from all the mines which produces the injuries mentioned in these findings.

The lower portion of the American river is very much filled with dehris, and has been, in places, much widened. As yet, however, no such state of things exist there as is seen in the Bear and Yuba near their confluence with the Feather. Perhaps if it were not for that instructive lesson we should not he justified in anticipating all the evils which may yet flow from these constant accumulations.

ABOUT ONE THOUSAND ACRES

Of valuable farming land have already been covered with heavy sand along the margin of the American river, and the adjacent lands are subject to frequent overflow.

The overflows would probably occur to a considerable extent, although there were no mining. Very much of the trouble from this source comes from back-water from the Sacramento.

In flood times, if the rains have been general, the American is the first to rise. The Sacramento then heing at its low state, the flood rushes out loaded with sand and mud, and, with very great velocity, is precipitated on the Yolo shore, and there covers large tracts of land with its sediment. At such times the current is much greater than at any other time, and, of course, a great deal of sediment which has accumulated in the river during slack or low water is carried out.

About 15 hours after the rise of the American, the flood from the Feather, also surcharged with mud, reaches Sacramento, and 36 hours later the floods of the upper Sacramento. By this the current of the American is checked, and considerable land sometimes remains submerged by back water. At such times, of course, sediment is left both on the lands and in the channel of the river, which otherwise would have gone off in suspension.

SACRAMENTO RIVER.

The plane of low water has heen raised about six and one-half feet since 1849 in the Sacramento. The rise in the low-water plane has heen continuous since 1868, when the low-water mark was about two feet above the low-water plane of 1849, although in some years, probably for special reasons, it has been higher than in the succeeding year.

This indicates that the bed of the river at the shoals has been filled at least six and one-half feet, and probably much more. The consequence is that the influence of the tide is not felt above Haycock shoals—nine miles below the city—it formerly heing about two feet at Sacramento.

As we go down the river there is a less elevation of the low-water level, indicating an increase in the grade of ths river, from which will follow additional force to carry off the sediment.

The levees of the river are insufficient to carry one-half the water during the periods of the higher floods. Breaks are, therefore, inevitable, and perhaps have caused, insome localities, greater damage than would have occurred had there heen no levees. The levees, to some extent, increase the scouring force of the water, hut not so much as would he the case if the water were not at its high stages already surcharged with sediment. The levees, also, somewhat prevent the river from wasting its material along the hanks and building up the valley as it builds its own hed, and causes it to carry to its mouth more material than it otherwise would do.

As to the islands helow Grand island, I conclude from the evidence in this case, that at present they cannot he reclaimed by any practical means. Of course, the quantity of sediment in the river makes the problem more difficult and the means more expensive if they are to he reclaimed; but it would seem evident that this cannot be done at any reasonable cost until they are still further built up hy the operation of natural causes.

SACRAMENTO CITY.

I am compelled, hy the weight of the evidence in the case, to find against the plaintiff in the charge that the prosecution of its industry hy the defendant, with similar operations hy others, has impaired, or to a material extent is likely to impair, the sewerage of Sacramento, or injuriously affect the sanitary condition of the city.

The sewers of the city are about seven feet above tide water. The drainage was never into the Sacramento river, and perhaps could not rightfully he there. It does not appear that the city has been deprived of any outlets for its sewerage hy dehris, nor do I see that the drainage has heen interfered with, except during the very highest floods, which may be expected about once in eight years. The interference, at all events, is quite inconsiderable.

It is said that the soil-water is raised in the city hy sipage, so that cesspools are emptied of their contents. It is natural to think that raising the water level in the river will necessarily raise the level of soil-water in the vicinity. That it does so, to some extent, I cannot douht.

The drainage canal from Sacramento to Snodgrass slough, a distance of 25 miles, has a fall of about six ft. There can be no good drainage under such circumstances without pumping, and I do not see how the dehris has made matters worse in this respect.

The health of the city has heen steadily improving for the last 25 years and during all that time the city has ranked very high in regard to healthfulness with cities of equal population and similarly situated.

There has been manifested during late years, however, some tendency to a change in the character of the disease, from those of a purely malarial character to those of typho malarial character. This seems to he the usual course of disease in all newly settled countries, and, according to the testimony in the case, could not have been otherwise. The slight indigestion of a typhoid epidemic during one year is nothing more than is to be expected in any city.

I am entirely satisfied that the question whether the deposits of dehris in the vicinity of Sacramento has affected or will injuriously affect the health of the city is altogether too much a matter of theory to he the foundation of a judgment which shall deprive the defendant of the use of its property.

FOULING THE STREAMS.

The first mining in the river bars and channels discolored the waters to some extent as early as 1853, and the rivers have become more and more discolored hy sediment since. The early mining was in well-washed sand and gravel, which contained none of the red earth which has since so highly colored the water. The dry diggings were in red earth, hut were prospected only during high water, and therefore during the summer the rivers become reasonably clear.

As ditches were constructed, and mining in what are called surface diggings, as contra-distinguished from deep gravel mines, commenced, the water began to be colored as at present, red or yellow. This color is from sesquioxide of iron, which is not found in the deep gravel mines. The cementing material, however, contains protoxide salts of iron. Peroxidation of this commences upon its exposure to the air and water. This ferruginous clay is readily transported hy the water, and probahly is not so peroxidized as to discolor the water while heing transported.

Washing in the red gravel has greatly diminished since 1875; hut probahly the water still receives its deep color principally from surface washings.

There is evidence of considerable

FILLING IN SAN PABLO BAY,

Principally along the channels through the hays. Practically there is yet no impairment of navigation in this hay, and is not likely to be for many years to come. Suisun bay is rapidly filling with sediment, hut I conclude from the evidence that the volume of water passing through will always maintain channels sufficient for the purposes of navigation.

Conclusions of Law.

First.—That the plaintiff's cause of action and its right to the relief in this section demanded, is not harred hy all or either of the statutes of limitation pleaded hy the defendant in this case or otherwise.

Second.—That defendant has not acquired any right to the use of the hed of the American river, or of the Sacramento river, as places of deposit for its mining tailings, nor to choke or fill with such tailings the channels of said rivers in the valleys thereof, nor to flow or overflow the said lands situate along the bank thereof.

Third.—That the said acts of defendant constitute a public nuisance, in that they are an obstruction of the free use by a considerable number of the citizens of this State of their said lands, situate along the hanks of said rivers as aforesaid, so as to interfere with the comfortable enjoyment thereof, and in that they unlawfully obstruct the free passage and use in the customary manner of the said Sacramento river.

Fourth.—The mining customs, usages and regulations authorized hy the statutes of this State, or recognized hy the decisions of its courts, are local in their operation, and have not and are not intended to have any effect beyond a mining har, diggings or district in which they have heen adopted or recognized.

Fifth.—That the mining laws and mining customs or practices of the said Gold Run mining district, in which said defendant's mines are located, mentioned and referred to in the findings of fact herein, were not intended to and did not and cannot protect the defendant in the doing of the acts, matters and things complained of in this action.

Sixth.—That the plaintiff is entitled to a decree of this court restraining and enjoining the defendant, its superintendent, agents and employees, from discharging or dumping into said North Fork of the American river, or into Canyon creek, and also from suffering or causing to flow into said river any tailings, howlders, cobblestones, gravel, sand, clay, dehris or refuse matter perpetually, or until it shall he first shown, upon application made to this court for a modification of such decree, that dams shall have been huilt in said American river, which will prevent the heavier portion of said material, including the coarser sands, from coming helow Alder creek, or until some other means equally efficacious shall be adopted to impound said dehris, and which, in the opinion of the court, upon such application, will certainly prevent sand, and all heavier material than sand, from being carried hy the water helow Alder creek.

J. TEMPLE,
Superior Judge, presiding.

June 12, 1882.

The Opinion.

The People of the State of California, plaintiff, vs. The Gold Run Ditch and Mining Company, defendant.

This action is brought to restrain the defendant from dumping his tailings into the North Fork of the American river. It is charged that these tailings, heing washed down hy the current, are deposited in and fill up the channel of the American river helow Alder creek, as well as the Sacramento, impairing the navigation, increasing the liability of both to overflow, and making each overflow more destructive, causing deposits upon the farming lands, thereby rendering them unproductive, raising the soil water, which also tends to unproductiveness, and producing malarial and other diseases among the inhabitants of the valley. It is substantially found that much of the tailings come down the streams, filling up the rivers, and producing most of the evils charged. Navigation has heen obstructed, much valuable land covered with sand, and that the continuation of the practice will probably he productive of still greater damage.

The finding may be considered for the defendant, however, upon the charge that the debris adds materially to the malarial influences, or have obstructed, or will obstruct, the sewers of Sacramento, or have injuriously affected the sanitary condition of that city. It is found that mining pollutes the water of the rivers with mud, rendering them less suitable for domestic purposes. And that numerous other persons engaged in the same pursuit contribute dehris to the same streams, hut for which contributions the river would be able to maintain their channels without serious obstruction, notwithstanding the detritus from the mine of defendant.

The case is quite unusual in some respects, and I have departed from the customary findings hy adding a general finding in which are stated some conclusions in a mode less formal, and some deductions from the evidence, hoping that the special findings will be sufficient to sustain the judgment, and that the general conclusions may aid the appellate court in a review of the case.

The decision has been more or less delayed hy other official work, and somewhat hy failure to receive in time the promised briefs, and I especially regret that counsel for the defense have not complied with my repeated request that each party would suggest the points upon which special findings were required. There is no possible utility in an elaborate argument on my part in support of the conclusions to which I have arrived; but, in fairness to counsel, I will briefly state some of the conclusions.

Tha defeose — which may be deeignated hy the terms statnte of limitations, prescription, dedication and way of necessity—may he passed with tha remark that obvioosly tha plea indioated hy each term or phrase cannot be a defeose in this case. Indeed, it appeared to me on the argnment neithor wos really relied upon, hut wera all nsed as a convenient means of illnetrating and enforcing a more plausible proposition, which may ho briefly stated as follows:

Tha onstoms, nsages and practioo of miners, whioh hava universally prevailed, and which have everywhere heen acquiesced in throughout the Stata ever since its organiz tion, have sanctioned this nse of tho navigable streams, and in connection with the recognition and approval of the Government, both State and national, for a long serios of years. Everyone knowing the practice, and no one objecting, has changed the common law npon this subject—or at least the equitable circumstances exiat which hind the conscieocea of both Governmants and which cannot he disregarded hy them. The equitable circnmstances alluded to are manifest and could hardly ho too stroogly stated. So great a calamity to ao many people as would result from a judgment in this case, were it to be a precedent, has prohably never been produced by any case in thie country. And the acts which are said to be wrongful have certainly heen tolerated so long without objection, if they have not been encouraged, that no shadow of hlame can possibly attach to those who have invested their money in it. If the qnestion were in a legislative hody, whether soma law which had permitted it, and under the sanction of which it had grown into importance, should he repealed, the suggestion would he irresistible. So it would in an action, perhaps, where it involved only the proprietary rights of the Government, or any interest of the Government, simply considered in its corporate capacity. Such were the facts in the cases cited for the defense.

But there can he no estoppel which shall prevent the State from exercising its general governmental powers in providing for good government; and certainly no equities can grow up in favor of one set of citizens as against others by the fact that illegal acts have heen long tolerated or that they are convenient in the preservation of a great industry the importance of whioh has heen repeatedly recognized. Here are many citizens complaining that their rights are heing violated, their property and their health threatened, and their common highway over navigahle waters obstructed hy the illegal acts of the defendant and others. To constitnte equitahle circumstances which can hind the Court in such a case they would need to he such as would legalize the acts claimed to he wrongful. Has, then, the national or State Governments licensed the defendant to make this nse of the navigahle streams, or in any way legalized the practice? Has the common law in that respect heen modified, as claimed hy the defendants? It is of couree not claimed that any action on the part of the Federal Government has changed the common law of this State. That is not within the authority of that Government. So are the authorities, and they were not needed in eo manifest a case. And it would seem equally clear that the United States has not licensed this nse of the rivers, and that it cannot do so, nor can it dedicate them to the use of the miners.

For the purposes of this inquiry it may be conceded that it has licensed the miners to enter upon the public land, to prospect and dig for gold; to appropriate the waters from the non-navigahle streams and conduct them for long distances, discharging them again—perhaps into streams from whioh they were not taken—corrupted and snrcharged with mining dahris. Washing the hills down into canyons and tha channels of the mountain streams. To make every canyon or gulch a common way for the tailings of all. That it has finally sold to them the mines with tha right to extract from them tha gold, and with the foll knowledge of the mode of working them, and with full knowledge that tho practice of miners in this respect was nniversal and under claim of right.

These propositions are not admitted on the part of the plaiotiff, but do any or all of them imply the consent of the Government to the deposit of tailiogs in the navigahle rivers?

Obviously, all these are the acts of a land owner. The Government has suffered this occupation and use of the public land. They can imply nothiog more, for the United States has no further rights in the matter, or powar over it. It was stated on tha argument, that Congress may, and perhaps has, devoted these navigable waters to this industry, under the power to regulata commerce. But evidently this cannot be so. The reason given was that gold facilitates commerce. The products of most industries promote commerce. Nothing facilitates it more than good government and security for property. Under such a construction, the power to regulate commerce with foreign countries and among the States would be the Aaron's rod to swallow all others. The reserved powers of tha States would only he exercised by sufferance. Mining is not a branch of commeroa, and certainly not of commerce with foreign nations or among tha States. But, if Congress did possess the power, the intention to permit the destruction of navigahle waters, so extensive and important, could not he inferred from any douhtful acts. Such a policy is opposed to the practice of all civilized people, and to our own tradhions especially. It is manifest from a simple statement of the proposition, that no such result was or could have been anticipated. Then the evil was not evident immediately. There does not seem to have heen any material injury until 1864, and even yet it is stoutly denied that the tailings materially injure navigation. The suggestion as to the intention to he inferred from the acts committed and industry encouraged apply with equal force to the claim that the State has licensed this use of the navigahle waters.

The Legislature and the courts have recognized the fact that the United States has licensed this extraordinary intrusion upon the public land and the rights asserted hy the settlers. Beyond this it has provided for their governmental wants as it has for other communities, and has done so, in part, by recognizing the rules and regulations adopted hy themselves when they practically had no government, save such as sprang spontaneously from the instinct for order and genius for organization which seems part of the natnre of people accustomed to self-government.

These were principally to settle their possessory rights to the land, and to subject it to what was then a novel use under our system. As has been said, it, hy wise judicial decisions, has molded them into a comprehensive system of common law, embracing not only mining law, hut also regulating the nse of water for mining purposes. Perhaps these customs and the practices of miners have heen the chief agency in modifying the law of riparian rights—if it has heen modified—as not suited to our climate and civilization. In all this, however, there is no rule or custom which can justify the olaim that hy common consent the navigable waters were snhjected to the nse of mining, so as to allow tailings to he deposited in them to the injury of navigation. The only thing that can he said is that, in the prosecution of a great indnstry hy a great many people, the practice of dumping into the mountain affluents of these streams has been followed for a long time, and that a great deal of money hse heen invested in the business, in the full helief, justified, to some extent, hy long toleration, that it would he permitted to continne, and that extensive villages have grown up dependent upon it. The rules and customs of miners and their practices, or the fact that they have become part of the common law, outside and apart from this long tolerated practice of dumping into these navigahle streams, cannot affect this qnestion.

The practice of dumping diractly into the navigahle watere has never existed, and it is difficnlt to see how long submission to the consequent injury differs in any respect from any other case where a community has tolerated a nuisance for a long time. In other words the defence is an ingenious attempt to evade the rnle. *Nullum tempus occurrit regi*, the evideoce of acquiescence is long endorance.

The mischief, however, as has been said, was not immediately apparent. An action could not have been maintained, for lack of evideoce of injury, for many years. A public wrong is not made legal, and certainly acquires no vested right to he perpetuated from long forhearance. There being no change in the common law, the case would he remitted to the ordinary defense of tha Statute of Limitations.

I have concluded to so find that when the heaviar debris is completely impounded mining may be resumed, virtually refusing to hold that the plaintiff may enjoin such operations as only corrupt the water with mud and render it less suitable for domestic and other uses. Perhaps I am somewhat moved to this hy the consideration that mining can never be prosecuted at all. It will probably he impracticable to impound the lighter portion of the sediment. I confess I shrink from a consequence so far reaching. It seems to be a conceded fact that this is not materially injurious either to navigation or the riparian lands. Counsel denied that there was any intention to assail the prosecution of drift, seam or quartz mining. There was no material injury from that source. The sediment from such mines is of the same character as the material which cannot he wholly impounded. Perhaps this will not materially add to the permitted evil.

The authority of the Attorney-General to bring the action in the name of the people, has been called in question, and may become a serious question in the Supreme Court. Practically, it was made only on the final argument. Under the circumstances, I do not douht the propriety of my referring that matter to the Supreme Court. If the point were sustained and the case dismissed, in the event of a reversal, a new trial would he necessary before the vital questions involved in the controversy could he presented to the appellate tribunal. There have heen many cases in that Court brought hy the Attorney-General, on the presumption that such power exists. No question of authority was made. A trial court, under such circumstances, may well follow the practice until a precedent is formed.

J. Temple, Superior Judge.

June 12, 1882.

The Decree.

In the Superior Court of Sacramento county, State of California. The People of the State of California, plaintiff, va. The Gold Run Ditch and Mining Company, defendant.

This cause having heen duly called for trial upon the complaint, and answer, and both parties appearing and waiving a jury trial, the said cause was duly tried before court without a jury, and the court having heard the evidence and the argument of counsel, has duly signed findings of fact and conclusion of law therefrom, which said findings are now duly filed in this court.

Now, therefore, hy reason of the premises and of the law, it is considered by tha court, and it is ordered, adjudged and decreed:

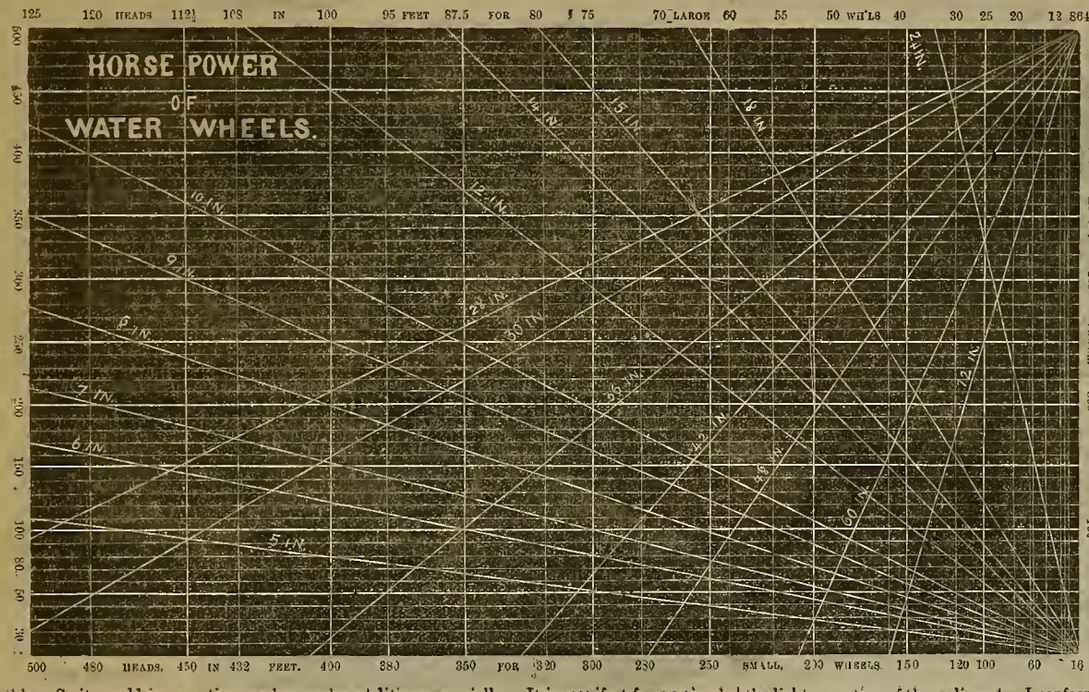
That said defeodant, and all the officers, superintendents, foremen, agents and employees thereof, he perpetually enjoined and restrained from discharging or dumping into the North Fork of the American river, or into any stream tributory thereto, and especially into Canyon creek, any howlders, cobblestones, gravel or sand from the mines; also from causing any such material to flow or to be washed into said river from its said mines or tracts of mineral land.

Subject, nevertheless, to this, that said defendants may at any time, as it shall he advised, apply to this court to have this decree and restraining order modified or vacated and set aside. And whenever, upon such showing, it shall appear that efficient means have been provided to impound, detain and hold back anch tailings at any point on said Americao river above Alder creek, and that such means are sufficient to detain all bowlders, cobblestones, gravel and the heavier sand, then said defendant shall he entitled to have said decree vacated and set aside. It is further adjudged and decreed that plaintiff recover costs herein, taxed at ——.

J. Temple,
Soperior Judge, presiding.

June 12, 1882.

Scale of Horse Powers.



In the scale, shown on this page, which we take from Prescott, Scott & Co.'s circular, the lines of horse power are parallel and equi-distant. The lines of heads in feet are parallel and are set at distances from 0 proportional to the cnhe of the square root of the head in feet. The lines of diameters are drawn diagonally, and interseot the lines of heads in feet proportionally to the squares of the diameters.

In order that the diagonal lines should not he too crowded, those representing diameters from five inches up to 24 inches have been drawn from one corner, while those from 28 inchea up to 72 inches have heen drawn from the adjacent corner on the line of 0 feet head. The lines of horse power are nnmhered increasing from the origin of the lines of diameters which they are designed to measure.

To illustrate the method of using the ecale, take two examples. First, a 39-inch wheel nnder 70-ft. head. Following the line marked 70 in the margin of heads in feet for large wheels, to its intersection with the diagonal of 30 inchee diameter and then going back from the opposite side of the diagonal in the line of horse power, the figure in the margin will indicato 200 horse power.

Second, a wheel of 14 inches diameter under 300-ft. head. Taking the line marked 300 in the margin, heads in feet for amall wheels, to its intersection with the diagonal of 15 inches diameter and following the horse power line from the same side of the diameter line to the margin it will he found to indicate 450-horse power.

The Sackett School. — This well-known Oakland school for hoys and yonng men closed a very prosperous year, by public exercises, on May 19th. The graduates delivered very creditable orations. The principal, Mr. Sackett, then distributed the medals and prizes. For the Harmon gold medal, for excellence in English, decided hy the standing in grammar and composition, George L King and Fred Stanford were so nearly equal that it was impossible to decide which one was entitled to it. The two hoys drew lots, and the medal was drawn hy Stanford. Other prizes were distributed as follows: Second Harmon prize, Albert C. Phillips; Hathaway medal, for excellence in classics, Harry Wells Sabin; Blasdel gold medal, for excellence in elocution, J. H. Hill; McFarland prize, for excellent conduct in the primary department, Harry Ainsworth; Taylor prize, for excellence in writing, Fred T. Griffith; Hainss' prize, for gentlemanly conduct in the family, James A. Crawford; spelling prize, Grant Marden. Rev. Dr. McLean presented diplomas to the three graduates—Harry Wells Sabin, of San Francisco, Fred Wilson Potts, of Los Angeles, and George Hathaway Bixby, of Los Angeles—making a few well-timed remarks. The Sackett school has now on its lists 92 pupils, and is moving to the front in all that marks thorough training.

The Electro-Magnet. — The question—"What constitutes the strength of the electro-magnet"—is answered through the *Scientific American*, as follows: The magnetic strength of an electro-magnet depends upon the eize of the iron core, the number of turns of wire surrounding it, and the strength of current charging the wire of this helix. In practice these helices are seldom wonnd to a diameter exceeding three times the diameter of the core, as what is thereby gained in magnetic moment is more than lost in increased resistance of helix circuit.

A Notable Steel Chain. — There has lately been made at Hull, England, a chain of Siemens steel; 180 yards long, containing more than 3,200 links, held together hy about 850 steel pins. It is intended for lifting purposes, has an estimated strength of 60 tons, and is thought to be the largest chain of its kind ever made.

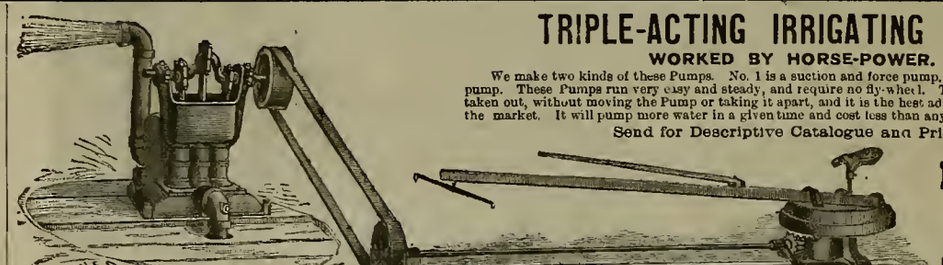
A PUBLISHER WANTED.

A good printer, or a steady and able business man, with a good reputation and a little means, can purchase (at less than two-thirds its value) the whole or a part of a long and well-established and paying newspaper and job printing office, in one of the rising business centers of this State.

Principals only need apply, (and that soon) to DEWEY & CO., at the office of this paper.

P. S.—A first-class printer can secure a permanent situation by applying soon. Also, a steady country boy a situation as janitor.



TRIPLE-ACTING IRRIGATING PUMP.

WORKED BY HORSE-POWER.

We make two kinds of these Pumps. No. 1 is a suction and force pump. No. 2 is a suction and lift pump. These Pumps run very easy and steady, and require no fly-wheel. The valves can be very easily taken out, without moving the Pump or taking it apart, and it is the best adapted Pump for irrigation in the market. It will pump more water in a given time and cost less than any other irrigator.

VIGORIT POWDER.

NO ACCIDENT HAS EVER HAPPENED.

ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.

They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.

The following qualities are common to all grades of Powder manufactured by the Company:

Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.

If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.

☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.

The Company manufactures:

DETONITE.

This is an explosive involving new principles and recently patented. It is the **Strongest Powder ever placed on the Market,** in this country or abroad. It is the **Safest Strong Powder ever made.** For very refractory rock this Powder is the most economical in the market.

VIGORIT, No. 1, XX.

This Powder is **Stronger than the Highest Grades of Hercules or Giant.** It is only surpassed by "Detonite." It is suitable for hard rock.

VIGORIT, No. 1.

For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.

VIGORIT, No. 2.

Equal to any corresponding Grade in the Market.

LOW POWDER.

VIGORIT, L. P.

This is a Powder suitable for **Rank Blasting, Log Splitting** or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is **Superior to Judson Powder,** in being more sensitive to the cap and more convenient in handling.

Best Qualities of FUSE and CAPS sold at Lowest Rates.

WATER JACKET SMELTING FURNACES

—FOR—

Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.

Send for circular.

Drainage of the Hydraulic Mining Districts.

We give on this page a map of the lower portions of the Sacramento and Sao Joaquin rivers, showing the tributary streams draining the hydraulic mining districts of California. This map is a *fac simile* of the large one, which accompanies the report of Col. G. H. Mendell, U. S. Engineers. The map will be useful to all interested in the hydraulic-mining industry, showing, as it does, the details of the water-courses of that portion of the State.

The navigable waters of California affected by hydraulic mining consist of the bays of Suisun, San Pablo, and San Francisco, forming the great estuary of California; and of the rivers Sacramento, San Joaquin, and the Feather.

The Sacramento river rises in the north and flows in a southerly direction through the great valley flanked on the east by the Sierra Nevada, and on the west by the Coast range. The Feather is a tributary of the Sacramento.

The San Joaquin has its source in the south and flows in a northwesterly direction through the valley, uniting with the Sacramento at the upper or eastern end of Suisun bay. The strait of Carquinez connects Suisun bay with San Pablo bay, which opens into San Francisco bay, and, taken as a whole, these separate bays and rivers afford a continuous channel, connecting with the Pacific ocean through Golden Gate. The auriferous drift deposits which are worked by the hydraulic process lie on the western slope of the Sierra, in a belt 40 or 50 miles wide, extending from the plains or edge of the valley to altitudes of 4,000 or 5,000 ft.

The length of this deposit, measured in a northwesterly direction, parallel to the crest of the Sierra, is about 150 miles, and extends from the Merced river on the south to Chico creek in the north, with some exceptionally placed deposits lying both north and south of these limits.

It may be remarked that in addition there are, on the Klamath and Trinity, one of its branches, quite important places, which are now worked. The detritus is lodged in the rivers, which are neither navigable or tributaries of navigable rivers, so that this separate mining district is not thought to come within the limits of this investigation. The Klamath empties into the Pacific ocean a few miles south of the northern boundry of California.

The tributaries of the San Joaquin, coming from the Sierra Nevada, and affected by mining, either past or present, are the Merced, the Tuolumne, the Stanislaus, the Calaveras, the Mokelumne, and the Cosumnes. Each of these rivers has small tributaries, which, for the sake of clearness, need not be mentioned by name, but which are to be understood as being included in the designation of the larger tributaries.

The Feather and American are the principal tributaries of the Sacramento, which drain the mining districts. The Feather is a large river, draining 3,400 square miles, and includes as its tributaries the Yuba, with its three forks, and the Bear, which rivers are noted as the seat of the principal hydraulic mining operations of California. The Sacramento and San Joaquin rivers, near their mouths, flow through a delta of considerable extent, the surface of which is below the level of flood waters. The connecting channels surround a number of islands. The soil is extremely fertile, and great efforts have been made, thus far with limited success, to reclaim the land. Insecurity in foundations and the absence of a proper material for making levees, have been the chief difficulties in the way of complete reclamation.

Several streams, the principal of which is Auburn ravine, carrying mining detritus and natural tributaries of the Sacramento river, do not reach it directly, but discharge into the basin between the American and Feather. The drainage of the Spring Valley mine, on the water of Butte creek, does not reach the Sacramento directly.

The lower portions of the Cosumnes, Mokelumne and Calaveras—all tributaries of the San Joaquin—lie in the delta lands, which receive a part of the mining detritus of these streams, and to this extent relieve the San Joaquin from injury.

The Mineral Springs of California.

On other pages of this issue we give the most complete review of the mineral springs of California ever attempted by a newspaper. The material is drawn from a careful monograph on the subject by F. W. Hatch, M. D., permanent Secretary of the State Board of Health. This document, being of a technical character and circulated mainly among members of the medical profession, is not attainable by the mass of readers whom its researches would interest and benefit. For this reason, we have attempted the publication in popular form, and trust that the result will be to the advantage of our readers everywhere.

The mineral springs of our State are one of the resources of California which are too often overlooked. Not only do they dispense their healing and restoring virtues to our citizens whom the cares and toils of life have enervated, but they bring to us a host of tourists and health seekers from all parts of the world. The number at present visiting our springs and health resorts is hardly a tithe of the throng who will come hither when our springs and their healing powers shall be better known. It is natural, in view of their short history, that knowledge of them should be somewhat fragmentary and incomplete. Concerning this point, Dr. Hatch says: "Practically, the history of our mineral waters, as derived from an actual knowledge of their effects upon disease—intelligent observation of the results of treatment with those afflicted with diseases properly diagnosticated—would, if it could always be secured, furnish us a much more reliable guide in forming just conclusions of their value in any given case than the theoretical reasonings of the chemist. Such accurate information, in the early history of medicinal springs, is not always to be obtained; popular rumors, or even the reports of individuals upon their own experience—of cures effected in their own persons—are to be received with much suspicion, on account of probable diagnostic errors and the misinterpretation of symptoms. Fortunately, we have the experience derived from the mineral springs of Europe as a guide, which have become so well known as curative agents in various diseases, that we are able, with a reasonable degree of accuracy, to associate their effect with certain known combinations of ingredients; and it is true that these effects in general correspond with what the materia medica teaches should be expected from the results of analysis. The same is true of many well-known springs of other States in this country—notably, those of Virginia. The mineral waters of California bear a marked resemblance in their chemical composition with some of those of Europe and Virginia, and from a knowledge of the latter we may draw rational conclusions as to the remedial virtues of the former."

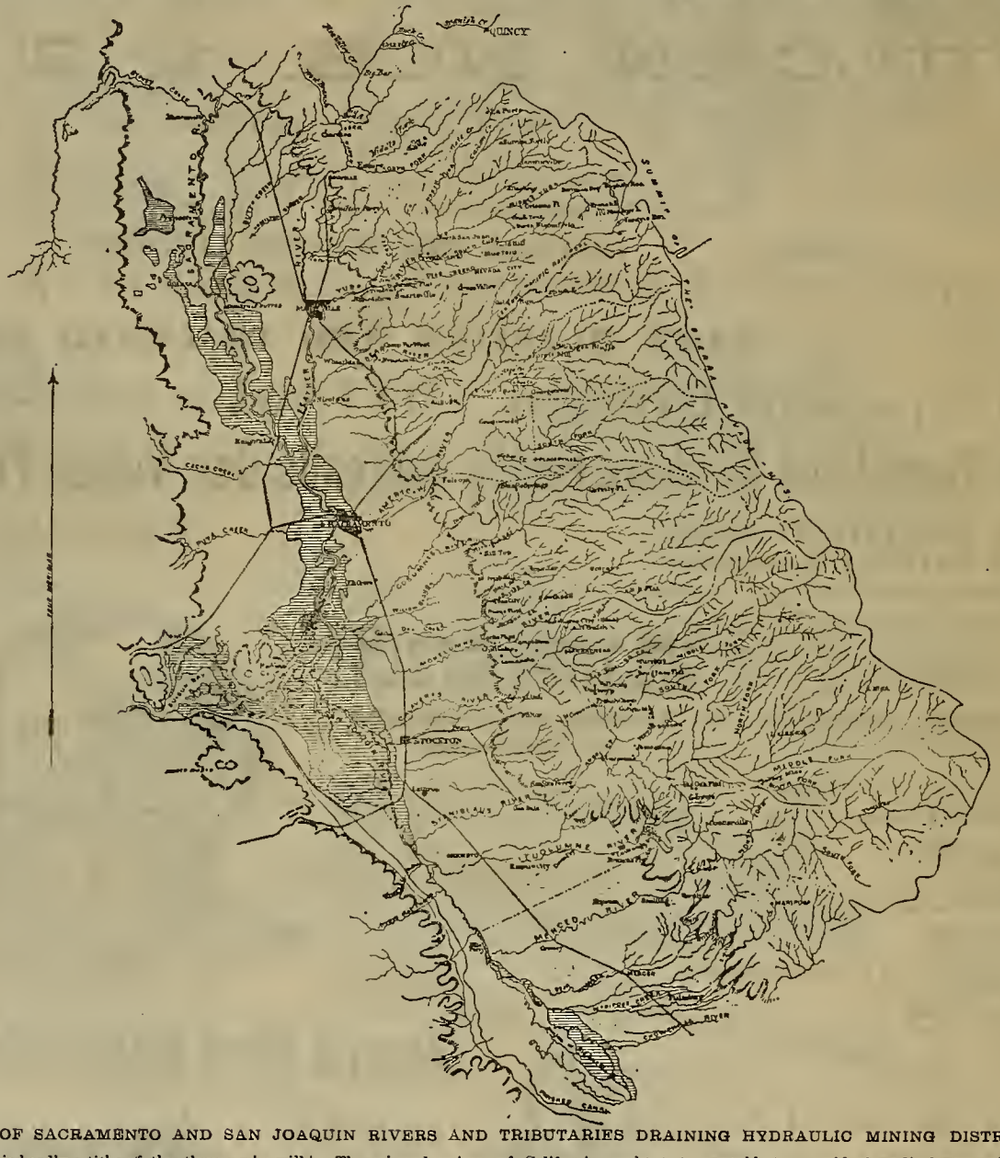
The analysis of the chemist is of great value as supplying data by which our springs can be compared with waters which have secured wide fame because of the cures they have effected and the co-relative benefits conferred. It would seem eminently fitting that the State should undertake work of this kind with reference to our mineral springs, because the effort should be systematic and comprehensive, and its results should be lifted above all suspicion of individual interest in the facts set forth. Sets of analyses procured by the owners of the properties will always be open to suspicion, even if they were really faultless. The recommendations of Dr. Hatch in this respect are worthy of general consideration.

The mineral springs of California ought to assume their legitimate place as instruments, either of evil or of good. They deserve investigation, and the public should be instructed as to their use. This can be done only when their constituents are accurately determined. When this is accomplished, those that possess a real value will continue to command confidence; while the worthless may be exposed.

This much, it is believed, is demanded in the interest of the public. The expenditure of even a small sum in this direction will redound greatly to the benefit of the State, and assist in developing one of its prominent and really valuable interests. It is not pretended that an analysis alone can be an infallible indication of the therapeutical value of mineral waters; experience affords the only positive evidence. Yet chemical analyses, by revealing to the physician the presence of ingredients with whose special effects he is familiar, will enable him to form correct general views of the action of the water, and serve to prevent, as remarked by a distinguished author upon the subject, "The incessant mistakes and mischief which medical men commit in sending their patients, haphazard, to drink mineral waters which are often unadapted to their cases." Analysis—a knowledge of the mineral combinations existing in these waters—added to the experience we are every year acquiring in their use, will give them a practical value, and establish their reputation upon a basis which, without it, they can never attain.

It may be said that the mineral springs are private property, and should be developed by private enterprise. This is true. But the action of individuals is uncertain, and while we are waiting for its determinations the interests of the public suffer. There is, besides, no guarantee afforded of the reliability of the analyses thus procured. They may be reliable, or they may not. Doubtless a considerable number of those already made have been done by competent hands, but of some we have reason to believe that the representations made are simply conjectural; nor can we be sure that due care will be exercised in this regard in the future. An analysis, unless trustworthy, is worse than useless. It misleads those who should, least of all, be the subjects of deception.

We trust the suggestions of the secretary of the State Board of Health will be productive, and that the important material endowment of the State in her mineral springs may ere long develop, and their values set forth in a form acceptable to a world of medical men and their patients.



MAP OF SACRAMENTO AND SAN JOAQUIN RIVERS AND TRIBUTARIES DRAINING HYDRAULIC MINING DISTRICTS.

SORTING RICH ORE.—Mr. Johnson, who has for some months been working the Indiana mine, has invented an original and novel racket for sorting rich ore. Some of the rock is of very high grade in silver, necessitating careful work. However, he says of his arrangement, that "It is made for a lazy man like me, and for a good many more who like to sit down to work. It is so arranged that when filled it screens the ore as it is being moved forward, and only handling it once. A man can make as many different grades of ore as he likes. The machine consists of a few boards, a piece of screen about two feet square, one joint of stove-pipe, one coal-oil can, a few nails and a piece of old rock-breaker, a few boxes and a pillow; yes, a pillow! I suppose you know what it is used for—it is much needed to perform the work; for a box is rather hard, even on the soft side of it. All the power required to work the machine is the muscle of one strong man, with plenty of patience and a willing mind to work."—*Inyo Independent.*

THE Washington monument has reached a hight of 270 ft., 20 ft. of stone having been added since May 1st.

BULLION FROM TAILINGS.—At intervals during the winter and spring, Mr. J. H. Holt, a man without a superior in working Inyo county ores, has been running the Rex Montis mill on tailings. Much of them were scattered along the creek far below the mill, having for years past been allowed to run into the stream and be washed away, as of too little value to bother about. By re-grinding them, some portions two or three times, he has secured nearly $2,500 in bullion, as shown by the sum of numerous express shipments made during the period named. This re-working is still being carried on, and quite as profitably as ever.—*Inyo Independent.*

THE married men employed by the Day mine at Royal City, who came there from two to four months ago, are now sending after their families, who have been residing in different camps on this coast, and some in the East. Really, this does not look bad for the future of Royal City.—*Pioche Record.*

INTERESTING DISCOVERY.—It is said that an important and hitherto unknown treatise by Copernicus, on the movements of the celestial bodies, has been discovered in the archives of the Astronomical Observatory at Stockholm.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

JOSHUA HENDY, Agent,

Machine Works, 49 and 51 Fremont Street, San Francisco.

Manufacturer of Quartz Saw Mill and General Machinery. Also Agent for BAKER ROTARY PRESSURE BLOWERS, and WILBRAHAM ROTARY PISTON PUMPS. P. BLAISDELL & CO.'S Machinists' Tools. HOT POLISHED SHAFTING from the Akron Iron Company, of Akron, Ohio.

Dealer in New and Second Hand Engines, Boilers, and all Descriptions of Machinery.

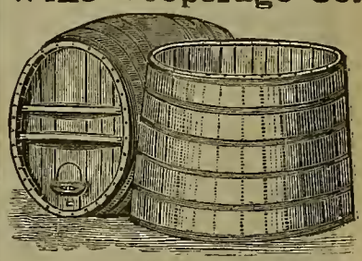
Wine Cooperage Co.



FULDA BROS., Proprietors.

30 to 40 Spear St., S. F.

ALL KINDS OF CASKS, TANKS, ETC.

Ship, Mining and Water Tanks a Specialty.

PISTON ROD PACKING.

For the best in the world, address, GEO. C. PHILLIPS, Silver City, Lyon County Nevada. Circulars free.

Educational.

The Harmon Seminary,

BERKELEY, CAL.

A NEW BOARDING AND DAY SCHOOL, FOR YOUNG LADIES.

Will be conducted by REV. S. S HARMON and Mrs. F. W. HARMON, for the last 10 years associate principals of Washington College.

The HARMON SEMINARY will receive girls of all ages; the instruction comprising Primary, Preparatory and Academic. Thorough course in the English branches. The Arts, Music and Modern Languages in charge of well known masters. Special course preparatory to the State University.

The HARMON SEMINARY will be first-class in all respects, and will combine the best educational advantages with home care, guidance and guardianship.

The first year will open August 3, 1882.

For prospectus and other information, address S. S. HARMON, Berkeley, Cal., Or. E. J. WICKSON, 414 Clay st., S. F.

SACKETT SCHOOL. (FOR BOYS)

Takes first rank for thoroughness and ability of its teachers; also for home care.

Business, Classical, and English Departments.

Next Term commences July 17th.

Send for Catalogue to D. P. SACKETT, A. M., Principal, Oakland, Cal.

THE HOME SCHOOL

—FOR—

YOUNG LADIES,

1825 Telegraph Avenue, Oakland, Cal.

The next year will begin on

WEDNESDAY, JULY 26, 1882.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

GRAND HOTEL

Santa Rosa, Cal.

WM MONTGOMERY, - - Proprietor.

This new and elegant fire-proof brick hotel having changed management and been refitted and refurnished, is now open to the public. Rates, $1 50 to $2.00 per day. Accommodations first class. Free coach and carriage to and from the hotel to all trains. Trains run every morning and afternoon for San Francisco, with return trains at later hours, making the trip either way in two hours and twenty minutes. Trains run to and from the Giant Redwood Grove, at Guernerville, daily, and connect with the Sonoma Valley railroad at Sonoma Landing. Daily lines of stages run to other portions of the county, off from the line of the railroad, in Bennett and Rincoln valleys, near the Grove of Petrified Trees, to the Geysers, and to the Coast Region.

Carson and Colorado Railroad.

(NARROW-GAUGE.)

The Company announces the completion of its line March 1, 1882, to CANDELARIA, Columbus Mining District, Esmeralda Co., Nev., 158 miles from Mound House (Junction with Virginia and Truckee Railroad).

STAGE CONNECTIONS,

At Hawthorne with U. S. Stage Company's daily coaches for Aurora (26 m.); Bodie (37 m.); Lundy and Bridgeport.

At Luning (125 miles from Mound House) with Gilmer, Salisbury & Co's tri-weekly stages (leaving Tuesday, Thursday and Saturday mornings) for Grantsville, Belmont and Tybo.

At Belleville (150 miles from Mound House) with Belleville and Independence Stage Co.'s stages for Benton (40 m.), Bishop Creek, Big Pine and Independence.

At Candelaria, with U. S. Stage Co.'s stages for Columbus (8 m.), Silver Peak, Montezuma, Alida Valley, Gold Mountain, etc.

THROUGH TICKETS

To the above points for sale at San Francisco, Sacramento Reno, Carson and Virginia R. R. Ticket offices.

This is the direct and natural route for Passengers and Freight, to points in Southern Nevada, Mono and Inyo counties, California. The line, built with steel rails and redwood ties and equipped with new and first-class rolling stock, is penetrating new and most promising Mining Districts which are now attracting deserved attention throughout the country.

For information on through freight rates apply to H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agent, Carson, Nev.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

IMPORTANT SEMI-TROPIC COLONY ENTERPRISE.

The Fairest and Best of Colonies.

THE REDLANDS,

In San Bernardino County, California.

Superior Soil, Climate and Irrigating Improvements.

The following information concerning one of the best-reputed and promising colony enterprises in southern California, is from the Riverside *Press*, of San Bernardino county, April 1, 1882:

A Model Settlement.

No place in California has sprung into public notice so rapidly and gained so deserved a reputation in so short a time as has the new tract of Redlands.

This tract is located between Old San Bernardino and Crafton on the south side of Mill Creek ditch and comprises 2 500 acres of as choice fruit lands as can he found in the State. The land is of a reddish clayey loam, not clayey enough to work hard, having sufficient admixture of sand to hold moisture and give the best results when planted to orchard or vineyard. The red lands of the State are everywhere celebrated as being superior for tree and vine.

The tract slopes to the northwest and commands one of the grandest views to he found in the State. To the north and northwest lies stretched out, several hundred feet below, the San Bernardino valley, with the towns of San Bernardino and Colton plainly in view, while, looking to the westward at night, the headlights of the Eastern-bound trains can he distinctly seen for 40 miles. Beyond the San Bernardino valley to the northwest, and stretching around to the northeast, the chain of mountains tower 9,000 ft. above the sea level, culminating in Mount San Bernardino, 11,000 ft. high, and Grayback, 11,550 ft. high, both of which stand up boldly from the Redlands point of view, and whose tops are covered with snow more than half of each year. Around to the left of the picture are the Cucamonga peaks, 40 miles distant, which complete the semi-circular mountain chain that makes such a beautiful background to the landscape. For mountain and valley scenery no more beautiful location can be found in the State than Redlands, outside of Yosemite valley.

Redlands is located 10 miles from the county seat, the same distance from Colton, and 15 miles from Riverside. The track of the Southern Pacific railroad runs within two miles of the Redlands tract, and at an early day a depot will he established for the accommodation of Redlands, Lugonia, Crafton and Old San Bernardino.

The Redlands tract is laid off hy running avenues from northeast to southwest, one-quarter of a mile apart and cross streets at right angles to those avenues every half mile, thus cutting the tract into blocks, each of which contains 80 acres. The avenues are each 100 ft. wide, and are being graded and set to shade trees, there being a row of trees down the center of each avenue and a row on either side, making a beautiful double drive with shade trees on either side. Between the front line of the block and the center line of shade trees is a sidewalk 12 ft. wide. The cross streets are 60 ft. wide, and are also being planted in shade trees on either side. The streets furnish a single drive with sidewalks on either side.

Although the first work done on the tract hy settlers could not be commenced till about the 1st of January, 1882, there are at the present time some 10 or 12 houses erected and in process of erection, with several to commence work soon. A number of tracts, in addition to those on which houses are being built, are being plowed up and planted to orchard and vineyard.

The lateness in the season when the land was bought by purchasers, prevented many from getting their land set out to trees or vines this year, but all who have purchased are making arrangements to plant extensively next winter and spring.

Town Plat.

Near the center of the tract is a town plat, consisting of 140 acres, cut up into lots ranging from an ordinary business lot to two and a half and five acre residence lots. Within this town plat, at the crossing of Palm and Center avenues, is a circular public park, with a fountain in the center. This park will he improved hy the proprietors of the tract. Above the town plat will be constructed a small reservoir, from which iron pipes will he laid to supply the town with water under pressure.

The Water System.

Is one of the most perfect in the State. The water supply comes partially from the South Fork ditch of the Santa Ana river and partially from private water developments in the Santa Ana canyon and other localities. The waters are to he conducted to a large reservoir, located in a canyon adjoining the tract, and distributed from this reservoir hy means of cement pipes. These pipes will he so laid as to carry the water without loss to the highest point on each ten-acre lot. The basis of water supply is one inch of water, statute measurement, to each eight acres of land. This is ample, and up to the best irrigated tracts in the State.

Work on the water system is being pushed as rapidly as men and money can do the work. The dam to the reservoir, which is ultimately to he 60 and perhaps 80 ft. high, is now about half done; the iron discharge pipes and watergates are in position, and nearly four miles of the largest distributing pipes are already manufactured, and most of this is laid. This portion of the work embraces the 8, 10, 12, and 14-inch pipes—the heaviest portion of the work. The smaller pipes, none of which will he less than four inches, will he made and laid as soon as the larger pipes are completed.

The orange, lemon, apricot, peach and raisin grape, will grow here to perfection.

Following is a list of the property owners at the present time. Those who have moved upon the tract are credited to Redlands, and the others to localities where they now reside:

Names.	Acres.
J. G. Cockshutt, Redlands	20

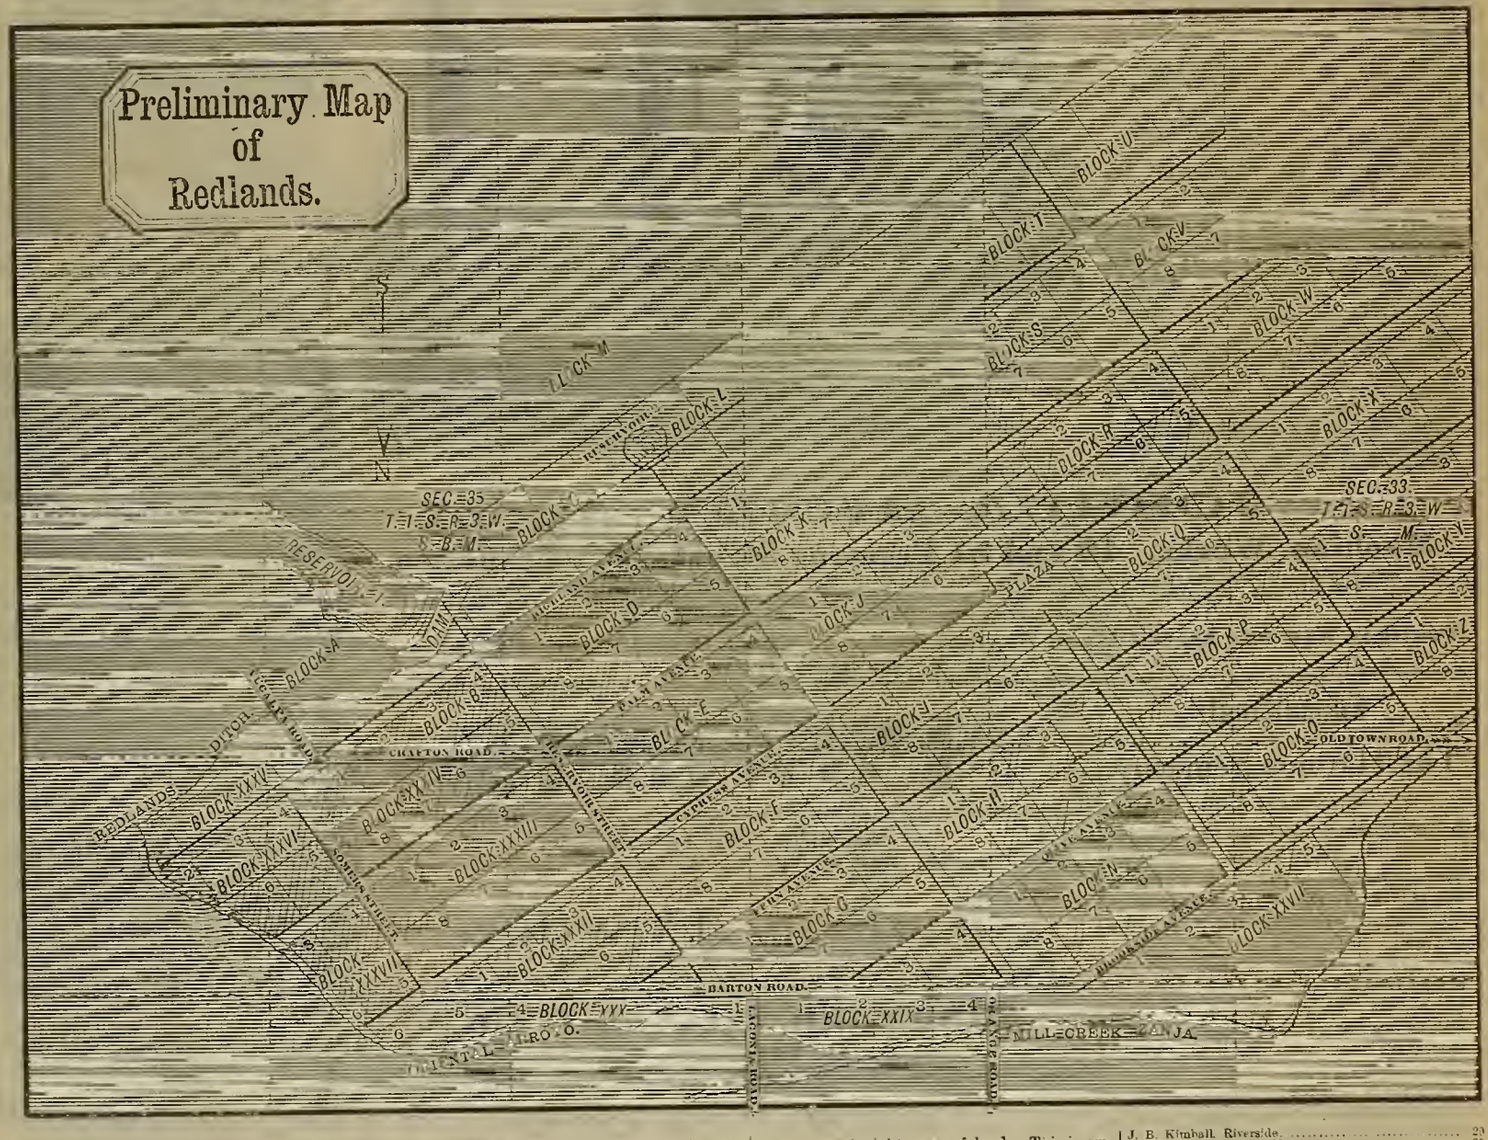
Total sold	1,004

Judson & Brown (San Bernardino, P. O.), owners of the tract, are energetic men, who leave no stone unturned to make their enterprise a success. They do not try to figure how little they can do and sell their land, but where they can put another thousand dollars and make the tract more desirable to first-class settlers. There is nothing shoddy about their operations. Redlands will stand in a few years as one of the finest settlements on the Pacific coast.



Hydraulic Gravel Elevators.

EDITORS PRESS.—I avail myself of a recent suggestion in the PRESS to lay before your readers a few ideas gathered from a protracted study of and experience with hydraulic gravel elevators, hoping they may be of service to others in advancing toward perfection an invention of great value to the mining community. A more careful attention to the natural laws under which the elevator works would no doubt have led before this to the invention, on the part of experimenters, of a much more perfect machine than has yet been brought before the public. But, strange as it may seem, no skillful scientist has, as yet, taken this matter in hand, the experiments with it thus far having been conducted only by practical men, who, having met with the degree of success which they sought, were content to "let well enough alone." But I do not hesitate to say that in the hands of a scientific man, familiar with such propositions, a hydraulic gravel elevator could be constructed producing a result at least 30% better than any of which we yet know.

In support of this statement, I will say that no elevator has yet been constructed to utilize more than 25% of the power exhausted, and yet the application of power is direct upon the resistance; there are no pulleys, bands or cogs—no friction of machinery to overcome. But mechanics working under these disadvantages realize from 60% to 70% of the power applied. Why is it, then, that we get such poor results? It is because experimenters and inventors have paid so little attention to the laws which should govern their efforts. The important improvements which have been made have been stumbled upon, not discovered through enlightened or systematic research.

While I do not profess to have studied in a school materially different from the others, I may say that some of these laws have forced themselves upon my attention.

Specific Gravity.

Ignoring friction, water running down hill falls as any other body; water running up hill rises conversely. In falling, it doubles in velocity every 16 ft.; in rising, it decreases one-half in speed every 16 ft. If we force a body of water up through the trunk or tube of an elevator, we must double the capacity of the trunk every 16 ft. of an elevation which it makes, because it is running at but half the velocity, and therefore requires double the space, and hence we may, with accuracy, determine the

Shape of the Trunk

Or discharge pipe, which is simply that of doubling in capacity for every 16 ft. of rise which it may have, regardless of the angle at which it reposes. Unless the trunk is so proportioned, we will have either the disadvantage of exhausting power by playing from the nozzle into a body of comparative still water in case the trunk is too large, or the still more serious one of keeping up an unnecessary velocity in case the trunk is too small.

The angle of the trunk is not a matter of great importance, but in consideration of the amount of material consumed in its construction, and the increased friction which a longer run involves, I have found 45° to be the most desirable. It is important that the trunk should be on a straight line from the nozzle for a distance of 15 or 20 ft., at least; otherwise, a large percentage of power will be lost in the shape of friction. It may, however, curve down at the upper end so as to enter the sluices more directly, and thus approximately conform to the natural curve of a projected stream of water. It may be made of wood or sheet-iron, the latter being preferred because it can be more readily and evenly tapered. The wear upon it is not great, and comes only on the bottom, so that by turning it one-eighth, a trunk made of No. 8 iron can be made to last indefinitely.

The Throat.

By this term is meant the lower end of the trunk, at the point where the material to be lifted receives sufficient impetus to carry it to the desired elevation. It is, of course, the smallest point of the trunk. It determines the capacity of the machine, and all other parts should be built in proportion to it. It is the point at which to determine the velocity of the whole material to be lifted, and from this velocity the wear and tear, and hence the manner of constructing the machine. The throat should never be elongated so as to form a neck or tube, as this would in a measure prevent the stream passing up the trunk from assuming a natural shape. The taper or enlargement of the trunk should commence at the throat, or as near to it as possible. The distance from the nozzle to the throat should never exceed the diameter of the latter, though where a limited feed is desired it may be much less. Where nothing but sand and "slickens" is to be raised, and that only to a short hight, a simple sheet-iron throat will last for some time, but where the material is at all heavy it is necessary to line the throat and the trunk for some distance above with iron dies several inches in thickness.

It is important that the throat should be neither too large or too small to perform the work required of it, as in either event great loss of power will result. To ascertain its size, several matters are to be considered. Ordinary gravel will be suspended in a flow of water rising at the rate of about three feet per second. It is necessary, therefore, that the water flowing through the trunk should, at the point of discharge, have a speed somewhat greater. I have found that a rate of six ft. per second is favorable. If we determine to discharge the water and gravel at a speed of six feet per second, it is plain that it would have to have a velocity of 22 ft. per second at a point 16 ft. below the discharge. Now the size of the throat should be just sufficient to carry all the water which we propose to use, provided the water were running at the speed which would be required to lift it to the desired elevation.

The Nozzle

Should then be large enough to give the required velocity to the whole volume of water used. For convenience, we may assume that we have a pressure giving us a velocity through the nozzle of 100 ft. per second, and that we wish to elevate material 16 ft. high. The question arises, what proportion of our water must be run at 100 ft. per minute to give the whole volume a speed of 22 ft? It will occur to the reader that, theoretically, it would take about one-fourth, or, making a very liberal allowance for friction, one-half. It is a fact, however, that if the above conditions were applied to any of the machines as now in practical use, the nozzle would have to be of a capacity to carry fully three-fourths of the water used, leaving only one-fourth for ground-sluicing or piping.

A stream of water running through a nozzle has the greatest force directly at or within a very few inches of the nozzle. It is, therefore, desirable to communicate the force or motion of the power stream to the inert mass of material to be lifted at a point as near the nozzle as possible, and to have this transfer take place within the smallest possible space. The space between the nozzle and throat is necessarily filled with water and gravel, and the greater the space the greater will be the eddy, or counter-current formed by water and gravel, which does not strike fairly into the throat, and returns to be acted upon again by the stream. The nozzle should point directly through the center of the throat.

No elevator has yet been constructed in conformity to all of the foregoing suggestions, but I may say that the best results I have ever seen obtained were in cases where they received the closest attention. HENRY DE GROOT, JR.

San Francisco, June 7, 1882.

GLENDALE, Montana, is another enterprising mining town. The Hecla company's mines and reduction works yielded last year $874,112, and the net profits were $237,728.

THE SANBORN WAGON.

The Sanborn Wagon.

We give on this page a picture of one of Sanborn's "sewing-machine wagons," which is adapted to quick, light work of many kinds. This is only one of many styles of vehicles made by Sanborn at the works at Manchester, N. H., and which has been sold on this coast for 23 years, thus proving their excellence. All the lumber is carefully seasoned to meet the requirements of a dry climate, and all parts, including axles and springs, are of thoroughly tested material. The setting of the axletrees gives the wagons an unusual ease of draft. At the Sanborn establishment, 24 and 26 Beale street, S. F., all kinds of vehicles can be had.

GARFIELD ON HOME MANUFACTURES.—Gen. Garfield said, June 4, 1878: "The people that cannot make their own implements of industry must be content to take a very humble place in the family of nations. So important in my view is the ability of the nation to manufacture all the articles necessary to arm, equip and clothe our people, that if it could not be secured in any other way, I would vote to pay money out of the Federal treasury to maintain Government iron and steel and woolen and cotton mills, at whatever cost."

SINGLE blanket capitalists are flocking into Butte City and other Montana camps in such numbers that the citizens have found it necessary to organize a 3-7-77, otherwise a vigilance committee, for self protection. Tramps and bad characters have been warned to leave, under pains and penalties.

Morse's New Gallery.

Mr. G. D. Morse, whose photograph gallery has been established in this city over 11 years, has just removed to the most complete, artistic and elegant rooms on the coast, at Phelan's block, Market St. The ascent to the gallery is by hydraulic elevators from Market and O'Farrell streets. On the fifth floor the exhibition gallery is reached, and here can be seen the magnificent work for which this establishment is so widely known. There are five parlors, all most elegantly and sumptuously fitted. The most elaborate of these is kept for ladies in evening costume, bridal parties, etc. The photographic rooms are furnished with all the latest appliances, mechanical inventions and other necessaries of the photographic art—the light is perfect and the surroundings so beautiful that a visitor, free from all disturbing elements and with mind harmonized, looks his best, and is sure to make a good picture. Mr. Jenks, whose works in oil painting are so noted, Mr. Koch, who has a great reputation for ivory-type and water colors, Mr. Hasselman, a crayon and porcelain painter, and Miss Buckman, a fine colorer of "cabinets," locket pictures, etc., are among the artists employed there. With such an establishment, success and overwhelming patronage must result, and we strongly recommend all our country friends when they visit San Francisco to pay a visit to this, one of the most magnificent galleries in America.

TONITE.

POWER WITH SAFETY.

Another and Incontrovertible Proof of the Unparalleled Safety of

TONITE.

At the burning of the Dry House at the Tonite Powder Works on the night of June 8th, where several trays of one of the ingredients used in the manufacture of Blasting Caps completely exploded, making a loud report, nearly a ton of Tonite in an adjoining compartment, separated only by a thin wood partition, caught fire, and was almost entirely consumed, but NOT ONE OUNCE OF THE POWDER EXPLODED.

The wire trays on which the Powder lay and the steam-pipes under the trays were not one of them broken or blown out of place, and a lot of the Powder partially burned was recovered from the fire.

Some of these Cartridges can be seen at the Company's office. The above is, perhaps, the severest test that any high-explosive was ever put to.

This Company Manufacture, also, Detonators, Electric Exploders, Etna Caps, Torpedoes, Distress, Fog and Alarm Ship Signals.

TONITE POWDER CO.,

310 California Street, San Francisco.

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

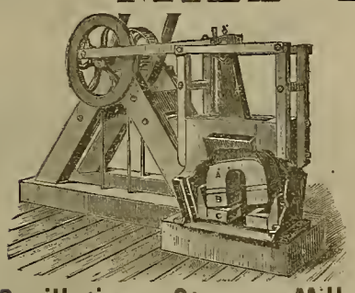
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

MILL AND MINING MACHINERY.



Oscillating Stamp Mill.

It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

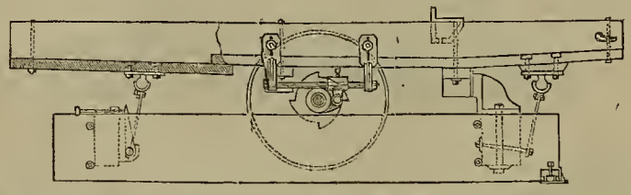
F. A. HUNTINGTON, | FRASER & CHALMERS,
220 Fremont St., S. F., Cal. | 145 Fulton St., Chicago, Ill.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,
220 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 220 Fremont Street, - - San Francisco, Cal.

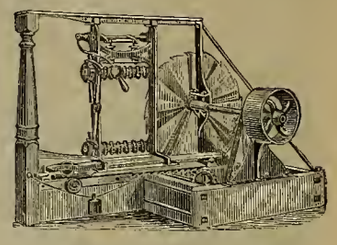


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

Amalgamating Plates

REPLATED OR MADE TO ORDER BY THE

CHICAGO PLATING CO.

Pacific Power Building, 23 Stevenson St., S. F.,

And 261 & 263 Randolph St., Chicago.

Having opened a branch house in S. F., the largest Plating and Polishing Establishment on the Pacific Coast, with all the latest improvements in machinery for plating in Gold, Silver and Nickel, with 12 years' experience in the Eastern States and Europe, we claim that our Silver Plated Amalgamating Plates are the most economical, durable and successful Plates on the Pacific Coast for saving gold. Every description of metal goods plated in the most durable manner by the

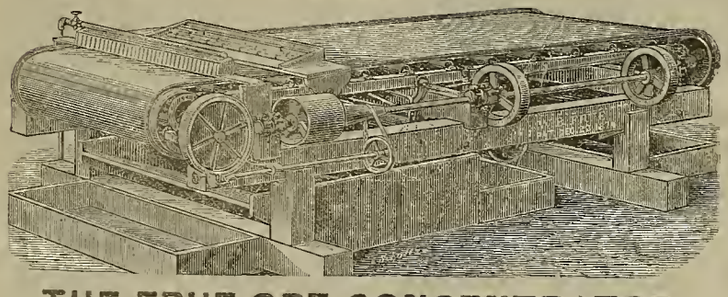
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Huckley, Spiers & Hayes, 220 Fremont street.

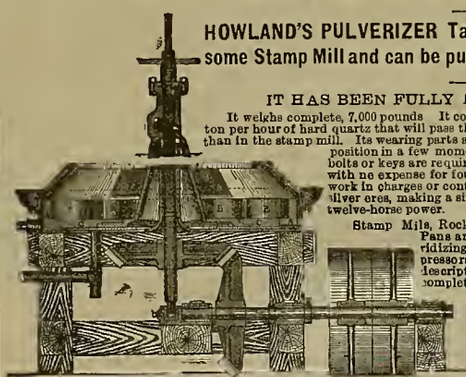
MOREY & SPERRY.
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

Electrical Apparatus and Processes for the Mining and Metallurgical Engineer.

[Read before the American Institute of Mining Engineers by N. S. Keith, of New York.]

No one of the live subjects of the day, to which the attention of the mining engineer and metallurgist should be turned, is of greater interest to him than electricity, in its applications to various mechanical, chemical, and metallurgical operations. The object of this paper is to call the attention of my fellow members and associates of the Institute to various new, as well as comparatively old, developments in the science and art of electricity, which seem to promise results of advantage.

Too many of the comparatively old applications have been neglected by the mining engineer, which, if he had given them a place among his appliances, would have assisted him greatly. The telegraph may be noticed as one. Its use is, however, confined to a person having skill in the manipulations of the key, the reading of the alphabet, and familiarity with the sounder. One of the simpler forms—the call-bell—has a range of application far greater, as to distance and convenience, than the old wire-pull, or the hoarse voice of the windlass-man or the bucket-dumper. A few Laclanche cells, two or more electric bells, and a mile or more of wire judiciously placed, will put the superintendent, at his office, in communication with the foreman of his mills and mines, so that by aid of a code of signals, great advantages may be gained without necessitating a knowledge of the Morse alphabet, or of the mechanical voice of the sounder. The telephone furnishes a means of communication between the often widely separated places of duty, which will save many a step, much loss of time, and wear of horse and body. It can be used by anyone who can speak.

But I wish to call attention particularly to a description of new applications of electricity which the miner and metallurgist will find, before long, so essential to his profession that their

Theory and Practice will be Taught in the Schools,

The same as metallurgy, mineralogy, and chemistry now are. That which we may call the new electricity is due to the practical development of the theory of the conservation of energy, and the consequent production of mechanism for the generation of currents of electricity of any desired quantity and intensity. So new is this electricity, in fact, that even the recent graduates know little or nothing of its modes of production or of its applications in practice. I will speak of the

New Applications,

Which are the result of the extensive production of machinery for generation of electricity. First comes that which appeals sensibly to the eye—light. It has been fully determined that there is no light, except daylight, as cheap as that produced by the voltaic arc; none so pure in color, none so bright. Many arc lights are in use in rolling-mills, machine-shops, hydraulic mines, surface works, and other places. The miner needs the electric light in the shaft-house, the stamp-mill, and at the furnace. If he has no engine at the shaft-house, this one at the stamp-mill or furnace can be used to run an electric generator, so that not only his shaft-houses can be illuminated, but also his mill or furnace, and even the road between, much cheaper than he can produce one-tenth of the light by the use of candles or kerosene, and with much greater safety.

It is doubtful, however, whether the voltaic arc light will be of any great practical utility in narrow veins of mines, because the light produced is too great in quantity and much more than is needed, by far, in the narrow spaces. Nor in the headings or stopes is it applicable, as it requires in such places too frequent moving. The work at the new railroad tunnel through Bergen Hill, at Weehawken, is successfully and economically lighted by 11 arc lights placed upon the circuit from one electric machine, two and one half miles long. The conductors are of well-insulated copper wire, carried along the ground upon poles, down and up the shafts, and into the various headings. The men can do more and better work in the good light. In lighting the banks at hydraulic mines, in iron-ore pits, in open cuts of railroad work; in fact, in all large spaces in which night work is carried on, this light has no equal.

Take now, some of the applications of

electricity which can be Used by the Miner

And metallurgist, if he has at his main engine, or water-wheel, a suitable generator of electricity. He may be sinking a shaft at the top of a mountain where it would be impracticable to place or operate a steam engine. If he places there an electric motor and connects it with a generator by conducting wires, he will have power at his command at the shaft, which, by the mere turning of a switch-handle, will work the whim or windlass, and hoist ore or rock, or work a pump. I have an instance at hand where electricity is now used in mining for the transmission of power, in the Loire valley, in France, at the works of the Compagnie de la Ferrooiere. One Gramme machine is employed as a generator of electricity, and another as a motor attached to a drum, which stands at the head of an inclined plane 110 metere long, with a grade of four centimeters per meter. The generator is 1,200 meters from the motor. The load raised is about 800 kilograms (1,760 pounds), and the ascent is made in one minute and a half. The work goes on with great regularity. The starting and stopping can be done as gently as desired. By means of a galvanometer in the circuit, one can tell at any moment what is being done at the incline, whether the work is stopped, whether the wagons are coming up filled, or not, etc. The work is about two-thirds of a horse power.

By means of this current one can

Ignite Blasts and Work Electric Drills.

Which are said to be economical in comparison with the steam drill. The operator can stop and start at will, and have all the advantages of mechanical movements, without the constant personal attention of an engineer at the shaft. He can light all his works from a central station at the mill, or other place where he has available power. Branch wires can be taken to the laboratory, where the electric current will aid him in his analyses and tests, and with it he can heat, boil, cupel, roast, and perform all the operations of the laboratory which require heat, power, or the determination of chemical affinity. It will detect imperceptible flaws in iron and steel bars, and determine the amount of carbon in steel. Think of melting metals by the fall of water! The suggestion of it even, not so many years ago, would have secured our excommunication.

It would take too long, and far exceed the proposed limits of this paper, for me to enter into the particular modes and apparatus for carrying on the various operations which I have enumerated; but I will briefly describe a few practical operations which can be carried out on a large scale.

For quite a number of years, in the neighborhood of Swansea, in Wales, a method of refining copper and separating such gold, silver, and other metals which the impure copper may contain, has been in practical operation on a large scale. Plates of black copper are made the anode in an electrolytic bath, consisting of a solution of sulphate of copper. Other thin plates of pure copper are made the cathode in the bath. By the electrolytic action of the current, produced by an electric generator, copper alone is dissolved from the black copper, and is deposited in a pure state upon the cathode. The impurities of the black copper sink to the bottom of the vat, and are removed from time to time and treated for their contents of gold and silver. The cathodes, as soon as they have reached the proper weight, are removed, and the copper therein is melted and cast into pigs for market. This process has been found more economical than any other for accomplishing the same result.

An analogous process is the one invented by me for the

Refining and Desilverization of Base Bullion.

The bullion, in plate, is placed in a solution of acetate of soda and sulphate of lead, and is so connected with the source of electricity as to be an anode, while plates of other metal are the cathode. Lead is dissolved and deposited electrolytically; and the deposit is practically pure. I have invented an improvement on this process, which consists in taking the skimmings of zinc, lead and silver, which come from the kettles in the process of desilverization by means of zinc, and putting them in bags as an anode, dissolving both the lead and zinc, electrolytically, and depositing them together as an alloy, or mixture, upon the cathode plates. The contents of gold, silver, etc., are retained in the bags, and are treated for these metals by smelting. The combination of pure lead and zinc is removed from the cathode and added to the next, or some other succeeding lot of base bullion, put into the kettles for desilverization, and in that manner the process continues. In place of treating the whole mass of bullion by electrolysis, I get, in the first place, by the zinc desilverization, say, 80 % of the base bullion as market lead; and, say, 22 % of a mixture of rich lead and zinc, which goes to electrolytic treatment. By adding, then, the pure lead and zinc to the succeeding lot of bullion, I effect the desilverization, and remove from it, as market lead, an amount approximately equal to the quantity of lead which is in the bullion placed in the kettle.

The process which has within a year or two been re-introduced by Siemens for

Melting Steel by Electricity

Can be applied to melting other metals and materials. The apparatus for this operation is comparatively simple. Take a black lead crucible of proper size and put it in another suitably larger, and in the space between the walls of the two pack some good non-conducting material, like asbestos. Introduce through a hole in the bottom of this combination a carbon rod, like one used in the electric arc light, and lute around it well with a paste of clay and graphite, so that it forms a conductor to the interior of the inner crucible. Next provide a cover, with a hole in the center of a size to freely admit another carbon rod. Now place above the crucible the mechanism of an electric lamp, so that the carbon carried by its movable rod can enter the crucible through the hole in the cover. Place in the crucible an amount of steel, or other metal, put on the cover, pass through the hole in it the carbon rod, and connect it with the movable carbon carrier of the lamp; connect the body of the lamp with the positive pole of the current generator, and then connect the carbon which passes through the bottom of the crucible with the negative pole. Immediately the upper carbon will be automatically withdrawn slightly from contact with the metal in the crucible and form a voltaic arc at that place. Fusion goes on rapidly, so that some pounds of steel can be fused in 20 minutes. The lamp mechanism serves to keep the carbon rod at its proper separation from the metal. Siemens says that there is no other equally economical mode of fusing small amounts of steel, because there is none which so concentrates the heat upon the material which it is desired to fuse. In fact, the fusion takes place before the outer crucible is raised any considerable degree in temperature.

The Latest Development in Electricity

Is in the so-called "storage" of it. By the term "storage of electricity," I do not desire to be understood literally, any more than I would be so understood in speaking of the store of heat in coal. It is merely a convenient term which avoids giving a chapter in physics. The first storage of electricity, other than in its so-called static condition, was effected by Plante in his well-known secondary battery. In this case, as in all subsequent arrangements for storage, energy is absorbed in the decomposition of water by electricity, which is again given up as a current of electricity when the proper circuit is furnished; or, better said, when the proper association of materials is made. The value of this arrangement of Plante, and the scope of application of its modifications, has not been recognized until recently.

There is nothing to be gained by expending zinc and acid for the production of electricity to effect chemical decomposition for sake of the subsequent reverse actions as electric current, for the battery can be used directly whenever such current is desired. But the recent mechanical means of generating electricity have so cheapened its production that it is now sometimes desirable to store up the electricity produced, as it were, in some portable form, so that it may be utilized in a place which is not available for its direct production and use.

The line of development which has received the greatest attention is the one of which Plante's secondary battery is the type. Faure's arrangement is the most prominent. The capacity of both depends upon the porosity of the surfaces of two lead plates; one in connection with the positive, and the other with the negative pole of a source of electricity. Plante's cell acquired its limited capacity by the result of repeated oxidations and reductions, effected electrolytically, of the surfaces of the lead while in a bath of acidulated water. Faure increased this capacity by applying a coating of oxide of lead directly to the lead plates, so that the increase on a given surface, in comparison with Plante's, is in the proportion of 2,000 to 75.

The Operation of Charging and Discharging

These cells is as follows: A source of electricity, having an electro-motive force somewhat in excess of two volts, is connected, as before stated, with the two lead plates in a bath of water acidulated by sulphuric acid, and the current is allowed to flow in them for a time, limited by the current and capacity. The result is that the coating on one plate is peroxidized, and this other has its coating of oxide reduced to metallic lead. If the source of electricity be then disconnected, and the wires which are attached to the lead pipes be kept separate, the charge will be only very slowly dissipated. But if the wires be connected, either directly or through any conducting substance, an electric current will flow in the reverse direction to that which was passed through the arrangement from the source of electricity, until the original condition of oxide on both plates is resumed. The action of the current through the plates is first to decompose the water of the solution in which the plates are immersed; the oxygen goes to the positive plate and is absorbed in peroxidation, while the hydrogen goes to the negative plate and acts there as a reducing agent, making metallic lead from the oxide. The reverse action takes place when the wires are connected. So it will be seen that the original electric current determined a chemical affinity, which, when circumstances allow, re-asserts itself with the development of a current of electricity. On a future occasion I expect to be able to describe a storage battery of my own invention, the particulars of which I am not at present prepared to give.

Sir William Thomson found 1,000,000 foot-pounds of electrical energy stored in a box weighing, with its contents, 180 pounds, made by Faure, at Paris, which he set free by use in Scotland.

The decomposition of only one pound of water by electricity absorbs about 5 300,000 foot-pounds of energy, which can be drawn at will from the storage battery through an electric motor. This equals two and two-thirds horse-power for an hour. The waste of power in the process of storing is not yet well determined, but the economic results promise to be favorable, and if expectations be realized, the applications of "bottled electricity" will be many.

Discussion.

Prof. C. O. Thompson: Can you give me any information with regard to a possible pollution of the atmosphere by the electric light through the formation of compounds of oxygen and nitrogen?

Mr. Keith: I cannot say that there are any specific data on this point. Ozone is probably formed, and that may possibly act upon nitrogen of the atmosphere to form nitric acid. Some investigators have said that nitric acid can be detected in the neighborhood of the voltaic arc, but not in deleterious quantity. Ozone acts to oxidize organic matter, and to that extent may be a purifier of the atmosphere.

Mr. G. W. Maynard: I am glad to bear testimony to the utility of the electric light in mills. I have seen it in use in several mills having from 26 to 60 stamps, with great success. The apparatus used were generally those made by the Brush company, and of the arc type. The light has a very penetrating quality, especially useful in the dust of dry stamp-mills. Under its use the amount of work done by employees is very materially increased.

Electricity is used for the refining of black copper in South Wales, by the Messrs. Elkington. I believe they use a chloride solution instead of a sulphate, so that insoluble chloride of silver is formed at the anodes. A very large number of tanks are used, and the electric generators are those made by Wilde, of Manchester, England. This process is also in use at Mansfield, Hamburg, and other places in Germany.

Mr. H. M. Howe: Will Mr. Keith tells us whether one pound of his apparatus, including apparatus and contents, will contain as much energy as one pound of coal; and, also, roughly, what will be the cost of 1,000 foot-pounds as stored in this manner, that we may see how the cost of energy so stored compares with its cost when stored in coal?

Mr. Keith: The comparative aggregates of energy are due to the combinations of two elementary substances in each case. In one, to the union of oxygen and carbon for heating water in the production of steam for an engine; and in the other case to the union of oxygen and hydrogen to form water with an incidental current of electricity. The amount of energy due to these unions is well known. Twelve parts of carbon combine with 32 of oxygen to form 44 of carbonic acid, with a freeing of energy equal to about 11,000 foot-pounds. Two parts of hydrogen combine with 16 of oxygen to form 18 of water, while 6,800 foot-pounds of energy are freed. Our best steam apparatus utilizes scarcely 10% of the energy due to the combustion; but it is a very poor electric motor which will not utilize more than 50% of electric energy applied to it. Some recent machines are said to utilize from 85% to 90%. Thus, it will be seen that, pound for pound, the electric energy is the greater. The energy due to the union of oxygen and hydrogen to form a pound of water exceeds 5,000,000 foot-pounds; and this can be stored for use electrically in apparatus weighing not 200 lbs.

Mr. Howe: So there is more available power in one pound of your machine than in one pound of coal?

Mr. Keith: I cannot now say that, when we take into consideration the weight of apparatus. But in the matter of materials which go to develop the energy; yes, and in the proportion of about fourteen to nine. And in the matter of available energy, this is probably large enough to more than counterbalance the weight of apparatus.

Prof. Silliman: I have had some experience in the deposition of copper by the dynamo-electric machine, both practically and theoretically. The process may, in my judgment, be made a commercial success. In the particular instance to which I allude it was not commercially successful for the want of a large enough dynamo. We had not at that time one of sufficient "quantity." One was begun by Mr. Weston, at Newark, of suitable magnitude, but failed of completion owing to destruction of his works by fire. It is merely a question of cheapness of power and the use of a suitable dynamo; always with the understanding that the attempt must not be based upon doing work beyond the capacity of the dynamo.

Steel wires are coated with copper at the works of Wallace & Sons, at Ansonia, Conn., for use in telegraphy. Copper enough is deposited on them by electricity so that small, strong conductors are produced, equal in conductivity to the much larger and heavier iron wire heretofore used.

Mr. Keith: I doubt the relative economy of the use of electricity in the separation of gold from silver. The process used in the Government assay office and mints gives by-products, which pay very much of the expense of separation by means of acids.

Mr. Howe: While black copper is successfully refined electrolytically at Birmingham and Mansfield, copper refiners in this country in vain endeavor to learn how to do it. I have clients who would pay any reasonable price to the man who could carry out the electrolysis of argentiferous black copper rapidly and cheaply. This is one of the great needs of the copper industry in this country.

A very interesting process for the extraction of aluminum from its oxidized compounds has lately been described to me by its inventor. The aluminous compound is placed in a carbon crucible, which is connected as the cathode of an electric current of great intensity. A voltaic arc is then thrown across from another electrode against this carbon crucible, the current thus first melting and then decomposing the aluminous compound, and metallic aluminum being deposited on the sides of the crucible.

Mr. Keith: I have heard such a process vaguely hinted at, but must say that I do not understand how aluminum can be produced except by some variation of this process.

A RECENT clean-up of Silver Bell (Arizona) ore at the smelter gave 100 bars of silver bullion and two tons of matte, which was shipped through Blake & Co.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR THE WEEK ENDING JUNE 6, 1882.

258,871—ELECTRO-MAGNETIC ACTION FOR MUSICAL INSTRUMENTS—Cyrus N Andrews, S. F., Cal.

258,980—ORE CONCENTRATOR—A. Blatchly & G. Kustel, S. F.

258,881—VALVE FOR COLLAPSIBLE FLOATS—Albert Bosshard, S. F.

259,143—DEVICE FOR CATCHING FISH—Thos. Heaton, Vancouver, W. T.

259,150—OBTAINING MAGNESIUM SULPHATE FROM CRUDE MINERAL—Fred'k. Hohlweg, S. F.

259,030—WOOD PRESERVING COMPOUND—John C. Marshall, Oakland, Cal.

259,184—WATCH OILER—W. W. Martin, Salem, Oregon.

259 189—COMBINED BEDSTEAD, TABLE, ETC.—Mary A. McMaster, Antioch, Cal.

259,201—COMBINED HEADER AND THRASHER—Wm. H. Parish, Salem, Oregon.

258,946—EDGER—James A. Robb, San Jose, Cal.

258,953—ROTARY PULVERIZER—James O. Stewart, Alameda, Cal.

258,958—PNEUMATIC COUNTER BALANCE FOR PUMP RODS OF DEEP WELL PUMPS—Wm. F. Toothaker, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

News in Brief.

A ST. LOUIS syndicate is said to have expended $1,500,000 in the purchase of mines and railroads in the coal regions of southern Illinois, with the intention of creating a new steel manufacturing city.

A CORRESPONDENT of the New York *Times* says that in the safe of the late Moses Taylor were 25,000 railroad bonds of $1,000 each ($25 000,000), piled up open, sheet upon sheet, in great stacks. These formed but one item of Mr. Taylor's wealth.

SENATOR MILLER, of California, has introduced a bill similar in its provisions to the Rosecrans bill, granting the right of way through the Presidio military reservation to the San Francisco and Ocean Shore railway company.

COMMANDER PARSON, commanding the *Wachusett*, reports to the Navy Department, under date of Fort Wrangel, Alaska, May 19th, that perfect quiet and good order exists in all parts of the Territory.

THE Buckeye flour mills, at Marysville, which have been using about 2,000 cords of wood annually, will on the 15th instant abandon the use of wood, and thereafter use Lincoln, Placer county, coal exclusively.

THE Grand Trunk railroad has had a passenger blockade. There were 4,000 immigrants at Quebec waiting for transportation to Toronto, and detained several days while additional cars were being prepared for their use.

THE western end of the Denver & Rio Grande railroad is nearly completed to Salt Lake. It is said that all the force possible will be put on the Colorado and Utah division, so as to have the trains running from Denver to Salt Lake by January 1st.

GEN. IGNATIEFF, at his own request, has been relieved from the post of Minister of the Interior, on the ground of ill-health, and has been appointed President of the Academy and a member of the Senate. He retains his membership of the Council of the Empire and his Adjutancy.

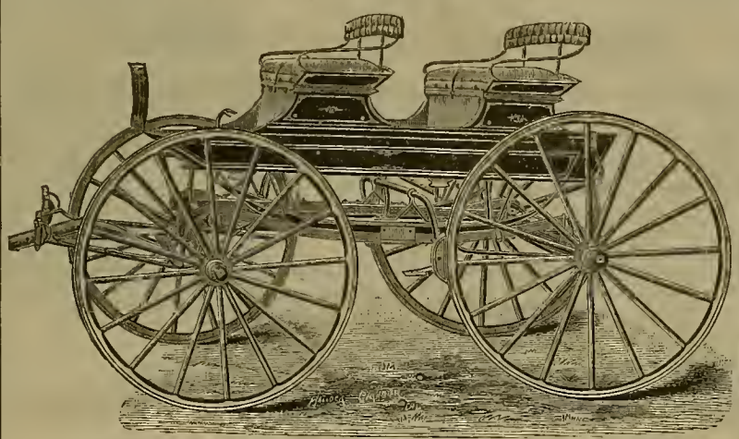
Benicia Agricultural Works.

We lately paid a visit to the above-mentioned works, and was fairly surprised at their extent and completeness. The principal owners are Messrs. Baker & Hamilton, of this city and Sacramento. The factory was formerly located at San Leandro, and was known as the Sweepstake Plow Company.

The Benicia Agricultural Works comprise foundry, machine, wagon, smith's, paint and finishing shops, covering a floor surface of nearly two and a half acres.

The wharf connected with the works is over 600 ft. in length. All the machinery is entirely new and of the best description, with all the latest improvements. Over 200 skilled mechanics are engaged.

The overland train passes through the



THOROUGHBRACE WAGON, OF BENICIA AGRICULTURAL WORKS.

works and stops to deliver and receive passengers.

One of their specialties is the manufacture of spring, express and thoroughbrace wagons, and of every description, to order.

We herewith give an illustration of their thoroughbrace wagon. Other illustrations appear in the advertisement on another page. Their premises are well worth a visit, and we recommend our readers to call at the works and see for themselves.

Cylinder Printing Press for Sale.

A large cylinder Hoe printing press, for country newspaper work, can be bought cheap by addressing Press, Box 2361, S. F.

Mining and Other Companies.

Seaton Gold Mining Company.—Location

of principle place of business, San Francisco. Location of Works, Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of June, 1882, an assessment, (No. 1) of Fifteen cents (15) per share was levied upon the capital stock of the corporation, payable in U. S. gold coin to the Treasurer, A. Warner, at his office, No. 224 Kearny St., room 2, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-first day of July, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on Wednesday, the Sixteenth day of August, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. A. MARTIN, Sec'y.

OFFICE—Room 6, 628 California street, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE

EUREKA CONSOLIDATED MINING CO.

Nevada Block, Room 37, San Francisco, June 15, 1882.

At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 74) of Fifty Cents per share was declared payable on the capital stock of the Company, on Tuesday, the 27th day of June, 1882. Transfer Books closed until the 28th instant.

P. JACOBUS, Secretary pro tem.

DIVIDEND NOTICE.

OFFICE OF THE

Silver King Mining Company.

San Francisco, June 7, 1882.

At a meeting of the Board of Directors of the above-named Company, held this day, a dividend (No. 30) of Twenty-five (25) cents per share was declared, payable on THURSDAY, June 15, 1882, at the office of the Company, Room 19, 328 Montgomery street, San Francisco, Cal. Transfer books will close June 9, 1882, at 3 P. M.

JOSEPH NASH, Sec'y.

Gaudalupe Silver Mining Company—Lo-

cation of principal place of business, San Francisco, California. Location of Works, Urique, State of Chihuahua, Mexico.

NOTICE—There are delinquent upon the following described stock, on account of assessment No. 23, levied on the 28th day of April, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Certificate.	No. of Shares.	Amount
Lee, R. B (estate of)	19	2	$100 00
Stetson, E. J.	27	1	50 00
McPherson, J. B (estate of)	13	1	50 00
Haynes, T. J (estate of)	20	2	100 00
Haynes, T. J. (estate of)	30	1	50 00

And in accordance with law and an order of the Board of Directors, made on the 28th day of April, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, room 13 No. 109 California street, San Francisco, California, on Monday, the Third (3d) day of July, 1882, at the hour of 2 o'clock, P. M., of said day to pay said delinquent assessments thereon, together with the costs of advertising and expenses of the Sale. WM. BLACKWOOD, Sec'y.

OFFICE—Room 13, No. 109 California street, San Francisco, California.

Norwich Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of Works, Glencoe Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1882, an assessment, (No. 1) of Twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 310 Pine street, room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of July, 1882, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 31st day of July, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. A. L. PERKINS, Sec'y.

Office—319 Pine St., room 15, San Francisco, California.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

BARGAIN.

Brodie crusher, hurdy gurdy, and grate bars, little used, F. R. J. DIXON, Greenwood, El Dorado Co., Cal.

F. A. HILL, Superintendent. **E. P. PALMER, Secretary.**

BENICIA AGRICULTURAL WORKS,

MANUFACTURERS OF

AGRICULTURAL IMPLEMENTS,

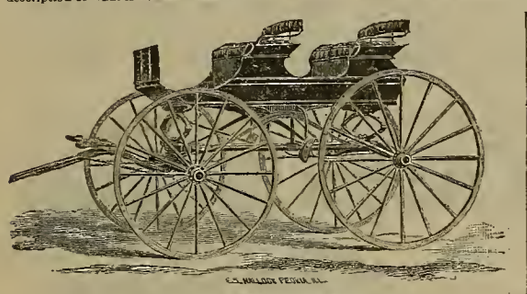
Gang Plows, Road and Field Single Plows, Iron and Wood Frame Harrows, Cultivators, Seed Sowers, Hay Presses, Haying and Harvesting Machinery Headers, Iron, Farm and Freight Wagons, Patent Iron Gear Spring Wagons, Spring and Thoroughbrace Wagons of all Kinds, Buckboards, Barrows, Store and Warehouse Trucks, Grain Cleaners, Barley Crushers, Eureka Ditching and Grading Plows, Sweepstake Quartz Mills, Etc., Etc.

Recently removed from San Leandro to Benicia, Cal. Formerly Sweepstake Plow Co. The Largest and Most Complete Agricultural Works on the Coast. The buildings are over 1600 feet in length, and have a floor surface of 105,412 square feet, or nearly 2½ acres. The Wharves, connected with the Works by rail, are over 600 feet in length, and have a floor surface of more than 40,000 square feet, including warehouse. The Machinery is entirely new, of latest improved patterns throughout. With this Mammoth Establishment and skilled mechanics in every department, we are prepared to build every kind of implement to order, and parties needing suggestions or assistance in perfecting inventions will have the best kind of aid and assistance, thereby saving time, labor and coin. Our facilities are such as to insure rapid work and prompt shipments, either by rail or water, thus making a good saving for parties in the interior who order goods from these Works. We particularly invite correspondence from the country, and prompt responses will be sent to all inquiries.

SPRING WAGONS.—The increasing popularity and demand for our Spring Wagons, warrants us in claiming for them a superiority over other wagons in this market. We claim a thorough knowledge of the business, acquired by years of experience in both the mechanical and practical construction. With improved machinery and skilled mechanics—using material of the best quality, timber thoroughly seasoned and put together with the utmost care—we challenge comparison with other manufacturers in price for the same quality and finish. We do not compete in prices with the manufacturers of Spring Wagons of an inferior quality, nor shall we impair our work in order to reduce the price, but will build to order Wagons and Vehicles of any kind required, which, for general proportions, style and finish, cannot be excelled on the Pacific Coast, and at a reasonable price. We make a variety of styles, although our Standard Wagons—which we keep in stock and make a specialty of manufacturing—are Nos. 0, 00, 1 and 3. Some of the other styles we do not usually keep on hand, but will build to order. We also manufacture in large quantities and keep in stock (No. 12) Buckboards, as shown in cut below. We manufacture all classes of heavy and light Thoroughbrace and Spring Wagons to order, paint them any color desired, and trim with any kind of material which may be preferred, due notice being given us.

WHEELS.—During the past ten years we have tried almost every description and found none that were strictly adapted to our California climate until we had them built in accordance with our own ideas, based upon years of experience. We now claim to have the best wheel made, being so constructed that they are proportionate in all their parts, with strength and size where required, while the hubs can neither check, swell nor decay and the grease cannot work through as with other wheels. The entire hub is covered both front and back with two malleable flanges, the outside flange forming the hub band. We have abandoned the use of the Rouse band, which comes higher and is not as good, and will put these wheels on all our wagons unless ordered wood hub. As soon as received from the factory they are passed through boiling oil and placed in the dry house until ready for use. Gearing is best selected Hard Wood, made to our own patterns. Body, best of seasoned Ash, Alder and Sugar Pine, well proportioned. Wood Work all receives a thorough coating of boiled oil, filling the pores of the wood—enabling our Wagons to stand the hot Summer weather of the interior. Springs—Best brand of Swedes Steel, oil tempered; thoroughly tested and warranted, and like our wheels and axles made strictly to our patterns, and for our class of work only.

PAINTING is not excelled in any part of the United States, and material of best quality. The wagons complete are the best that can be made for the money, and are all that can be desired. Stylish, easy running, durable and first-class throughout. We do not prepay freight. Orders from persons unknown to us must be accompanied by the cash, or a convenient satisfactory reference. If a cut is not shown of the wagon desired, please call on us, or our agents, or write us a full description of what is wanted—with an order—and we will guarantee to fill it with satisfaction to the customer and credit to ourselves.



No. 1.—With Pole and Brake.

No. 1 is a stylish 4-Spring Wagon, with Pole and Brake, and 1¼-inch axle. It is adapted for, and extensively used as a Family Carriage—taking the place of a Carriage for that purpose. The seats are easily removed; has a drop tail board, and, for general business purposes, pleasure excursions, picnics, etc., it cannot be excelled. Its style, finish and general appearance makes it a very popular wagon with all. Side Springs, 1¼ inch, 5 leaves. End Springs, front, 1¼ inch, 3 leaves; hind, 1¼, 4 leaves.

Price List:

With Wood Hub Wheels.....$220.00 | With Sarven Patent Wheels.....$225.00
Pole for No. 1,$24.00. Shafts for No. 1, $15.00. Brake, $15.00.

No. 1.—With Top.

No. 1, with Top, is a popular Family Wagon and Carriage, and is of the same mechanical construction, style and finish as No. 1 without Top. It is a neat standing Top, with drop curtain; is nicely trimmed and handsomely painted. The Top can be quickly removed if desired, and an open wagon made of it. It takes the place of a more costly vehicle, and supplies a want long felt for a stylish cheap Carriage. Axle, 1¼ inch. Springs same size as used on No. 1.

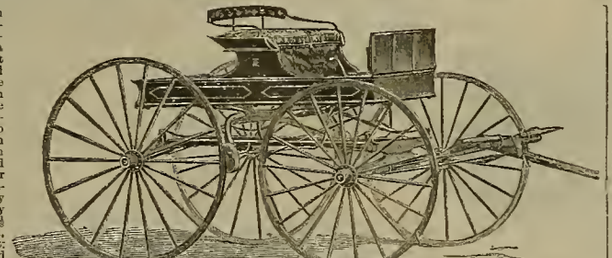
Price List:

With Wood Hub Wheel.....$270 | With Sarven Patent Wheel..$275

No. 3.—With Pole and Brake.

No. 3 is built very much on the style of our No. 1 Wagon, 4 springs, but has 1¼-inch axles and heavier springs, intended for heavy work and loads; has a drop tail board and good length of body, while the seats are easily removed. It is used as a Grocery and Express Wagon; and for farmers who require a wagon for family use and farm purposes, we can highly recommend it. Price List:

For Open Wagon, Wood Hub Wheel..$225	Sarven Patent		$230
For No. 1 Top Wagon " " .. 275	" "		280
Pole only	24	Brake only	15



No. 0.—With Pole and Brake.

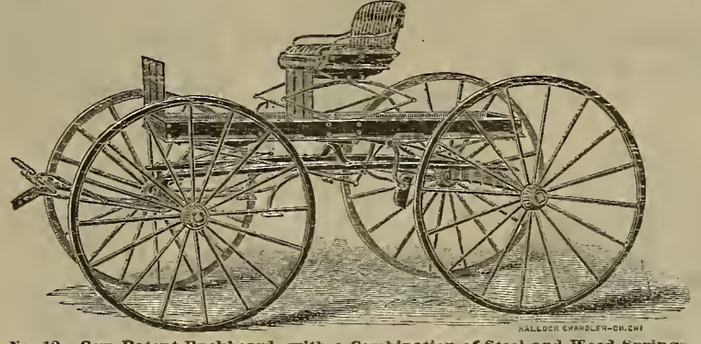
No. 0, as shown in cut, is a light Business Wagon. It is extensively used as a Delivery and light Express Wagon, and is made with Pole and Brake, or with Shafts only. The springs are so constructed as to take up what they lengthen out; are hung upon jacks, and will hold up a much heavier load than springs attached the ordinary way. It is stylishly painted. Axle, 1¼ inch. Springs, ⅞ inch, 5 leaves. Price List:

With Shafts and Wood Hub Wheel, $155; with Pole only and Wood Hub wheel $167; Sarven Patent Wheel, with shafts $160; Sarven Patent Wheel, with pole only, $172. Add to above prices for Brake, $12. No. 0 Shafts not leathered, $12; No. 0 Pole, $24.

No. 00.—With Patent Equalizing Rods.

No. 00 is a light Side-spring Wagon—or Buggy—put up with our Patent Equalizing Rods, which cause the body to set level when unevenly loaded; that is, when the load is upon one side, the body will remain level, and not tip sideways, as is common with side springs. It also makes it ride much easier. Its price makes it popular as a Business Wagon as well as Buggy, it being light, stylish and neatly painted. Axle, 1 inch. Springs, 1¼ inch, 4 leaves. Price List:

With Shafts and Wood Hub Wheel, $160; with Pole only and Wood Hub wheel $170; Sarven Patent Wheel with shafts only, $165; Sarven Patent Wheel with pole only $.75. No. 00 Shafts leathered, $15. Brake for No. 00 put on, $12. Pole for No. 00, $24.

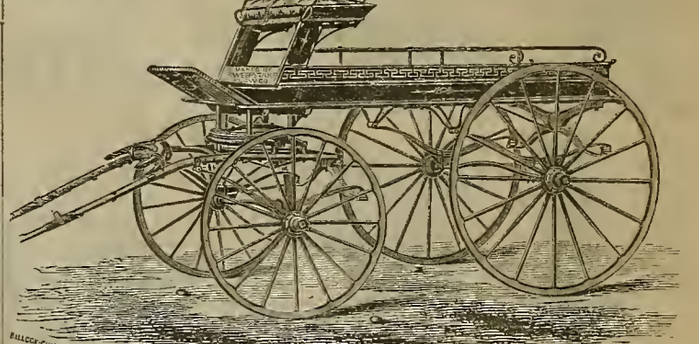


No. 12.—Gem Patent Buckboard, with a Combination of Steel and Wood Springs.

Is Stylish, Light, and Easy Running, nice for Business or Pleasure. The Hill's Patent Buckboard is fast coming into favor on account of its combining all the essential points required in style, shape and workmanship. The flexibility of the steel springs, combined with that of the wooden side bars, secures an ease in motion not heretofore attained in Buckboards.

PRICE LIST.

1 inch Axle, Shafts, Sarven Patent Wheels, Iron Dash.....$133.00	With 1¼ Axle, add to above prices		5.00
1 inch Axle, Pole, Sarven Patent Wheels, Iron Dash..... 145.00	With 1¼ Axle, add to above prices		10.00
1 inch Axle, Pole & Brake, Sarven Pat Wheels, Iron Dash... 155.00	With Leather Trimming and Dash, add to above prices...		8.50
With Leather Dash, add to above prices	2.50	With high lazy back, same as shown in cut, extra	2.50



No. 4—Platform Grocery Wagon.

No. 4 is made only to order. It is intended for a Grocery Wagon, and is an elegant and well-made vehicle and well adapted for that purpose. The wheels turn under the body like those of a hack, thus enabling it to turn in a confined space. It has become very popular; it is in every way complete. It has only to be seen to be appreciated. Nothing better in its line can be found.

PRICE LIST.

With Shafts and Brake, Sarven Patent Wheel, 1¼ inch axle	$240.00
With Pole and Brake, Patent Wheel, 1¼ inch axle	250.00

A complete description of all our Manufactures cannot be given in the space here allotted, nor in any reasonable newspaper space ordinarily used for Advertising; therefore we invite correspondence, that we may send Circulars and Descriptive Lists. Merchants and Farmers are invited to visit our Works and examine for themselves. It is our aim to excel all in our line of Manufacture in producing not only the best wagons but the best Implements with all the Latest Practical Improvements which are peculiarly adapted to the requirements of our soil, and the Pacific Coast, both in tilling the ground and harvesting the grain; producing articles which combine all that genius, enterprise and practical experience can insure. A guarantee to the purchaser and a credit to the Manufacturer.

Those desiring to visit the Works, can leave San Francisco at 8 A. M. and reach *our station*—Mail Dock—at 9:40 A. M., and return via ferry to Martinez, at 11 M.; by rail, at 5:46 P. M., and reach Benicia at 5:30 P. M., or leave San Francisco at 4:30 P. M. and reach Mail Dock at 6:40 P. M. Trains from Sacramento reach Works at 8:10 and 9:40 A. M. and 5:45 P. M. Trains leaving San Francisco at 8 A. M. and 4:30 P. M., also those arriving from Sacramento at 8:10 A. M. and 5.45 P. M., will stop at Mail Dock by notifying the conductor. All the river steamboats stop at our wharf. Shipments made should be marked "B. A. W., Mail Dock, Benicia."

VOLUME XLIV Number 25

Improvements in Underground Surveying.

[Written for the PRESS by LUTHER WAGONER.]

In an nndergronnd snrvey, where great precision is reqnired, the chief difficnlty is generally in measnring the angles, and this trouhle is augmented with the shortness of the sights. Usually a plnmmet is snspended from a nail driven in the timbering, or a plug inaerted in a drill hole; a point is taken on the gronnd and the instrnment is aet over the point, and the angle measnred in the nsnal manner. Several sources of error are here introdnced: 1. The difficnlty of suspending a plumh-line from a nail with a triangular notch in it, so as to occnpy exactly the same place each time—nsually a small variation occnrs; 2. Eccentricity of the point of the plnmmet; 3. Air currents deflecting the plummet from its normal position; 4. Error of marking the precise point of plummet; 5. Error of plumhing transit over point; 6. Difficnlty of setting instrument over the point in rocky gronnd and want of firmness, preventing repetition of angles and manipnlation of instrnment; 7. Want of space to move around instrument; 8. A possihle error of line of collimation not passing throngh the center of the instrument can be eliminated by reversion. To overcome these difficulties, the following-desorihed apparatus was devised and used for the location of the Garfield shaft, New Almaden quicksilver mine, California. The locat'on of this shaft requirsd a snrface line 3,500′, rising 800′ over the mountain, and a tunnel line of 3,700′, having 10 angles, the third conrse having a length of 40′.

Fig. 1 of the engravings showa the general arrangement devised, and which may briefly be described as a system of setting up nearly under the station, and afterwards determining the amonnt and direction of eccentricity of instrnment. For this purpose a small mirror, *j*, Fig. 1, having a scale graduated to .005 foot, was secured by a thumb-screw to the top of the transit. To adjust it, the telescope was directed to a lamp, and the thumb-screw being loosened, the mirror was turned right or left until the observer's eye, distant about two feet, and its reflected image pointed towards the lamp. The mirror is then made fast. It is not necessary that a perpendicular to the mirror should be parallel with the line of collimation, but it is convenient, and as the eccentricity is generally less than .01 foot, great accuracy is not necessary.

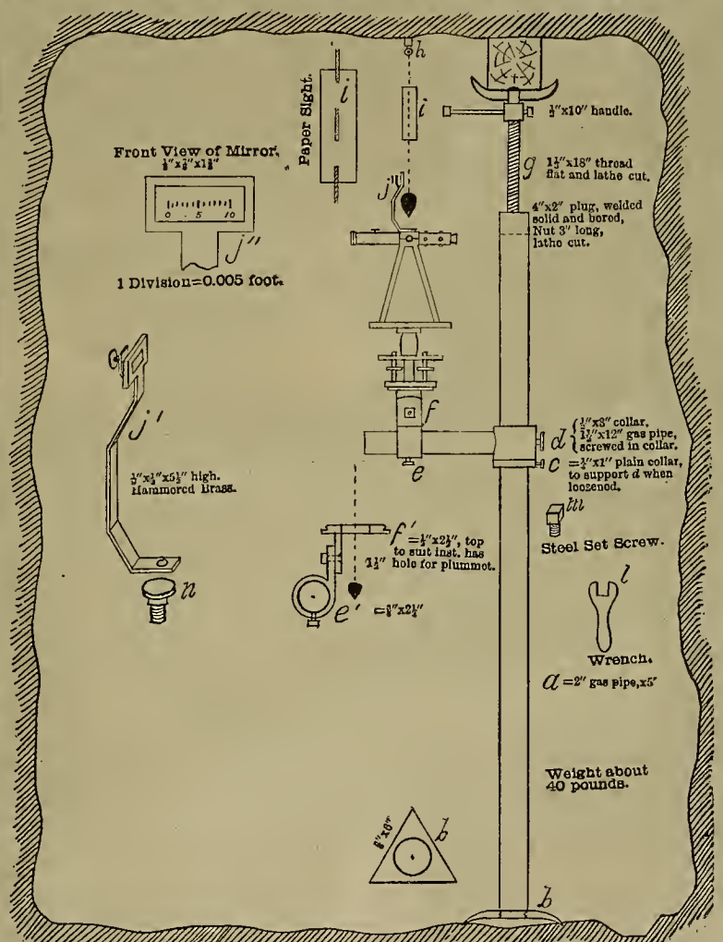
Fig. 2 (see engraving on page 417) shows the application of the mirror. In this example the plumb line is at B, and the instrument at O; the eccentricity is .03 foot and its direction is 60° to the right from station A.

If the instrument was exactly nnder the plummet, it is plain that the reading of the reflected plumb-line would he oonstant for all direotions of sight. In this case the instrument is slowly revolved until the minimum reading of the refleoted line npon the acale is found to be 0.024; and 180° more, the maximum is found to be 0.084; the msan is 0 054, and upon turning the telescope until this reading is given. the angle of eccsntricity. AOB., is seen to he 60°, and its amonnt is 0.084—0.024÷2=0.030. To reduce the measured angle to center, the diagram. Fig 3, is employed; entering it on the left at 30° and .030, we have 0 026, or .030×Sin. 60°; on the bottom line of distances for 28 ft. and .020; the diagonal line followed out gives 19″.2 as the correction for this side. The diagram oan he also entered at 28×5=140; following ont .026 over 140 we find 3″.85, and this multiplied by 5 gives 19″ 2, the correction; for the angle BCO we have .030×Sin 90°=.030 and 26 ft. This gives 23″.8, and 19″.2+23″.8=43″, which, suh tracted from the measured angle, leaves 150° 01′ 11″ as the corrected result.

In this system the plumb-lines, about 18 inches long, are suspended, and are not removed or touohed until the work is finished. Where the distance is greater than the plumh-line can he seen, small strips of white paper, like *i*, Fig. 1, are strung on the plumb-line and illuminated with a coal-oil lamp or bull's-eye lantern.

To support the transit firmly and allow sufficient space to manipulate the same, the wrought-iron gas pipe snpport, Fig. 1, was devised. When the screw is run in it is 5′ 4″ over all, and rnn out it is 6′ 7″. Its arrangement is snch that it can be set in any position, and it was found to possess enormous rigidity, as compared with the tripod, as shown in the Fig. 1. It could be shook hack and forth at *f*, with a force of 40 lbs., withont permanently changing the cross-wires from a fixed mark. A slide rest, auch as is used for small lathes, could he attached to *f*, and would make a valnahle addition to the support, especially for taking direotion from plnmb-lines swung in the shaft.

With this apparatus, sights as short as oan be read with the telescope can he introduoed, and the angles measnred with extreme precision.



Front View of Mirror.
1″x½″x1⅛″
1 Division=0.005 foot.
Paper Sight.
½″x10″ handle.
1½″x18″ thread flat and lathe cut.
4″x2″ plug, welded solid and bored, Nut 3″ long, lathe cut.
½″x3″ collar.
1½″x12″ gas pipe, screwed in collar.
=½″x1″ plain collar, to support d when loosened.
Steel Set Screw.
Wrench.
=2″ gas pipe,x5′
Weight about 40 pounds.
½″x½″x5½″ high. Hammered Brass.
=½″x2½″, top to suit inst. has 1½″ hole for plummet.
=⅜″x2½″

FIG. 1—WAGONER'S JACKSCREW STAND WITH MIRROR AND SCALE FOR TRANSIT, AS USED IN THE NEW ALMADEN MINE.

MINES NEAR OROVILLE.—The Minerva Gold and Silver mining company's mine and mill are situated five miles northwest of Oroville, Butte county. The mill consists of four Huntington batteries and three amalgamators. It is about 500 ft. from the month of the tunnel of the mine, and the main length of the tunnel is 600 ft. The tunnel has four wings, the longest heing about 100 ft. and the shortest 50 ft. The ore is mostly of a sulphuret nature, and pays about $16 per ton. The mill and mine are owned hy W. E. Duncan, and are under the snpervision of Mr. C. H. Chick. The Banner mine is situated ahont one-eighth of a mile above the Minerva, and is one of the best equipped mines in the State, having the latest improved hoisting machinery. The shaft ia down abont 200 ft. At present the mill is not running.

Death of W. B. Hyde.

Col. W. B. Hyde, of Oakland, died snddenly at Custer, Idaho, this week. After spending the winter with his family in Oakland, he had only lately returned to the sosne of his labors at the General Custer mine and mill, the flonrishing property which he was ably managing, and in which he was largely interested. Col. Hyde was a well-known civil engineer, snd was for many years in the employment of the Central Pacific railroad company. He was an ingenious inventor, and ohtained many patents from the Government. For many years he devoted his attention to the problem of atsam plowing, and was as well posted on that subject as any man in America. Hs informed the writer not long since that he intended publishing a work on the snbjeot. He invented a system of operating dry-docks hy hydranlio method, and also had turned his attention largely in the direction of ice manufaoture. The water supply of San Francisco was another subject to which he had given careful study. Col. Hyde was an ardent student, and went to the bottom of any snhjsct which he nndertook or in which he hscame interested. He possessed a mass of general information seldom grasped by men of his age. His mind was intensely analytioal, and always strove for reasons as well as for general resnlts. A brilliant conversationalist, genial companion, tenderly loving father and husband, he will he sadly missed hy not only his immediate family, but a large circle of friends and acquaintances. His ahility was recognized by all with whom he came in contact, and made him able to grasp oomprehensively the details of what he nndertook, so as to carry it to a successful issne. Within the past few years he has devoted himself to mining, and bronght the property with which he was connected to high standing and great pecuniary snccess. It is sad that a life so full of promise should have been cut ao suddenly short. Col. Hyde was a member of the Society of Enginsers, and a life-member of the California Academy of Sciences.

Placer County Quartz Mines.

During the last six months the energetic prosecntion of work on two quartz ledges, known and prospected to some extent for several years, has developed two mining properties which will undoubtedly remove, in part at least, the clond nnder which qnartz mining in the vicinity of Auhnrn and Ophir haa lain for the last six or seven years.

The owners of the Gold Blossom qnartz mine, sitnated on Crater hill, ahout one mile west of Ophir, have had stoped several hundred tons of qnartz from gronnd opened up by their shaft and levels. The average of the rock is of an excellent quality, carrying a very high percentage of rich sulphnrets; and in the stopes just referred to a chimney of ore, oonsisting of an almost solid mixtnre of iron and copper pyrites and galena, and containing a large amonnt of coarse free gold, has heen strnck. This ore assays np into the thousands per ton. They have also just finished the construction of a mill for the ore from this mine. Owing to the condition of the gold in the ore, being almost entirely in the snlphurets, the usual form of mill used for the treatment of gold-bearing quartz has not heen put up, the process and mill employed being as follows: The ore, after being broken by a crusher, is reduced to a powder by a Tustin pulverizer; then sized hy screens, the finer material, containing a high percentage of snlphurets, going directly to the chlorination plant, and the coarse to ooncentrators, which separate the sulphnrets from the gangne. This latter is not thrown aside as waste, hut, together with quartz from the mine considered too poor in sulpburets to he treated as above, is first run through a ten-stamp mill. It it expected to save and treat hy chlorination a mnch larger percentage of sulphnrets than is practicahle by the usual method of mill, and thus reducing the loss of gold in tailings to a minimum.

The other property referred to at the commencement of this article is the Belmont quartz mine, situated two miles northwest of the Gold Blossom. The ledge is very large, outcropping from 10 to 15 ft. ahove the surface, and about 6 ft. in thickness. About six months since, Wm. Werry, for many years engaged in quartz mining areund Ophir, acquired control of the mine. A shaft had been sunk hy the former owner, and from it ore taken claimed to have milled $40 per ton. This shaft was cleaned out and continued to a depth of 170 ft., at 75 ft. levels run 100 ft., and at 150 ft., run 150 ft., opening np the vein in both directions from the shaft. The course of the ledge is northeast and southwest, and the dip nearly vertical. The thickness of the ledge is nowhere less than 3½ ft., and varies from that to abont 7 ft., the average increasing, as far as observahle, with dspth. The ore is free milling. Ahout 300 tons on the dnmp, taken from the shaft and levels, by numerous samples worked by mill process gave results per ton varying from $25 to $80 in hnllion worth abont $12 per ounce. From these tests it is estimatsd that the ore on the dump and in sight in the mine will yisld abont $20 per ton. This propsrty, giving every promise of heing extremely rioh and permanent. was purohased a short time since by G. W. Grayson—the first investment made in that looality by a San Francisco capitalist for several years.

A NEW mill is to he erected in Homer district for reducing ore from the Nioma mine.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Hydraulic Mining Question.

EDITORS PRESS:—At last Judge Temple has rendered hie decree, and the significant word *enjoined* is upon everybody'e lips. One announcement reads: "Judge Temple makes the injunction in the Gold Gold Run case perpetual." "The conclusions of law found hy the court are againat the hydraulic miners." The infereuce naturally to be drawn from such a rendering is, therefore, that the miners have no redress, so as to enable them to prosecute their work successfully, except hy appeal to the Supreme Court, and awaiting that decision. Meanwhile great industriee and industrious workers may he paralyzed, for the practical or virtual ehutting down of mines largely affects manufactures, as well as cuts off the bread supplies from thousands of homes, and re-plants chaparral where pears and peaches were flourishing. Nay, worse—recalls the coyote and the wolf and the hear, where domeetic fowls, and the lamb and the cow had yielded their first-born for the sustenance of men, and yet were more ahundant annually. "Peace reigned within the homes of the workers, and plenteousness filled their palaces," for wherever nome is, and the wherewithal, and contented minds, and happy hearts, cheerful workers are as proud of such homes as though they were castles or palaces—and every man's home ie his castle—except, perhaps, in unhappy Ireland. And yet upon what tennre is a California home, where the laws are so constituted that although he has paid *Uncle Sam for a patent forever for his mine and homestead*, and he goes on to work that mine according to usage, which, as a primary necessity, requires water and a dumping ground, he is, nevertheless, practically barred from the use of either by the decision of a court, which virtually lays down the principle that everything we find in nature is to he left intect for him that may come after you, or the equivalent—don't use the rivers, however necessary. There seems something plausible in euch a creed and such a judgment, and some of us deceive ourselves into the idea that it is "doing unto others as we would he done by." But it is not; neither is it the law of God, "by whom and for whom all things were made." That great and glorious being who made all things for Himself, nevertheless, when He created man, said: "Let us make him in Our image. Let him have dominion over everything; let nothing remain intect, and to him they shall he for meat and for drink"—that is to say, not only every living thing ehell be at man's command, as they had been at God's command, and we know that it is practicelly eo, even every time we visit a menagerie, for we there have evidence direct, that man can make the lion to lie down with the lamh; and every man who is a man thinks and feels that God-like instinct or will within him. which leads him on to diecover properties and uees and names for the whole cahinet of God's creation, without and within the bowels of the earth. Whence are these promptings. if not from above? What is it makes man honored and may hand his name down to future generatione as a benefactor to his rece but discovery? In other words, the unravelling of God's laws and interpreting them to men. Aye, and even the artist does this with his little quilled eable pencil, and portrays divinely, with means that the savage never could have found such a use for, through a little manipulation, almost a *fac simile*, pictorially at least, of one of the grandest works of God—the Yosemite. Painting is God's law interpreted. The photographer elicits a greater marvel. He weds chemistry and light, and in an instant reveals the image of a heloved mother, as a perpetual gift to a fond son or daughter; or the latter, perhaps, who is about to leave home, possibly with her wedded spouse, and offers this tender and loving tribute to her revered perent, that she may gaze upon, and almost recall the living presence with joy, and yet with tears, for still the silence of the picture writes down, "parted." But almost more wouderful etill, the telephonist brings hack her well-known voice into her very chamber—"Mother, dear, bahy is horn." Thus, it is clearly God's will that we should go on, and on, interpreting laws that He himself has laid down. And not only eo, but commanded him to follow "with the eweat of his hrow," and then "it shall be for meat and drink to hiu." Thus it matters not what vocation we select, "there is work for all in God's vineyard," and we shall he "unprofitahle servants," if we do not pursue the hent of our calling. God and nature never impose any restriction to the successful working of our vocations. Every kind of vocation virtually enjoys its own commonwealth everywhere, and is pureued according to the best means of pursuing it, or according to the best-known means of pursuing it. If a man does that, he cannot, upon any principle of equity, he called to account for treepassing upon the rights of others, for others can have no rights which hinder another from diligently pureuing hie vocation, according to the hest meane known. There are rights, however, that are superior to other rights, just as they rise higher and higher in science, or are paramount to the general commonwealth. Thus, no matter what description of property a man may have, if the commonwealth demands a railway or an acqueduct, or even a puhlic road to he made through that domain, it must give place to the general improvement. It ie a speciee of property that has inferior righte to uthere, and ie so regarded and valued. So, if a man own ill-conditioned property in a city where a new thoroughfare is deemed more desirable, he muet sell out for the public improvement; and whereie the difference, if a man owns a farm which either stande in the way of a far more profitahle mine being worked, which is a ecientific undertaking, or if worked according to usage of the hest means known, still unavoidably causes injury to a part, at leest, of said farm, and society does not make laws for individuals so much as for the people collectively; such property mey experience some damage compared with the present standard of value, hut it enhances the value of other property not subject to the same damage, because it makes such property scarcer and more in demand. The way to get even would he, to acquire an interest in each of these kinds of property, and nature and society have no pity for a man who risks his all upon one die. Even the merchant would he mad to own but one ship, and have no means of insuring that or ite cargo. He must take the consequences, if disaster arises. But the merchant who has a fleet of ships makes his profits upon the aggregate, although he experiences losses. So, if a man has put all his means into a farm which a river may wash out, he takes a desperate venture, for the sake of chances of reward out of real proportion to the mean value of the ranch. Perhaps he does well for a time, and if he is saving he may be able to levee againet disaster, or huy a better place later, or perhaps he becomes part owner in the mine that unavoidably causes him damage. The probability is, anyhow, that the mine owner ie willing to compromise with him and pay him for all reasonable damages he may have now sustained. But the mine owner ought not to he estopped from following a higher class of undertaking than the farmer is engaged in—an undertaking that the Government puts at an enhanced value, hy rating the lands at an enhauced value from the very first. Again, it is absolutely criminal for a man to maim or injure another man bodily; and yet, if a man has sustained a bodily injury through acoident or otherwise, another man who understands maiming scientifically—a eurgeou—is called in requisition and paid handsomely for his services. There are laws, therefore, which override other laws. The lesser must give way to the greater. Science asserts her own superiority over mere labor, and science has ite proportionate right of exercise. God and nature have estahlished no such principle as enjoining, excepting in the Ten Commandments, which are definite, and none of which apply to estopping a valuable industry. Now, then, if man makes laws which are not warranted hy the divine law, and in pretended espousal uf right, he is a liar, or, as Scripture eays, he maketh God a liar, and ie working against the providence of God. The honorahle judge who enjoins tbe Gold Run mine, therefore, is making a decree upon a false assnmption, for the rights of man du not warrant the estoppel. The honorable judge doubtless has no intention of eetopping the right of man, and his ruling, perhaps, arises from a misconception of right and wrong, and the logical conclnsione that are due to the necessities of the case, for it would eeem as though the application of the plaintiff—that an enjoinder should rest—was founded in error, and the application should have been simply for equitahle damages. The defendant ought, therefore, to he entitled to a verdict as against the plaintiff for error in procedure, and au appeal he taken to the Supreme Court upon this point, to sustain this view, when the Supreme Court may, thereupon, order a new trial. But the rendering of Judge Temple is not, in fact, final; for, by its own definition, it dismisses the complaint that the defendant had no right to throw its tailings into the American river. On the contrary, it confirms said right within certain limits—limits defined by Judge Temple himself—to wit, said American river ahove Alder creek. The question arises, upon tbis, had Judge Temple any such diecretionary power uf hsing his own arhiter of what constituted lawful or unlawful distsancs? If he had not euch power, then his waiving the objection to using the American river at all for dumping ground waives the whole question, for if he could see no legal objection to the defendant's so using the river, theu he was bouud in equity to nonsuit the plaintiff, and give a verdict for the defendant; hence Judge Temple ie prohahly in error in that ruling, likewise, which is a eecond ground for appeal to the Supreme Court. The upshot may be, however, that "the defendant may at any time," or now, therefore, apply to the court Judge Temple presided over; and the decree empowers to have the decree vacated, because of its insufficient grounds of adjudication; or, if miners prefer, they may possibly he ahle to confine themselves within the text of the permission to throw euch tailings into the river, and retain them above Alder creek. It may be noticed in the deoree that the right of applyiug to the court to vacate the decree does not depend, however, upon firet impounding and detaining the tailinge above Alder creek. It may be noticed, further, that the word retain is not ueed in the decree. "Efficient means to detain" may not mean more than doing the heet they can, although absolute retention may not transpire. Lighter sand is permissible, so that the whole vexed question of slickens is not prohihited, or even suhject to damages. Perhaps, therefore, the miners can get along with the decision very well. The remaining question, however, of who shall fuot the bill, may, perhaps, be demurred to; for, if the minere have done no legal wrong and were entitled to a verdict, then, of course, the complainants ought to he compelled to pay coste. That is another point, therefore, fur the Supreme Court to decide, if not even for the Superior Court, with another judge presiding, under the permiesion granted to apply for a vacating order of the decree at any time. Upon the merite of the rendering, however, if the miners go on throwing their debrie into the river, and some cohhles get pest Alder creek, who shall deoide whose they are? or who put them there? Now, then, suppose a boy, out of pure mischief, finds some cohhles higher up, and every day picks np one or two and puts them helow Alder creek. Ie the Gold Run mining company responsible for that urchin's malice? Or, eupposing eome farmer, for pure deviltry, or in the pay of some of the learned counsl (if such a thing were poseihle; no perseonal reflections intended) for the prosecution, were to cause such cohble-stones to he transported helow Alder creek, can the Gold Run mining company prevent it? If they are allowed to dump it into the river at all, they cannot be expected to put it under lock and key. So who is to take the consequences of subsequent events, or who is tu determine whether said cobbles did not roll down from the adjoining cliffs?

Upon the whole, the Gold Run enjoinder is pretty full of loop-holes, and I don't know but what the minere may regard it rather as a victory than not. Perhaps already many of them are crying, "Oh, he joyful!" But the most aggravating feature in the case is, the perpetual recurrence to law it must inevitably entail. Of course, that is "Oh, be joyful!" to the lawyers, but ae unwelcome to others as Jarndice ve. Jarndice. There is, in fact, nothing in the decision to prevent the miners from continuing to use the rivers as dumping grounds. The license for all coarser material as far as Alder creek removes all difficulty.

A SACRAMENTAN.

Sacramento, June 13, 1882.

P. S.—If prize essays are in order, I hope the merits of mine will be duly coneidered. Who knows the amount of grief I may assuage hy showing how much "honey there may be in the lion's mouth" of Judge Temple's enjoinder?

Nevada County Notes.

EDITORS PRESS:—For the third year, I am spending the summer months on the divide between Bear river and Steep Hollow oreek in the county of Nevada. I am boarding at the residence of Mr. Frank T. Maguire, who is an old California pioneer. Early in 1850, Mr. Maguire was a mining partner of Mr. W. B. Ewer, of the RURAL, at Nevada City; and he was one of the owners of a hay yard in Sacramento, before the great fire of 1851. In 1852 he commenced mining in Steep Hollow creek, near Lowell Hill, where he was successful in making a raise of the golden metal; and, in 1864, he bought the possessory right of an improved quarter esction of land, between Liberty Hill and Lowell Hill, where he has resided for 18 years, cultivating his ranch and looking after his mining intereets.

Mr. Maguire has an elegant residence, which is built of pine and spruce, rustic outside, sugar-pine ceiling inside, and thoroughly covered, inside and out, with the celebrated Pacific ruhber white paint. His harns and out-houses are large and commodious. He hae 60 acree under a substantial cedar rail-fence, and 10 ecres under a cedar post and picket fence. He has a fine urchard of apple, pear, plum, peach and quince trees. He cultivates the etrawhsrry, raspberry, blackberry and grapevine. He has horses, cows, hoge and poultry. He raises alfalfa, red clover and potatoes. Of the 60 acres under rail fence, at least 40 acres are ewale or natural meadow land, producing a great yield of succulent grass for hay and pasturage. This ranch has unrivaled faoilities for irrigation. At the head of the valley there is a number of large springs, which furnish at least 20 inches uf pure, clear, cold water throughout the year. A portion of this water is oonducted by a ditch and flume into an immense framed tank commanding the cultivated grounds, where the warm raye of the eummer sun prepare it for irrigation.

There are three other orchards and ranches in this vicinity. Oue is owned by Hon. Jere Levee; a second by Mr. Wm. Wilkinson, and a third one by Mr. Chas. Eastin, at Lowell Hill. I have very carefully examined the orchards of Messrs. Maguire, Levee and Wilkinson, and their apple, pear, plum, cherry and quince trees appear to be in a perfectly healthy condition. There is ae much fruit formed as the trees can possibly carry to ripeness. The late and severe frosts, which were so destructive to young frnit in Trinity, Shasta, Napa, Contra Costa, Monterey, Ssn Luie Obiepo, and other counties, only caught the peach treee here, ae the other varietiee of treee were later in hloesom. There will aleo he great crope of etrawberriee, raepberriee and blackherriee. The gooeeberry growe wild all over thie divide; hence, I do not eee it cultivated in gardene; but I have noticed it by the side of the wagon road, along the mountain traile and through the woods. It is as common as the rattlesnake, hut not half as dangerous. The numerous hoge running at large all eummer feed and grow fat on wild herries, roots and acorns. They also root out snake holes with abundant success.

In November of eacb year, Messrs. Maguire and Levee send their cowe and young cattle down to ranches in the lower foothills for the winter, and then drive them hack in May for their summer range. Only a few milch oowe and saddle horses are wintered up here, as the snow usually falls from four to eight feet deep, and unly trails are kept open. Boye and girle have lote of fun in sliding down bill on enow-shoes.

The next question to be considered is, the profit of these mountain ranches. I will draw from the figuree of 1881, as they are a sample of previous years. In November Mr. Maguire sold his apple crop in hulk at the ranch at $50 per ton, to the merchant at Lowell Hill, the buyer finding hie own sacks and hoxes. He also sold several tons of potatoes, at the same price per ton, and in the same manner. When he delivered potatoes to boarding-houses and miners in small luts, his price was $3 per cental. Mr. Levee sold hie apples at $2 and $2.50 per cental, and bie potatoes at $2.50 per cental, oash on delivery. Mr. Wilkinson sold his last lot of apples, in May, at $4 per cental, or $2.50 per hox of 60 lbs., delivered at the C. P. R. R. at Dutch Flat. Not a pound of apples can now be purohased on the divide. But Mr. Levee is holding a few hoxes of Nickajeoks, Limbertwigs, Newtown Pippine, Spitzenbergs, Mock's Late and White Winter Pearmains, to test the relative merits and qualities of the latest winter apples. Hia calling friends may enjoy the toothsomeness of the best fruit in the State; but be has no more to sell of the orop of 1881.

Potatoes yield six tons per acre, when they are properly planted with well-rotted manure and carefully irrigated. Hence, an acre of potatoee is worth in bulk or at retail $300@$360 cash. Some partiee here think that they can raise eight tons to the acre, but I have not seen it done. The varieties of potatoes cultivated are the Early Rose, Early Goodrich, Peerless, White, Neshannock and tbe Selt Lake potato. Strawberriee sell at 8 lbs. for $1; garden vegetables at from 2 cts. to 3 cts. per pound; milk at 40 cts. per gallon; fresh butter at 50 cts. per pound; fresh eggs at 40 cte. to 50 cts per dozen. Alfalfa hay is worth $25 per ton; each aore of alfalfa is worth $125, at five tons per acre for three outtings. Mr. Maguire's place is 4,050 ft. above tide water, as measured by instruments, and Lowell Hill is 50 ft. higher. Mr. Eastin'e apple trees were planted 20 yeare ago, and Mr. Maguire'e 24 years. The other orchards are only some 12 years old.

The geological formation is slate bed-rock from Grass Valley up to Little Bear valley, and the elevation is from nearly 2,500 ft. to 4,500 ft.; hence, this helt of oak, pine, cedar, spruce and tamareck, is the natural home of the apple, pear, plum, cherry, gooseberry and hluc-blaok raspberry. The people of the valleys may have the orange, lemon, fig, olive and their nasty alkali water, with their scorching north winds, in full welcome; but give us the climate, eoil and fruits, uf the higher hills, where the snow falle every winter and where the pure cold spring water gushes out of the mountain side. Up here, robust hoys and healthy girls aro reered; and here, also, they are educated in good puhlio schools.

THOS. S. MYRICK.

Lowell Hill, June 5, 1882.

A RARE CURIOSITY.—According to the Utica (N. Y.) *Observer*, Mr. F. B. Morse, of that city, has in his possession a carefully preserved specimen uf a mermaid, captured by him while hathing on the Chinese coast. The animal is a singular looking object, the head, shouldere and forward portion of the hody, including a pair of arms, bearing a striking resemblance to the human form, while the remainder is like a fish, with the usual fine and tail. The head was covered with hair when the animal was captured. It was taken alive while lazily swimming among some beautiful coral formations in ehallow water, but it only lived two or three hours in captivity, and the body was preserved by a Chinese process. It measured two feet and fonr inches when alive, but its length haa shrunk to 21 inches.

THE Czar desires to appease the people, and has decided to grant reforms. A manifesto will shortly be issued, statiug that the Czar desires to celebrate his coronation hy granting reforms, but is compelled to postpone the ceremony for a year, because of the impossihility of completing the preparations earlier. Two commissione will be instituted to consider questiona of central institutions and share in the admiuistration to he given the people.

THERE has been a fair average catoh of seals on Neah Bay and Quilleute, W. T., thie season, bnt owing to the advance in oost of catching, and the decline in value in foreign markets, the seasons' bnsiness, on the whole, hse heen unprofitable.

THE JUTE FACTORY.—The State prieon jute factory ie now turning out 6,500 yards of burlap daily. There are 400 convicte employed in its manufacture, who are learning eo rapidly that Warden Ames will eoon be ahle to dispense with free lahor.

MECHANICAL PROGRESS.

Mixing and Applying Paints.

The composition nf paints should be governed by the nature of the material to be painted. Thus the paints respectively heet adapted for painting wood anl iron differ considerably. The kind of surface to be covered, *i. e.*, a porous surface requires more oil than one that is impervious. The natnre and appearance of the work to be done—delicata tinta reqnire colorless oil; a flatted surface must he painted without oil, which gives gloss to a shining snrface. Again, paint ueed for surfaces intended to be varnished mnst contain a minimnm nf oil. The olimate, and the degree of exposure to which the werk will he snbjected; thue, for outeide work boiled oil is nsed, because it weathers hetter than raw oil. Turpentine is avoided as much as possible, because it evaporates and does not last; if, bowever, the work is to be expoecd to the snn, tnrpentine is neceesary to prevent the paint from hlistering. The skill of the painter aleo effects the composition; a good workman oan lay on even coats with a emaller quantity of oil and turpentine than a man who is unskillful; extra turpentine eepecially, is often addcd to save lahor. The qnality of the materials nften makes an important difference in the proportions nsed. Thus, more oil and turpentine will combine with pure, than with impure white lead; thick nil mnst be ueed in greater quantity than thin oil. When paint ie pnrchased ready ground in oil, a soft paete will require less turpentine and oil for thinning than a thick paste. Lastly, the different coats of paint vary in their com. poeition; the first coat laid on to new work requiree a good deal of oil to soak into the material; on old work, the first coat reqnires turpentine to make it adhere; the intermediate coats contain a proportion of turpentine to make them work smoothly, and to the final coats the coloring materials are added, the remainder of the ingrediente heing varied ae already described, according as the snrface is to he glosey or flatted.

The exact proportion of the ingredients to he nsed in mixing painte varies according to their qnality, the natnre of the work required, the climate, and other conaiderations. The composition of the paint for tbe different ocate aleo differs considerahly.

The area which a given quantity of paint will cover depends upon the nature of the surface to whiob it is applied, the proportion of the ingredients and the state of the weather. When the work is required to dry quickly, more turpentine is added to all the coats.

In repainting old work, two coats are generally reqnired, the old painting heing considered as priming. Sometimes another coat may be deemed necessary.

For old outside work exposed to the snn, and in cold weather, more turpentine should be used to make the paint flow freely.

All priming shonld he ruhhed out as far as poseihle, for if it is flowed nut loosely or laid on thick, it will be apt to hlieter and rnn. In priming over spots, however, where patching is heing done, it may sometimes be necessary to leave the coat thick or heavy, for new work can never he re-touched and look well after the work is second coated or finished; for snch retouching would ehow and spoil the whole work. In priming, the paint should flow easily, and the hrneh should be pressed on to tbe wood so that the paint will he forced into the pores. In all cases it is a great saving of time to cover ae large a surface as convenient before smoothing or finiehing off. All work on the same surface should he finished at the one application, if possihle, for "lape"—which form the jnnctions of work done at diffsrent times—should he avoided wherever they can, as they are sure to disfigure the work where they exist. Of course, it ie sometimes impossihle to avoid lape, hut where they must occur, care ehould he taken to make the connection with as little "lap" as possihle, or it will be certain to show throngh the work when finished. The defect, if occurring during the second coating, will show much worse than in the priming coat.

In painting, like everything elee, a system must he followed to make much headway. Experience, perhape, is the only effective teacher in this matter; and any rulee laid down hy ue will have hut little effect, if the operator does not, or can not syetematize. The workman who followe a eystem will do nearly twice as much work with less labor as the man who works only hy the rule of thumh. In painting hlinde, lattices, railinge, cut hrackets or other similar work, eome method of operation ehould he adopted. A little observation on the part of the operator will soon teach him the best methods to adopt in doiug any particular kind of work. We copy the above from a little work just puhliehed in New York, and entitled "Hints for Painters, Decorators and Paper Hangers."

THE USE OF ALLOYS.—The opinion seems to he rapidly gaining ground among metallurgiete that, wherever mechanical etrength ie desirahle, an alloy ie preferable to pure metal. One of the greatest obstructions to the mechanical value of iron ie ite tendency to cryetallize. Whether the article he a moneter gun or a ship'e cahle, tbe result is the same. But the tendenoy of iron thue to cryetallize may be prevented hy the admixture of other metale. In almost every direction natnre has placed certain metallic masses, to which the name "meteoric iron" has heen given, on the enpposition that these matters have fallen from the atmosphere, the composition of thie eubetance, wherever found, heing ohiefly of iron and nickel, the latter varying from 2% to 10%, with small qnantities of cohalt, and, it is said, chrominm. Science has made artificial meteoric iron, and tests ehow its qualities to he identical with those of the native compound. But in addition to this, it ie more dnctile and hae more tenacity than pnre iron. A mixture of 98 parts purc iron and two of nickel hae all of the peculiarities of the beat meteoric iron.—*Blacksmith and Wheelwright.*

Hardening Steel.

The effect of occluded gaees in iron and steel, says *Engineering*, is now being carefully studied hy metallurgists in general, and a committee of the Institution of Mechanical Engineers recently raieed the question in one of its reporte as to whether the hardening and tempering of iron and steel might not be produced hy the expulsion of ocolnded gaees during the heating process and their snhsequent exclusion hy the sudden cooling and contraction. Prof. Chandler Roherts has undertaken to anewer this question, and hy heating rods and steel in vacuo by means of the electric current, and suddenly quenching them in ccol mercury, he demonstrates that steel will harden when there are no gases to ahsorb. The metal was, of coursé, rohhed of its occluded gases hy means of an air pump connected with the vacunm chamher, and the parte which were quenched in the mercury were found to he glase-hard, while those which did not reaoh the cold fluid were found to he quite soft. Prof. Roherte, therefore, conclnded that gases do not play any part in the process of hardening and tempering. Prof. Hughes, who hae made numerons experiments on the subject, helieves that the temper of eteel is due to the chemical union of the iron with the carbon. At low temperature thie union takes place only in a slight degree, and hence in soft steel we have the carhon keeping aloof from the iron; hnt as the temperatnre is raieed the comhination ie furthered, until, in the caee of gray or hard steel, we have really a kind of diamond alloyed with iron. Sudden cooling ie neceseary to fix the comhination, for in elow cooling the carhon eeparates from the iron. Thie tbeory ie a very promieing one, and is eupported hy a variety of faote, Mr. Stroh, for example, having observed that when an electric spark passee hetween two iron contact pieces and fuees them, the fused part gets diamond hard and will ecratch a file.

Riveting.

In a report on riveting in locomotive hoiler work, made hy a committee of the American Master Car Builders' Association, ie found the following: The operation of "driving" rivets consists in placing a set on the end of the rivet, and sledging it down to form the head, the operation requiring two men to eledge—one to hold the set, one to manage the holder—and a hoy to heat the rivets. The rivet is not struck direct hy the sledgee at any time dnring the operation of driving, hut the head is formed entirely hy driving the set down equarely on the end of it. To drive a rivet requires about 24 hlows witb the nine-pound or ten-pound sledges, at the rate of about 80 hlows per minute; a flatter, with a face about one and one-half inches square, ie then placed on the lap alongside the rivet, and given five or six hlows to close the eheets together; the set is then placed on the rivet head again, and given five or six more hlows, and the rivet is finished, the whole operation of driving requiring about 35 seconds of time to the rivet. In practice we find that a riveting gang will drive in the seams of the shell of a hoiler an average of 30 rivete per hour, or 300 per day, and in the seams of the fire-hox, in throat and hack sheete, dome, mud ring, hraces, etc., an average of ahout 22 rivete per hour. This includes the time necessary for taking out holts, drifting holes, adjusting the toole and work. In hand riveting, two rivetere will drive, on an average, taking the whole hoiler, only ahout 125 rivets per day, or 12½ per hour.

WATER WHEELS.—There are three ways hy which the power may he ohtained from the falling water, and all water wheele oome under one or the other of these three, viz: hy weight, by pressure, or hy impulse. Which kind ehould he used in any given case must he determined hy circumetances. In no case can any kind of machine he made to yield more power than the amount due to the weight of water and the distance fallen, hut there may he a very large loss, aud one kind of wheel heing eubstituted for auother, frequently diminiehes the loes so much as almost to lead one to helieve that the wheel itself was a eource of power. To diminish the necessary lossee to the smallest amouut poesihle ie the aim of the skillful maker of water wheels, and the differenoe hetween the old-faehioned overehotstraight-float wheel, so often introduced hy paintere in their picturesque landecapes, and one of the modern turhinee, is ahout ae great as hetween a steam engine of tbe last century and an automatio expansion engine of the present day.

AMERICAN agricultural implement makers have heen officially invited to open a epecial correspondence with a certain portion of Rueeia, with the idea of introducing our agricultural machinery there.

SCIENTIFIC PROGRESS.

Important Astronomical Observations.

Intereeting and important resulte are reported from tbe English, French and Italian observers who went to the village of Soham, in lower Egypt, to observe from that point the solar eclipse of the 17th ultimo. The partiee were favored with fine weather, and though the totality of the eclipee continued hut 72 seconds, yet in that extremely short epace of time very much of eoientific interest was acquired.

The firet thing noticed was a small comet very near the sun, which, from ite location, ooald not have heen the one which for eome weeks hae heen attracting the attention of ohoervers all over the world. The comet was photographed, and its pictnre will afford a study of much interest in the future.

The second, and much the most important item of interest, wae the darkening of the lines of the epectrum, as reported hy the French party, giving evidence of a lunar atmosphere. If thie observation is enhstantiated, it will effect a revolution in the direction of lunar physics, and relegate our moon from her hitherto suppoeed state of death and desolation to one of at least comparative life and phyeical activity.

The third item of marked interest is the announcement that the epectrnm of the sum's corona was photographed for the first time. If this waa euccessfully done, we may from this hope for increased knowledge of the constitntion of the sun's magnificent appendage, seen only in a total eclipee, so grandly heantiful ae to make the heholder feel like veiling his eyes in the celestial preeence. The corona, with its silvery light, its epreading wings, its ciroles, arches and curves stretching ont into fathomlese depths around the darkened sun, ie considered as one of the most impressive and awe-inspiring sighte in which celestial majeety and grandeur are ever embodied. Its oonstitnente and office in solar economy are prohleme whose solution is much desired.

According to the *Scientific American*, the Englisb expedition, with Prof. Lockyer as the ohief director, laid ont an organized plan of operations. Some of their points of obeervation were to note if the ahundance and activity of the rosy protuherances gave proof of the present disturhed condition of the sun while passing throngh ite maximum period of snn epots; to compare and detect the difference in the spectra of rosy flames and sun epots; to get an idea of the physics of the solar atmoephere—that ie, to find what it looks like; to etudy—if the expreseion may he used—its circnlatory system; and to determine its chemical nature, especially if the chemical elements exieting in the snn are dissociated or separated hy the intenee temperature exieting there. Special attention is now directed to solar phyeics and chemietry, in consequence of the hold and ingenions theory of Dr. Siemens on the conservation of solar energy.

Photography was greatly relied upon in the solution of these intricate problems, and so much have methods improved in the rapidity with which the image can he impressed on the sensitized plate that seconds will now record more than minutee did 20 years ago. Tho telescope and the epectroecope were combined with the photograph in the attack on tbe sun's surroundings dnring the eclipse.

There is every reaeon to hope for nnusually noteworthy results to he obtained from thie eclipse, observed with the hest aetronomical instrumente the world can furnisb, and with aetronomers of world-wide renown to nee them effectually under the cloudlese sky and in the serene atmosphere of the station on the Nile. We have etill to hear from otber stations on the line of totality, and to wait for fuller details and photographs that will teli ue still more of the good news from the observatione of these scientific parties.

Is the Mediterranean of Recent Origin?

The degree of likeness or unlikeness of the fanna and flora in regione more or less apart, may he found to throw light on changes tbat have occurred in the configuration of land and eea. This line of thought hae lately ongaged the attention of M. Blanchard. In an interesting paper to the Paris Academy he showe, by numerous examples, how the fauna and flora on the extensive coasts of the Mediterranean present the same general character, which disappears at a short dietance from the ocast, where tho ground rises. If the Mediterranean coaets, he saye, were hrought together, the most attentive inveetigator might pass from Europe to Africa, or to Aeia, without any trait of living nature making him aware nf it. Now, ae very moderate obstaclee prevent the dissemination of a large number of animals and plants, it eeems certain that the Mediterranean would he absolutely impaesihle for most speciee.

M. Blanchard infers that the sea has heen formed at a recent epoch, in the midst of a region already inhahited hy the animale and plants now found on its coaet. Recent data as to the marine fauna he regards as confirming this view; for the fauna of the depthe appear to he entirely from the Atlantic. The inland sea must at one time have extended much further eastward, and may have communicated with Arctic waters and with the Indian ocean; it appeare not to have heen in junction with the latter eince the miocene epoch. From tbe geological point of view, M. Danbree was unable to think the Meditorranean of quite recent formation; for there are cretaceous, eocene, and miocene depoeite in the epace it covers. More recently, in pliocene times, the sea exceeded its present shorce, and pliocene deposits are found throughout the extent of the preeent hasin in the numerous islands which rose from the sea at the end of the tertiary epoch.

The Daily Swelling of Plants.

With delicate means of measurement Herr Kraus hae recently proved the existence of a phenomenon in all plant organs, which is connected witb their variahle water-content, snd consists in a periodical swelling and contraction in the 24 hours. Leaves, etc., decrease in thicknees from the early morning till the afternoon, when they hegin to ewell again, attaining a greater size hy night than hy day (this is well eeen in agave, aloe, and the like). Similarly with huds, flowers, green cones, fruits, etc., and with steme and branches. Herr Kaiser had hefore proved such a period in trunks of treee, and Herr Kraus shows that hoth wood and bark ehare in it, independently or unitedly. The various experiments of Herr Kraus—removal of foliage, watering, shutting out light, etc.—lead to explanation of the phenomena hy the varying reciprocal action of those factore which hring water into the plant and those which carry it away. By night only the waterahsorhing activity of the parts helow ground operatee; hy day the water-conenming activity of the parts above ground heeides. The water-consnming activity depends mainly on the foliage and on light (removal of leaves or of light stops the contraction) and consists eseentially in tranepiration. Herr Kraus states that when a plant is watered these things occur: In a short time, lese than an hour, the stem hegins to swell; hoth wood and hark take part in this, the wood always first. The swelling progresses at a pretty quick rate, upward of several meters per second. After some time, perhaps an hour, contraction gradually recurs. The contraction hegan at the upper part of an acacia after 10 minutes, whereae the swelling at the lower part continued 50 minutes. Thie shows that the contraction is due to the activity of the foliage, and is gradually extended downward.

The Resemblances Between Men and Monkeys.

If the skeletons of an orang-outang and a chimpanzee he compared with that of a man, there will he found to be the most wonderfu. resemhlance, together with a very marked diversity. Bone for bone, throughout the whole structure, will he found to agree in general form, position, and function, the only absolnte differences heing that the orang has nine wrist-honee, whereae man and the chimpanzee have hnt eight; and the chimpanzee has thirteen pairs of ribs, whereas the orang, like man, has hut twelve. With these two exceptions, the differences are those of shape, proportion, and direction only, though the resulting differences in the external form and motions are very considerable. The greatest of these are, that the feet of the anthropoid or man-like apee, as well as thoee of all monkeye, are formed like hands, with large opposahle thumhs fitted to graep the hranches of trees, hut unsuitahle for erect walking, while the hands have weak, small thumhs, but very long and powerful fingers, forming a hook rather than a hand, adapted for climhing up trees and suepending the whole weight from horizontal hranches. The almost complete identity of the skeleton, however, and the close eimilarity of the muecles and of all the internal organe, have produced that striking and indicrons resemhlance to man which every one recognizes in theee higher apee, and, in a lese degree, in the whole monkey tribe; the face and features, the motione, attitudes, and gestures heing often a strange caricature of humanity. Let us, then, examine a little more closely in what the resemhlance consists, and how far, and to what extent, theee animals really differ from us.—*Popular Science Monthly.*

PROGRESS OF THE TELEPHONE.—It hegins to look as if the telephone would shortly hecome as formidahle a competitor of the telegraph in the country, as it has already become in tho cities. Arrangements are now heing made to connect a large number of the interior towne of the Western States with the chief cities, like Chicago and St. Louis. For some time large towns near to each other have enjoyed the nse of the telephone, and the eervice haegiven great satiefaction. A new company, with a new telephonic eystem, is spoken of hy the papers. Thie new telephone, eo it is said, can tranemit meeeages more clearly and at longer distances than by the Bell system, and has the circuit so arranged that noñe hut the party to whom the meseage ie sent can hear what is heing said. Additional improvements in the telephone may he expected in the future, and its use ie hound to he greatly enlarged. With its expansion let us hope that the service will he improved and cheapened.—*Industrial World.*

HIGHT OF THE ATMOSPHERE.—Dr. A. Kerher has estimated the hight of the atmoephere from the phenomena of refraction. By two different methods he ohtains hights of 189 and 192.6 kilometere (117.4 and 119.7 miles).—*Wied. Annal.*

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive furtber reports:

Horn Silver, Jnne 11th, $27,500; Hanauer, 11th, $23,000; Stormont, 11th, $3,450; Queen of the Hills, 11th, $1,275; Ryan, 14th, $2,048; Horn Silver, 14th, $17,500; Germania, 15th, $7,000; Hananer, 15th, $2,100; Mayflower. 15th, $11,050; Hanauer, 16th, $1,410; Mayflower, 16th, $5,350; Bullionville, 16th, $3,461; Frisco, 15th, $4,282; Tintic, 16th, $1,593; Barbee & Walker, 16th, $1,578; for Salt Lake City for week ending June 16th, $151,243; Horn Silver, 18th, $35,000; Bullionville, 18th, $10,873; Hanauer, 18th, $2,030; Bingham, 18th, $1,450; Eureka Con., 7th, 8th and 9th, $6 895.16; Contention, 12th, $11,065 96; Standard, 13th, $19,654.25; Northern Belle, 15th, $8,149.56; Bodie, 19th, $6,453; Eureka Con., 10th to 13th, $9,099.16; Contention, 17th, $39,390.

S. R. De Long, Engineer of the Tucson and Gulf of California railroad, and his anveyors, returned, having completed the location of the line from Tucson to Port Lobes, on the gulf. The distance to tide water is 200 miles. In no place is the grade over 70 ft. to the mile. The average is but 30 ft. The entire route is over plains, and passes near and through a vast region of rich mineral country.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

No special activity has been manifested during the past week in mining stocks. The Virginia *Enterprise* thinks that the present appearance of the leading north end mines ought to justify better prices, and seems to think they are liable to be seen soon. At the Mexican the outlook is improving. The winze sunk on the 2700 level is cutting into ore of a good quality. It was started 12 ft. east of the streak of ore cnt hy the main south drift on the 2700 level, and is now hetween 25 and 30 ft. deep. The ore streak in the winze is found to he almost vertical, though on the 2700 level it had a considerable dip to the east. It seems that only the top of the deposit was found on the 2700 level. It now appears to he widening, and the chances are good for finding quite a large body of ore.

A station is heing cut out for a joint Ophir and Mexican winze on the 2900 level; also a cooling house. The station requires to he of quite a large size to make room for the engine and hoisting frame.

At the joint Gould & Curry and Best & Belcher shaft they are cutting out for a tank pit and pump foundation at the 2500 level. They will soon be prepared to commence drifting on this level.

The Savage folks are preparing to explore some very promising ground, both on the 2400 and 2200 levels.

The Chollar-Norcross-Savage shaft has reached the 2600 level, and is being sunk a further distance for a snmp. As soon as a working station has been made, a main drift will he started west. This will drain all the middle mines and enable them to resume active operations.

The Yellow Jacket folks are opening out their old npper levels and will soon begin the extraction of ore tbrough the Winters shaft. Thus far the principal work has been for the purpose of securing a proper circulation of air.

Meetings and Elections.

Alpha Con. M. Co., June 16th. Directors—John W. Coleman, J. S. Wall, J. B. Russell, Jos. Clark, C. L. Weller; William Willis, Secretary and Treasurer.

Lodie Con. M. Co., June 16th. W. P. Willard, President; W. H. Lent, Secretary; Bank of California, Treasuror. Directors—Tbomas Brown, Josepb Clark, L. Teese, Jr., W. F. Herrin, Geo. W. Sessions, L. M. Jones (New York.)

New York Mining Exchange.—S. V. White, President; John Stanton, Treasurer; A. W. Peters, Chairman; E. A. Wood, Secretary; R H. Gallagher, Assistant Secretary. The contest for membership of the Governing Committee resulted as follows: To serve one year, Frank B. Whitfield; to serve 2 years, J. T. Scott; to serve three years, H. Dunhaven, C. L. Clarkson, C. H. Badeau, C. J. Werner, T. L. Watson, R. K. Cooke, A. L. Faris, A. Lexow, S. W. Hoagland.

Fair Vila Co., Tombstone, June 19th. Directors—A. B. Hull, Wm. M. Pierson, L. M. Pearlman, David McClure, James L. Kiug.

Heavy Bulkhead.—At the Alta the 2150 level has been oleaned ont and work resumed in the main west drift. They are now preparing a foundation for a stone hulkhead, which will he erected at the point where stood the wooden one that recently gave way. The stone one will be made to withstand a pressure of 1,000 lbs. to tho square inch.

The Smelters.

Smelter sites have been located from Bellevue to within a few miles above Hailey so closely together that on the map they have the appearance of a fine tooth comb. Still no preparations for huilding have commenced. Talk is cheap, but it does not erect smelters. Here at Ketchum we have the largest smelter on Wood river, with two additional stacks en route. We have also been informed that the much talked of Horton smelter that was to occupy the whole ground between Hailey and Bellevue will he put upon Bowlder creek in a short time. This may or may not he so, hut if it was to he erected at Bellevue, why are the mines in that vicinity shipping ore to Salt Lake? Why do they not "blow in" the Hailey smelter before it blows away? The Philadelpbia company's smelter at Ketchum has ore enough to keep up a continuous run until snow flies, and perhaps the whole year round. It's capacity will he from 60 to 70 tons every 24 hours, and will he "blown in" when a sufficient amount of fluxing and coal can he procured. Many teams are busily engaged drawing ore and flux, and the coal-kilns are once more in full hlast. A smelter is talked of for Trail creek and one for Bowlder, bnt as far as we can ascertain it amounts to little more than talk. We propose to give our readers nothing but the facts as we gather them, helieving that these hurrah tiger sensational articles about 14,000 smelters, half a dozen railroad terminuses, and the only town in the whole country, in time react and are detrimental to the place from which they are oirculated. Ketchum's growth has been slow, snre, and will he permanent. We have the greatest number of good mines, and the only smelting works worth mentioning. As to the fnture of our city we willingly let it rest with the development of the mines and the enterprising men hacking us. Take us at our worst and we are happy.—*Ketchum Keystone.*

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

Eagle Con. M. Co., June 16th, capital stock, $1,000,000. Directors—Peter F. Dunne, Joseph M. Nourges, Josepb Dunne, Joseph M. Byers, George E. Woodbury.

Banghart Con. M. Co, June 17th. Location, Shasta Co. Capital stock, $1,000,000, in 100,000 shares. Trustees—John H. Carmany, President; George Spaulding, Vice-President; J. Henry Applegate, Jr., Secretary and Treasurer; Fred M. Stocking, Superintendent; and Geo. H. Goddard.

Shasta M. and M. Co., June 16th. Capital stock, $60,000. Directors—Maurace B. Blake, M. A. Parks, A. B. Brown, San Francisco; W. H. Sears, Marin; G. W. Fisber, Alameda.

M. Raphael, of Wadsworth, writes to a friend of a recent strike in his mines at Downieville, Nye county, Nev., the developments showing an ore body estimated to he worth $250,000. The property comprises six mining claims. The ores are lead, with iron gangue, carrying, also, some horn silver. They smelt with usnal facility. There is a snperahundance of wood and water convenient and accessible. This camp has a large territory to draw upon, abonnding in mines in which dry ores prevail, accompanied with quartz, which is of great advantage in reduction.

Mining Summary.

The following is mostly condensed from journals publisbed in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Bright.—Amador *Dispatch*, June 17: Work is steadily progressing on the Bright mine, located in Schober's ranch, near town. The sbaft is down about 60 ft, and we are told that the prospects are remarkably favorable.

Rich Rock.—Some very rich rock, and quite a bandsome ledge of it, now exhibits itself in the bottom of the shaft being sunk on the Ginocchio mine. The rock appears mucb richer than that nearer the surface.

Decided.—The contest for some mining claims on Murpby's Ridge, near Jackson, wbich has been pending for some time in Washington, between I. N. DeWitt and Jas. Morgan, has just been decided in favor of the former.

CALAVERAS.

Gravel Mines.—Calavoras *Chronicle*, June 17: A visit to a few of the gravel mines in this vicinity during the week found tbem all in operation. Work on the Sullivan claim, at the bead of Chili gulcb, still goes on, with the object of getting the claim in a condition to work to advantage. Ventilation is needed in the diggings and bas necessitated the sinking of a shaft to secure this end. The sbaft is being sunk at the rate of about 3 ft a day, and the depth to be attained in order to connect with the tunnel will he about 135 ft. A body of good gravel has been reacbed in the tunnel, and as soon as the mine can be ventilated it will be in a paying condition. The Belle Franco, formerly the "Bob Paul claim," adjoining the Sullivan claim below, is being operated steadily. At present the company are working in old ground, requiring a great deal of timbering. The new tunnel through wbich the mine is at present being worked penetrates into the bill a distance of over 700 ft, and is in paying gravel. Labors in the Gleeson mine continue without interruption. The incline tunnel, together with the main drift, measures between 1,400 and 1,500 ft. No great amount of water is encountered, and the pump is sufficient to keep the mine clear. In the Duryea hydraulic quite an area of surface ground has been piped off during the winter and spring, and owing to the depth of the bedrock the bottom gravel could not be worked off by hydraul cing. In consequence the piping process has been suspended and the bottom is now being taken up and transported to a "dump" by means of cars. The "bottom" is about 12 ft in depth, but being of a comparatively loose nature, is easily worked, and rapid headway is being made. About 10 men are employed altogether, who take out about 150 carloads a day. On tunnel ridge opposite the Duryea claim, is the Green Mountain claim, owned and worked by Messrs. Brown & McSorley. During the past 4 or 5 months a new tunnel has been opened to the works. The old tunnel bad become in need of repairs, and as work bad reacbed that point at wbich the old tunnel did not afford the best facilities for carrying on operations, a new one was opened, by which the mine can be worked to better advantage. This mine has been paying well for years, and having been explored sufficiently to ascertain the fact that a very large body of paying gravel exists, the owners continue operations with the assurance of having a mining property that will continue remunerative for years.

Rocon Diamond.—About half a mile below the abovementioned mine, on the same ridge, is the Rough Diamond, better known as the Jillson claim. A half interest in the mine was recently purchased by H. Longly, Esq., a gentleman who formerly and for a number of years was engaged in the quartz milling business at Glencoe. The Rough Diamond furnishes an example of the indomitable pluck and perseveraunce, added to knowledge gained from experience, that is necessary to make mining enterprises successful. It was repeatedly given up by different parties as ground that would not pay to work, the character of a great deal of the ground being of the nature of cement, and required to be put through a mill. Besides this it was also found, but not until recently, that the bottom gravel was not always the pay gravel, but that the pay is sometimes found in ground six or eight feet, and even more, above the ledge, with comparatively nothing in the gravel upon the ledge. The main tunnel has now reached a distance of 800 feet into the hill, and is to be carried farther. From this a north and south drift are run, the former being about 175 ft in length, and the latter over 350 ft. The main tunnel has recently been re-timbered and made secure. Seventeen men are employed, and the force is to be increased at once. Work goes on night and day, the underground management being under the direction of George Green, Esq., a thoroughly practical and experienced miner. The mill with five stamps is kept running continually. Five stamps more are soon to be added to the mill, the framework having originally been made to admit of it, if desired. The mill is advantageously situated to permit of working the mine from four different tunnels, which were run in former years, and can be used to facilitate operations in the future. Messrs. Jillson and Longly have a claim that is calculated to last for many years and be a paying property.

Hard Times Down.—According to report, the Gwin mine has closed down permanently, and the machinery is to be disposed of. A few weeks ago some rich rock had been struck in the 400 level, but it did not hold out, proving to be only a "bunch." The Norwich mine, at Gleucoe, and also the Fidelity, have shut down during the week. Whether the suspension of operations will be permanent, or only temporary, is not yet known, but it will probably be but temporary.

EL DORADO.

Gold Hill.—*Mountain Democrat*, Juno 17: Alf Rogers struck a pocket a short time ago in his mine on Putty ravine, about one mile south of Gold Hill, from which he took out about $2,500 in two hours.

The Benfeldt Mine.—Fred Benfeldt made another good clean-up at his gravel mine near Smith's flat last week, amounting to 225 ounces, worth $18.50 per ounce—$4,162 50. His expenses amounted to a trifle under $2,000. Profit, $2,162.50 for 12 days run, or a little over $180 per day.

INYO.

At Work.—Inyo *Independent*, June 17: Dick Glenn and George Floyd are working a rich gold ledge, situated about a mile from the New Coso station, in the range of mountains generally referred to as "Old Coso."

Inyo Con. M. & M. Co.—The special clean-up of the big mill at Panamint was to have been completed on the 15th. With the bullion already shipped, on hand and yet to be melted, the proceeds of the last run will aggregate 40 bars, from 900 to 1,000 ounces each, of a total value of from $38,000 to $40,000.

To Start Up.—The Hawley mill, at Owens Lake, will start up on Monday next for a protracted run, about 600 tons of ore being now on hand. The mill has been standing idle for a couple of weeks owing to the burning of the boat *Bessie Brady*, and the consequent cutting off of the wood supply.

Kearsarge District.—The shaft in Kearsarge tunnel has been sunk 30 ft, and the vein of ore struck a short time ago has steadily increased in width as depth has been attained. The outlook is very encouraging now for a bonanza in the Kearsarge mine.

Monock.—After a few days stoppage on account of the breaking of water pipes, the Modock furnace fired up again and is running steadily, making a fine output of bullion.

MARIPOSA.

Coulterville.—Mariposa *Herald*, June 16: Messrs. Dan and Charles Wagner, of Coulterville, were in town a couple of days the first of the week, and called on us last Monday. They speak very encouragingly of the prospects of that section of our county on the other side of the river. The new mine of Brown, near Garrote, has been bonded for quite a nice little sum, besides what has been paid in

cash. Rush of business on the part of our visitors prevented us from obtaining full particulars. Eight wagons, loaded with machinery, were seen en route for the mines in that section, last week. This bespeaks a lively future for our sister town. We hope that Coulterville will realize all that the prospect indicates. The Cook company is continuing its work on the Potsi, and in a short time an immense body of good milling rock will yield the reward of industry and enterprise. The Marble Spring, or Compromise, shows a prospect that encourages its owners to continue their work with renewed zeal. Rumors afloat a few weeks ago are to the effect that the company has been shipping at least $1,000 of amalgam per week. A few more such mines scattered through the county would soon give us a return of the livelier times that are faded and gone. All that is needed to stir up the county and place prosperity once more at our door is to get a few enterprising miners at work. Certain retarding influences have prevented this section from being fully prospected. Other parts of the State, where thorough work has been done in mines, have well paid for the trouble. Let competent men give these parts a thorough prospecting, and we are sure that they will be satisfied with the results. There is no reason why these parts should not yield their due proportion of the precious metal. Capital and a fair trial is all that is required.

THE MAGGIE JOHNSON MINE.—Mariposa *Gazette*, June 17: This mine, which is situated on the Kendall mountain, at the head of Cathey's valley, is fast acquiring prominence, and, judging from the result, it will be listed hereafter as one of the leading mines of the county. For some time past the mine has been worked by its owner, Mr. D. M. Johnson, Jr., with arastas, which was paying him from $20 to $30 per ton, when he was first observed, about 6 months since, by Mr. T. L. Kemble, of San Francisco, a mining engineer, who immediately became attracted to the spot, and bonded the mine from Mr. Johnson for 6 months for $2 500. Mr. Kemble proceeded as soon as practicable to erect a 5-stamp mill thereon, run by a 10-horse power engine, which will crush 4 tons every 24 hours. The mill had been running until last week, when a clean-up was made, showing the average of 16 tons to be $23 per ton. This fortunate result will undoubtedly lead to permanent mining in this section, for there are several other mines in the same neighborhood, known as the Kendall, Christman Olft, and others, that have been sufficiently prospected to be known as paying mines if properly developed.

MONO.

PATTERSON DISTRICT.—*Chronicle-Union*, June 10: On Tuesday we visited the new town of Clinton, in the Patterson district, which is destined to be one of the most promising mining centers on the Pacific coast. The new town site is located at the base of Clinton peak, and about two miles from the Aurora and Carson road. It is in Mono county, the State boundary line running about one mile north. In an air line it is about 10 miles north of Bridgeport, and 22 miles northwest from Bodie. It boasts of a five-stamp mill—Summers' mill, one store and postoffice, two saloons, the Summers and Ebi boarding house, a large and well appointed livery stable, two assay offices, a tonsorial establishment and bootmaker. Between 30 and 40 buildings now constitute the town, but new ones are being started every day. Wood is delivered by Indians at $2.50 per cord. The Summers mill has just been supplied with a new engine and boiler from the Gold Hill foundry. The engine is of 50-horse power, which will enable the owners to make a 10-stamp mill of it with comparatively small outlay. Another pan will soon be put in, making three in all, which will add materially to the capacity of this little bullion-producer. The mill commenced work again on Wednesday evening on ore from the Summers mine. The ore is packed on mules from the mine, a distance of three miles, but the company will, in due time, build a wagon road to it. The old mill turned out about $8,000 a month, with but one shift and from medium ore—float ore, we may say—and as the capacity of the works has been increased and the mine is producing better ore, we may reasonably look for a greatly increased output of bullion from the Patterson district. Work on the Summers mine is being pushed with good results. Henry E. Battin has been appointed superintendent and has taken charge. The 200-ft level has been reached, the developments being highly satisfactory, the ore increasing in quantity and richness as depth is attained, and placing the mine in a condition of permanency as a bullion-producer. Substantial prospecting is the order of the day in the Patterson district. The Summers are prospecting several other claims, which they consider better than the Kentuck, better known as the Summers—ore from the Patterson assaying as high as $3,000 in silver and gold to the ton.

THE MAY LUNDY.—Homer *Index*, June 17: An additional force of 20 men went to work in the May Lundy mine Thursday evening, and others will be added from time to time as required. The tramway from the mine down to the wagon road in Lake canyon has been put in thorough repair, the toll-road has been widened and otherwise repaired, and ore is being steadily sent to the mill by 6-horse teams.

GREAT SIERRA-TIOGA.—The tunnel was driven 20 ft during the week. The header is still in very hard black slate, highly mineralized, hard on drills, but breaking well. Two hundred and forty feet of track has been laid in the tunnel, so that hereafter the work of clearing away the broken rock can be prosecuted much more rapidly.

PLUMAS.

PLUMAS NATIONAL MINE.—Greenville *Bulletin*, June 14: The district is now in a very prosperous condition. All the mills but two are running, the exceptions being the Monitor and the Plumas National. The last-named mine passed under the control of a new company in New York some time ago. The property has a complete plant of the most improved machinery, including engines, mill and Frue ore concentrators. The facilities for working are all that could be desired. Wood and water are abundant; and with reasonable prudence in the management the mine can be made a good paying property.

GREEN MOUNTAIN MINE.—The Green Mountain mills are running steadily on good ores. The work on the tunnel is progressing well. Every day's work done on this property serves to demonstrate more fully its extent and value. Its present condition is the best proof of the sound judgment of the men who invested money enough to develop it and bring it to the condition it now is in. The Italians who are working over the tailings have just started a new arastra.

GOLD STRIPE MINE.—On last Friday morning the Gold Stripe mill at Wolf Creek was started up, and is now running steadily. Yesterday morning Mr. Pardee received from New York his appointment as superintendent, and will henceforth have charge of both Gold Stripe and Cherokee mines.

INDIAN VALLEY MINE.—The Indian Valley mine is doing about as usual. No new developments have lately been made; the monthly yield of bullion differs but little one month from another. There is ore enough in sight to make extensive prospecting unnecessary.

CHEROKEE MINE.—The Cherokee mine is doing very well. Recent indications in the mine warrant the belief that in a very short time some valuable developments will be made.

SAN BERNARDINO.

CALICO CONSOLIDATED.—San Bernardino *Index*: John Lawshe, A. H. Hart and W. J. Linville have purchased an interest in the Calico Consolidated mining company, in which Barton, V. Mitchell and others are already interested. Mitchell and Linville have just returned from the mine, and are highly pleased with its prospects. J. C. Dickson has let a contract to sink 40 ft more on the shaft of the Wonder mine, at Calico. The shaft is already down 50 ft. Eighteen heavily laden teams for Calico were counted on the road on Sunday. Owens & Morse are making adobes at the Fish Ponds station, for use at Calico. Mud houses at Calico will make cool and pleasant resorts. Two of Nadeau's large freight teams, consisting of four wagons each, passed the Fish Ponds station on Saturday, having on board 28 tons of freight for Providence mountain. Ten tons of the richest ore from the Silver King mine, Calico, were shipped to San Francisco last week for reduction. J. D. Bethune bought a one-fifth interest in the Bedford Forest mine, at Calico, yesterday, of M. A. Murphy, of Colton, for $1,025. The developments on this mine give the expectation that it will pay for the working right along.

SIERRA.

GRAVEL MINE SOLD. *Mountain Messenger*, June 17: Eastern parties have purchased a controlling interest in the Lafayette hill gravel claim on the ridge, between Alleghany and Moore's flat, and a short distance below Clip's flat. The ground has been well prospected, and the new owners are now in San Francisco for the purpose of getting machinery with which to work it. They propose to drift the ground and lower the gravel to Kanaka creek by machinery for washing.

ROBBED.—Some persons robbed the sluices of James Patterson, of Excelsior, last week. The robbers were tracked as far as Red Dog, but could be followed no further. James is positive that it was not done by Chinese. No great amount was obtained.

COARSE GOLD.—The encouraging news comes from American hill that a good prospect of coarse gold has been found. The bedrock is pitching into the mountain.

BLACK JACK.—Mr. Burke, of Alleghany, is in charge of the Black Jack mine for the owners.

NEVADA.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—*Enterprise*, June 18: The joint California east drift on the 2700 level has been advanced 19 feet. The joint west drift on the same level has been advanced 26 ft.

OPHIR.—The main south lateral drift on the 2900 level has been extended 21 ft. Are cutting out a station for the joint Mexican winze. Ore is being extracted from the croppings.

SIERRA NEVADA.—No. 2 winze on the 2500 level has been sunk 8 ft. On the 2700 level main north drift No. 1 has been advanced 20 ft. Are still repairing the winze between the 2300 and 2400 stations.

UTAH.—Repairing and re-timbering the top of the incline. The repairs on the guides in the incline have been completed. The south lateral drift on the 2500 level has been advanced 9 ft, and the east drift on the same level 5 ft.

CALIFORNIA.—The south drill hole in the main south drift on the 2700 level has been extended 150 ft. On the same level the joint Consolidated Virginia east drift has been extended 26 ft. Are extracting ore from the old croppings.

MEXICAN.—Crosscut No. 2, on the 2700 level, has been extended 20 feet. Are enlarging No. 1 winze. This winze is showing some fair milling ore in the bottom. West crosscut No. 1, on the 2900 level, has been extended 33 ft. Are cutting out a station for a joint Ophir winze.

UNION CONSOLIDATED.—Are stoping out ore on the 2500 and 2600 levels. During the week 625 tons have been extracted, and 633 tons and 1,910 pounds sent to the mill. The west cross-cut, on the 2600 level, has been extended 10 ft. On the 2700 level, south drift No. 2 has been advanced 30 ft, and the south drift on the 2900 level has been advanced 20 feet. The amount of bullion in the office is $12,547.03.

YELLOW JACKET.—The rise of water in the mine during the past week has been 12 inches. At the Winter's shaft the sagebrush station is completed for 200 ft, having repaired 52 ft during the past week. The ground passed through being clay, is very unfavorable to rapid progress.

SUTRO TUNNEL.—Main tunnel repairs, 11,000. 19,000 and 19,200. The track and intersection of main tunnel and north lateral has been re-laid and repaired, and some repairs made at point 11,000. The flow of water is equal to 6,650,139 gallons per 24 hours.

COLUMBUS DISTRICT.

NORTHERN BELLE.—Candelaria *True Fissure*, June 17: During the week all preparations needed have been fully completed to enable the railroad company to do the ore hauling. The first load was delivered at the mill on Saturday last. Work during the past week on the fifth shaft level has not progressed as rapidly as usual, the formation being considerably harder. The main drift has been extended only 17 ft, the face being distant from the station 200 ft. The other shaft levels are looking full as well as last week and continue their usual yield. The levels above the adit show very well throughout.

ESMERALDA DISTRICT.

CORTEZ.—Esmeralda *Herald*, June 17: Last Thursday, W. P. McIntosh received word from the New York company to start work on the Cortez mine, and he set about immediately to get everything in readiness. Yesterday morning operations began at the mine once more in earnest, with a good force of men. There is a large amount of rich ore developed in this mine, which the superintendent informs us he will commence stoping at once, and will ship to mill just as soon as the best arrangements for the reduction of it can be perfected. As work was only begun yesterday, and the superintendent too busy to be very communicative, the foregoing facts are all we are able to lay before our readers this week in regard to what is to be done.

LEWIS CONSOLIDATED.—The Lewis Consolidated mine, on Middle hill, commenced work one week ago, by starting to drift north and south in the ledge from the main shaft. Thursday the face of the south drift was in ore worth several hundred dollars per ton, according to the judgment of some of the best judges of ore in the camp. Yesterday, while working in the north drift, the miners discovered that what they supposed was the hanging wall had commenced to fall down. This was thought to be rather strange, and the miners were directed to run in a little farther, to see what was there. After breaking down about a foot thick, a vein of very rich ore was found. The vein is not very large, though large enough to pay well if it continues down as rich as where found—but who can tell how soon one of those rich chambers may be struck? Verily, one man can see no farther into the ground than another. The find being about the center of the district, speaks volumes for it. Although very large and rich bodies of ore were found on the hills each side of Middle hill, it seems to have been almost completely neglected, and not prospected to any great extent. With the starting up again of the Cortez, which all who have examined claim to be rich in gold and silver, and the present flattering prospects of the Lewis Consolidated, the mining outlook of the district has brightened materially the past few days, and we honestly believe we have a future before us second to no mining camp in Nevada. Mr. McIntosh, who has taken charge of the Cortez, has for the past four years made a careful study of the mines of the district, and we think is as well fitted to work them successfully as any person we know of.

EUREKA DISTRICT.

THE FIRST ORE SHIPMENT.—Eureka *Sentinel*, June 16: The first ore shipped from the Albion mine since it has been shut down by litigation with the Richmond company passed through Main street yesterday afternoon to the reduction works of the Eureka Consolidated. The shipment was about 15 tons, in 2 wagons drawn by Charley Broy's ten-horse team. In the first wagon was a hogshead-shaped canvas affair, braced inside by stout hoops, bearing the ironical superscription in big black letters, "This is T. W.'s Hat," and on the east side, "Not a hat full of ore in the mine"—expressions borrowed from the argument of the Richmond counsel—while on the rear of the canvas was painted a hilarious rooster crowing and sportively exhibiting his spurs. The wagons, which had been expected at 2, did not appear until nearly 5 o'clock, by which time the street was thronged with people to view the spectacle. While the wagons were being loaded at the mine, the New Town people turned out in force, and enjoyed the sight hugely. The E. & P. locomotive backed up as near as possible—within a stone's-throw of the dump—and whistled in congratulation.

LEWIS DISTRICT.

BETTY O'NEAL.—Lewis *Herald*, June 14: In compliance with instructions from the company's office in San Francisco, the force at the Betty O'Neal mine has been reduced to about 30 men. The company give as a reason for the reduction the expense attached to having their ore worked in a custom mill. It is the intention of the management to open up the mine thoroughly, and take out as little ore as possible at present. The shaft will be sunk, levels run, and the ore bodies exposed; and if the prospects will justify, a mill will be built. The winze being sunk is in good ore all the way, and opening up a bonanza. The ore that is being taken out of different levels is of good quality, and the ore bodies are not decreasing in size. On comparing the average of the ore worked from the Betty O'Neal under the management of Mr. R. Gilles and the last run, a difference of but 7 cents per ton was obtained in favor of the last run. The first run was over 300 tons, and the last over 500 tons. Average of ore, $113.84 per ton.

EAGLE MINE.—The tributers are still taking out ore from the Eagle mine, and making good wages. About 25 tons of their ore has been worked at the Eagle mill, but we have not been able to obtain the result. Why there should be any mystery about it is something that we do not understand. The tributers even do not know what their ore worked, and are awaiting returns from assays sent off. And right here we return our sincere thanks to the superintendent of the Betty O'Neal mine, who has on all occasions given us all the information required as to amount of ore worked and value of bullion shipped. John Rhoads and H. Kerr are opening up a prospect south of the new mill. They have not had any assays from there yet, but say they have a large ledge of decomposed quartz. In Campbell district the Hoskin boys have about a carload of ore out, ready for shipment to Salt Lake reduction works. Twist brothers have also some good ore on their dump, and are taking out more. The Frisbie mill has been placed in running order, and it is expected will start up on ore from the Lady of the Lake mine shortly. Several prospectors have brought pieces of good ore in from new discoveries for assay, mostly galena.

SACRAMENTO DISTRICT.

A GOOD MINE.—*Silver State*, June 15: Walter Schmidt, late superintendent of the Desert Crystal Salt Works, at White Plains, and a man named Bender, have discovered a vein of ore in Sacramento district which is proving very valuable. They had five tons of the surface rock worked at the Vandewater mill which yielded $100 to the ton. They now have about two tons of selected ore from the mine which it is thought will work over $2,000 to the ton. Much of the ore is horn silver, like that found in the Moonlight mine when it was worked years ago.

SILVER GLANCE DISTRICT.

PRINCIPAL MINES.—Lyon County *Times*, June 12: Silver Glance District is 34 miles south of Carson City, on the Carson and Aurora wagon road, near the Mountain House. The principal mines in the District are La Adventura, Union, Little Giant, Orphans and Minnehaha. Mr. Dwelly is building a five-stamp mill to work La Adventura ore, which will start up in a few days. The ore will pay from $20 to $50 per ton. Mr. Williams is running a two-stamp mill on ore from the Orphans mine, which is very rich. There are several claims in the district that are worthy of notice, but they are now lying dormant on account of the owners not having the means to prospect them. The ores of this district are principally gold, the gold being worth over $18 per ounce. The veins of the district run northeast and southwest, and dip to the west. The formation is porphyry.

ARIZONA.

TOMBSTONE.—*Epitaph*, June 15: There is no particularly noticeable change in the mines of Tombstone camp since our last report. All are looking well, and steady improvement in their size and richness, is the word all along the line. A very important strike has been make in the Randolph. In the crosscut connecting No. 2 with the drift from shaft No. 1 a rich body of ore has been encountered, which gives promise of being one of the richest yet made in this district. The crosscut has already penetrated this ore body 7 ft, and the face shows a fine body of carbonates and chlorides. The owners of this valuable property are feeling good, as well they may, over their prospects. This strike cannot but have an important bearing on that group of mines in the southwestern portion of the district. Those mines are rapidly coming into popular favor, and their strength and permanency is being demonstrated day by day, as depth is attained. Looking the mineral field of Tombstone carefully over, it can be asserted that its present condition never appeared healthier, or its future prospects brighter. It remains the leading bullion-producing camp on the coast, and as the wonderful richness and extent of its ore bodies is being thoroughly understood, confidence in its brilliant future gains additional strength.

SUMNER.—Prescott *Courier*, June 16: The tunnel in the Sumner mine is now in about 75 ft. Pieces of the ore recently thrown up by the upcut were rich in gold.

PARKER MINE.—The Groom creek mill is running on refuse stuff from the Parker mine, which is yielding at the rate of $20 a ton, gold.

HASSAYAMPA.—Supervisor J. N. Rodenburg and Mr. George Sines came in last evening from visiting the Dosoris and Blue Dick mines, Hassayampa district. They last evening expressed themselves delighted with what they had seen. George says there is a 4-ft vein of rich ore in the Blue Dick. Tunneling to strike the Dosoris at considerable depth is progressing.

SMELTING.—Mr. J. T. Shull, just from Lynx creek, gives a glowing account of Prof. Shafer's good luck in smelting Dosoris and other ores. The furnace "froze up" night before last. Major Burke, Prof. Shafer and the workmen staid with it all night and got her back again. When Mr. Shull left, 20 bars of silver had been run out. Messrs. Reede and Boyd, practical Nevada furnace men, have joined Prof. Shafer's force. Good ore is abundant and success is almost certain.

TIGAR.—George A. Hammond, just from the Tiger mine, reports progress in freeing the mine from water.

COLORADO.

CARIBOO.—Cor. Denver *Mining Review*, June 16: The shaft is down 1,000 ft, with levels at intervals of 60 ft from the surface, and crosscuts east and west for a distance of 900 ft. In July the 800 and 920 levels will be connected by a winze, increasing the output to 15 tons daily, and one month later the 920 and 680 levels will be connected in like manner, which will handsomely increase the quantity of mineral raised. The pay streak runs from 3 inches to 4 ft, the average mill run amounting to 52 ounces. During the past year the yield amounted to the handsome sum of $232,000, and this year the amount will be increased. The building and machinery erected is the finest we have seen in the county. The shaft, hoister, compressor and sorting room are all covered by one roof. The building is 80x30, the engine is 80-horse power, and compressor six-drill capacity.

IDAHO.

BULLION CAMP.—Wood River *Miner*, June 10: About 150 miners are now employed in mines in this camp. The Jay Gould is proving to be a bonanza for its owners. The Porter Brothers have struck it rich in the Eureka fraction, lying west of the Eureka mine. All the mines of Bullion are improving as depth is attained. The Mayflower mine will send a block of solid galena weighing 1,000 pounds to the Denver exhibition.

THE ROAD.—The road from Galena to Vienna is being put in good order, so that the machinery for the Johnston Brothers mill can be taken in as soon as it arrives at Galena.

NOTES.—W. O. Arnold made a rich find near the head of Warm Spring creek one day last week. Within a few hours from the time he found the croppings he had a pile of glittering galena out on a newly-made dump. Mr. Arnold has associated with him Mr. Lee Baker, of Dakota, and the two propose to push work on the find as rapidly as possible. At present writing they have some three tons of ore out, and a body of solid galena in place measuring over 2 ft in width. The Columbia and Beaver will will be started up just as soon as Mr. J. K. Owen, who is now in Sawtooth, can get things in readiness. Mr. Owen is to put up the mill for the Vienna Con. M. Co., of which the Johnston Brothers are principal owners. All of the mines in and near Vienna are said to be showing up finely. The Solace, Mountain King and one or two others, bid fair to outstrip, in richness and productiveness, any mines yet developed on or near Wood River. A considerable body of milling ore has been discovered on Trail creek. S. S. Houston is the fortunate finder. The ledge matter is from 4 ft to 6 ft in width, and said to be very rich. In the immediate vicinity of Mr. Houston's claim are a number of good prospects, but they are all argentiferous galena in character. Some of these specimens of silver-bearing lead ores have returned assays as high as 700 and 800 ounces silver to the ton. The new find is on the same belt as the Elkhorn and many other valuable mines, and the chances are the ledge will turn into smelting ore before its owner has sunk many feet on it. A number of new finds have been made in the hills east of Hailey during the week. Some of them are very promising in appearance. The Philadelphia Co.'s representative are actively engaged in operations on Warm Spring creek and at Muldoon, on Little Wood river. In the former place the smelter, which was put up last fall, is nearly ready to be blown in, and a second stock of 40 tons capacity is being added. The new smelter was unloaded on the site chosen for it last Saturday afternoon. A matting furnace is under course of construction and new hoarding apartments are nearly finished. Fifteen more coal kilns are being built, and other improvements of note are going on. There will be lively times on Warm Spring creek this summer. Hundreds of men have been put upon different properties during the past few weeks, and when the first pay-day comes its influence will be felt in Hailey. At Muldoon, on Little Wood River, the activity which has prevailed in both mining and town building is on the increase. Lots are still in good demand at fair figures, and work is being done in and about the mines. New strikes and finds are of daily occurrence, but though bulk predominates wherever ore is found, the majority of prospects are of low grade. The camp, however, is about as promising as any in this section. A 2-ft vein of solid galena ore has been uncovered near the North Star mine. The fortunate finders are Ed. Ryan and Tim Keegan. The Germania mine will send its ore to the Oaklena works for reduction. A 2-ft vein of high-grade ore has been struck in the Golden Sheaf mine, which returned assays varying from $138 to $312 in silver. The Tennessee shows a 4-ft vein of an average value of 150 ounces silver to the ton.

WOOD RIVER SITUATION.—*Times*, June 14: The past week has been exceedingly quiet on lower Wood river, and nothing very startling occurred. A rich strike of ore was made in the Deadshot, one of the claims of the Bellevue mining company. Three other strikes were made on Deer creek, and a number of others were probably made elsewhere, but the frequency of such occurrences here has rendered them commonplace. The mines of Bullion continue to ship ore in a moderate way, their owners not being in any hurry, apparently, to convert their galena into cash. The Mayflower is, however, doing nobly, its aggregate shipments to date this season exceeding 250 tons. E. Daft's ore-buying establishment was opened in Hailey on Monday. Mr. Daft is prepared to sample, and pay for immediately after sampling, all ores that may be offered to him, and in any quantity, from 100 pounds to any number of tons. He intends to compete with Salt Lake, San Francisco, Omaha, Kansas City, and all other markets. At Ketchum, the Philadelphia company's smelter was blown in last Saturday, with several hundred tons of ore in the bins, and sufficient flux and charcoal on hand for a lengthy and successful run. There has been quite an exodus to the upper country, caused by the opening of the grade across the Sawtooth range, and the towns of Vienna and Sawtooth are booming.

MONTANA.

GLOSTER MILLS.—Helena *Independent*, June 17: The product of gold from the last two clean-ups of the Boston & Montana's Gloster mills amounted to $27,115 for 26 days of running, and from present indications, this amount will be increased considerably in the future for rune of the same number of days. Thus far, every step in the progress of development has only enhanced the value of the mine, by adding to the immense ore reserves that guarantee the future of this enterprise. A large steam-hoist will be erected over the main shaft of the Gloster as soon as practicable. The Gregory works are turning out lead bullion at the rate of six tons per day, which averages, in gold, silver and lead, over $300 to the ton. Out of nearly 300 tons of this furnace product the lowest assay was 135 ounces of silver and 3.02 ounces gold, and the highest was 152 ounces silver and 5.27 ounces gold per ton. During the month of June the shipments from the Gregory amounted to nearly or quite $100,000 in value. There is a rumor afloat to the effect that the Bonanza Chief mill will be likely to find a location and active service soon in the Ten Mile district.

OREGON.

NOTES.—Jacksonville *Times*, June 16: Mining is approaching a close.....Considerable prospecting in quartz is now being done in Willow Springs precinct..... A. Schmidt has built a new reservoir to facilitate his mining operations on Jackson creek.....The English Co.'s mines at Galice are said to have paid better than usual last season.....Roten Bros., of Willow Springs, have their arastra in operation and are crushing some rich quartz .....Hayes & Magruder will soon commence getting their mines on Rogue river ready for Winter.....The miner's of Gall's creek are doing pretty well this season. Some of them have considerable water yet.....Water is getting light, and nearly all of the miners will be done for the season before the end of the month.....R. Cain, who came up from Galice creek last week, says that Green Bros. are now engaged in crushing rock worth $100 a ton.....Lannes Klippel and W. S. Brodbeck were down from Big Applegate last week and report mining operations in full blast there.....Simmons & Howard, of Galice creek made several partial clean-ups, which resulted satisfactorily. The final one proved the best of all.....Rummell & Bagley are about ready to commence mining the bed of Bear creek. They have just finished a large water wheel with which to facilitate operations. .....Dan Silva, superintendent of the Applegate & Ayer Co.'s mines, was in town last week and reports that he struck the old channel again. Better pay than ever is expected hereafter.....Patterson Bros. are putting in a little giant at their claim on Beaver creek. Their ditch will be 300 rods long, and they have 700 ft of pipe on the way from San Francisco. They will use a 3-inch nozzle .....Lance & Co. and Goldworthy & Co., of Foot creek, are still busily engaged, and will make excellent runs. These claims are rigged up in good shape, and are well supplied with water for the greater portion of the year. .....Sheriff Bybee and A. W. Hawkins left for Waldo, Monday, to look after their mining interests. They are interested in one of the best placer mines in the State with Wm. Newman, and propose putting it in good shape for next winters' run.....Winer & Simmons, of Waldo, are still piping day and night, but will commence cleaning up in about a month in order to get ready for winter. They have a full head of water for several months longer, as there is still considerable snow in the mountains.

UTAH.

VALE LEDIS.—*Silver Reef Miner*, June 16: Suits in attachment aggregating some $8,000, have been commenced against the Leeds company, and their property here has been levied upon, and is now in the hands of the Sheriff. This wholly unexpected move on the part of the creditors seems fully justified by the dilatory action of the trustees, and their failure to provide means to meet matured out tanding obligations. At the time of the commencement of legal proceedings the company's mill was running profitably upon tailings, of which there is estimated a two years' run. There is no question but that it would have been but a matter of time when the company's indebtedness could be fully met from this source, but creditors generally are not disposed to wait an unreasonable time for their money when there are sure means of collection at hand. The closing down of this property is the more to be regretted on account of the recent encouraging outlook, it having been under a cloud for the past two years, and just being again put in good running condition through the energetic effort of the superintendent.

A Comstock Hero.

How Van Dusen Carried Supplies into the Alta.

The reporter had an interview later with Mr. Van Dusen. He is a rather slim man, about five ft. seven inches tall, with a thin, dark beard, black eyes, prominent nose and lantern jaws. Indeed, he could stand very well for a reduced photograph of Brother Jonathan. But Van Dusen is not a Yankee. He is a native of Michigan, and 47 years of age. The reporter found the hero of the day in the wash-room of Fitzpatrick's boarding house in lower Gold Hill, rubbing soap on his hands, and wholly absorbed in the occupation. He looked up with some surprise from his basin in the wooden sink when the reporter spoke to him, and said he wanted an interview with him. Van Dusen is not a talkative man, and it was only in response to the journalist's constant questions that the story of his adventures was drawn from him piecemeal. While giving a bit of information as to his perilous journey, Van Dusen would pause between splashes in his basin, turn up his dripping countenance for a moment, and then industriously resume his ablutions. He was rather amused than otherwise that a newspaper should think it worth while to send a reporter to ask him about such a trifle as going into a drift 1,400 ft. long, 2,150 ft. below the surface, filled, in part, with almost scalding water over three ft. deep deep and loaded with poisonous gases that had slain two men who had made the attempt before him. There was no affectation about his unconsciousness of having done anything heroic. It was absolutely real.

"Oh, no; I'm not exhausted," said Van Dusen, as he rubbed his face vigorously with the towel on the roller. "I'm feeling chipper —never better in my life."

He encountered the bodies of Bennett and Callahan. Both were lying on their backs. He merely paused as he came to each corpse, and then passed on.

"Then," said Van Dusen, "I got to the cooling house and saw the boys."

He seemed to think that the statement of this fact furnished all the information that was necessary.

"They were glad to see you, of course?" suggested the reporter.

"Yes, but they were a darned sight gladder to see the ice in my machine."

He had to leave his lantern out in the drift, as there was a tremendous draft in the cooling house.

"It was pretty dark in the cooling house," said Van Dusen, "and when I went in the first thing I asked was, how many of them were alive. They said the whole seven, and I said I was mighty glad to hear it. 'What do you fellows want most?' I said, and they answered 'grub and ice.' They did go for my ice. (Mr. Van Dusen chuckled at the recollection.) One chap—it was so dark I couldn't see him—laid his arm across his breast and began hauling it out of the machine, and piling it up on his arm. I guess they knew what had happened to the two boys that went down in the morning, for they asked me if there were any dead bodies in the drift. I said there wasn't, for it wouldn't have done 'em any good to know. They had seen the lights that the boys carried, and they went out kind of sudden when they fell, of course. so it wasn't hard to guess what happened."

"They had fixed things in the cooling house, and were pretty comfortable, managing to get tolerably cool air and water. They wanted all the air they could get, of course, and one of 'em sings out to me as I was going, to tell 'em on top to work hell out of the compressor. I thought, perhaps, that there might be one or so in the crowd that was near giving in, and I asked if anyone wanted my knapsack to try to make the riffle for the shaft, but they wouldn't hear of it, so I started back. Bennett walked down the drift a ways with me. He had his head on him, and wasn't scared or anxious a bit, so far as I could see."

On the return trip, one of the rubber air-tubes of his knapsack got loose, and he had to depend upon one. Then the foul air put his lantern out, and his only guide as he floundered through the last 300 ft. of hot water, was the faint gleam of the candles of the men at the station. One of the doctors at the mine said that there was not one man in a thousand could have achieved the feat accomplished by Van Dusen, and that it was marvelous that he should apparently suffer so little, physically and mentally, from so terrible an ordeal. Van Dusen, at six o'clock, was back in the hoisting works, standing around with his hands in his pockets, taking a keen but calm interest in all the work that was being done toward the rescue of his fellow miners.—*Enterprise.*

A Chance for Prospectors.—There is, perhaps, no more promising field for the prospector than that belt of mineral country lying between Carson and Patterson district (Sweetwater), of which the Mountain house is about the center. It has never been half explored, having been merely skimmed over by men who, for the most part, hardly knew what they were looking for. Daily reports of good finds come from that section, which will, perhaps, one day be the scene of thriving mining operations.—*Reno Gazette.*

It is said that the Bodie company has recently purchased for $5,000 some Comstock machinery that cost $120,000.

Colony of Redlands.

The writer, visiting Redlands in the latter part of March last, was very much impressed with the superior advantages this colony seems to possess. The lands are situated at the extreme end of the San Bernardino valley, where it narrows and rises upon the very flank of the grand old San Bernardino mountain. The altitude corresponds with that of the highly favored mesa lands, which are famous for producing the choicest, fairest and earliest of citrus fruits; table, wine and raisin grapes.

No one can fully realize the superior charms possessed by this colony without viewing its beautifully elevated position. Nearly every lot has a delightful outlook upon the bordering hills and mountains, and the towns, plains and cultivated lands spread out before its lawn-like, sloping front.

When the squares between the grand avenues, laid out in the published map, are improved and highly cultivated, as there is every reason to believe they soon will be, the view of the colony itself, from the very sloping position it occupies, promises certainly a more charming picture than that of any of the most favored colonies, preceeding Redlands in the calendar, on the coast.

A scene of great activity prevailed in laying out the wide and sightly avenues, building the reservoirs and latest improved system of water-pipes and distributing gates; manufacturing upon the ground, at different points, an immense amount of durable cement water-pipes, ranging from 4 to 24 inches in diameter; laying pipes and breaking up new ground. Altogether it was such an outdoor industrial show as but few persons view in a lifetime, and one that seemed to reflect great credit upon its projectors and enterprising managers.

Realizing the importance of a right start in colony building, Messrs. Judson & Brown determined to invite the best class of settlers only to Redlands. They wish to protect the town, laid out for its business center, from intrusion of intoxication dealing saloons, with their associated evils and trouble-dealing accompaniments.

The strength of this colony will be greatly advanced by thus associating a band of worthy settlers who will firmly co-operate in worthy undertakings only, and stand by each other in sustaining the good social and business reputation of the community.

Taking advantage of the experience of earlier colonies, we do not see why it should not be demanded that Redlands shall, in many particulars, be an improvement upon others. In another column will be found a more minute mention of this worthy enterprise, published by the representative press of Riverside, in this same county.

Alaska Mines.—A correspondent of the *Post* says: The mines of Alaska are as yet undeveloped, and the interior of the country has not been explored sufficiently to show what may be discovered in this line. Reports, however, have come from all sections of the country of immense deposits of precious metals. Reports came a few years ago of what was termed "a mountain of silver," discovered in northern Alaska. Specimens of this ores were brought to San Francisco by the discoverers, and, upon being assayed, gave such satisfactory results as to lead to the organizing of an expedition, which sailed from San Francisco last spring in pursuit of the treasure. The expedition reached the object of its pursuit and was a success, so far as finding the promising lode was concerned; but the vessel was wrecked with her cargo of ore as the party was preparing to leave for San Francisco. Having stopped on this coast for wood and water, she was caught in a southwester and driven upon this beach. The prospectors, excepting three, finally reached San Francisco at different times, some being picked up by trading vessels, and some securing passage on the revenue cutter, *Corwin*. They have told their tale. But little has reached the public of their adventures in this new field of wealth. Alaska to-day offers inducements to the able-bodied, energetic and thrifty, to make money by hard licks and perseverance. I believe the day will come when fortunes will be taken from her mines alone. Her mines will be the means of developing this country, which should be done and encouraged by our Pacific coast people, bearing in mind that it should be legitimately done. We are not in a condition to have an excitement brought upon our people, no matter what the mines may show, and Alaska, at present, is not a country to make a rush to. Let's take hold of these things slowly, and I think good results will come from our labors.

George I., King of Greece, is, perhaps, the most unpopular monarch in Europe. He seldom visits any public assembly or institution, or manifests any interest in public affairs, but gives almost undivided attention to his farm and horses. His subjects think that he regards Greece merely as a rented estate, out of which he is striving to make as much money as possible while his tenure lasts.

It is stated that the Catholic clergy of London are about to commence preaching a crusade among the Irishmen of their flocks, against connection with secret societies.

A New Educational Institution.

The educational institutions of California are a credit to the Pacific coast. Our public schools are unsurpassed, and the liberality of the people toward them is proverbial. There is also a group of most excellent private schools and seminaries, to which young people are sent from all parts of the coast.

The newest of the private institutions is the Harmon seminary for young ladies, at Berkeley. It will be a new school in a bright new building, but it will be in charge of Rev. S. S. Harmon and Mrs. F. W. Harmon, educators who for more than 30 years have been known by their works in different parts of the State. This institution is to be a quiet, home-like school, which will endear itself to the affections of the pupils, and which will in turn benefit them by the influence of home guidance and guardianship, as well as by the weightier matters of the classroom. As shown in the engraving, the front portion of the building rises three stories, and is about 50x60 ft. upon the ground. Back of this is the central portion, 30x100 ft., two stories high, with a two-story projection in the rear 20x32 ft. Upon the left of the main hall are the reception-room and two music-rooms. Upon the right is the large school-room. The ground floor of the central portion of the building contains the dining-room and four recitation-rooms, with cloak-room and side entrance for day scholars. The ground floor of the rear projection is devoted to the culinary department. The upper floors, aside from music and art-rooms, will be chiefly devoted to scholars' apartments.

It is the purpose of Mr. and Mrs. Harmon, and those associated with them, to establish an institution for young ladies which will be first-class in every particular. It is expected that the work of the seminary will arrange itself in several departments. The institution will be complete in itself, in that it will have a regular course of instruction, for which diplomas of graduation will be awarded. It will also embrace a department of instruction with a special reference to the preparation of young ladies who desire to enter the State University. In addition, there will be a conservatory of music and courses of instruction in the fine arts, modern languages and *belles lettres*, in each of which will be secured the services of masters of recognized superiority. In all courses there will be a disposition to place the institution abreast of all true progress in the art of instruction and the choice of studies for the curriculum. The first term will open August 3, 1882.

Mexican Mines.—A correspondent of the *Bulletin* says: Mining property continues to be sought for, and several parties are here from California purchasing, among whom may be mentioned F. A. Benjamin and Dr. Goodfellow, as also Prof. Cox, late of the State Geological Department of Indiana, who goes out to Barranca to examine that district in regard to coal. Quite a stir has been created here by the discovery near Llanos of a very rich gold mine by Dr. Detwiler, one of the grading contractors, and some others. From a sample shown me, I think it fully equal to any free-milling ore I have so far seen. As no great amount of work has as yet been done on it, the future is uncertain; but from the statements of the discoverers and the nature of the ore, it bids fair to rival, if not excel, the Minas Pristas. The shipment of treasure per steamer this month is small, owing to the non-arrival of any treasure from Pinos Altos, the bulk of the shipment being from Minas Prietas, now under the superintendence of H. A. Johnson. Louis Hollu, of Cumarepi, is in town, and it is understood that he has secured capital to open up the silver and copper mines of that district held by him. Quite a large amount of machinery and mining stores came by the *Mexico*, and go forward to Pinos Altos, the Carmen or Guiguipe mine and Minas Pristas. Captain Wm. Randall's mine, the Amarillas, is also opening out well, and will be soon in a producing state.

Better Times in Inyo.—Though no big mining sales are to be chronicled, nor has "capital" ordered the inauguration of any gigantic mining operation, through which quantities of this needful may become plentiful in our midst, there are several little mining operations in hand which together must in due time tend materially to ameliorate some of the generally prevailing pangs caused by the unprecedented scarceness of coin and other grub collaterals. These are that, within the present month there will be two furnaces and probably seven quartz mills in operation. Two of the latter are entirely new additions to our bullion producing resources; in fact, all but one or two are new in the field, since, with the exceptions referred to, it has been months or years since any of them have done anything in that line. The furnaces are the Defiance and Modoc; the mills are the Panamint, Keeler, Key-not (or Taylor), Laura, Brown Monster (5 of its 30 stamps), Rex Montis and Pioneer. Though two of these mills are running on tailings only, and some of the others are using but a portion of their stamps, the equivalent of stamps in actual operation will not fall short of 40, to which the furnaces and several arastrae are to be added. It has been many a day since this county could boast of having such a number of reduction works in operation at the same time, the remainder of this month being considered as the "present time."—*Independent.*

Smelters and Mills in Butte.

A short time since we took a short item from a letter in an exchange which gave the number of smelters, mines, etc., in Butte, Montana. The *Inter-Mountain* corrects the items as follows:

Of smelters there are four instead of three in the Butte district. They are owned by the Montana & Colorado Co., the Parrot Co., the Bell Co., and the Montana Copper Co. They have a total capacity to treat 200 tons of ore daily.

Of mills, we have the new Alice, 60 stamps, and the old Alics, 20 stamps; the Silver Bow, 30 stamps; the Moulton, 40 stamps; the old Lexington, 10 stamps. Besides the above, which are all in operation, we have the Lexington, 40 stamps, which will be finished in a few weeks, and another of the same capacity is soon to be erected by the same company.

The Dexter mill which has been idle some time will soon resume operations on high grade ore. The Clear Grit will soon begin the erection of a 20-stamp mill, and during the coming season Haggin & Tevis will most likely put up a smelter for the Anaconda, as will also the Original Butte Co.

In relation to concentrators, the Press is also misinformed. Instead of one concentrator there are three, and at least two more will soon be erected. The Williams concentrator, near Rocker, has a capacity of 50 tons per day, is provided with the best of machinery and is in highly successful operation. An *Inter-Mountain* reporter was all through the works last evening and was much impressed with the amount of ore on hand. The Longmaid concentrator near the depot is also making a good record. It consentrates 40 tone of ore per diem.

The Bell Co. will erect a 10-ton concentrator at the earliest practicable moment to treat the thousands of tons of low-grade ore on hand. A very successful concentrator is running in the Centennial mill and the owners of the Liquidator propose at an early day to put in another concentrator in the Clipper mill.

With these trifling exceptions the information published in the Press is entirely correct, and it is sincerely to be hoped that our estsmed contemporary will make the necessary corrections. The Press has ever been well disposed towards Montana.

Ore Concentration.

"A New Era in Working Sulphuret Rock" was the heading of an article, which, during the editor's absence, got into this paper of August 14, 1880. In looking over the figures they show evidence of being nothing but guesswork, and that there was no attempt at regular sample work. For instance, the statement occurs that in the work of the Frue's "assays of ore, that went as high as $200 and even $300 per ton, have yielded not more than from $30 to $40 per ton," and that such quality as yielded $25 per ton, yielded $100 per ton by chlorination. In the first place, it shows only 14% saved by amalgamation and concentration. Now, if this is not a mistake, it will be easy enough to show or convince any mining man that the statement of the chlorine work was merely guess work. "Such ore of the same quality, as heretofore paid $25," representing 14% of its value, would make the assay value of the ore $178.57; $100 would only be 55%, which would be too much less than the 90% and 95%, which they do get. Evidently, the article was directed against the Frue through ignorance. We write this, knowing that the whole thing can be shown to be a mistake—in which the two processes are shown to do very poor work, and wish to call attention to the fact that the Frue concentrator has saved twice the money over any other concentrator machines on the ores of this camp. As to the per centage shown in this article, we will state that the Frue has taken 97½% from $42 pulp after amalgamation on copper plates in one of our own mills, by parties not interested in the sale of the machines. Any one wanting proof of this can find it right here at home. Since writing the above, we learn positively that the gentleman giving the information upon which was based the article in 1880, admitted upon reading it next day that he had unwittingly given the reporter the wrong figures.—*Nevada Transcript.*

The official statement of the Homestake mine for the first quarter of 1882. is as follows: The net bullion proceeds were $286,322, and the expenses, including $10,523 as taxes, were $170,398, leaving a net profit of $115,924. Out of these three dividends were paid, amounting to $112,500, leaving a surplus of $3,424, which, added to surplus on hand December 31, 1881, $297,975, showing a surplus March 31, of $301,399.

Says the Reno *Gazette:* No place on the coast presents so many advantages as Reno for profitably running ore reduction works on a large scale, and when the Nevada and Oregon railroad is completed to the north, and the Carson and Colorado has tapped the base rangs of Inyo county, capital, without doubt, will note these advantages and seek investment here.

For the week ending May 8th, the Father de Smet mine yielded 2,375 tons pay ore from the first and second levels. In the 200 ft. of tunnel extended from the McGinty chamber a new body of good ore has been cut.

Smelting Furnaces for Wood River.

Appliances that will Insure Success in Treating our Ores.

The Pacific Iron Works, Rankin, Brayton & Co., of San Francisco, have recently shipped a 40-ton smelting plant to the Philadelphia Co., at Ketchum. This, with the smelter and sampling works constructed by this firm for the same company last fall, makes a capecity of 80 tons per day. The same firm have also just completed an 80-ton plant for the Wood River company, to be erected at once on the Muldoon mine. Both these enterprises are owned and operated by the Philadelphia companies, under the general management of Colonel Green, a gentleman of large expsrience in mining operations in California. No expense has been spared to make these worke the most perfect and complete in all their appointments of any that have been constructed. The amount of bullion they will turn out when fairly in operation will convince the most skeptical as to the resonrces of the Wood River country. The Pacific Iron Works' smelters, for both galsna and copper oree, have worked a revolution in the smelting business of the conntry, and have made success of many an enterprise that would otherwise have been a failnre.

The advantages demonstrated in these furnaces are facility and cheapness of transportation and construction, economy in fuel, fineness of bullion prodnced, and capscity for continuone and uninterrnpted work. Any ore that can he emelted, it is claimed, can he worked cheaper in these farnacee than hy any other process.

The mining interests of the country are largely indebted to the enterpriee of this firm for working up to snch a state of perfection this important branch of mining machinery. A large nnmher of companies in Arizona, New Mexico and Nevada are operatiog these furneces with the most satisfactory results. And we feel assnred that nothing will insure the snccess of our various smelting enterprises so much as the general adoption of these approved appliances for treating ores.—*Wood River Times.*

MINING ACCIDENT.—On Monday last, in the face of south drift No. 2 of Union five holes were drilled and charged. One hole was charged three times before an explosion occurred, and then it did not result, as desired, in blowing ont the rock. The relief shift, composed of Richard Hicks, John Beargo, John Bleck and James F. Brown, again charged the holes. Hicks end Bsargo had finished their work on the west side, and Black and Brown were cbarging those on the east. Hicke was gathering up the toole to convey them beyond the reach of the blast, when an explosion occnrred which immediately killed Black and Brown, seriously wounded Bsargo and filled the flesh of Hicks witb the flying splinters. Brown's body was torn to pieces; Beargo was fearfully lacerated with flying rocks, sbattering his sknll, the pnlsation of the brain being visible. Hicks being much nearer the bulkhead behind which they would find shelter, received injuries less severe than those of hie companions, and was enabled to walk home. The cause of the accident is not known, but the most plausible theory is that the hole repeatedly charged contained a cap, and exploded hy the later tamping.

POLISHING SHELLS.—Spon gives the following fecte respecting the methods employed for polishing shells: 1. Marine shelle are cleaned hy rnbbing with a rag dipped in ordinary hydrochloric acid till the outer dull skin is removed, washing in warm water, drying in hot eawdust, and polishing witb chamoie leather. Those shelle which have no natnral polished surfacs may either be varnished or rubbed with a little tripoli powder and tnrpentine on wash-leather, tben fine tripoli alone, and lastly witb a little fine olive oil, hringing np the surface witb chamois as before. 2. The shells are first boiled in a strong solntion of potash, theu ground on wheels, sometimes through one etratnm, to ehow an underlying one, then polished with bydrochlorio acid and putty powder. In tbie operation tbe hands are in great danger. · Shell grinders are generally almost cripples in their hands. 3. Polishing motber of-pearl—Go over it with pnmice stone finely powdered (washed to separate the impuritiee and dirt), with which polish it very smooth; then apply pntty powder and water hy a rubber, whicb will produce a fine gloss and good color.

PLAIN TALK FROM WOOD RIVER.—A correspondent of the Eureka *Leader* writes as follows in regard to the outlook in the Wood River conntry: Next year may bnd furnaces, smelters, eaw-mills, etc., enongb in this country to make it a really lively district, but nntil snch time I would warn all *poor* people to let Wood River alone. There are to-day 150 men here to one job, and before another month 200 men will be ont of work, and money also, to one man working. Snch is the outlook. Onr merchante and bneinece men all wonder what the trouble is; hut they do not take the time and tronble to think a few moments in a eensible way. Bueinese ie not what we desire it should be, nor what we expected it to he. Many people are coming in daily, hut they all come broke, and this ie what is tbe matter with Wood River. I may he slightly censured hy eome of our "flighty" hueiness men, hut it is true, "and don't you forget it." We have enough bueiness bouees in Bellevne and Hailey to supply a city of 50,000 people. And etill they all kick hecaute tbey do not make anything.

Useful Information.

A NOISY MONKEY.—One of the most extraordinary and the largest of all the monkey tribee fonnd in America is the "howler monkey," so oslled from the loud voice of the males. A. R. Wallace, in the *Popular Science Monthly* for May, alludes to this animal as follows: Often in the great forests of the Amazon, or Orinoco, a tremendous noise is heard in the night or early morning, as if a great assemblage of wild beasts were all roaring and screaming together. The noise may be heard for miles, and it is londer and more piercing than that of any other animals, yet it is all produced hy a single male howler sitting on the branchss of some lofty tree. They are enabled to make this extraordinary ncise by means of an organ that is poesessed by no other animal. The lower jaw ie unusually deep, and this mekes room for a hollow bony vessel about the size of a large walnnt, situated under the root of the tongue, end having an opening into the windpipe by which the animal can force air into it. This increases the power of its voice, acting something like the hollow case of a violin, and prodncing those marvelous rolling and reverberating sonnds which csused the celebrated traveler, Waterton, to declare that they were such as might have had their origin in the infernal regions. The howlers are large and etout-bodied monkeye with bearded faces, and very strong and powsrfully grasping tails. They inhahit the wildest forests; they are very shy, and are seldom taken captive, though they are less active than many other American monkeys.

TO CLEANSE A SOILED CHAMOIS LEATHER.—Many workshops contain a dirty wash leather, which is thrown aside and wested for the want of knowing how to clean it. Make a solution of weak soda and warm water, ruh plenty of soft soap into the leather and allow it to remain in eoak for two houre, then rub it well until it is quite clean. Afterward rinse it well in a weak solution compossd of warm water, soda and yellow soap. It must not he rinsed in water only, for then it wonld he so hard, when dry, as to be unfit for use. It is the small quantity of soap left in the leather that allowe the fiber perticles of the leather to separate and become soft like eilk. After rinsing, ring it well in a rough towel and dry qnickly, then pnll it about and brush it well, and it will become softer and better than most new leathere. In using a rongb leather to touch up highly-polished surfaces, it is frequently obeerved to scratch the work; this is caused hy particles of dust, and even hard ronge, tbat are left in the leather and if removed by a clean rougy brush it will then give the brightest and best finieh, wbich all good workmen like to see on their work.

DANGER FROM OILED FLOORS.—The dangers attending oiled floors and seats in public buildings appear to have been illustrated in the recent destruction of Walker hall, one of tbe Amherst college huildings, whose floors had been oiled only the day hefore. The danger is not so mucb in saturating the woodwork, hnt in the waste used in performing the opsration, which careless workmen are liable to leave hehind them. The Springfield *Republican*, in speaking of thie fire, relates, also, another instance: That some yeare ago, contractor Johnson, who built the Northampton First church, and many other similar edifiose in the Connecticut valley, "had an impression" one evening that something was not right ahont a church he was finishing, the pews of which the workmen had heen oiling that day; so he went to the building and nnlocked it to find that flames were jnst breaking out near the entrance of the andience room. Wben one of the men left work at eix o'clock he laid the piece of cotton waste, which be had heen using, on the rail of the last pew, and the resnlt was spontaneous oombustion in three or four hours.

THE USE OF SHARK SKINS.—The skins of certain sharke are nsed in jewelry for sleeve bnttone and tbe like, and when dried and cured take a polish almost eqnal to tbat of stone, and greatly resemble the foesil coral *porites*. The vertebrae of tbe shark are always in demand for canee. The opening filled with marrow dnring life is now fitted with a steel or iron rod. The side openings are filled with motber-of-pearl, and when polished the cane is decidedly ornamental. In India, in 1880, $300,000 worth of shark fins were shipped to China for food. In the islands of tbe Pacific the fish is in great demand for its teeth, which are manufactured into weapone of various kinde, ranging from spears to sworde and daggere. The teeth are all serrated or saw-edged, and make terrible wounds. The hase of tbe tooth ie bored with eome small instrnment, and 40 to 50 of them are tied or laebed to a hardwood sword, forming the edge. The hilt ie also protected hy croespieces armed in the same way. So effective are theee weapone that the natives of these islande wear an armor made of rope especially to protect themselves from the shark's teeth.—*Sea World.*

A MICRO-TELEPHONE has heen used with success in discovering underground water-courece in the Tyrol. By the way, may not thoee persone who ueed "divining rode" to discover where wells conld be dug have heen posseseed of an nnnsually eensitive power of bearing, whicb enabled them to detect the gurgling of water deep down in the earth, and simply employed a willow wand as a "hlind."—*Invention.*

A PUBLIC LIBRARY WITHOUT NOVELS.—In Germantown, a part of the suburbs of Philadelphia, there is a free library of 10,000 volnmes without a novel in it. When the librarian was asksd, "Why don't you keep novels?" he replied: "Because we hold that it does harm to our young readers. Fully one-half of those that come here are young folks. Novels, at that period, are not the things for them. We hold that their minds should be led to take up some more wholesome reading—hooks on travels, or natural history, or biography—something that will amuse and instruct together." "Is there any diseatisfaction because you have no novels here?" "No, we have from 400 to 600 visitore a week, snd they increase every yeer. We have books on all sorts of trades—erchitecture, engineering and carpentering. We find these books are a great deal read, and have not the least doubt ae to their usefulness."

MUCILAGE.—Persons are often at a loss for a very strong mucilage, having sufficient power of tenscity to fasten sheets of pastehcard together. The following cement is recommended by a scientific authority: Melt together equal parts of pitch and gutta perche. To nine parts of this add three parts of boiled oil and one-fifth part litharge. Continue the heat with stirring until a thorough union of the ingredients is effected. Apply the mixture hot, or somewhat cooled, and thinned with a small qnantity of benzole or turpentine oil.

POTATO FLOUR.—Potato flour, or the dried pulp of the potato, is attaining considerable importance in the arts—so much so, in fact, that in Lancashire, England, some 20,000 tons of it are sold eunually, and its market value is etated to he much greater than that of wheat flour. The article is extensively used for sizing and other manufacturing purposes, and, on being precipitated with acid, is converted into starch. After having been calcined it is used with advantage as a dressing for silk.

CEMENT.—Lovel, in Paris, has patented a method for the manufacture of cement, by mixing magnesia with tbe crystallized sulphate of magnesia and moistening the mixtnre with water, also by mixing the magnesie with a solution of the sulphate of megnesia.

POISONOUS COSMETICS.—A young lady recently died in Boeton from poisoning with cosmetics containing lead. Sucb cases are not rare. It ie time we had a law against tbe manufacture of such articles.

DISINFECTANTS.—"What ie the action of disinfectants?" was asked of a medical student. "They smell so bad tbat people open the door, and fresh air gets in," was the reply.

PATENT MEDICINES IN FRANCE—In France all patent medicines must be indorsed hy an official board of physicians before they can he sold.

Good Health.

Hereditary Disease.

There is, strictly epeaking, no such thing. Children are not born diseased (some specific maladiee excepted), even if one or both parents are, but they are simply born with a predisposition to such parental malady. They are born with the material, witb the powder, hut actual disease will no more occur, unless exciting causee are applied, than powder would detonate without the aid of fire. The observaot reader has often felt surprised at seeing robust, hearty children, of parents who were seemingly at not a great remove from tbe grave; and, if rational care were taken of sncb children, tbey would live to become healthy men and women. The practical lesson should he, a hopeful diligence in the rearing of children of diseased parentage. The difference between the ohildren of healthy and diseased parents amounts to this: As to tbe latter, tbe powder is drier, they have less capability of resisting the causee of disease; the consequence is, a greater neossity for carefulness; tbis necessity is often felt and practically attended to. The result is, tbat such persons are found living, scores of years after they have moldered in tbe grave, who, in priding themselves on baving constitutions which nothing could hurt, could not be made to feel the need of carefulness, and, consequently, perished long before their prime.

We have an instructive and royal illustration in point, in the persons of Queen Victoria and her children. Intermarriage with hlood relatione for agee hae deeply impregnated the Guelph family with scrofula. The earlier years of the Britieh Queen were spent in feeblenese and disease, and yet she is now the apparently healthy mother of a large family of robuet, healthy children, which is at once creditable to herself, and to tbe medical skill wbicb dictatee the hygiene of her houeehold. Tbe daily rontine of these children ie, to rise early, breakfaet at eight and dine at two. First hour after breakfast, the classics; next, the modern, grammatical instruction being also carefully given; next, military exercieee for the boys; tben mueic and dancing; then the riding school; music and drawing for the girls; then the carpenter's shop, and, occasionally, the laboratory; then ebooting and working in tbe royal gardens; then eupper; then prayers, and then to hed.

Reenlt, high bodily health, in spite of agee of *"hereditary tendencies"*—*Hall's Jour. of Health.*

Instructions by Which We May Keep from Drowning.

The human body weighs a pound in the water, and a chair will carry two grown persons. That is, it will keep the head above water, which is all that is necessary when it ie a quee-tion of life or death. One finger placed upon a stool or chair, a small box, or a piece of board, will easily keep the head above water, while the two feet and other hand may be used as paddles to propel toward the shore. It ie not at all necessery to know how to swim to be able to keep from drowning in this way. A little experience of the buoyant power of water, and faith in it, is all that is required. We have seen a small hoy, who could not swim a stroke, propel himself back and forth aoross a deep wide pond by means of a board that would not sustain five pounds' weight. Children, and all others, should have practice in the sustaining power of water. In nine cases out of ten, the knowledge that will sustain a pound weigbt is all thet is necssary to keep one'e head above water, and will serve better in emergenciee than the greatest expertness as a swimmer. A person unfamiliar with the buoyant power of water will natnrally try to climb on top of the floating object on which he tries to save himself. If it is large enough, that is all right. But it is generally not large enough, and half of a struggling group is often drowned in the desperate scramble of a life and death etrnggle to climb on top of a piece of wreok or other floating object, not large enongh to keep them all entirely above water. This often happens when pleasure boats capsize. All immediatsly want to get out of the water on top of the overturned or half-filled hoat, and are all drowned except those whom the wrecked oreft will wholly bear up. If they would simply trust the water to sustain .99 of the weight of thsir bodies, and the disabled hoat the otber hundredth, they might all he saved under most circumstances. An overturned or water-filled wooden boat will sustain more people in this way than it will carry. It would keep the heeds above water of es many people as could get their hande on the gunwale. These are simple facts, eesily learned, and may eome day save your life.

A Cheap and Serviceable Filter.

A cheap and serviceable filter may he made by the following method: Take a large flower pot, or earthern vessel, make a hole one-half inch in diameter in the bottom, and insert in it a sponge. Place in the bottom of the vessel a numher of clean stonee of sizes varying from tbat of an egg to an apple. Place upon thie a layer of much smaller etones and coarse gravel. Then fill the jar withia two inches of the top, with equal parts of pulverized charcoal and sharp sand, well mixed. Place loosely over the top of the jar white flannel cloth, allowing it to form a hollow in the middle of the jar, into which tbe water can be poured. Secure the edges by tying a stont cord aronnd the outside of the jar. By keeping a suitable vessel under the filter thue made, and snpplying rain-water when needed, very pure water can be obtained. It can be kept in a cool place in the summer. It will reqnire to be renewed occasionally by exchanging the old eand and charcoal for fresh. Tbe flannel and sponge must be frequently cleansed.

Such a filter, if allowed to become empty every day, or evsry other day, at least, ought to last several years. Water which has a distinct odor should never be passed through a filter. Filtration will not purify such water.

The hardnsss of hard water is not removed hy filtration. If a charcoal filter is employed, some of the mineral ingredients of the water will be retained in the filter, but no very considerable proportion. The use of bard water will very soon spoil the best filter made, by the deposit of lime.—*Good Health.*

EFFECTS OF LAGER BEER ON GOATS.—Recently some Pennsylvania beer sellers tried tho effects of beer on a goat. Whether the experiment was for tbe purpose of determining the quality of tbe beer, or the constitutional toughness of tbe goat, is not recorded; but the result was fatal to the goat, notwithstanding the hardihood for wbicb he is proverhial. Jnst how many glasses were required to extinguish him is not mentioned; but he died, and the bigh quality of the beer was established beyond tbe possibility of cavil. But this is not the end of tbe story. The Humane Society learned of the proceeding, and immediately began an action against the heer venders for cruelty to animals. The action was undoubtedly jnetifiable, hut is a matter of wonderment that the same law-makers who bave found it an offenee to kill goats with beer, have never once thonght of its being a crime to destroy human beings by the eame means, altbough there are abundred thoueand human beings sacrificed by tbie means, to one goat. It is to be hoped that the question of prohibition will be agitated until human beings are, at least, as well protected as goats.

COPPER IN BREAD.—The author concludee that wheat normally contains copper to tbe extent of eight to ten parts per million. He has experimented with grain, the seed of which had not been "pickled" with sulphate of copper (as ie often done to prevent smnt), and has eatisfied himself that the copper was not dne to any impurity in hie reagents, or to the gas pipes and hurners.—*Jules Van Dens Berghe.*

Passing Events.

The result of the debris decision continues the leading topic among mining men interested in California mines. No steps have yet been taken towards an appeal. The large mines will immediately begin to prepare for impounding their debris. The Government has appropriated $250,000 toward improving the Sacramento and San Joaquin rivers.

The party from the burned Arctic exploring ship *Rodgers* has arrived safety at Sitka. Master Putnam, who volunteered in place of Master Halsey, lost his life by being carried to sea on an ice-floe.

The burning of the end of the old Oakland pier, with the destruction of one ship and damage to others, is a local event furnishing some excitement.

Another mining expedition started from this city to Alaska this week. The men composing it, having been up there last season, know what they are going after.

The loss of the British steamer *Escambia*, on the bar outside the Golden Gate, is a circumstance of unusual importance. She was apparently overloaded, and turned over on a sea boarding her, some 26 lives being lost, besides the costly ship and valuable cargo. The ship is represented as having been faultily constructed, as she heeled down on her side badly whenever it blew, and her solid bulwarks held so much water on deck as to make her dangerous to handle at sea. A consular inquiry is being made into the cause of the event.

The discovery of nickel ore in Oregon is an event of great commercial importance, and one which is more fully referred to in another column,

The miners in the different States and Territories are moving in the matter of the Denver Mining Exposition, but so far, nothing has been done in this State.

This number of the PRESS is the last of volume XLIV.

Close of the Volume.

This number closes Volume XLIV of the MINING AND SCIENTIFIC PRESS. Those of our readers who have been such since the commencement of the volumes will remember the scope and variety of its contents. Those who have only seen a few numbers can, by a glance at the index which fills the last page, see an "abstract by title" of all we have presented to our subscribers during the past six months.

We flatter ourselves that no mining paper in the United States has furnished more practical information to practical miners than the PRESS has. Moreover, we have presented each week a condensed and comprehensive report of current news from all the Pacific States and Territories, mining notes from all regions, districts, camps and mines in every direction. And this is in addition to the mechanical, scientific and general information the paper has given. We have spared no trouble in making the PRESS as interesting and valuable as possible.

We propose to continue to do this during the coming volume and those which will come after it. We need, however, the co-operation and assistance of practical miners and progressive mechanics and artisans everywhere. We need their help in more ways than one.

We hope that this will be considered a good time to renew subscriptions; and also that those who see this number of the PRESS, and who are not already subscribers, will send in their names. All mining men and mechanics on the coast should support their home paper.

The Denver Mining Exhibition.

We notice by our interior exchange that in some of the most prominent camps attempts are being made to get up collections of geological and mineralogical specimens to forward to the Denver exhibition. The main difficulty seems to be the lack of money to pay some individual to collect the specimens and go with them to the exhibition. The different appointees, from the various States and Territories, seem to be expected to pay their own expenses as well as do the work.

The fact of the matter is, it takes good hard work to collect specimens for such a purpose. People generally are apathetic and need constant reminders. Moreover they need personal solicitation or notice, and even then the Commissioner must do the labeling, packing, etc. When all this has to be done without pay, and at one's own expense, it is hard to find men to do it.

Governor Murray, of Utah, has appointed Prof. J. E. Clayton as Commissioner from that Territory, and as that gentleman has a large private collection of his own which he will exhibit, and will take several other private collections, Utah will make a good show.

Governor Sheldon has selected W. B. Sloan as Commissioner from New Mexico. Governor Tritle, of Arizona, has chosen Prof. Church to represent that Territory. The county of Cochise is to be represented by Hon. Patrick Hamilton, and Tombstone district by Theo. R. Sorin.

Oregon, Nevada, Washington, Montana, Idaho and California are still without commissioners, and no active steps have been taken in either one of these States or Territories for representation. The papers are urging the miners to come forward with specimens, but what is everybody's business is nobody's business.

The most proper person to represent this State would be the State Mineralogist. He is unable to leave, however, owing to lack of appropriations. The State Mining Bureau is so short of funds that the Mineralogist has now to do nearly all the work, and cannot, of course, close the Bureau and go away. Nor could he remove any of the specimens. We fear California will be poorly represented. There is now scant time, and so far no active measures have been taken. If the Governor appoints a Commissioner, that official must pay his own expenses in collecting specimens and his passage to and from Denver, besides his board while there. Under these circumstances it will be hard to find anyone to accept the commissionership. If anything is to be done in this State it must be done quickly, for it will be better to make no show at all than to make a poor one.

NON-ASSESSMENT MINES.—The Nevada *Transcript* says: Nothing is being done at the Fortuna mine. It is a good claim, but was incorporated under the laws of the State of New York, which prohibit the levying of assessments. The working capital gave out before the shaft was sunk to a respectable depth. I. M. Taylor, the chief manager, went East over a year ago to see what could be done about it, and he stated upon leaving that he expected to commence work on it again very soon. The "very soon" is still in the future.

IT is stated that the German government regards the small majority on the resolution adopted in the Reichstag, declaring inadmissible any further measure hurdening the tobacco trade, as an indication that the refusal of the Reichstag to accept the tobacco monopoly would not be permanent.

Nickel in Oregon.

At the last meeting of the San Francisco Microscopic Society, the first public and reliable notice was made of the important discovery of a large deposit of a rare form of nickel ore at a place about eight miles from the town of Canyonville, Douglas county, southern Oregon, and three miles from the Oregon and California railroad. The deposit closely resembles that discovered in New Caledonia, in 1864, as will be seen from an article on the subject in another column of this issue. Professor Liversidge, in 1874, read a paper before the University of Sydney on the "Nickel Minerals from New Caledonia," wherein he says: "These minerals consist of two hydrated silicates of nickel and magnesia, which are found in small veins and fissures, traversing the serpentine occurring at Mont D'Or, not far from the town of Nonmsa, New Caledonia. They are associated with chrome iron, steatite and other minerals commonly occurring in serpentine, and are seen disseminated through the loose blocks and bowlders of that rock scattered over the surface of the ground. The chief differences between the two minerals are found in some of their physical properties, for chemically they do not differ so widely; in fact, both forms contain nearly equal proportions of nickel; their other constituents, however, vary considerably."

In the "Transactions of the Royal Society of New South Wales," for 1876, is a lengthy notice by the Vice-President of that society on the deposits of nickel ore in New Caledonia.

In a pamphlet by Capt. A. E. Brune, lately published in this city, he says: "New Caledonia, discovered by Capt. Cook over 100 years ago, is, next to New Zealand, the largest island in the great South sea, being upwards of 220 miles in length and 40 in width. Its valleys and transverse plateaux contain large areas of transcendent fertility, teeming with spontaneous vegetation; yet, no product of this prolific island figures in the world's commerce, except its sandal-wood, gold, copper and nickel ore—the latter presenting itself in the form of a magnesium hydro-silicate, which has received the name of garnierite."

Dr. Hood has given the following comparative analyses of the Oregon and New Caledonia nickel ores:

	Oregon Ore A....	Oregon Ore B....	Garnierite.....	Noumea.....
Silica.....	48.21	40 35	47.23	47.90
Iron and Alumina oxide..	1.38	1.33	1.66	3.00
Nickel oxids.....	23.88	29.66	24.01	24.00
Magnesia.....	19.90	21.70	21.66	12 51
Water.....	6.63	7.00	5.26	12.73
	Amorphous—Hardness, 2.5; specific gravity, 2.65; color, pale apple green, becoming lighter by exposure. Adheres to tongue; not unctuous. Does not fall to pieces when placed in water.	Amorphous—Hardness, 2.0-2.5; specific gravity, 2.20; color, dark apple green, becoming lighter by exposure. Adheres to tongue; unctuous. Falls to pieces in water.	Amorphous—Hardness, 2.0-2.5; specific gravity, 2.27; color, apple green. Adheres to tongue; not unctuous. Falls to pieces in water.	Amorphous—Hardness, 2.5; specific gravity, 2.58; color, dark apple green. Does not adhere to tongue; unctuous. Does not fall to pieces in water.

The peculiarity of this rare deposit of nickel will be highly interesting to mining geologists, and we hope, ere long, to see works erected for its reduction in or near San Francisco, as the demand for this useful metal is daily increasing.

ALTA MATTERS.—The 2150 level has been cleared of debris and men have resumed work in the west drift. On going into the main east drift it was found that the center of the bulkhead was gone down to within two courses of timber from the floor of the drift. On the south side a considerable section of the bulkhead was still standing, and on the north a smaller amount. The bulkhead was built up of timbers about six ft. long, all in the shape of wedges or keystones, and about one ft. square at the large end. The bulkhead was in the shape of a segment of a circle, the arch being inward toward the water that it kept back. These timbers were well bolted together and embedded in cement. The sections remaining were found so solid that several blasts were required to throw them down. The site of this old bulkhead is being cleared and they are now cutting out for the new stone bulkhead. The stones used will be seven feet long, and each stone will he cut in the form of the keystone of an arch. Owing to the great pressure on the old bulkhead, the ends of some of the timbers burst open and split out like the splints of a wooden broom.

The Hydraulic Mines.

In the last number of the MINING AND SCIENTIFIC PRESS we gave the full decision of Judge Temple in the debris case. By this time its details are pretty well understood, and, of course, to the miners it was very unsatisfactory; but still its tenor is such that they can comply with its provisions by building retaining dams which will keep back the "howlders, cobbles and beavier sand." Quite a number of mining companies owning the large mines in Nevada and Sierra counties are already taking steps to impound the debris. The North Bloomfield company, of Nevada county, has already commenced the construction of a dam, to be some 40 ft. in hight, at the mouth of the canyon into which the company discharges its tailings. This will afford reservoir capacity to impound the debris from its mine for quite a length of time, and as the ground devoted to this purpose belongs to this company, it will have no further trouble in the matter, beyond the cost of the dam.

In an interview with Mr. Hamilton Smith, Jr., President of the Miners' Association of California, who has given the subject very close study and is thoroughly posted, he says:

"For the retention of debris upon a large scale, it will be almost necessary to have either State or Congressional action, as in many places the beds of the mountain streams are owned by river miners, and in order to devote these streams to reservoir purposes, the power to condemn their beds should be granted by legislative action. Should Congress pass the appropriation proposed by Mr. Page for the relief of the Sacramento river, the situation will be very much simplified.

"The restraint of debris coming in the future from the mines can only be thoroughly accomplished in conjunction with works for the restraint of the great masses of the debris now in the mountain rivers. Should Judge Temple's decision be confirmed by the higher courts, and should it be definitely decided that it is the duty of the miners to store their tailings, it will be their best policy to join forces with the United States engineers, so that the engineering works built shall answer the double purpose of holding back the debris now in the river beds, and also of impounding that which in the future may be washed into them.

"It is apparent that a final and speedy decision of this Gold Run case by our Supreme Court is most desirable for both farmers and miners, and we all hope that the law will settle it within a few months. It has all along been understood that, no matter what Judge Temple's decision might be, the case would be appealed at once, and doubtless the Gold Run company will carry out that understanding. The important thing for both of the contending parties is, that they should know exactly what the law is, so that they may know what future action to take in the matter.

"I most certainly believe that there is a practicable method by which the vast quantity of slickens and bowlders brought down by the present system of hydraulic mining can be effectually impounded. I have the most implicit faith in the ability of the miners to accomplish that very thing; but it will require an immense outlay of both money and labor. Naturally the miners will not feel justified in expending large sums in building dams, unless they know that these expenditures will insure immunity from further legal attacks. If they were once assured that they would not be molested in the future, they would have no hesitation in building works of the most substantial character.

"Some of the largest and most substantial dams in the world have been built in the mining counties of California, for the storage of water to supply the mines during the dry season. These dams are safe from breakage beyond peradventure, and if it be so easy to build dams 100 feet or more in hight to store water, it is surely much easier to construct dams which will safely hold back bowlders, gravel and sand."

THE DOWNEYVILLE STRIKE.—A correspondent of the Reno *Gazette*, writing from Downeyville, says: "This is the greatest mineral country in the world, I believe. The Downey mine, in Downeyville, on Friday, run a drift into a cave 150 ft. from the surface, the walls of which alone contain 2,000 tons of ore that will go over $500 to the ton. It is not known what is beyond this, but the ledge is supposed to extend for a mile very near the surface. The owners of the mine are going to put up another smelter. The one they now have has a capacity of 20 tons per day, and the other is to be of the same size. The whole country around Downeyville and Grantsville is already located, and prospectors are at work everywhere."

CHIEF OFFICER WATTS, of the American ship *Imperial*, from San Francisco, was arrested on his arrival at Queenstown, charged with wounding, with intent to kill, several of the crew of the American ship *Gatherer* on her recent voyage.

VESSELS of 1,000 tons will soon be steaming through the Welland canal. The work of enlargement was begun 10 years ago, and Canada has expended $13,000,000 up to date.

The Microscope in Metallurgy.

Nickel and Gold Ores.

In the MINING AND SCIENTIFIC PRESS of April 1, 1882, we published a paper by Melville Attwood, F. G. S., on the subject of the "Microscope in Metallurgy," which was read before the San Francisco Microscopical Society. We now append a paper by the same author which is a continuation of the former one, and which was read before the Microscopical Society at its last meeting:

In continuing the subject of "The Microscope in Metallurgy," I feel that I cannot urge too strongly on mill men the necessity of a more extended and general use of the microscope in their calling, particularly in special points of inquiry. Its importance in a matter which occurred last week I think well worth relating. Some time ago a discovery of a large and valuable deposit of a rare variety of nickel ore was made in Douglas county, Oregon. Nos. 1 and 2 are specimens of the ore, No. 2 having one side polished, after the manner described in a paper—the subject, "Porphyry"—that I read before the society. In this particular case the simple mode of preparing it, as you will see by examination, shows very beautifully the structure of the ore.

Rare Variety of Nickel Ore.

The value of the discovery attracted a great deal of attention, and induced a number of parties to search for that metal, and last week a specimen of rock (No. 3 and No. 4 section), with a number of assay certificates, said to be the results of trials from different pieces of the same rock by assayers in this city, was handed to me, no doubt in good faith and with the best intentions, the results, according to the different certificates, varying from 10% to 25% of nickel. The deposit was represented as being extensive and situated at a comparatively short distance from San Francisco, and the modest sum of, I think they told me, $2,000,000 was asked for the property. I gave a portion of the rock to one of the most reliable assayers here, who kindly agreed to try it for me, and at the same time I broke off another piece to have a section cut from it for microscopic examination. The return from the assay office was no nickel, and the examination by the microscope proved the correctness of the return from the assayer, showing, without a question or doubt, the specimen of supposed nickel ore to be nothing more nor less than a piece of common serpentine rock.

Analysis of a sample of nickel ore from Piney mountain, Cow creek, Douglas county, Oregon:

Nickel protoxide	6.14
Chromium sesquioxide	0.12
Magnesia and alumina	13.04
Silica	53 20
Iron sesquioxide	16.80
Water	10.70

The above was result of analysis of a mixed sample of five different rocks, including the serpentine wall rock. Subsequent analyses of selected ore give as high as 29.33 protoxide of nickel.

Through the kindness of Dr. Hood, I am not only able to exhibit to you a collection of the Oregon ore, but also the rocks and minerals associated with it, and an analysis by Dr. Hood of an unassorted sample of the deposit. The last report from the working of the mine was that they had exposed thousands of tons of the ore, which would yield from 10% to 25% of nickel, which would be worth from $400 to $500 per ton. The estimate of the value of ore is taken from published transactions of the Royal Society of New South Wales, 1876, wherein it states 20% nickel ore is worth about 2,000 francs per ton in Europe. The ore is a hydrated silicate of nickel and magnesia, resembling the new mineral "garnierite," met with near the town of Nonmea, New Caledonia, and found traversing serpentine rocks, associated with chrome iron, steatite, and other minerals.

Prof. Liversidge, University of Sydney, read a paper before the Royal Society of New South Wales, 1874, on "Nickel Minerals from New Caledonia," a copy of which I have placed amongst the specimens, for any of our society who feel interested in the subject to read.

Garnierite; new mineral. Amorphous. Hardness=2.0–2.5; sp. gr.=2.27; apple-green; adherent to tongue; fracture conchoidal; falls to pieces in water. SiO_2 47 236; Al_2O_3 + Fe O, 1.668; Ni O, 24.010; Mg O, 21.660; Ca O, traces; H O, 5.266=99.840.

Milling of Gold Quartz.

One of the principal objects of this paper, however, is to criticise the *modus operandi* in use at the quartz mills in this State, and to try and point out what I consider its errors, and to suggest a method of working which is likely to prove more profitable. From the most reliable information I can obtain respecting the milling of gold quartz in Europe, South America and Australia, it appears that the time required for the amalgamation of the gold in iron pyrites, or raw ore, called here sulphurets, whether treated in wooden barrels, or in arastras, is about 24 hours, and their loss in simple amalgamation in wooden barrels (under 4 %) does not amount to one-half of that sustained in the roasting, or first stage, in the process of chlorination of the gold sulphurets—unless the reports of the St. John del Rey, and other large companies for the past 40 years, and also that of the smaller works in northern Italy are false—all of which have been published from time to time, and no one who knows anything about English mining companies, and particularly those men in charge of such as the St. John del Rey company, would entertain for a moment.

Amalgamation for gold in barrels is not in use at any of the mills in this State, nor has it ever been fairly tried here.

Those who have carefully panned out samples, taken from the refuse or leavings after the chlorination process, will tell you, that the coarser particles of gold are not entirely extracted by that process, so that in many cases the lose of the larger particles of gold must be very great.

This process, under any circumstances, contrasts very unfavorably with simple amalgamation in barrels, the loss of gold being greater and the cost more than double.

The greatest error, however, in our milling for gold, is, I believe, the fine stamping of medium grade vein stone. As I have stated before, stamping ought to be conducted, like the cracking of a nut, if possible, to break the envelopiug shell and to free without injury the metallic kernel. The screens for sitting the stamped quartz are usually made of perforated iron

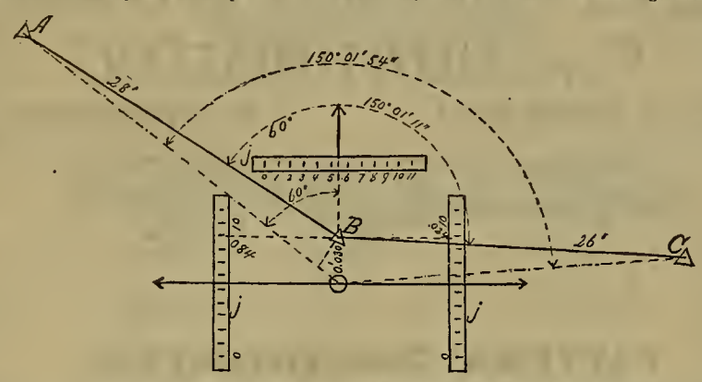

FIG. 2—APPLICATION OF THE MIRROR (See first page).

sheets; steel-wire cloth is better in many respects, as it allows more stuff to pass through in a given time, thus causing a saving in the cost of stamping, and also in the gold.

Steel-wire cloth with 144 holes to the square inch, which will allow grains having a diameter of one-fifteenth of an inch to pass through it, is not too coarse; indeed, if the vein stone contains much pyritic matter I would recommend 100 holes to the inch.

It will be found, when reduced to the above size, that if any gold with quartz adhering to it (say one-fifteenth of an inch in diameter) should pass through the screens, that it will be caught or saved on the blankets.

The screens in general use here reduce the pulp so fine that 80% of it will pass through a sieve having 2,500 holes to the square inch. Fine films of gold like those I exhibited at a former meeting, which were mechanically mixed with the iron pyrites, and the laminated gold, formed by unnecessary dead stamping, present so much more surface in proportion to their weight that they are carried away by slightly moving water, and easily dissolved by some of the so-called chemicals used in the pan process.

I have, mounted on slides, specimens of the Grass Valley (No. 5) and Bodie (No. 6) golds, the former as broken from the hard vein stone, and the latter the same as it is generally met with in the richer portions of the Bodie veins, occurring comparatively loose in a quartzose ferruginous matter, the larger portion of the quartz being in rounded grains (No. 7), and the gold mostly crystallized (No. 8). You will see by examination of the specimens brought for inspection, how great the loss would be in reducing it with a flow of water fine enough to pass through a sieve having 2,500 holes to the inch, or having a diameter of one-seventieth of an inch.

In amalgamation in the batteries, unnecessary dead stamping causes some of the amalgam to be battered and converted into a black mass, becoming mixed with the baser mineral, particularly so, should a small quantity of zinc get into the mercury, the magnetites and waste iron from the wear of the shoes, etc., would be coated with mercury; and the amalgam thus sickened, a large portion of it will pass over the silvered plates. (No. 10 sample from one of the Bodie mills.) I find the battery pulp, even without mercury in the batteries, but when a large proportion of pyritic matter is being treated, to have a decided acid reaction, due in a great measure to the presence of ferric and ferrous salts, soluble in water. The former of these salts destroys the action of the quicksilver, enfilming it with a compound insoluble in water, and preventing that metallic contact taking place between detached mercurial globules so necessary to amalgamation.

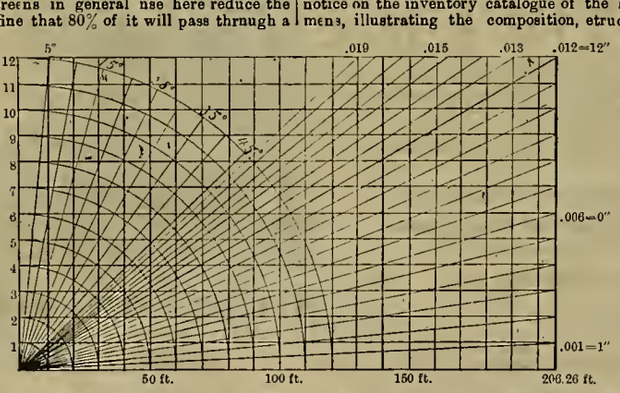

FIG. 3—DIAGRAM FOR REDUCTION TO CENTRE (0 001 feet in 206 20=tan. 1").

Alluvial Gold of New Zealand.

In 1876, Doctor Hector, Director of the Geological Survey of New Zealand, kindly presented me with a valuable and highly interesting collection of the alluvial gold of New Zealand. I mounted a few grains on glass slides, from 15 of the different samples, to be used for microscopic examination, and exhibited the collection at a meeting of this Society during that year, but as we have now so many new members who have not seen them, and wishing to awaken an interest amongst those of our society who have better opportunity than myself, and if possible, induce them to imitate Doctor Hector, and make a collection of the gold from the placers of California, as the excuse, if any be needed, for again showing them to you. I may add that a careful microscopic study of the collection will enable any one to tell the class of placere they were taken from; and if a collection of the characteristic gravels and bowlders met with in the different deep placers were also made, and sections cut from them for microscopic examination and determination, it would enable us to tell from what rocks they were derived—a matter of much importance to those engaged in alluvial washings, and much better than any paleontological guesses respecting them. In one of the old numbers of the *Mining and Smelting Magazine*, is a short notice on the inventory catalogue of the specimens, illustrating the composition, structure, and other characters of the Irish, British and foreign rocks in the collection of the Museum of Irish Industry, Dublin, wherein they remark:

"That great branch of the science of geology which Mr. Jukes, in his "Manual of Geology," defines as "geognoey," is the portion of real importance for industrial purposes. It includes the mineral composition and structure of rocks (lithology) and their physical relations, excluding all questions of age (petrology). To Mr. Jukes, the author of this catalogue, must he given the credit of having first, in this country at least, given due prominence to this branch of geology. Admitting the paramount importance of paleontology, and the arrangement of strata in a chronological series, it cannot be denied that geology has been prejudiced in the minds of practical miners by a too exclusive devotion to these subjects. It is, of course, ridiculous to rail at collections of "shells," but still it is natural that a man who knows nothing of paleontology should be impatient of that exclusive devotion to it which alone, for many years, passed for geology. When geologists turn their active attention to lithology and petrology, that is, the respective mineral composition and structure of rocks, and their physical relations on a large scale, we are satisfied they will find no more zealous or able coadjutors than this class of practical miners."

Milling Medium-Grade Gold Quartz.

As many of our members may not have seen the letter I addressed to the Mining Bureau on the milling of gold quartz, I will briefly state what I recommended in the milling of a medium-grade gold quartz. The screens should be of steel-wire cloth, having 12 holes to the linear inch. The bottom of the screen, when in place, should be three inches above the dies, and three inches horizontally from the dies. Each five stamps should have three sets of blanket-trays of the usualy width and depth—nine feet long altogether, but in three-foot lengths, with a drop of three inches between them, the blankets only covering two feet six inches of the upper part of the trays—inclination of trays from three to five degrees. The pulp, after passing over the blankets, should be brought by sluices to the middle tray, and a sluice trace of about four feet long should conduct the pulp, by two distributers on the right and left, to silvered plates three feet wide and two feet five inches long, made like stairs, with a tread of two inches, and the riser one-half inch inclined backwards under the tread. This form of plates has been used with great success in the sea-beach washing for gold. I am indebted to Dr. Hood, of this city, for the description of this form of plate. After leaving the plates, the pulp can be treated in Hendy or Frue concentrators, and the concentration reground, and then amalgamated in barrels. By this plan the present mills can be made to do double the work and save more gold, without increase of expenditure.

In conclusion, I can only repeat, that the microscope has been of special value in this instance, by enabling us to extend our powers of observation beyond the limits of our unassisted eyesight, and thereby aiding us to determine the condition of the gold in iron pyrites, so that mill men who feel so disposed can greatly simplify their treatment of gold quartz, and at the same time obtain better results.

The great difficulty in obtaining fair samples from vein stone carrying gold, renders the results from assays of it of little value; indeed, worse than useless. To it may be attributed the great number of failures in this branch of mining. I regret that I am able to say that I know of too many cases of failure entirely resulting from it, some of which occurred very recently, where men of good character, but utterly ignorant of mining, have been mistaken by assays, and induced to erect costly machinery on worthless mines, thereby ruining themselves and many of their friends.

Alaska Mines.

In the MINING AND SCIENTIFIC PRESS of November 12, 1881, was an article describing the mining region about Golowin bay, on the north coast of Norton sound, Alaska. The account was gained from an interview with Col. A. F. Williams, a gentlemen who had just returned from there, after prospecting the region referred to all summer, during which time the schooner that the party went up on was wrecked. The principal location made was a galena deposit, running 83% lead and some $160 per ton in silver.

Another vessel has been procured, the schooner *Leo*, and a party starts from this city Saturday to work in the mines, Col. Williams again going in charge. The company is called the "Alaskan Gold and Silver Mining, Milling and Trading Co."

A number of animals are taken up in the *Leo*, including a lot of horses and jacks, to be used in hauling ores and timbers for the mines, until such time as the company may complete a railroad 12 miles in length, which is now in contemplation. R. B. Hard, formerly Sheriff of Contra Costa county, is in charge as Superintendent of the mine. A. F. Williams, of Oakland, is President of the company. J. C. Green, of Oakland, goes up with the present expedition to lend his assistance. He will return in the fall on the *Leo*, with a small quantity of ore from the mines. Five practical miners are sent up as workmen. The company expects to work 200 natives during the coming winter, transporting the ore on sledges to the harbor of Golowin bay, 30 miles down Fish river from the mines.

It is only a few weeks since a party left here on a sailing vessel, taking on deck a small stern-wheel steamer. This steamer is to convey the prospectors up the Yukon river, the banks of which they are going to prospect. There are gold diggings in this river several hundred miles from its mouth. The mines of Harrisburg district are now being steadily worked. This summer and next considerable prospecting will be done in Alaska Territory. Each year more interest is manifested in this region, and as more men go up there a larger area will be prospected. If two or three really good mines should be developed, general attention will be directed to Alaska as a mining region.

EUREKA ORE PRODUCT.—From 1873 to January of the present year the gross ore product of Eureka district amounted to about $40,000,000. From 1869, when ore began to be produced in the district, up to 1873, at least $10,000,000 worth of ore was taken out of the various mines then being developed; so that the total gross ore product of Eureka district, from 1869 up to January last, may be set down, within safe limits, at $50,000,000,

CHICAGO **FRASER & CHALMERS,** ILLINOIS.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Brückner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x30. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Ore. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

MILL AND MINING MACHINERY.

Oscillating Stamp Mill.

It has no Stems, Cams, or Tappets, and adjusts itself to the wear of the Shoes and Dies.

For simplicity, economy, durability and effective working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power. Awarded First Premium and Medal at Mechanics' Fair, S. F., 1880.

Manufactured by

F. A. HUNTINGTON, 220 Fremont St., S. F., Cal. | FRASER & CHALMERS, 145 Fulton St., Chicago, Ill.

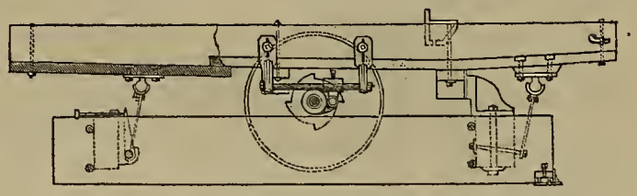
Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds. Send for circulars.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco, Cal.

F. A. HUNTINGTON,

No. 220 Fremont Street, - - San Francisco, Cal.

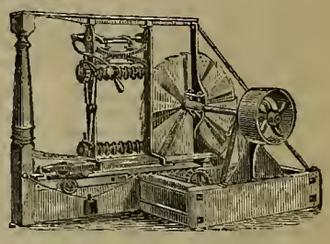


PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

☞ Send for Circulars. ☜



SHINGLE MACHINE.

For simplicity, durability and rapidity of action, these Machines have no equal, cutting from 3,000 to 4,000 per hour. They are now used by all the principal Millmen on the Pacific Coast.

SAWMILL MACHINERY,

Of all descriptions made to order.

F. A. HUNTINGTON,

No. 220 Fremont Street, San Francisco.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

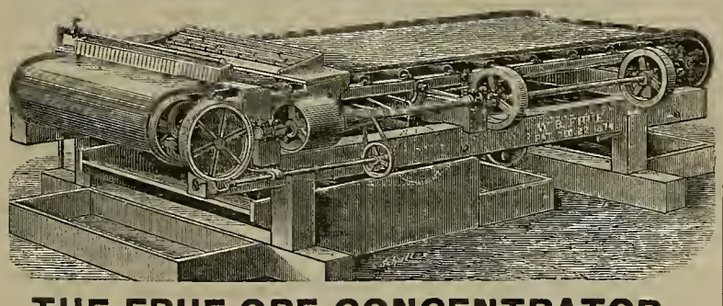
PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

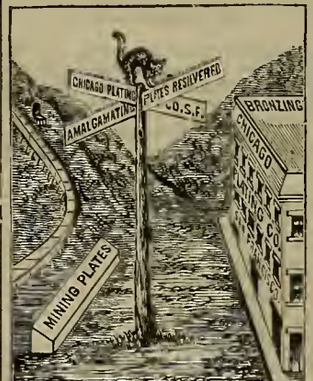
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Buckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.



Amalgamating Plates

REPLATED OR MADE TO ORDER BY THE

CHICAGO PLATING CO.

Pacific Power Building, 23 Stevenson St., S. F.,

And 261 & 263 Randolph St., Chicago.

Having opened a branch house in S. F., the largest Plating and Polishing Establishment on the Pacific Coast, with all the latest improvements in machinery for plating in Gold, Silver and Nickel, with 12 years' experience in the Eastern States and Europe, we claim that our Silver Plated Amalgamating Plates are the most economical, durable, and successful Plates on the Pacific Coast for saving gold. Every description of metal goods plated in the most durable manner by the

259,442—CAN FILLING APPARATUS—Wm. West.
259,443—APPARATUS FOR CRIMPING THE ENDS UPON CIRCULAR CANS, Wm. West.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WOOD PRESERVING COMPOSITION.—John C. Marshall, Oakland. No. 259,030. Dated June 6, 1882. With this peculiar composition the wood may either be immersed therein, or the the compound may be applied with a brush, when found more convenient. The compound should be applied to the wood while hot. Take, for example, the tire of a wheel which has become loose. It should be raised suitably and allowed to revolve, so that its tire and felly will be immersed in the hot compound, which will penetrate between the wood, and the tire will fit as tightly as before. If applied to the felly, when the tire is first put on, the wood will be prevented from shrinking. This compound is useful for buckets or casks which are to stand in the sun, or have so been exposed for some time. Its previous application will prevent the shrinking or warping of the staves, or its subsequent use takes up shrinkage and makes them tight again. In all cases where wood is liable to shrink or warp, this application is useful in preventing this result, or in remedying it if it has happened. It is also a good preservative for wood, as it will prevent decay.

CAN-FILLING APPARATUS.—William West, Keene, Ontario. This invention relates to that class of apparatus which is employed to pack meat, fish, or other solid substances into cans to be hermetically sealed for the market; and it is an improvement upon an apparatus patented by John West and R. D. Hume, Oct. 19 h, 1880, of which patent the present inventor is sole owner. The present improvements consist in certain details of construction, by which the material is delivered beneath the vertical plunger in a better manner; the operation of the cutting knives is more perfect, and the knives are less liable to become dulled. The mechanism by which the different parts are operated is also improved.

APPARATUS FOR CRIMPING THE ENDS UPON CIRCULAR CANS.—Wm. West, Keene, Ontario, Canada. This is an apparatus for crimping the ends upon cylindrical cans, and for preparing these ends for soldering by applying the acid thereto after being crimped upon the can. The invention consists in certain constructions and combinations of devices for perfecting the operation.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

A TURNED LEAF will point out the article supposed to be of special interest to persons receiving sample copies of this paper.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Mining and Other Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Gaudalupe Silver Mining Company—Location of principal place of business, San Francisco, California. Location of Works, Urique, State of Chihuahua, Mexico.

NOTICE—There are delinquent upon the following described stock, on account of assessment No. 28, levied on the 28th day of April, 1882, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Certificate.	No. of Shares.	Amount
Lee, R. B (estate of).....	19	2	$100.00
Steptoe, E. J.....	27	1	50.00
McPherson, J. B. (estate of)	43	1	50.00
Haynes, T. J. (estate of)...	20	2	100.00
Haynes, T. J. (estate of)...	30	1	50.00

And in accordance with law and an order of the Board of Directors, made on the 28th day of April, 1882, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, room 13, No. 109 California street, San Francisco, California, on Monday, the Third (3d) day of July, 1882, at the hour of 2 o'clock, P. M., of said day to pay said delinquent assessments thereon, together with the costs of advertising and expenses of the Sale. WM. BLACKWOOD, Sec'y.
OFFICE—Room 13, No. 109 California street, San Francisco, California.

Norwich Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of Works, Glencoe Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board Directors, held on the 5th day of June, 1882, an assessment, (No. 1) of Twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 310 Pine street, room 15, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of July, 1882, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 31st day of July, 1882, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. A. L. PERKINS, Sec'y.
Office—310 Pine St., room 15, San Francisco, California.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.

The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.

No other furnaces can compare with these for durability and in capacity for uninterrupted work.

MORE THAN SIXTY of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.

These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.

Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to examine mines and to superintend construction and running of furnaces. Estimates given upon application.
Send for circular.

Bath House and a Fine Swimming Bath.

Address all communications to "SIEGLER SPRINGS," Lake county, Cal. W. T. GARRATT, Manager.

Educational.

PREPARATION
FOR THE
MASSACHUSETTS INSTITUTE OF TECHNOLOGY

Is a specialty at **Chauncy-Hall School,** Boston, Mass., and its remarkable success can be ascertained from the Chairman and Secretary of the Faculty of that celebrated institution.

It aims to fit its candidates so thoroughly that they will not be weighted by "conditions" to be made up after entering.

The School is within two minutes' walk of the Institute, affording unequaled opportunities for consulting the professors.

It is also very near many of the most elegant buildings in Boston.

HEALTH receives unusual attention. MILITARY DRILL under competent officers.

Chauncy Hall has annually sent classes to

COLLEGE

For nearly fifty years, and has had but one certified candidate rejected.

THE BUSINESS COURSE

Gives such a generous culture as fits a young man to take a high rank as a merchant.

This is the **oldest and largest** private school in Boston.

The fifty-fifth year will begin Sept. 13th.

The Harmon Seminary,
BERKELEY, CAL.

A NEW BOARDING AND DAY SCHOOL, FOR YOUNG LADIES.

Will be conducted by REV. S. S HARMON and Mrs. F. W. HARMON, for the last 10 years associate principals of Washington College

The HARMON SEMINARY will receive girls of all ages; the instruction comprising Primary, Preparatory and Academic. Thorough course in the English branches. The Arts, Music and Modern Languages in charge of well known masters. Special course preparatory to the State University.

The HARMON SEMINARY will be first-class in all respects, and will combine the best educational advantages with home care, guidance and guardianship.

The first year will open August 3, 1882.

For prospectus and other information, address

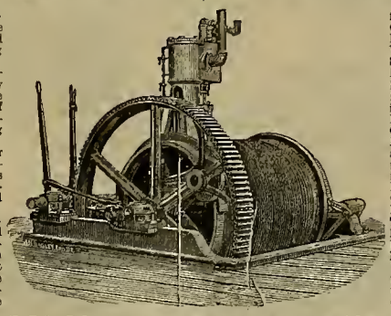
Colorado Iron Works,
MANUFACTURERS OF
ENGINES, BOILERS, RAILWAY CAST AND WROUGHT WORK, BRIDGE WORK, BOLTS AND BOLT ENDS, BUILDING WORK, ETC.
MINING MACHINERY A SPECIALTY.

Our manufactures of mining machinery embrace every kind of machine and appliance for the mining and reduction of ores.
We have had an experience of more than twenty years in the manufacture and practical operation of mining machinery in Colorado and the neighboring States and Territories.
Our facilities are superior to those of any manufactory in the West, our works having been recently rebuilt, greatly enlarged and completely equipped.
We invite the investigation of mine owners and mill men seeking machinery. We can furnish, on board, at our works, or set up at the mines anywhere in the Rocky Mountain region, on short notice, the following machinery: Cornish Pumps, Steam Pumps, Stamp Mills for Wet or Dry crushing, Pans, Settlers, Agitators, Retorts, Bullion and Ingot Moulds, Reverberatory Furnaces, Bruckner Cylinders, Revolving Roasting Furnaces and Dryers, Melting Furnaces, Concentrating Machinery, Rolls, Crushers, Conveyors and Elevators, Ore Samplers and Grinders, Hoisting Engines, Water Jacket Furnaces, Slag Pots and Cars, Lead Pots and Ladles, Blast Pipes and Water Tuyeres, Blowers, Cupellation Furnaces, Market Kettles, Wire Rope, Cages, Buckets, Skips, Ore Cars, etc. Estimates furnished and prices quoted on application. Send for illustrated catalogue.



COLORADO IRON WORKS,
P. O. Box, 1921, - - - - Denver, Colorado.

VIGORIT POWDER.
NO ACCIDENT HAS EVER HAPPENED.
ALL POWDERS manufactured by the California Vigorit Powder Co. are SUBMITTED during the course of manufacture TO SCIENTIFIC and accurate TESTS for safety and strength.
They are tested for Safety against Friction, Fire, a Temperature of 212° Fahr., and the various shocks to which Powder is liable in practical handling.
The following qualities are common to all grades of Powder manufactured by the Company:
Safety, Non-Leakage; Freedom from Noxious Gases; Uniformity and Strength.
If consumers desire it, the EXACT STRENGTH of any Powder shipped to them will be GIVEN IN FOOT POUNDS.
☞ Send for Pamphlet showing methods of testing the different qualities of all Powders.
The Company manufactures
DETONITE.
This is an explosive involving new principles and recently patented. It is the Strongest Powder ever placed on the Market, in this country or abroad. It is the Safest Strong Powder ever made. For very refractory rock this Powder is the most economical in the market.
VIGORIT, No. 1, XX.
This Powder is Stronger than the Highest Grades of Hercules or Giant. It is only surpassed by "Detonite." It is suitable for hard rock.
VIGORIT, No. 1.
For general work this Powder has no superior. It has the advantage over Giant, Hercules or Vulcan in safety and freedom from noxious fumes.
VIGORIT, No. 2.
Equal to any corresponding Grade in the Market.
LOW POWDER.
VIGORIT, L. P.
This is a Powder suitable for Bank Blasting, Log Splitting or the work generally in which Black Powder can be used. It is STRONGER THAN BLACK POWDER, having from twice to ten times the effective strength, depending on resistance. It is Superior to Judson Powder, in being more sensitive to the cap and more convenient in handling.
Best Qualities of FUSE and CAPS sold at Lowest Rates.

J. W. QUICK, MANUFACTURER,

SCREENS

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

WE ARE SOLE AGENTS FOR THE GENUINE

ALBANY COMPOUND, CYLINDER AND SPINDLE OILS. All others are Counterfeit.

TATUM & BOWEN

CYLINDER AND COMPOUND OILS

12 CALIFORNIA ST.

Lubricating and Lard Oils.

F. VON LEICHT,

Mining and Civil Engineer,

Montgomery Street, San Francisco.

Reports, Surveys and Plans of Mines made.

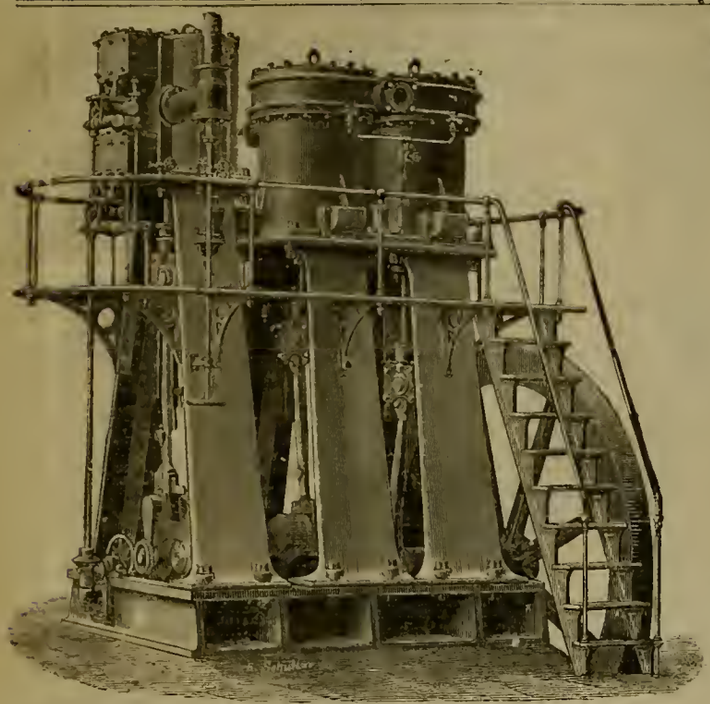
LUTHER WAGONER. JOHN HAYS HAMMOND.

WAGONER & HAMMOND,

MINING ENGINEERS,

318 PINE ST., SAN FRANCISCO, CAL.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.



With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolnte certainty in the action of the valves at any speed. Perfect delivery of tbe air at any speed or pressure. Tbe heating of tbe air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or sbut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction tban our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

NATIONAL COMPRESSORS and ROCK DRILLS.

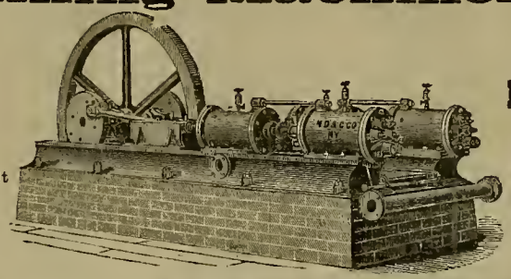
REYNOLDS & RIX, Agents,

No. 49 Fremont Street, San Francisco, Cal.,

MANUFACTURERS OF AND DEALERS IN

Mining Machinery.

We manufacture the BEST **Air Compressors** Ever driven by belt from Water Power.

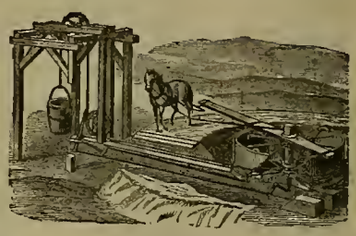


Hoistinq Rigs.

DONKEY ENGINES For Pile Driving.

MINING CARS,

Ore and Water **BUCKETS.**



MINERS' HORSE-WHIM.

One Horse can easily helst over 1,000 pounds at a depth of 500 feet. The whim is mainly built of wronght iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame work. When required these whims are made in sections to pack on mules.

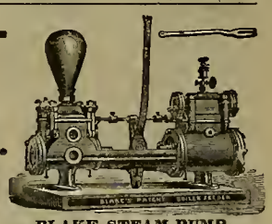
PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

H. P. GREGORY & CO.,

Importers and Dealers in Machinery and Supplies.

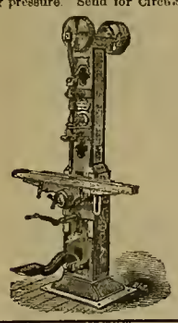
Nos. 2 and 4 California Street, S. F.

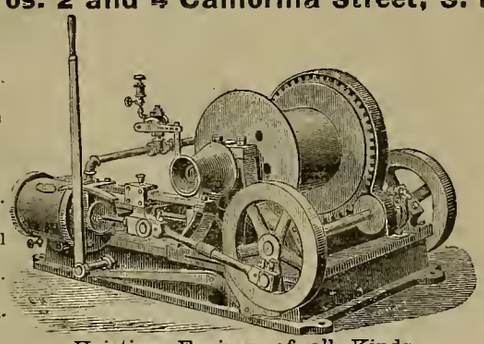


BLAKE STEAM PUMP. More Than 16,000 in Use.

SOLE AGENTS FOR.

- Fay & Co., Wood Working Machinery.
- Bement & Son's Machinists Tools.
- Blake's Steam Pumps.
- Perry's Centrifugal Pumps.
- Gould's Hand & Power Pumps.
- Perrin's Band Saw Blades.
- Payne's Vertical and Horizontal Steam Engines.
- Williamson Bros. Hoisting Engines.
- New Haven Machine Co.'s Machinists' Tools.
- Otto Silent Gas Engines.





Hoisting Engines of all Kinds.

SOLE AGENTS FOR.

- Stnrtevant's Blowers and Exhausts.
- Judson's Steam Governors.
- Pickering's Steam Governors.
- Tanite Co. Emery Wheels.
- Nathan & Dreyfus' Oilers.
- Korting's Injectors and Ejectors.
- Disston's Circular Saws.
- New York Belting & Packing Co.'s Rubber Belting, Hose, Packing, etc.
- Ballard's Oak Tanned Leather Belting.

JOHN BERGSTROM,

ORGAN BUILDER.

29th. and Mission Sts.

E. MAIN, 315 Folsom Street,

Makes to order Gents' Fine French Calf Boots from $6 to $10; Gaiters from $3 to $6; Alexis from $3.50 to $5; Mens' Heavy Kip Boots, $6; Oxford Ties, French Calf, $4; California Leather, $3.50; Men's Working Shoes from $2.50 to $3; Children's Shoes made to order. Persons in the country ordering to the amount of $12, I pay the express charges. I sell nothing but my own manufactura.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

California Inventors

Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., S. F., Elevator, 12 Front St.

RICHARD C. REMMEY, Agent,

Philadelphia Chemical Stoneware Manufactory,

1100 E Cumberland St., Philadelphia, Pa.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists. Also, Chemical Bricks for Glove Towers.

BARGAIN.

Brodie crusher, hurdy gurdy, and grate bars, little used, F. R. J. DIXON, Greenwood, El Dorado Co., Cal.

PISTON ROD PACKING.

For the best in the world, address, GEO. C. PHILLIPS, Silver City, Lyon County Nevada. Circulars free.

Lane's Mineral Springs,

CALAVERAS COUNTY, CAL

Pine and Hemlock Chemical-Vapor and Electro-Thermal Bathe.

Connected with these Springs are Hot and Cold Baths. The Water of these Springs is Cold, Clear and Palatable, having been used 20 years for Medical purposes.

These Fountains of Health are located 35 miles east of Stockton, in the foothills of the Sierras; at an altitude of 1,000 feet above the level of the sea. Always ready, Winter and Summer, for the reception of patients, on account of the even temperature of this most genial climate.

The accommodations consist of a Hotel, Cottages, Camp Grounds and Stables.

Stage leaves Commercial Hotel, Stockton, at 7 A. M., Tuesdays and Saturdays.

P. O. Address, Knight's Ferry, Stanislaus Co., Cal.

JAMES HUTCHINS, Proprietor.
